was to spend Christmas at Perth. Before he crossed the Forth he was warned by an old Highland woman that if he passed he would never return. She tried unsuccessfully to get access to him again at the Dominican monastery at Perth, where he lodged. At midnight, when he was half undressed, Graham with 300 men surrounded the monastery. Their approach was heard, but it was found that the bolts had been removed by treachery. James was hastily concealed in a vault underneath the room. Before the conspirators entered a brave attempt was made by Catherine Douglas, one of the queen's maids, to bar the door with her arm, but the fragile obstacle broke and Graham burst in. The fall of another of the maids into the vault discovered the king, who fought fiercely for his life. The queen was wounded in trying to save him, fulfilling an unconscious prophecy of the *Kings Quhar*. At last, after killing two of his assailants, he fell, overcome by numbers (February 1437). Vengeance speedily overtook the murderers, who had made no provision to follow up their deed. Within a month they were all executed in a manner exceeding even the barbarous usages of the time. James was buried in the Carthusian monastery, where his doublet was long kept as a relic and seen by the people with veneration. Such was the sad fate of the best of the Stuarts,—a king in advance of his age and too rapid in his reforms.

James II (1437-60), an infant of six, called "Fiey-face" James from a red stain on his cheek, was crowned at Holyrood five weeks after his father's death, and there commenced one of the long minorities which the early deaths of the Stuart kings made common, and during which history is chiefly occupied with the contest for the person of the king. These have been truly represented as weakening the royal authority. The possession of power rendered the nobles impatient of restraint and accustomed to licence, but they had also a reverse effect. When the monarch succeeded he was received with favour by the people as a deliverer from the oppression of the barons, too often petty tyrants. A rule of law allowing him to revoke grants in his minority was often used with great effect. On the whole, monarchy, in spite of the weakness and vices of the kings, was popular in Scotland until the Reformation and the fatal chain of events in which Mary was involved introduced a democratic tendency, which grew under the bad government of her successors. The nobles, though their word was law with their kinsmen and retainers, were seldom favourites of the people. Archibald, fourth earl of Douglas, the greatest of the Scottish nobility and duke of Tournaï in France, was lieutenant-general of the kingdom from James's accession till his own death the year after, but Sir William Crichton, master of the household of James I, who was keeper of the castle of Edinburgh, where the young king was detained, appears to have exercised the chief power. Shortly after the death of Douglas James's mother carried off her son, on the pretext of a pilgrimage, to Surling, of which Sir Alexander Livingstone of Callander was governor. Livingstone laid siege to Edinburgh, but made terms with Crichton, who became chancellor. The alternate struggles and reconciliations of these rivals continued till James was fourteen, when he favoured Douglas (the eighth earl) in order to free himself from their control. This was a time of civil or rather of private wars. The only contemporary chronicle marks almost every year with the seizure of a castle or a party fight. Douglas brought the earl of Crawford and his retainers from the Highlands, who ravaged the estates of the bishop of St Andrews, and himself besieged Edinburgh castle. The castle surrendered, but Crichton, one of the adroit statesmen who rise after every fall, continued chancellor, and soon after, by negotiating the marriage of James with Mary of Guelders (1448), ensured his favour with the court. Shortly after the cele-

1448 1466

bration of this marriage Livingstone, now chamberlain, with many of his kindred and friends, was suddenly arrested and tried before a parliament at Edinburgh, two were executed, and the others, including the chamberlain, attainted and placed in strict ward in Dumbarton Douglas and Crichton received part of the forfeited estates James was chiefly advised at this period by Bishop Kennedy, whose counsel was the old one of "divide et impeta" He now determined to do to the more powerful Douglas as he had done to the Livingstones The earl had shown no moderation in prosperity His revenue and retainers equalled those of the king 1000 horsemen were his ordinary train, and he attended the king's marriage with five times that number His courts on the borders were almost parliaments In the year of jubilee (1450) he went to Rome with a large suite On his return he visited the new king of England, Edward IV At the parliament of Edinburgh (1451) he submitted to the king's mercy, and at the request of the queen and estates received a regnant of his lands and honours He was already suspected of treason, and had in fact renewed a secret bond with the earls of Crawford and Ross, the most powerful nobles in the north, which threatened the royal authority James felt a crisis had come and summoned Douglas to Stirling at Shrovetide There the young king, in violation of hospitality and a safe conduct which he had given the earl, when Douglas refused to break the bond with the other earls, struck him with his knife and killed him (21st February 1452) An appeal to arms necessarily followed Douglas's brother James, the ninth earl, came to Stirling and burnt great part of the town But the clergy and commons and other nobles, some even of Douglas's own kin, not sorry at the fall of one who overtopped them, stood by the king Parliament sanctioned James's act and declared Douglas had deserved death At length, after repeated struggles, Crawford was defeated at the Mur of Brechin and Douglas fled to England His estates were of course forfeited The lordship of Douglas was granted to Angus Etrick Forest and Galloway were annexed to the crown. Some years later Douglas made another desperate effort against James, but after wasting Merse was totally defeated by Angus (1458) The energy of James in visiting all parts of his kingdom was conspicuous during the last period of his reign The good relations with the French and other Continental courts continued With England—one brief interruption excepted—peace had been preserved during the reign of Henry VI Henry even agreed to restore Roxburgh and Berwick to Scotland in return for assistance against the duke of York When Henry was taken prisoner at Northampton, his queen and her young son fled to Scotland, and James was called on to fulfil his engagements He laid siege to Roxburgh, which for more than a century had defied his predecessors, and after a stout resistance it was taken, but James did not live to enjoy the triumph When inspecting the discharge of a new gun it burst, and he was killed (3d August 1460) He had not reached his thirtieth year.

His reign had been singularly fortunate, for he succeeded (where his father failed) in restoring the royal authority and reducing the power of the nobles. This may have been

James's energetic rule

Character of James's legislation

¹ The origin of two great families dates from the fall of Douglas Sir James Hamilton of Cadzow deserted his kinsman for the king and received large grants of land and the king's daughter as wife Sir Walter Scott of Errol and Buccleuch, a border chief, was similarly rewarded These were the ancestors of the dukes of Hamilton and Buccleuch

² In the next reign along with the king's banished brother, Albany, he made a daring raid on Lochmaben, but being taken prisoner he ended his days as a monk at Lindores A saying attributed to him, "If a man cannot better be, he may be a monk," was a sign of the change of times since Celtic kings were proud to assume the cowl.

partly due to the counsels of Kennedy, bishop of St Andrews, and Crichton, but James showed skill in government and vigour in war, though the murder of Douglas has left a stain on his character The crown was richer at his death than it had been since the time of Alexander III, by many forfeitures secured from alienation by the Act of Annexation (1455, c 41) The royal prerogative was strengthened by the first statute defining treason (1449, c 25) Provision was made for the execution of criminal justice by the king, his justiciar, and sheriffs, and of civil justice by the session Stringent rules were laid down against violent spoliation of lands and goods (1449, c 30) The coinage was regulated, an attempt made to preserve its standard, and to prohibit export of gold and silver (1451, c 23) Towards the end of the reign, when war with England was impending, statutes were passed for the defence of the borders, giving the king more direct control, and declaring that the office of warden should not be hereditary The progress of agriculture was furthered by the famous Act for the encouragement of feu farm, an existing form of tenure becoming more common, and another giving fixity of tenure to leases until the expiry of their terms notwithstanding alienation of the lands There were also many minor laws which had for their object the welfare of the people Though the legislation of James II was not so large, it was perhaps as important as that of James I.

On the Sunday after his father's death James III (1460-88) was crowned at Kelso A regency was formed of James consisting of the queen, Kennedy, and others A parliament followed at Edinburgh, which was blamed by the nobles for leaving so much power in the hands of a woman, but there was a full appointment to the offices of state, and, though Mary of Guelders aimed at more than the guardianship of her son, it does not appear that she really exercised royal authority After the defeat of Towton (29th March 1461), Henry VI and his queen took refuge in Scotland In return for their reception and in hope of further aid, Henry surrendered Berwick (23d April) to the Scottish king, in whose hands it remained till its final annexation to England at the close of the reign Edward IV retaliated by a treaty (13th February 1462) with the banished earl of Douglas, the earl of Ross, lord of the Isles, and Donald Balloch, by which Douglas was to be restored to his estates, and the whole country north of the Forth divided between the two Highland chiefs George, earl of Angus, who had risen on the ruins of this house of Douglas, made a counter-league with Henry VI, by which he was promised an English dukedom and valuable lands between Trent and Humber, but was to preserve his allegiance to the Scottish king These were paper promises, and all that came of them were an ineffectual rising in the north and the relief of Alnwick, which had been besieged by the Yorkists Next year the Lancastrian cause having received a fatal blow by the defeat of Hexham, a singular offer by Edward IV, to marry the queen dowager of Scotland—one of the many schemes of the king-maker, earl of Warwick—was frustrated by her death or perhaps by the discovery of an intrigue with Adam Hepburn of Hales, whose wife was alive Kennedy, who had the chief control of Scottish affairs, negotiated the release of Alexander, the king's brother, who had been taken by an English cruiser, and secured a truce between England and Scotland for fifteen years He understood the nature of his countrymen better than any man, and was always ready to give counsel in parliament, while his learning, especially in the civil law, made him respected by foreign powers When he died the country wept for him as for a parent.

Before his death a plot had been formed which threw the young king into different hands. Amongst the barons

Minority of James III

Ascend-
ency of
Boyd

who received office at the commencement of the reign one of the foremost was Robert Boyd of Kilmarnock, the justiciar. Boyd determined to play the part of Livingstone in the last reign, and usurp the supreme power by seizing the person of the king. Bonds with this object were entered into between him, Fleming of Cumbernauld, Lord Kennedy, a brother of the bishop, and others. While holding a court at Lanthgow James was carried off to Edinburgh by Boyd. Kennedy made a feint to save him by seizing his bridle, but was overpowered, perhaps the attempt was real, for Kennedy afterwards separated from the Boyds. In parliament Boyd went through the form of asking pardon of the young king in presence of the estates, and was immediately entrusted with the custody of the royal person (October 1466) and that of his brothers Albany and Mar, as well as the fortresses of the kingdom. Next year he was made chamberlain, which gave him control of the revenue. The marriage of his son Thomas, created earl of Arran, with the king's sister Mary, marked the height of his ambition. The fall of Boyd, as sudden as his rise, whom with his brother Alexander James at first favoured, was due to the same cause as that of Livingstone,—the king's marriage and his desire when major to assert his independence. Negotiations for an English match having fallen through, an alliance with a Norwegian princess was determined on, and an embassy sent to Norway by parliament. Christian of Denmark and Norway readily assented. He promised his daughter a dowry of 60,000 florins, besides a surrender of the claim of arrears of the annual payment for the Hebrides. But, as it was inconvenient to pay the dowry, both the Orkneys and the Shetlands were mortgaged to Scotland, and have remained ever since under the Scottish crown. Two years later (July 1469) the princess Margaret arrived in Scotland, when the marriage took place. Arran on his arrival at Leith with the king's bride received a message from his wife warning him that James had conceived a great hatred against him, accordingly he fled to Denmark. In the parliament his father and his uncle, Sir Alexander Boyd, were attainted. The chamberlain saved himself by flight, Sir Alexander was executed. The specific charge made was the seizure of the king's person, but a general clause had reference to the immense estates they had annexed. The king's sister, divorced from Arran, was married to Lord Hamilton, who thus laid the foundation of a family whose head more than once aspired to the crown.

The refusal of parliament in 1473 to sanction the proposed passage of James to France, to aid Louis XI against Charles the Bold, on the score of the expense and risk, was the first indication of the difference between the king and the nobility which led to the disasters of the close of his reign. The parliament of 1473 took a bolder step. At its adjournment it committed its whole powers to certain members, of whom the duke of Albany and the earl of Mar, the king's brothers, were the principal,—a measure which indicated a want of confidence in the king. He had shown himself, like Louis XI, disposed to govern by new men who owed their elevation to himself,—a policy which alienated the aristocracy. Of these favourites the chief were Robert Cochrane, originally, it was said, a mason, who proved himself a skilful architect, Roger, an English musician, and Andrews, a physician, who dealt in astrology,—all able to gratify tastes of James. There were besides a few young men of birth who gained favour by flattery or other arts. Cochrane became all powerful and disgusted the nobles by sumptuousness and arrogance, and the people by debasing the coin. He succeeded, it was reported, by relating a prophecy that a lion should be devoured by his whelps, in producing in the king's mind an aversion to his brothers, whose characters and knightly

accomplishments made them popular. James seized Mar 1476-1488 and sent him to Craigmillar castle. He soon after died (1476) in Edinburgh under circumstances which gave rise to suspicion of foul play. The gift to Cochrane of the vacant earldom or its revenues strengthened the suspicion of his complicity. Albany, committed to Edinburgh castle (1480), escaped to Dunbar and thence to France. He there married Anne de la Tour d'Auvergne, whose son was the regent Albany in the reign of James V. Failing to induce Louis to do more than urge his restoration, two years afterwards he quitted France and at Fotheringay entered into a treaty (1482) with Edward IV, by which, in return for the empty title of Alexander IV, he owned the subjection of the country to England and made other humiliating promises. Supported by the earl of Gloucester and the exiled earl of Douglas, Albany laid siege to Berwick, while James collected his forces on the Borthwickmuir of Edinburgh and advanced to Lauder. There the chief nobles, indignant at the favour shown to Cochrane, mutinied, and, led by Angus, who then acquired his name of "Bell the Cat," seized Cochrane and some of the other favourites of James and hanged them before his eyes. Berwick fell and was never afterwards recovered by the Scots. The nobles, distrusting Angus, who had made secret terms with Albany and the English king, were induced by Schiras, the archbishop of St Andrews, to effect a reconciliation between the king and his brother, who received the vacant earldom of Mar and for a little became chief minister. A parliament in December appointed Albany lieutenant-general, but his continued intrigues with the English king being discovered he was attainted for treason and fled to England (1483), and thence to France. James had now a brief period of peace, during which the revolutions in England freed him from the danger of war in that quarter. New matrimonial projects were tried. It was proposed that the prince of Scotland should marry a niece of Richard III, Anne de la Pole, daughter of the duke of Suffolk, and after Richard's deposition a marriage with Elizabeth, daughter of Edward IV, was suggested. On the death of Queen Margaret James himself made an offer for the hand of the widow of Edward IV. Such proposals, though abortive, were signs of a better understanding between the two countries, or at least between their sovereigns. When the rebellion broke out in the following year the nobles and James accused each other of treasonable correspondence with England, but no assistance was got by either, for England was still scarcely released from its own civil war. In 1487 the greater part of the Scottish barons rose in arms. James had abandoned himself to another favourite, Sir John Ramsay, whose life had been spared at Lauder. The chiefs of the party were the earls of Angus and Argyll, Blackadder, bishop of Glasgow, and the Homes and Hepburns, powerful barons on the border. Having seized the person of the young prince, whom they already designated king, they pretended to act in his name. James retreated to Aberdeenshire, for the northern barons still adhered to him. Father and son, at the head of their respective forces, first met at Blackness (May 1488) on the Forth, where a pacification was agreed to on terms which showed the king's party was the weaker. In the following month the rebellion was renewed and the king was slain at Sanchie (11th June), within sight of Bannockburn. He was buried at Cambuskenneth, being only thirty-five years of age. He did not fall, like his father, through the strength of the nobles, for they were much divided, and he commenced his independent reign master of the situation. The Wars of the Roses gave him an opportunity, which he missed, of strengthening his kingdom in relation to England, whose monarchs adopted a new attitude

ment by
favourite
ites

1438-1512 towards Scotland from that of the Plantagenets,—seeking alliance rather than war. His own weakness, his love of favourites and of money, his passion for music and art—perhaps inherited from his grandfather, but carried to excess and not counterbalanced by the qualities of a statesman and general—proved his ruin. The rebellions, first that of his brother, then that in the name of his son, were fatal precedents in the reign of Mary Stuart.

James
IV

James IV (1488-1513) was already sixteen when crowned at Scone. His reign is an interlude in the record of almost constant battles, murders, and executions with which Scottish history abounds. There were not wanting causes of offence between England and Scotland, but the politic Henry VII avoided war and effected what previous kings had failed in the marriage between the royal houses. James, a popular monarch, succeeded better than any of his predecessors and successors in keeping on good terms with all classes. His court was one of splendour for a small country, indeed Scotland, almost for the first time, possessed a court which set the fashion of civilization and culture. The death of James III, instead of exciting the horror awakened by the death of James I, was treated with indifference, almost as a relief. The chief offices of state were distributed amongst the supporters of the young king. The first business of the parliament, which met in Edinburgh, was the treason trials. The persons put on their trial were not those who fought against but those who supported the late king. Several were condemned, but prudently treated with great leniency. All were charged with correspondence with England as well as with their presence at the field of Stirling (Sauche). There followed a curious transaction called in the records “the debate and cause of the field of Stirling,”—the first debate in a Scottish parliament of which we have any account. The result was a unanimous resolution “that the slaughter committed in the field of Stirling, when our sovereign lord’s father happened to be slain, was due entirely to the fault of him and his privy council divers times before the said field.” There was not a single execution. Heritable officers who had fought against the prince were only suspended, not deposed, and the heirs of those slain were by special grace admitted to their estates. The only person who felt compunction was the young king. His frequent pilgrimages and an iron belt he wore were due to his remorse for his father’s death. The leniency of James was rewarded by the loyalty of the nobility, except a few northern barons headed by Lennox and Huntly, and these, after being defeated by James in the following year, were also treated with clemency. The only trace of rebellion during his reign was a secret intrigue between Henry VII and Angus, who succeeded to the traditional policy of the Douglases.

Legis-
lation

A determined effort was made by parliament to put down robbery and theft by special commissions to certain lords who were to be responsible for different districts. It was provided that the king in person should attend the justice ay (eye),—a provision which James acted upon. A new master of the mint was appointed to restore the purity of the coinage. The penalty of treason was to be imposed on those who purchased benefices from Rome. An active spirit of reform, a desire to remedy the evils of the late reign, was displayed by both the king and his advisers. The personal character of James showed itself in a liberalism contrasting with his father’s avarice, and in a love of chivalrous display encouraging tournaments and martial exercises, as well as in the care of the navy.

Forma-
tion of a
navy.

From the time of Bruce we hear of ships and shipbuilding, natural in a country with so large a seaboard, Scottish merchantmen now began to make distant voyages, and their ships, half privateers, half traders, were commanded

and manned by sailors who were a match for those of any country. The most famous commander, Wood of Largo, with the “Flower” and the “Yellow Carvel,” cleared the Forth of English pirates. Stephen Bull, an English captain, promised to take Wood dead or alive, but was captured himself, James sent him back to Henry VIII with a chivalrous message that the Scots could now fight by sea as well as land. Wood was made one of the king’s council. By his advice James built the “Great St Michael” for a crew of 300 and 1000 men-at-arms. It exhausted all the woods in Fife except Falkland, and cost £30,000. The king’s policy was not confined to building ships of war every town was to have vessels of at least 20 tons. The navy was for the protection of trade, to which the national instinct pointed as a source of wealth.

The marriage of James early attracted the attention of parliament, and embassies were sent to foreign courts to seek a suitable spouse, but James had formed a connexion with Lady Margaret Drummond, and could not be persuaded to a political alliance. The chief events of his reign prior to his marriage to Margaret Tudor were his expeditions to the north-east and the western Highlands. He adopted with the chiefs a similar policy to that which had succeeded with the barons, attaching them to his person by gifts, offices, and favours, and committing to them the suppression of crime. In 1496 the impostor Perkin Warbeck came to Scotland and was recognized by James, who gave him his kinswoman, Catherine Gordon, daughter of the earl of Huntly, called for her beauty the White Rose, in marriage. Raids were twice made across the border on his behalf, but there was only one engagement of any consequence, at Dunse (1497), and an unsuccessful siege of Melrose.

Henry VII whose talent lay in diplomacy, approached the Scottish king with the tempting offer of the marriage of his daughter Margaret. Commissioners met to consider this at Jedburgh, and, though James refused to give up Perkin Warbeck, a truce was arranged, and Perkin left Scotland. The marriage of James and Margaret was soon afterwards agreed to and a peace concluded. The papal dispensation was procured in 1500, but the final treaty was not ratified till two years later (8th August 1502). Some of Henry’s counsellors sought to dissuade him from the marriage, for if his son Henry died James would be next in succession to the English throne, but he replied that if so Scotland would be an accession to England and not the reverse, recalling the example of Normandy and England. Margaret, a girl in her fourteenth year, made a triumphal progress to Scotland, where she was received with pomp, but the marriage was one of policy, and the young wife was discontented with her new country and her husband. Their court, as it is painted in the poems of Dunbar was merry, but not moral. The licence which prevailed and was tolerated by the church was shown by the elevation of one of the king’s bastards by Jane Kennedy to the archbishopric of St Andrews when a youth of eighteen. Others received rich benefices, and Jane Kennedy herself married the earl of Angus. Scottish history during the six years after the king’s marriage was uneventful.

Henry VII’s death (1509) changed the relations between Scotland and England. Henry VIII had not liked his sister’s marriage, and his refusal to deliver to her a legacy of jewels left by his father led to a coolness. The mutual attacks of English and Scottish privateers and border frays increased the bad feeling. Andrew Barton’s ship the “Lion,” after an obstinate conflict, in which Barton was killed, was seized (1512) in the Downs by the sons of Howard, the English high admiral, and James’s request for redress was met with the contemptuous answer that kings should not dispute as to the fate of pirates. But it

James’s
marriage
to Man-
garet
Tudor

War with
England

was Henry's Continental policy which in the end provoked the war. The struggle in Italy between Louis XII and Pope Julius II gave him an opportunity, and he allied himself with the latter and invaded France. He attempted before leaving England to secure peace with Scotland by promising to redress its grievances. But James had renewed the old alliance with France, and the only answer given to the first embassy in 1512 was an offer to mediate between France and England. In 1513 the message was, that if Henry passed to France war would not be declared without a herald being sent. The French queen (Anne of Brittany) had given James a ring with a substantial subsidy, and he had already made up his mind for war. Like Henry, he longed to win his spurs. Henry went to France in June, and soon after his arrival at the camp at Tournai, the Scottish Lord Lyon brought the threatened declaration of war (11th August 1513). The grounds stated were the seizure of Scotsmen on the borders, the refusal of Margaret's legacy, and the death of Barton. No time was lost by James in carrying the declaration into effect, but the war was disliked by the nation. The earl of Arran, sent with the fleet to aid the French, sailed instead, in defiance of orders, to Carrickfergus. James himself called out the whole land force contrary to the advice of his council, mustering at the Borroughmuir 100,000 men according to English accounts—probably exaggerated, but doubtless as large an army as had been seen in Scotland. Crossing the border, he took Norham, Wark, and Ford. At the last of these castles the wife of Heron, the proprietor, then a prisoner in Scotland, beguiled James by her beauty, causing him to waste several days and betraying his movements to the enemy. In the conduct of the battle (9th September 1513) which followed he committed almost every fault a general could commit,—neglecting to engage when the enemy were crossing the Till, allowing himself to be outflanked by Surrey, who got between him and the Scottish border, abandoning his strong position on the hill of Flodden, and finally exposing his own person on foot in the centre of the fight. Some Scottish writers claim that the battle was a divided success and that the total number of English killed was greater, but Hall, an exact chronicler, says 12,000 Scots fell and only 1500 English, as appeared from the books of wages when the soldiers were paid. What made Flodden so great a disaster was the quality of the Scottish loss. The king himself, his son, the archbishop of St Andrews, two bishops, two abbots, twelve earls, and fourteen lords, besides many knights and gentlemen, were left on the field. There was scarcely a noble family which did not mourn some of its members. Surrey did not follow up his victory by invading Scotland, since his object was gained: the diversion by the Scots in favour of France was at an end. Scotland was again left with an infant king, scarcely more than a year old.

Flodden

The character of James IV was on the surface. An excellent observer, the Spanish ambassador Ayala, notes his good looks and agreeable manners, his knowledge of languages and history, his respect for the service of the church and its priests, his liberality and courage, "even more than a king should have, not taking the least care of himself," his bad generalship, "beginning to fight before he had given his orders," and his wise statesmanship, deciding nothing without counsel, but acting according to his own judgment, which was generally right.

Scottish learning at this epoch

The reign of James fell within the era of the revival of learning, and Scotland, though late, came within the circle of the intellectual which preceded the religious reformation. It was common for Scottish scholars to complete their education and sometimes to remain teaching in the universities of France. One of these, Elphinstone, bishop of Aberdeen, who founded its university, brought another,

Hector Boece, the historian, to be first principal of King's College, Aberdeen. James himself engaged Erasmus as tutor to his son, the future archbishop. Two other Scotsmen passed to Paris in the beginning of the next reign, John Major and his pupil Buchanan, who brought back less of the critical but more of the Reforming spirit. These and other learned men neglected a reform as essential as any,—the use of the mother-tongue in their writings, and the neglect has lessened their fame, but it had its exponents in Dunbar, Henryson, Sir David Lyndsay, and Gavin Douglas. The printing press also found its way to Edinburgh, and Chepman and Myllar published their first broad-sheets with works of Dunbar, Douglas, and the remains of the older poetry (see p. 540 *sq.* below).

7 *The Reformation, its Antecedents and Consequences*.—James V (1513-42), scarcely eighteen months old when he succeeded, was at once crowned at Scone, where a parliament met, chiefly attended by the clergy. The queen dowager was appointed regent,—a secret message, however, being sent to John, duke of Albany, to come from France and assume the regency. The son of the exiled brother of James III., Albany had by his marriage to his cousin, the heiress of De la Tour d'Auvergne, become a great noble in France, where he held the office of high admiral, and neither he nor the French king, Louis XII., was willing that he should quit France. The *Seigneur de la Bastie* came as his representative. The precipitate marriage of the queen, four months after the birth of a posthumous child, to the young earl of Angus, and a dispute as to the see of St Andrews, to which Margaret appointed Gavin Douglas the poet, her husband's kinsman, although Heron the prior had been chosen by the chapter, led the Scottish estates to renew their request that Albany should come to Scotland. He arrived at Dumbarton on 18th May 1515 and was at once appointed regent. The queen refused to give up her son, but Albany besieged Stirling and forced her to surrender. Her new husband fled to France, and Margaret first to Dacre, warden of the marches, and then to her brother's court, where she was joined by Angus. At Harbottle in Northumberland, on her journey south, she bore a daughter, Margaret Douglas, afterwards Lady Lennox, Danley's mother. Henry VIII asked the Scottish parliament to remove Albany from the regency, but was met with a decided refusal, for, though a party of nobles, especially the border barons Lord Hume, the chamberlain, and his brother, were opposed to him, he was supported by the nation. The young duke of Ross, Margaret's younger son, having died suddenly, Albany procured a declaration from parliament that Ross's elder half-brother was illegitimate and himself next heir to the crown. Hume and his brother were seized and executed at Edinburgh (26th October 1516). These events aroused suspicion that Albany aimed at the crown, but the suspicion appears to have been unfounded. His tastes were French; hence he quickly tired of trying to govern Scotland, and in autumn obtained with difficulty leave of absence for four months. Before leaving he put Dumbarton, Dunbar, and Inchgarvie (in the Forth) in charge of French garrisons under De la Bastie, who held the post of warden of the marches, but an interim regency was appointed. Margaret now returned to Scotland; but she was not permitted to take part in the government. Shortly after his arrival in France Albany negotiated the treaty of Rouen (20th August) by which an alliance between France and Scotland was agreed on against England, and a promise given that the Scottish king should marry a daughter of Francis I., or if that failed another French princess. In September De la Bastie was murdered near Dunbar by Hume of Wedderburn with the connivance of Dacre. The perpetrators were forfeited, but never brought to justice, although

1516-1534 Arran, who succeeded to the office of warden, was sent for that purpose. The absence of a supreme authority gave free scope to the licence of the nobles.

See Plate VI
Struggle between Angus and Arran

A serious rising in the Highlands to support the claim of Macdonald of Lochabail to the lordship of the Isles lasted for several years, till the death of the claimant and the vigour of the earl of Argyll, the head of a house now rising into pre-eminence, led to its suppression. The chief disturbances arose from the ambition of Angus. Archibald, his uncle, was chosen provost of Edinburgh, his brother William seized the priory of Colidingham, his uncle Gavin, though he failed to secure the primacy, retained the see of Dunkeld. Angus was supported by the earls of Crawford, Erroll, and Glamis, by Forman, archbishop of St Andrews, and most of the other bishops, except James Beaton, archbishop of Glasgow and chancellor. The English warden, Dacre, was also on his side and tried by intrigue and bribery to foment dissension and prevent Albany's return.

The opposite faction was headed by Arran, Lennox, Eglinton, Cassilis, Semple, the bishop of Galloway, and the chancellor. Scotland was thus divided between an English party, strongest in the east, and a French party, chiefly in the west. Then disputes reached a crisis in a street fight in Edinburgh, which got the name of "Cleanse the Causeway" (30th April 1520), in which Angus drove Arran out of the town and seized the castle. Sir Patrick Hamilton, a brother of Arran, was slain by Angus,—an injury never forgiven. Meantime Margaret quarrelled with her husband, and, though there was a temporary reconciliation, mutual accusations of infidelity were too well grounded to permit of its being permanent.

Supremacy of Angus

Next year Albany returned and the queen, who had been in secret correspondence with him, entrusted him with the custody of the young king. Henry VIII again requested the Scottish parliament to expel Albany, but they again refused, and Angus made terms with Albany on condition that he should himself withdraw to France. War was now declared between England and Scotland (1522), but, although Albany advanced with a large army as far as Carlisle, he was persuaded by Dacre to a month's truce and soon after went back to France, leaving the king in charge of a regency of which Beaton, Arran, Huntly, and Argyll were the leaders. Albany returned in the following year and again with a large force invaded England, but failed to take Waik, while Surrey, the English commander, ravaged the border. This failure lost Albany his credit with the Scots. In 1524 he went to France on condition that if he did not come back before 31st August his regency should end. He never returned, and during his absence Margaret carried off her son from Stirling in Edinburgh, where, although only a boy of twelve, he was declared king. Angus made an agreement with Wolsey to support the English interest, and at a parliament in Edinburgh Albany's regency was declared at an end (12th February 1525), and Angus and Beaton obtained possession of the king's person and governed in his name. The queen, who had now openly broken with her brother, in vain appealed to France and Albany. The French were occupied with the war against the emperor, but she obtained from James Beaton, now archbishop of St Andrews, a divorce from Angus and married Henry Stuart, son of Lord Avondale, creating him Lord Methven.

For three years Angus retained the supreme power and filled all offices with his adherents. Beaton, with whom he quarrelled, was required to resign that of chancellor, and Angus nominated himself as his successor. The indignant nobles made unsuccessful attempts to seize the person of the king, who at last, on 23d May 1528, effected his escape from Falkland, riding at night to Stirling, where he was welcomed by the governor. Before parliament met a pro-

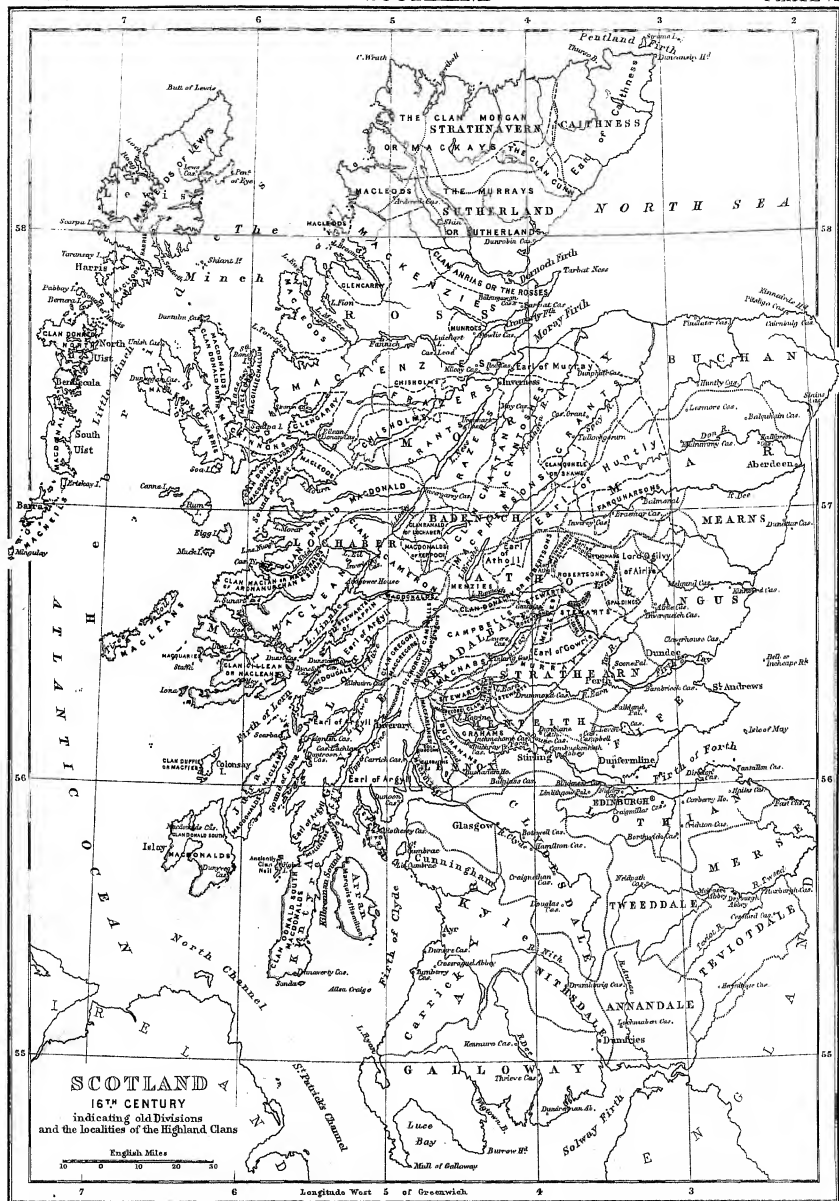

clamation forbade any Douglas to remain in the capital. A new ministry was appointed with Gavin Dunbar, now archbishop of Glasgow, who had been the king's tutor, as chancellor, Cameron, abbot of Holyrood, as treasurer, and the bishop of Dunkeld as privy seal. The Douglasses were attainted and their estates divided amongst the nobles of the opposite faction. A truce was made with England for five years. During the minority and duress of James the Scottish nobility became accustomed to bribes either from England or France. The French, to which the higher clergy belonged, were in the ascendant at the court of the young king, who naturally felt ill-will towards the Douglasses and leant on Albany, and after a time on Cardinal David Beaton, bishop of Mirepoix in France and nephew of the archbishop of St Andrews, whom he afterwards succeeded. Beaton was the Wolsey of Scotland, but James V was not Henry VIII, and the ambition of the great prelate was baffled, not by the king, but by the nation. Three months before the king's escape Patrick HAMILTON (q.v.), abbot of Ferne, was burnt for heresy at St Andrews.

James, only seventeen when he gained his independence (1528), showed, like other Stuarts, activity in government, and the fourteen years of his actual rule, while not marked by outstanding events, were a period of renewed order and prosperity. He first turned to the borders, where constant wars with England had bred a race of lawless freebooters. By the severity of his measures he succeeded in doing what Angus and his predecessors had in vain tried to do. The borders continued till the union to trouble the ministers of the law, but the clans who lived by plunder and blackmail were first really broken by the expedition of James V. But it was not only borderers who required to be taught that a king was again on the throne. Argyll, who had sought to make himself independent, was deprived of his lieutenantcy and imprisoned. Bothwell, the father of Mary's husband, was beheaded for the favour he showed the borderers, and the estates of the earl of Crawford were forfeited. James made a progress through the Highlands and was sumptuously entertained by the earl of Athole. While criminal justice was strictly enforced, a step was at last taken to organize a central civil court (15th May 1532), which had been a settled plan of the kings since James I. The College of Justice or Court of Session was founded in Edinburgh by the influence of Albany with the pope,—funds being got from the bishops' revenues for the payment of the judges. Of the fifteen judges eight, including the president, were to be clergy, and the barons were conciliated by the anomalous office of extraordinary lords.¹

The relations between James and Henry VIII. continued hostile and there were mutual raids till peace was concluded in 1534. Henry was then at the critical point of his divorce from Catherine of Aragon and anxious to secure an ally. France and Spain were also competing for the favour of the Scottish monarch, and Charles V. proposed a marriage with Mary of Portugal. But he had already indicated a preference for a French alliance, selecting Mary, daughter of the duc de Vendôme. The pope addressed James as defender of the faith, a title Henry VIII. had forfeited. The clergy by Beaton's advice granted him a large allowance out of their revenues. These inducements and the influence of Beaton and Dunbar, the two archbishops, kept James firm in his attachment to the old church, in spite of the temptation which Henry held out in its endowments and of the satires in which Sir David

¹ There were already signs of the small beginning of the revolution of lay lawyers who were to play an important part in Scottish affairs in the 17th and 18th centuries. The establishment of a settled system of justice, independent alike of the baronial and ecclesiastical courts, was a much needed reform; but the latter still retained their consistorial jurisdiction.

tion of
govern-
ment by
James V

Lyndsay, his old tutor, and Buchanan, the tutor of one of his bastards, exposed its abuses. In 1537 he went to France to see his bride, but, falling in love with Madeleine, daughter of Francis I, obtained her hand instead. After an absence of nine months he returned, but the young queen died within a few weeks after landing. The following year he married Mary, dowager duchess of Longueville, daughter of Claude of Lorraine, duke of Guise. Next year (1539) Henry made another attempt to gain James through his envoy Sir Ralph Sadler, but, though the succession to the English crown in the event of Prince Edward's death was held out as a bait, James remained unmoved. In 1540 the king made a voyage round Scotland,—the first circumnavigation of his dominions by a Scottish sovereign. The Irish are said to have offered him their crown, and the barons of the north of England, whose sympathies were Catholic, were inclined to favour him. The position was perilous for Henry, many of whose subjects still remained Catholics at heart. He made a last attempt to induce James to meet him at York, but the Scottish king would not go so far across the border. Henry now ordered the marches to be put in a state of war, and Sir James Bowes, accompanied by Angus and Sir George Douglas, crossed the border, but was defeated in Teviotdale by Huntly and Home. The duke of Norfolk advanced with a large force, and, efforts to avert war having failed, James assembled the whole Scottish army and marched to Fala on the Lammermuirs, where he was reluctantly obliged to disband his force through the refusal of the nobles to go farther, they even thought of repeating the tragedy of Lauder, but could not agree as to the victims. James raised a smaller force and gave the command of it to Oliver Sinclair, whose promotion was ill received by the barons. Their discord allowed an easy victory to Dacre, who routed them as they were passing over Solway Moss (25th November 1542), taking Sinclair and several of the leaders prisoners. The news, brought to James at Caerleaverock, together with the disaffection of the nobles, broke his heart. A few weeks later at Falkland he heard of the birth of Mary Stuart, but the news brought him no comfort. His saying, "The crown came with a lass and will go with a lass," has passed into history, although the prophecy was not fulfilled. Outwardly his reign had been, with the exception of the closing scene, successful. He had restored order along the borders, and put down all attempts of the nobles against his person. He had maintained the church, supporting the bishops by severe laws against heresy. He had secured by his marriage the alliance of France and was on good terms with other Continental states. His powerful neighbour had not succeeded in wresting any land from Scotland. He was, like his father, a popular king, mingling with the people in their sports, and respected because of his strict administration of justice. But his foreboding was not without cause. The power of the nobles had only been restrained, not destroyed. The aristocracy had too many heads to be cut off by one or several blows. The principles of the Reformation were gradually spreading in spite of the attempts to stifle them, and the infant to whom he left the crown had to encounter rebellion at home and the hostility of England, not the less dangerous that she was her to the English crown and its rulers veiled their hatred of her by professions of friendship. Knox describes James as "a blinded and most vicious king." Buchanan, who knew him better, is more fair, ascribing his faults to his time and bad education and doing justice to the qualities which made him loved by the people.

Mary Stuart
Mary Stuart was deemed queen of Scotland from 14th December 1542 till 29th July 1567, when her son James VI. was crowned in her stead. This period of a quarter of a century is more crowded with events than any other part

of the Scottish annals, except the War of Independence, 1334-1545. It was the epoch of the Reformation, and it became a question of European as well as national importance which side Scotland would take. Closely connected with the religious question was the political, affecting the union of Scotland and England. The life of Mary, who united the personal charm of her race and its evil fortune, adds tragic interest to the national history. It falls into three parts,—from her birth to her return from France as the young widow of Francis II in 1561, from her arrival in Scotland till her flight in 1568, and from her arrival in England till her execution in 1587, but only the second of these enters into the direct current of Scottish history. During the first Scotland was under the regency, first of Arran, then of Mary of Guise. It was rumoured that Cardinal Beaton forced James V. on his deathbed to sign a will naming him regent, or had forged such a document; but the principal nobles proclaimed the earl of Arran heir-presumptive to the crown, governor of the realm, and tutor to the queen, and this was confirmed by parliament in the following spring. Beaton was thrown into prison, but soon released. The death of James suggested to Henry a new scheme for the annexation of Scotland by the marriage of the infant heiress to his son Edward, and he released the nobles taken at Solway Moss on easy terms under an assurance that they would aid him. Angus and his brother George Douglas also returned to Scotland from their long exile on the same promise. Sir Ralph Sadler, one of the ablest English residents at the Scottish court—half envoy, half spy—was sent to conduct the negotiations. Arran was tempted to favour the marriage by the offer of the princess Elizabeth for his son and the government north of the Forth. But the queen dowager, though she pretended not to be averse to it, and Beaton did all they could to counteract Henry's project. One part of it, the immediate delivery of Mary and the principal castles to the English king, was specially objected to. A mutual alliance between the two kingdoms was agreed to on 1st July 1543, and Mary was to be sent to England when ten years old. Soon after a party of the nobles opposed to the match got possession of the young queen and removed her to Stirling. The English treaty was ratified by parliament, but Beaton and his partisans did not attend, and a few days later the regent, as Sadler expresses it, revolted to the cardinal. It was evident that the assumed lords, though in English pay, were not to be relied on, and Henry resolved on war. His first act—War with the seizure of Scottish merchantmen in English ports—roused the patriotic feeling of Scotland. Before the close of the year the Scottish estates declared the treaty with England null and renewed the old league with France. Lord Lisle was sent with a fleet to the Firth of Forth, along with Hertford (afterwards the protector Somerset) as commander of the army, and Leith was sacked and Edinburgh burnt, though the castle held out. Lisle on his voyage home ravaged the ports of the Forth, while Hertford destroyed the towns and villages of the Lothians, aided by the English wardens, who made a raid across the border. Hertford returned the following year and destroyed the abbeys of Kelso, Jedburgh, Melrose, Dryburgh, Roxburgh, and Coldingham, besides many castles, market-towns, and villages. Such barbarous warfare renewed the memory of the War of Independence and the intense hatred of England, which had greatly abated. Lennox and Glencairn alone of the nobles sided with the English, and the Reformers saw with regret the nation driven to a French alliance as at least preferable to English conquest.

Beaton at this time really governed, imposing his will death on the vacillating regent and sternly repressing heresy of Wishart and Beaton. George Wishart, the chief preacher of the Reformers, was seized, found guilty of eighteen articles of heresy, mostly

1545-1558 taken from Calvin, and burnt at St Andrews. The war of religion, now openly declared, could not be carried on without bloodshed on both sides. Beaton was assassinated less than three months after Wishart's death in his own castle by Norman Leslie and other young men, some with private grievances, all desiring to avenge Wishart. The effect was adverse to the Reformers. Leslie and his associates, joined by a few others, of whom Knox was one, being shut in the castle, held it for a short time against the regent, but were forced to surrender to Strozzi, the French admiral.

Somerset's rank

The death of Henry VIII (1547) did not put a stop to the war with England. The protector Somerset proved to be an implacable enemy, and, partly to strengthen his position as regent, determined to strike a more signal blow. Invading Scotland simultaneously with a large fleet and army, he defeated the Scottish regent at Pinkie (18th September 1547), took Edinburgh, and placed garrisons in several castles. Scotland had suffered no such reverse since Flodden. The progress of the capital was thrown back at least a century, scarcely a building remains prior to the date of his savage raids. Somerset was not in a position to follow up his advantage, for he had to return home to counteract intrigues. The young queen was sent from Dumbarton in the following summer (August 1548) to the court of France, where she was brought up with the children of Henry II by Catherine de' Medici. Before she went a French force had been sent to Scotland, and in the camp at Haddington the estates had, by a majority led by the regent and queen dowager, agreed to Mary's betrothal to the dauphin. The regent was promised the dukedom of Chastellerault in return for his part in the treaty. For two years a fierce intermittent war continued between England and Scotland, but the former country was too much engaged in home affairs and the French war to send a large force, and the Scots recovered the places they had lost except Lander. The issue of the French war was also adverse to the English, who were forced to agree to the treaty of Boulogne (24th March 1550), in which Scotland was included. In September the queen dowager went to France and obtained the transfer of the regency from Arran to herself. On her return, Arran not being prepared to relinquish his office, she proved herself a skilful diplomatist, gaining over the nobles by promises and the people by abstaining from persecution of the Reformers. A single execution—that of Adam Wallace, "a simple but very zealous man for the new doctrines"—took place in 1550 under the sanction of Archbishop Hamilton, natural brother of Arran, who had succeeded Beaton, but that prelate, whose natural disposition was towards compromise, authorized a *Catechism* in 1552 which minimized the distinctions in doctrine between the church and the Reformers, and was conspicuous for omitting all reference to the supremacy of the pope. At this time a large section of the clergy and people were still wavering, and the necessity of retaining them by moderation and reform was evident. The death of Edward VI and the accession of Mary in 1553 had an important influence on the progress of the Scottish Reformation. The Scottish Reformers who had taken refuge in England had to escape persecution by returning home or going abroad, and the powerful preaching of Herliaw, Willock, and Knox, who came to Scotland towards the end of 1555, promoted the new doctrines.

Regency of Mary of Guise

In the spring of 1554 the queen dowager at last succeeded in obtaining from the reluctant Arran a surrender of the regency. Mary had now attained her twelfth year and a nomination by her of her mother as tutor gave the form of law to what was really the act of the queen dowager, the French king, and the nobility. The people acquiesced,

for all classes were tired of a governor whose chief object was money. His actual investiture in the French dukedom removed any scruples in relinquishing a dangerous dignity. For the next six years the queen dowager was regent and conducted the government with such prudence that her real aims were only seen through by the most penetrating Knox has been accused of a harsh opinion of her, but the upshot of her policy if successful would have been to subject Scotland to France and to that party in France so soon to be the relentless persecutors of the Reformers. She knew well how to hide her time, to yield when resistance was impolitic, to hide her real object, but this she pursued with great tenacity of purpose. A variety of circumstances favoured her,—the condition of England under Mary Tudor, the ill-will Arran had incurred, the absence of any leading noble who could attempt to seize the supreme power, the safety at the French court of her daughter, in whose name she governed, and the knowledge of her adopted country acquired by long residence. Yet her first step was a mistake so serious as to have well-nigh provoked revolution. In appointments to offices she showed such preference for her own countrymen as created intense jealousy on the part of the Scottish nobility, and would probably have led to open action but for the fact that many Scotsmen got offices and pensions from the French king. The new regent applied herself at once to the perennial work of every Scottish Government, the repression of disorder in the Highlands, and first Huntly, afterwards Argyll and Athole, were sent to Argyll and the Isles, but the presence of royalty was, as had before been found, the best remedy, and she made next year a circuit in person with more success than any of her lieutenants. Under the advice of her French counsellors she now garrisoned Dunbar with French soldiers and built a fort at Eyemouth (1556). She even ventured to propose to levy a tax for the maintenance of a standing army, but the remonstrance of 300 barons, headed by Sir John Sandilands, forced her to abandon a project so fatal in that age to liberty. Next year, at the instigation of the French king, she endeavoured to force the country into an English war. No time could have been worse chosen, for commissioners from England and Scotland had actually met at Carlisle to adjust differences between the two countries. The Scottish barons refused to fight, and from that date, Bishop Lesley notes, the queen regent could never agree with the nobility, and sundry of them sought by all means to raise sedition against her and the French.

In the parliament at the close of the year commencing Mary's sonners were appointed to go to France for the marriage between Mary and the dauphin. Their instructions were to obtain a promise from both to observe the liberties and privileges of Scotland and its laws, and a ratification of the Act passed in 1548, when it was first proposed to send the young queen to France. The contract of marriage provided that then eldest son was to be king of France and Scotland and the eldest daughter (should there be no son) queen of Scotland, to be given in marriage by the joint consent of the king of France and the Scottish estates. In the event of her husband's death Mary was to be free to stay in France or return to Scotland. The marriage was solemnized at Notre Dame on 24th July 1558. But prior to the public contract a secret arrangement had been made, by which Mary, in three several deeds, made over the kingdom of Scotland to the king of France and his heirs if she died childless, assigned to him possession of the kingdom until he was reimbursed in a million pieces of gold for her entertainment in France, and declared that, whatever documents she might afterwards sign by decree of parliament, thus arrangement expressed her genuine intention. After the return of the commissioners the crown

to the marriage to the dauphin

matrimonial, with the title of king, was granted by parliament to the dauphin.

While statesmen were occupied with the queen's marriage the Reformation had been steadily advancing. Knox laboured incessantly, preaching in Edinburgh ten days in succession and making rapid visits to the central and western shires. He attracted to his side representatives of the nobility and gentry, and had much support in the towns. The earl of Glencairn, Lord Lorne, Lord James Stuart, the future regent, and the laird of Dun, John Erskine, in Angus were amongst his earliest followers, as well as many of the tradesmen and artisans. Knox now openly denounced attendance at mass as idolatrous and began to administer the Lord's Supper after the manner of the Swiss Reformers. He was summoned to Edinburgh on a charge of heresy, but, though he kept the day, the proceedings were dropped. Shortly after he was again summoned, but meanwhile had accepted a call from Geneva. In his absence he was condemned for heresy and burned in effigy at the market cross of Edinburgh. Though absent, he continued the master-spirit of the Reformation in Scotland, and as the result of his exhortations Argyll, Glencairn, Morton, Lord Lorne, and Erskine of Dun drew up a bond (3d December 1557) to "defend the whole congregation of Christ and every member thereof . . . against Satan and all wicked power," themselves forsaking and renouncing "the congregation of Satan with all the superstition, abomination, and idolatry thereof." This was the first of many bonds or covenants in which, borrowing the old form of league amongst the Scottish nobility, the Lords of Congregation applied it to the purposes of the Reformation. They afterwards passed resolutions that prayers should be read weekly in all parishes by the curates publicly, with lessons from the Old and New Testaments, and that doctrine and the interpretation of the Scriptures should be used privately in quiet houses until God should move the pence to grant public preaching by faithful ministers. Argyll at once acted upon the resolutions and protected John Douglas, formerly a Dominican, his chaplain, who preached at Castle Campbell in spite of the remonstrance of Archbishop Hamilton. That prelate next took a fatal step. Walter Myln, parish priest of Lunan near Montrose, an old man of eighty-two, was burnt for heresy at St Andrews (8th April 1558). He was the last Protestant martyr in Scotland. The total number of deaths was small, it is believed twenty in all, but many people were banished or forced to leave the country and many fled, while none were allowed freedom of worship. Immediately after the death of Myln there began, says Knox, "a new fervence amongst the whole people." Gathering courage from the popular feeling, the Lords of Congregation presented petitions in rapid succession to the regent. The first laid before her prayed "that it might be lawful to meet in public or in private for common prayer in the vulgar tongue, to interpret at such meetings hard places in Scripture, and to use that tongue in administering baptism and the Lord's Supper", in reply permission was granted to preach in private and to administer the sacraments in the vulgar tongue. The second presented at the meeting of parliament prayed for a suspension of all Acts against heretics until a general council, that copies of the accusation and depositions should be given to all persons accused of heresy, that the accused should be allowed themselves to interpret any words charged as heretical, and should not be condemned unless found guilty of teaching contrary to Scripture. "The regent," Knox remarks, "spared not amiable looks and good words," but suffered the parliament to be dissolved (2d March 1557) without any answer. In the spring a synod met in Edinburgh and a third petition was laid before it,

saying that the canons should be enforced against clergy who led scandalous lives, that there should be preaching on every Lord's day and on holidays, that no priests should be ordained unless able to read the Catechism distinctly, that prayer should be in the vulgar tongue, that the mortuary dues and Easter offerings should be optional, and that the consistorial process should be reformed. Another point was included according to Lesley, —that bishops should be elected with the consent of the laity of the diocese and priests with that of their parishioners. The synod replied that they could not dispense with Latin in public prayer as appointed by the church, and that the canon law must be observed as to elections of bishops and priests. On other matters they were prepared to make concessions, and passed thirty-four canons in the spirit of the council of Trent directed to the due investigation and punishment of immorality of the clergy and the inspection of monasteries, better provision for preaching by bishops and priests, the remission of mortuary dues to the very poor, and the recognition of the sacrament of baptism as administered by the Reformers. A short exposition of the mass was to be published. These concessions proved the necessity for reform, but, as they were silent on the principal points of doctrine, as well as on the more radical reforms in church government, they could not be accepted. The time of compromise, if compromise had ever been practicable between Rome and Geneva, to which the Scottish Reformers adhered, was now past. Two events had occurred before the synod separated which hastened the crisis. On 17th November 1558 the death of Mary Tudor once more placed on the English throne a sovereign inclined to favour the Reformation. In May, during the sittings of the synod, Knox returned to Scotland and the Scottish Reformers once more had a determined leader.

The regent issued about Easter (1559) a proclamation forbidding any one to preach or administer the sacraments without authority of the bishops. Willock and other leading preachers having disregarded it were summoned to Stirling on 10th May. Their adherents assembled in great numbers, but mostly unarmed, at Perth, a town zealous for the Reformed opinions. Erskine of Dun went from there as a mediator to the regent at Stirling; she promised, but in vague terms, that she would take some better order with the ministers if their supporters did not advance. Notwithstanding they were outlawed for not appearing on the day of trial. Next day, when the news reached Perth, Knox preached his first public sermon (11th May) since his return, inveighing against "idolatry." Hardly had he ended when a priest began mass and opened the tabernacle on the high altar. A young man called out, "This is intolerable that, when God by His Word hath plainly damned idolatry, we shall stand and see it used." The priest struck the youth, who retaliated by throwing a stone, which broke an image. From this spark the fire kindled. The people destroyed the images in the church and then proceeded to sack the monasteries. The example of Perth was followed at many other places. The regent could not remain passive when the Congregation was sanctioning such action. But her position was one of grave difficulty. Her main support was from France, and though she had adherents amongst the Scottish nobility, Argyll and Lord James, who were still with her at Stirling, were really committed to the Congregation. What course the new queen of England would take was still uncertain. On 11th May the regent advanced towards Perth, but the arrival of Glencairn with 2500 men from the west to aid the Congregation led to a compromise, of which the terms were these: both parties were to disband their troops; Perth was to be left open to the regent, but no French troops were to come within 3 miles, the inhabitants were

1559-1560 not to be called upon to answer for their recent conduct, and all controversies were to be reserved for parliament. The Congregation, however, remained distrustful, Knox openly preached that the treaty would only be kept till the regent and her Frenchmen became the stronger, and before leaving Perth the Lords of Congregation entered into a new bond for mutual defence. The regent entered Perth the day they left (29th May), accompanied by the duke of Chastelleraut and a bodyguard of French as well as Scottish troops paid by French money. The deposition of the provost in favour of a Papist and the occupation of the town by these troops were deemed breaches of the agreement, and Argyll and Lord James now joined the Reformers and took the lead in their proceedings. Then numbers increasing, the regent felt unable to retain Perth, and quitting it marched south, followed by the army of the Congregation, to which she abandoned Stirling, Linlithgow, and Edinburgh, taking refuge at Dunbar. The only conflict was at the Muir of Cuper, where a small force sent to save St Andrews was quickly dispersed by the superior numbers of its opponents. It was made a condition of a truce that no Frenchman should be left in Fife. The Reformers occupied Edinburgh for a few weeks, but were obliged to abandon it upon new terms of truce intended to preserve the *status quo*. Both parties were engaged in negotiations for active assistance, the one from France and the other from England. The regent had been daily expecting reinforcements, and a considerable number of troops about this time landed at Leith, which they began to fortify.

Negotiations of Reformers with England

In the end of June Kirkcaldy of Grange began a correspondence, afterwards continued by Knox, with Cecil, Percy, and Sir Herbert Croft. Their scheme was far-reaching. The young earl of Arran, though brought up in France, had become Protestant, and if he, the heir-presumptive to the Scottish crown, were married to Elizabeth the union of the two countries would be secured along with the Reformation. This would be a counter-stroke to the union of France and Scotland under a Catholic, which almost at the moment became for a brief time an accomplished fact, by the dauphin succeeding as Francis II to the French crown on the death of his father. The policy of the Guises, who continued to control the Government under the new king, almost forced Elizabeth in this direction. Mary quartered the arms of England with those of Scotland, implying denial of Elizabeth's right both as illegitimate and as a heretic. But Elizabeth knew the value both of her hand and of the state, which, thanks to the ability of her ministers, was daily becoming more loyal. She had special cause for hesitating to ally herself with the Lords of Congregation. Knox had offended her by his vehement *Blasts against the Regent of Women*, which, though primarily aimed against the Catholic queens, admitted no exception in favour of a Protestant. Nor could Knox even when supplicating aid adopt the courtier's language to which Elizabeth was accustomed. She was really afraid of the revolutionary principles of some of the Reformers, which seemed to threaten the throne as well as the altar. Moreover, Arran, who came secretly to the English court, did not please her, and there was an end of the matrimonial part of the scheme. The rest of it would probably also have miscarried but for the consummate statesmanship of Cecil, who saw where the interest of England lay. In August 1559 Sadler was sent with £3000 to the assistance of the Scottish Protestants. Another supply followed, but was intercepted, and in January 1560 a treaty was agreed to at Berwick between Elizabeth and the Lords of Congregation, to whom the duke of Chastelleraut had now gone over. The Scots engaged not to enter into an alliance with France, and to defend the

country against French aggression. Elizabeth was to support Scotland by an army, but no place of strength was to be left in English hands. If any were taken from the French they were to be razed or retained by the Scots. The Scots were to assist England if attacked by France, and to give hostages for fulfilment of the treaty. Next spring an English army under Lord Grey crossed the Tweed (28th March 1560), met the forces of the Congregation at Prestonpans, and invested Leith, in which the French were also blockaded by sea. The regent had taken refuge in Edinburgh castle, and here on 10th June she died of dropsy. She had been desecrated gradually by almost all her Scottish adherents. The last to go was Matilda of Lethington, the most talented but also the most cunning of the Scottish statesmen. His desertion was the sign of a lost cause. Even some of the higher clergy now conformed. Lord Erskine almost alone remained faithful. The regent's own courage never failed, and, though she received a visit from the leaders of the Congregation and consented to see Willock, she died a firm Catholic. Her misfortunes and her conciliatory policy during her long struggles to maintain the French connexion with Scotland have gained her a lenient judgment even from Protestants, all save Knox, whose personal animosity is palpable, though his view of her policy is correct.

Death of Mary of Guise

Her death removed the chief obstacle to peace, which the English and the French courts had for some time desired, and the treaty of Edinburgh was concluded on 8th July 1560 upon terms favourable to Scotland. The military forces of both France and England were to evacuate Scotland, except a certain number of French, who were to remain in Inchkeith and Dunbar. Leith and Eyemouth were to be dismantled, and Mary and Francis were to abstain from using the arms of England. By separate articles certain concessions were granted to the nobility and people of Scotland showing the length to which the limitation of the monarchy was carried. No French or other soldiers were to be brought into the realm unless in the event of an invasion and only with the consent of the estates. Neither peace nor war was to be made without their consent. A council of twelve (seven chosen by the king and queen and five by the estates out of twenty-four selected by the estates) were to govern the kingdom during the absence of Mary and Francis. The chief officers of the crown were to be natives. An Act of oblivion was to be passed for all Acts since 6th March 1558. Neither the nobles nor any other persons were to assemble in arms except in cases provided by the law. The duke of Chastelleraut and his son, Anian, and all other Scots were to be restored to their French estates. With matters of religion the deputies refused to deal, but envoys were to be sent to the king and queen to lay before them the state of affairs, particularly those last mentioned.

Before parliament met an important step towards a new Reformation organization of the church was taken. Superintendents, some lay, others clerical, were appointed for Lothian, Glasgow, Fife, Angus, Mearns, Argyll, and the Isles. The principal ministers of the Congregation were planted in the chief towns.—Knox receiving Edinburgh as his charge. The convention parliament which assembled on 10th July and began its business on 1st August 1560 was the Reformation parliament of Scotland. Like Henry VIII's famous parliament, its work was thorough. It not merely reformed abuses but changed the national creed and accomplished more in one than the English parliament did in three sessions. The parliament was the most numerous yet held in Scotland, being attended not only by nearly all the nobility but by some bishops and an unusually large number of lesser barons or landed gentry, representatives of the burghs. Its statutes never received the royal assent,

Treaty of Edinburgh

Reformation parliament

but were confirmed by the first parliament after Mary's deposition. On 18th August the Confession of Faith received the sanction of the estates. On the 24th an Act was passed declaring that the bishop of Rome had no jurisdiction or authority within the realm. Another rescinded all Acts passed since James I. contrary to God's word, and a third prohibited the mass or baptism according to the Roman rite, and ordained strict inquisition against all persons contravening the statute. The form of church government was not explicitly altered. The archbishop of St Andrews, and Dunkeld and Dunblane alone of the bishops, are said to have voted against the Confession, and Athole, Somerville, Catliness, and Bothwell alone of the nobles. The whole power of the state was at this time in the hands of the party of the Reformation and resistance was useless. The Confession of Faith, the cornerstone of the new policy both in church and state, was drawn up by Knox and five other ministers, but revised by the more moderate Reformers Lethington and Wiman. The power of the civil magistrate was declared in terms which indicate the revision of Lethington rather than the original draft of Knox. Its language is certainly such as monarchs had been little accustomed to, though the expression is not so blunt as Knox used in preaching and conversation. Kings, princes, and magistrates in free cities are declared to be those to whom the reformation of religion "chiefly and most principally appertain." They are themselves to be judged by God, being appointed for the maintenance of the true religion and suppression of idolatry. Resistance to them, but only when vigilant in the execution of their office, is declared sinful.

The same persons who had prepared the Confession were entrusted with the composition of a code of ecclesiastical polity, and a draft, after being first laid before the convention of 1560, was submitted as revised to that of the following year. This *First Book of Discipline* was not universally approved, several of its provisions, especially those relating to church estates and their application to the support of the ministry, the relief of the poor, and the furtherance of education, were little to the taste of the nobility, and it was never sanctioned by the estates or fully acted on. Other parts of it were, however, embodied in the *Second Book of Discipline*, which became the law of the Reformed Church. It remains a memorial of the far-sighted views of Knox, its author, and the verdict of posterity has been in his favour and against the nobles who prevented its being carried out. See PRESBYTERIANISM, vol. xix p. 679 sq.

The death of Francis II. (6th December 1560) materially altered the political situation. The much feared subordination of Scotland to France was at last averted. Mary Stuart, only nineteen, was young enough to be influenced by a new husband and new responsibilities. Her character was not yet known, but her relations with Catherine de' Medici were not friendly, and there was little doubt that she would take advantage of the provision in her marriage articles and return to Scotland. Sir John Sandilands's mission to France to procure the royal sanction to the treaty of Edinburgh and the Acts of the Reformation parliament must have been unpalatable, and he was not favourably received. Before she left France Mary was visited by envoys of the opposite parties into which Scotland was divided. Lesley, official of Aberdeen, afterwards bishop of Ross, and her valiant defender, was sent by the Catholic lords and bishops with a special message from Huntly, urging her to come to Aberdeen, where an army of 20,000 men would be at her disposal. But Huntly had not proved trustworthy during the regency and Mary rejected an offer which would have plunged the kingdom in war from the moment she landed. The very day after she had seen

Lesley her brother Lord James, who had been sent by 1560 1568. the Lords of Congregation, met her at St. Dizier. She received him favourably, but declined to ratify the treaty till she consulted her council. An attempt was made to capture Mary on her way to Scotland, but, sailing from Calais on 14th August, she landed at Leith on the 16th. She was accompanied by three uncles and a considerable suite, including Castelnau the historian, Brantôme the memoir writer, and the poet Chastellard.¹

On her return to Scotland Mary showed herself disposed to conciliate the Reformers provided she was allowed the exercise of her own faith. This had been guaranteed her by Lord James. His near kinship to the queen at a time when the stain of bastardy was less regarded, and his close relation with the Reformers, made him necessary to both and gave him an influence which his eminent prudence used for the good of the nation, but with an eye to his own advantage. Without thrusting himself too prominently forward, he led the privy council (ably supported by Lethington), and, without the name, was in fact prime minister. The title of Mar, and, when that was reclaimed by the her of the Eskines, of Moray or MORERAY (q.v.), with its large territories, gave him the designation by which he is best known, as well as great wealth, which he dispersed by means not well explained. But the leaven of another influence than that of the statesman was now at work in Scottish politics. This was embodied in John Knox, the most representative Scotsman since Wallace. The first Sunday after Mary's arrival the mob tried to interrupt mass at Holyrood, and Moray had himself to keep the chapel door to prevent its being broken. "His best excuse was," says Knox, "that he wald stop all Scotchmen to enter into the mass." Next Sunday Knox preached in Edinburgh against idolatry. "One mass was more fearful to him," he said, "than 20,000 armed enemies." Little likely as such sentiments were to please the young queen, a meeting between her and the preacher was arranged by Moray, the only third party present. On the matter of religion he was unbending, yet not more so than Mary. His judgment of the queen's character was, "If there be not in her a proud mind, a crafty spirit, and an indurate heart against God and His truth my judgment faileth me." In 1562 Huntly, the chief Romanist in the north, who offered to have the mass said in three counties, rebelled, being indignant at the grant to Moray of an earldom whose estates he then held. Mary, accompanied by her brother, made a progress in the north, where Huntly was defeated and slain at Corrichie, his elder son being imprisoned, his second beheaded, and the lands of Huntly, of his kinsman the earl of Sutherland, and other barons of the house of Huntly forfeited. On her return to Edinburgh Mary again met Knox at Holyrood. He rebuked her for dancing and other frivolities, advised her to attend the public sermons, and told her that it was not his duty to leave his studies in order to wait at her chamber door. There were other interviews, in one of which (April 1565) only Mary seemed to yield a little. She was anxious to use his influence to quiet a threatened rising in the west, and to heal a quarrel between her half sister the countess of Argyll and her husband. Knox promised his aid, but required in return that the penal laws should be enforced against the Papists. This Mary agreed to, and her promise was also apparently kept. Hamilton, archbishop of St Andrews, and forty-seven other persons were prosecuted for hearing confession

Mary's
return to
Scotland.

¹ The story of Mary Stuart, which now approaches by rapid steps its climax, has been told by Mr. Strathmore (see Mary, vol. xv p. 684 sq.) and a poet may regard human character in a manner different from the historian,—interpreting motives and drawing conclusions which history, whose view is limited by evidence, cannot reach. Here only the leading facts in her personal story can be stated so far as they affect the course of Scottish history.

1563-1567

and celebrating the mass. Yet Knox's comment in his *History* is, "Thus conference we have inserted to let the world see how Marie queen of Scotland can dissemble, and how that she could cause men to think that she bore no indignation for any controversy in religion, while that yet in her heart was nothing but venom and destruction, as short after that did appear." She was in fact corresponding with her uncle the cardinal of Lorraine, with the pope, with Philip II., testifying her steadfast attachment to Papacy and her desire to restore the Catholic faith. At a last conference Knox remonstrated against her marriage, then thought imminent, with a Papist, claiming the right of a subject "to speak out on this topic which so nearly concerned the commonwealth," remaining unmoved by the last argument of a woman, which he savagely describes as "howling and tears in greater abundance than the matter required." Nothing but perusal of the conversations can bring before us this pregnant passage of history—the abasement of the Scottish monarchy before the religious democracy—of the woman forced to dissemble and weep before the stern man believing he delivered a message from God to the head of a corrupt court. Something was allowed to Knox's sincere outspokenness. He moved men and women alike by words which, like Luther's, go straight to the realities of life. He is the typical Scottish divine framed on the model of the Hebrew prophets, and often reproduced in weaker copies. The Reformation in Scotland, in both its strength and its weakness, was his work more than that of any other man. The Presbyterian form of government, of which his friend Calvin was the author, was introduced by Knox from Geneva and continued for long to enforce discipline, first by censure and then, if need be, by excommunication and temporal punishment, entirely in his spirit.

Mary's
marriage
to Darn-
ley

Not only to Knox and the Reformers but to all classes the question of the day was the queen's marriage. Apart from her beauty, her political position rendered her hand of importance to the balance of power. It held not only the dowry of France and the possession of Scotland but a claim, which might be at any moment asserted, to the English crown. She avowed her inclination to marry, and indeed she required a man to put her in possession of her kingdom. Don Carlos, the archduke of Austria, son of Philip of Spain, Charles IX. of France, the kings of Denmark and of Sweden, the archduke Charles, second son of the emperor, were all passed in review but rejected. Elizabeth pressed the claim of her favourite Leicester, a project supported by Cecil and Moray. In the end the fair face and fine figure of her young cousin Henry Stuart, Lord Darnley, carried the day. A party of the Scottish nobles—Athole, himself a Stuart, Morton, Crawford, Eglinton, and Cassilis—favoured the alliance. David Rizzio, the queen's foreign secretary, who already had great influence with her, promoted it. But it was her own act, the most dangerous of many false steps in her life. Shortly before the marriage (29th July 1565) Moray attempted to seize Darnley and the queen as they rode from Perth to Callender near Falkirk. When it was accomplished he rose in arms with the duke of Chastellerauld, the head of the Hamiltons, Argyll, and Rothes, but Mary with a large force pursued them from place to place in the Roundabout Raid, from the neighbourhood of Edinburgh through Fife, where she levied fines, and finally to Dumfries, from which Moray fled to England. He had been secretly but not vigorously supported by Elizabeth, who, when she heard of his flight, recalled her orders to Bedford, then on the marches, to place troops at the disposal of the insurgents. Mary still retained some of the popularity of a young queen, and fostered it by an apparent desire to humour the Reformers. For the first time she attended a Protestant

sermon. But the consequences of a union between a high-spirited woman, active in mind and body beyond her sex and years, with a vain and dissolute youth were soon seen. His alienation from the queen, the murder of Rizzio, with the intrigues that preceded and followed it, the rapid growth of Bothwell's influence, the pitiable vacillations of Darnley, and his murder at Kirk of Field (10th February 1567) have been sketched in the article MARY (vol. xv of *Dan-
p* 596 sq.). The authors of the last crime were Bothwell, who derided it, and his servants, who executed it. Then confessions leave no doubt of their own guilt. Who were then accomplices has from that day to this been debated without conclusive answer. The great controversy is whether the nobles with Moray at their head had bound themselves to support Bothwell, as he and Mary afterwards declared, or whether Mary, possessed with passion for Bothwell and hate of Darnley, herself instigated her husband's murder. Some have thought both the queen and the nobles were implicated. The casket letters, alleged to have been found in a coffin that was given to Morton by Dalglish when entrusted with it by Sir James Balfour for its delivery to Bothwell, must be left out in any fair examination of this question. The mode of their recovery and their production, first partially and secretly before Elizabeth's commissioners at York, then with apparent but not real publicity at Westminster (for Mary's counsellors were not allowed to see them), their contents, so different from her known writings, and the disappearance of the originals render their evidence inadmissible. What weighs most against Mary is her subsequent conduct, explicable only in favour of innocence if she was absolutely in Bothwell's power from the time of the murder to the defeat of Carberry,—an hypothesis not borne out by facts. Though Lennox and his wife urged that the murderers be brought to justice, there was delay till 13th April, when Bothwell was at last brought before an assize. The trial was a sham, and his acquittal on the pretence that there was no accuser could deceive no one.

The strange wrong which commenced when Darnley was Mary's just buried, if not before, was continued by the seizure of Mary by Bothwell near Cramond and her captivity in her own castle of Dunbar—a pretence according to her adversaries, an opportunity for an outrage from which marriage was the only escape according to her defenders—as last culminated in the marriage at six in the morning, at Holyrood, on the 15th of May 1567. It was the month when wicked women marry, said the people, writing Orville's line on the Tolbooth walls. Before it took place she created Bothwell duke of Orkney, and pardoned him for any violence. She also wrote in palliation of his conduct to the French king. His divorce from Lady Jane Gordon had been hurried through both the bishops' court and that of the Protestant commissaries,—in the former on the false pretence that there had been no papal dispensation for his marriage to one of near kin, and in the latter on the ground of adultery. Mary had been more than once warned of the consequences of such a marriage by Lord Herries, by the faithful Melville, and by Craig, the minister who, with the utmost reluctance, proclaimed the banns. It was an act which required no warning. She had no alternative, urge her vindicators, to save her honour, and her tears on the morning of marriage are proof that she was forced, but the more scrupulous admit she should have preferred death to union with a man she must at least have known was not clear of Darnley's murder. Her enemies said then, and historians who take their side repeat, that it was the madness of a passion she could not resist. The view most consistent with the facts seems to be that she accepted, not without fits of remorse, the service of the strongest sword at her disposal on the only terms on which she

could obtain it. But, if Mary cannot be acquitted of the degree of complicity implied in accepting the consequences of the murder, many of the leading nobles were involved in equal guilt. On 19th April a bond asserting Bothwell's innocence and urging Mary to marry him had been signed at Ainslie's tavern, not only by Bothwell's few friends, but by "a great part of the lords." Most of those who signed had in the parliament just concluded received grants of land or remission of forfeiture, and it is urged by Mary's defenders that they were bribed to acquiesce in Bothwell's designs. When the bond was afterwards put in evidence against them their plea was that they had been forced to sign it by Bothwell. It is contended on Mary's behalf that with so many of the nobles committed to approval of the marriage she had no one on whom to rely. There is something in this argument, but it does not meet the point—Why did she rely on Bothwell? That a scheme was arranged before Darnley's murder to entrap her into this marriage, in order to pave the way for her deposition, and that the casket letters were fabricated to clench her guilt, has been suggested, but the facts necessary to prove so deep a train of conspiracy are wanting. The two Scotsmen who almost alone maintained the character of honest men, Kirkcaldy of Grange and Sir James Melville, who were so far from being unfriendly to Mary that they ultimately espoused her cause, believed that she was a willing victim and threw herself into Bothwell's arms. The narrative in her own despatch to the bishop of Dunblane does not allege that she was forced, but only that "he patheie extorted and patheie obtained our promise to take him as our husband."

The leading nobles were not disposed to accept a new master in Bothwell, whose vices, unlike those of Darnley, were coupled with a strong instead of a weak character. They kept jealous possession of the young prince, placed in the custody of Mar in Stirling, and, when a muster was called to enforce order on the border, secretly collected their forces to act against instead of for the queen and her husband. Within a month of her marriage she was met at Carberry Hill, near Musselburgh (15th June 1567), by a force of the confederate lords, headed by Morton and Glencairn, Ruthven and Lindsay. Mary, after a fruitless attempt at mediation by Du Cioe, the French ambassador, and an offer equally vain by Bothwell to decide the issue by single combat, surrendered to Kirkcaldy. Bothwell rode off to Dunbar with a few followers, and Mary was conducted to Morton's camp. Once in their hands, the lords treated her as a prisoner, and confined her at Lochleven Castle, where she was forced to abdicate, surrendering the crown in favour of her son and committing the regency during the minority to Moray. The young king was crowned at Stirling on 29th July. The prudent Moray, who had kept out of the way in France while these events were transacted in Scotland, now returned and was installed as regent (22d August). Mary remained prisoner in Loch Leven for nearly a year. After her escape on 2d May 1568 the duke of Chastellerault and other Catholic nobles rallied round her standard; but on 13th May Moray and the Protestant lords met her forces at Langside near Glasgow, and the issue of that battle forced her to fly to England, where she placed herself (19th May) in the hands of Lord Lowther, governor of Carlisle, recalling Elizabeth's promises of protection. Mary, however, found that she was really a prisoner. Like Bala, she disappears personally from the field of Scottish history, but her life in exile, unlike his, was spent in busy plots to recover her lost throne. It became clear as time went on that she placed her whole reliance on the Catholic minority and foreign aid, even in prison she was a menace to Elizabeth and ready to plot against her as an enemy. The Pro-

testant party increased in Scotland until it became a 1567-1569. majority almost representative of the whole nation, even her own son when he came to hold the sceptre, little inclined as he was to accept Presbyterian principles, regarded her as a revolutionary element fortunately removed. His knowledge of Balaugton's plot for the invasion of England is proved, though her assent to the death of Elizabeth is still an open question. By her will, confirmed by her last letters, she bequeathed the crown of Scotland and her claim to that of England to Philip II. The letters contain this modification only, that her son was to have an opportunity of embracing the Catholic faith under the guardianship of Philip to save his own throne. There was no such reservation as regards that of England. The Armada, from whose overthrow date the fall of Spain and the rise of Britain as the chief European power, was due to the direct instigation of Mary Stuart.

Meantime, in Scotland, four regencies rapidly succeeded each other during the minority of James. The deaths by violence of two regents, Moray and Lennox, the suspicion of foul play in the death of the third, Mai, and the end scarcely less violent because preceded by a trial of the fourth, Morton, mark a revolutionary period and the impossibility of the attempted solution by placing the government in the hands of the most powerful noble. Hereditary royalty, not the rule of the autocracy, was still dominant in Scottish politics and a regency was an experiment already disparaged in the preceding reigns. Moray, said Sir J. Melville, "was and is called the good Moray's regent," mingling with this praise only the slight qualification that in his later years he was apt to be led by flatterers, but testifying to his willingness to listen to Melville's own counsels. This epithet bestowed by the Protestants, whose champion he was, still adheres to him, but only partisans can justify its use. He displayed great promptness in baffling the schemes of Mary and her party, suppressed with vigour the border thieves, and ruled with a firm hand, resisting the temptation to place the crown on his own head. His name is absent from many plots of the time. He observed the forms of personal piety,—possibly shared the zeal of the Reformers, while he moderated their bigotry. But the reverse side of his character is proved by his conduct. He reaped the fruits of the conspiracies which led to Rizzio's and Darnley's murders. He amassed too great a fortune from the estates of the church to be deemed a pure reformer of its abuses. He pursued his sister with a calculated animosity which would not have spared her life had this been necessary to his end or been favoured by Elizabeth. The mode of production of the casket letters and the false charges added by Buchanan, "the pen" of Moray, deprive Moray of any reasonable claim to have been an honest accuser, zealous only to detect guilt and to benefit his country. The reluctance to charge Mary with complicity in the murder of Darnley was feigned, and his object was gained when he was allowed to table the accusation without being forced to prove it. Mary remained a captive under suspicion of the gravest guilt, while Moray returned to Scotland to rule in her stead, supported by nobles who had taken part in the steps which ended in Bothwell's deed. Moray left London on 12th January 1569. During the year between his return and his death several events occurred for which he has been censured, but which were necessary for his security,—the betrayal of the duke of Norfolk and of the secret plot for the liberation of Mary to Elizabeth, the imprisonment in Loch Leven of the earl of Northumberland, who after the failure of his rising in the north of England had taken refuge in Scotland, and the charge brought against Matiland of Lethington of complicity in Darnley's murder. Lethington was committed to custody, but rescued by

Mary a
prisoner

1569 1575 Kirkaldy of Grange, who held the castle of Edinburgh, and while there "the chameleon," as Buchanan named Matland in his famous invective, contrary to the nature of that animal, gained over those in the castle, including Kirkaldy. Moray was afraid to proceed with the charge on the day of trial, and Kirkaldy and Matland became partisans of the queen. The castle was the stronghold of the queen's party,—being isolated from the town and able to hold out against the regent who governed in the name of her son. This defection was mourned over by the Reformers. Knox, with the self-confidence which marked his character, sent from his deathbed to Kirkaldy a message of warning that "neither the craggy rock in which he confided, nor the carnal wisdom of the man [Matland] whom he esteemed a demi-god, nor the assistance of strangers, should preserve him from being disgracefully dragged to ignominious punishment." It has been suspected that Matland and Kirkaldy were cognizant of the design of Hamilton of Bothwellhaugh to murder Moray, for he had been with them in the castle. This has been ascribed to private vengeance for the ill-treatment of his wife, but the feud of the Hamiltons with the regent is the most reasonable explanation. As he rode through Linlithgow Moray was shot (23d January 1570) from a window by Hamilton, who had made careful preparation for the murder and his own escape. Moray was buried in the south aisle of St Giles Cathedral, Edinburgh, amid general mourning. Knox preached the sermon and Buchanan furnished the eptaph, both unstinted panegyrics. His real character is as difficult to penetrate as that of Mary. It is easy for the historian to condemn the one and praise the other according to his own religious or political creed. It is nearer truth to recognize in both the graces and talents of the Stuart race, which won devoted followers, but to acknowledge that times in which Christian divines approved of the murder of their enemies were not likely to produce a stainless heroine or faultless hero, indeed necessitated a participation in deeds which would be crimes unless they can be palliated as acts of civil war. Let us also, if we can, Moray and Mary of Darnley's blood. It remains indisputable that Mary approved of Moray's assassination and that Moray would have sanctioned Mary's death.

Regency of
Lennox and
Mary

Moray succeeded in the regency by Lennox, Darnley's father, the male nearest of kin to the future sovereign, but really the nominee of Elizabeth. His brief term of office was marked by the renewal of the English war under Sussex and other generals, which made the queen's cause again the more popular. Lennox, another victim of violence, was slain (3d September 1571) in a hasty attack by one of the Hamiltons on Stirling, from which Morton, the real head of the Protestant party, who at first had been taken and threatened with the same fate, barely escaped. Mar, who had all along held the custody of the young king, was now chosen regent and held the post for a year, when he died (28th October 1572). During his regency the civil war between the queen's and the king's party continued. An English intrigue was carried on with great mystery, and never brought to a point, by Randolph and Killigrew to deliver Mary to the regent that she might be tried within her own dominions. On the death of Mar, Morton, who had been the most powerful noble during the last regency, at length reached the object of his ambition by being elected regent. On the day of Morton's election Knox died. He was "one," said Morton, "who never feared the face of man." If we condemn his violent language and bitter spirit, it is just to remember that he lived during the red heat of the struggle between Rome and the Reformation, and died before the triumph of the latter in Scotland was secure. He had felt the thongs of

the galleys and narrowly escaped the stake. The massacre of St Bartholomew spread consternation throughout Protestant Europe just before his last illness. Mary and Philip of Spain were still plotting for the destruction of all he held vital. His scheme for the reformation of the church and application of its revenues was in advance not of his own time only. He contemplated free education for children of the poor who really required such aid,—a graduated system of parish schools, burgh schools, and universities, which would have forestalled the most recent educational reform. While he introduced Presbyterian government by kirk-sessions, presbyteries, synods, and general assembly and opposed even a modified Episcopacy, he saw the advantage of the superintendence of districts by the more learned and able clergy. While he insisted on the preaching of the word and the administration of the sacraments in the vulgar tongue, his liturgy shows his favour for forms of public prayer. Knox's first wife was English, and two of his sons took orders in the Church of England. Scottish Presbyterianism had not yet been hardened by persecution into a hatred of prelacy as bitter as that of Popery. It meant separation from Rome, but inclined to union with England, and the question of the form of church government was still open.

Morton, like his predecessor, favoured the Episcopal Regency order, and, acting upon a compromise agreed to at Leith, a modified Episcopacy was restored. The bishops appointed were declared subject to the king in temporal and to the church and general assembly in spiritual matters, and were to have the same jurisdiction as the superintendents. The assembly of Perth protested against the use of certain ecclesiastical titles, but passed over that of bishop. Most of the clergy sanctioned, though with reluctance, the appointment of bishops in the hope of retaining their revenues. The people called them "tulchan" bishops, from the straw counterfeited used to rob the calf of its mother's milk. Almost the whole church property remained in the hands of the landed proprietors, Moray in the first instance and afterwards Morton receiving a lion's share. Avarice was Morton's besetting sin. In other respects he was an energetic and capable ruler. He effected at Perth, with the aid of Elizabeth's envoy, a pacification with Huntly, Chastelherault, and the Catholic nobles who supported Mary. Only the castle of Edinburgh held out, and thus, aided by English artillery, he succeeded in taking after a brave resistance by Kirkaldy and Lethington. Kirkaldy and his brother were executed at the cross of Edinburgh. Lethington escaped their fate in what Melville calls "the Roman manner,"—at his own hands, perhaps by poison. The death of the bravest and the ablest Scotsman of that age put an end to the last chance of Mary's restoration by native support. Morton, now without a rival, restored order in the borders, and when an encounter occurred between the English and Scottish borderers called the Raid of the Redswire his prudence prevented it becoming a national conflict. He appointed a commission for the reform of the law,—a far-sighted scheme, often attempted but always stopping short of success, to codify the law, which several Continental states, notably Denmark, about this period engaged in. The time was not ripe for a change which, now that it is, remains unaccomplished. But, while all seemed to favour Morton, there were undercurrents which combined to procure his fall. The Presbyterian clergy were alienated by his leaning to Episcopacy, and all parties in the divided church by his seizure of its estates. Andrew Melville, who had succeeded to the leadership of Knox, was more decided than Knox against any departure from the Presbyterian model, and refused to be won by a place in his household. His expensive buildings at Dalketh, which got the name of

Knox's
work

the Lion's Den, roused the jealousy of the nobles. The arrogance of his favourites exceeded his own. The commons were disgusted by a deprecation of the courage. The powerful earl of Argyll, incensed by the recovery from his wife, the widow of Moray, of some of the crown jewels, and Athole, a Stuart and Roman Catholic, united with Alexander Baskine, governor of Stirling, who now had the custody of the young king, in a league which received so much support that Morton bent before the storm and offered to resign. The king, whose education had been forced by Buchanan, now barely twelve years of age, nominally assumed the government, but was directed by a council of nobles headed by Athole as chancellor. Morton surrendered the castle of Edinburgh, the palace of Holyrood, and the royal treasures, retiring to Loch Leven, where he busied himself in laying out gardens. But his ambition could not deny itself another stroke for power. Aided by the young earl of Mar, he got possession of Stirling castle and the person of the king. Civil war was avoided only by the influence of Bowes, the English ambassador. A nominal reconciliation was effected, and a parliament at Stirling introduced a new government. Morton, who secured an indemnity, was president of the council, but Athole remained a privy councillor in an enlarged council with representatives of both parties. Shortly afterwards Athole died, of poison it was said, and suspicion pointed to Morton. His return to power was brief, and the only important event was the prosecution of the two Hamiltons, the abbots of Arbroath and Paisley, who still supported Mary and saved their lives by flight to England. The struggle with the Presbyterian clergy continued. The *Second Book of Discipline* had been presented to the king before he assumed office, and, although the general assembly in 1580 condemned Episcopacy absolutely, parliament did not sanction the condemnation. The final fall of Morton came from an opposite quarter. In September 1579 Esmé Stuart, Lord D'Aubigny, the king's cousin, came to Scotland from France, gained the favour of James by his courtly manners, and received the lands and earldom of Lennox, the custody of Dumbarton castle, and the office of chamberlain. One of his dependants, Captain James Stuart, son of Lord Ochilsee and brother-in-law of Knox, had the daring to accuse Morton at a meeting of the council in Holyrood of complicity in the murder of Darnley, and he was at once committed to custody. Some months later Morton was condemned by an assize for having taken part in that crime, and the verdict was justified by his confession that Bothwell had revealed to him the design, although he denied participation in its execution. He was executed by the Maiden—a guillotine he had himself brought from England—on 2d June 1581.

From December 1580 to August 1582 the government was in the hands of Lennox and Stuart, now captain of the guard,—a small force which the estates had reluctantly allowed the king to protect his person. Their jealousy threatened but never reached an open rupture. Stuart was rewarded by the gift first of the tutorship, then of the earldom of Arran in April 1581. Lennox was created duke, a title seldom granted in Scotland. Their aim, carefully concealed by nominal adherence to the Protestant faith, appears to have been the association of Mary with her son in the government, a breach with England, the renewal of the league with France, and the restoration of the Roman Church. The nobles, tried by office or the spoils of the church, were men of too feeble character to resist, but the Presbyterian ministers were made of stronger metal. Illegal banishment of the contumacious clergy and arbitrary orders of council were followed by a rising against Episcopacy. The proclamation of an extraordinary chamberlain air—an itinerant court of justice—to be held by Lennox

at Edinburgh on 27th August precipitated the *coup d'état* of 1575-158 the Raid of Ruthven, which took the usual form of Scottish revolutions,—the seizure of the king and the transfer of power to his captors. When on a visit (22d August 1582) to the earl of Gowrie, son of his mother's foe Lord Ruthven, banished at his castle of Hunting Tower near Perth, the earl his host, Mar, the master of Glamis, and others, taking advantage of the absence of Lennox and Arran, surrounded the castle with armed men and made James a prisoner, though still ostensibly treating him as king. Arran, returning to Perth with only two followers, was seized and put in prison. Lennox, after taking refuge in the castle of Dumbarton, fled to France, where he died in disgrace with the Catholics, because he had conformed to the Protestant doctrine.

The government was for ten months in the hands of a new council, of which Gowrie as treasurer was the head. There was no parliament, but a convention at Holyrood ratified the consequences of the Raid of Ruthven. A declaration was extorted from the king condoning his capture, but James, no longer a boy, chafed under the tutelage of the Protestant nobles and the admonitions of the Protestant ministers. In June of the following year he escaped from Falkland to St Andrews, which was held by Colonel Stewart. Arran was recalled, the Raid of Ruthven declared treason, Gowrie executed, and the chief Protestant lords banished. Melville and other ministers found it necessary to fly to England. A parliament confirmed the supremacy of Arran, who was created chancellor, and the forfeiture of the chief persons implicated in the Ruthven Raid. The king's power was declared to extend over all estates and subjects within the realm, all jurisdictions not approved by parliament and all assemblies and conventions without the king's hence were discharged. A commission was granted to Patrick Adamson, archbishop of St Andrews, and other bishops for trying ecclesiastical causes, and a form of judgment was established for depriving ministers of their benefices for worthy causes. A declaration was required to be subscribed by all benefited men—ministers, readers, masters of colleges and schools—acknowledging their submission to the king and obedience to their ordinary bishop or superintendent appointed by him, under pain of forfeiture. A few subscribed unconditionally, others with the qualification, "according to the Word of God", but a large number declined, and suffered the penalty. Early in 1585 Adamson issued a paper declaring the king's supremacy in matters ecclesiastical, defending the restoration of bishops, and announcing the king's intention that the bishops should hold synods twice a year, that general assemblies should be allowed provided they had his sanction, but that no jurisdiction was to be exercised by presbyteries. This document, which cut at the root of the Presbyterian system and was a formal declaration in favour of the royal supremacy and Episcopacy, was met with vehement protests by Melville and the exiled ministers.

Meantime a series of intrigues went on between the James English and Scottish courts. Elizabeth, while ostensibly favouring the exiles, disliked their political principles. James and Arran, instead of leaning on the papacy as Mary did, had shown signs of accepting a solution of the problem of church government more like that of England than of Geneva. There was here ground for a compromise of the religious controversy which political reasons made so desirable. Accordingly Lord Hunsdon, a favourite courtier of Elizabeth, met Arran near Berwick in the autumn, when it was arranged that the master of Gray, then a follower of Arran and personal favourite of James, should go to London in October. At his instance Elizabeth removed the banished Scottish lords and ministers from Newcastle to London. But Gray was playing his own

game, and his suggestions that these lords might return to Scotland, and that the alliance with England should be carried out by their aid and his own influence independently of Arran, were taken up by the queen, who had no personal liking for Arran, and ultimately effected. Elizabeth sent Wotton to Scotland, who won the confidence of James, to whom he promised a pension of £5000 a year, and while openly negotiating with Arran secretly plotted with Gray for his downfall. A mutual league between England and Scotland against the Catholics, called "the Bond and the True Religion," was agreed to by a convention of estates in July 1585.

This was a turning-point in the life of James and in the history of Scotland. The choice was made between France and England, Romanism and Protestantism. It was not likely to be reversed when with Elizabeth's declining years the crown of England was thrown into the balance. The day before the conclusion of the treaty Arran was at the request of Elizabeth's envoy put in strict ward, under the pretext that he had been privy to the death of Lord Russell, son of the earl of Bedford, in a border fray, and he only escaped at the price of his estates and honours. In November the banished lords—Angus, Mar, the master of Glamis—returned, and along with them the two Hamiltons, and, aided by Gray, they seized the person of the king and the castle of Stirling, and assumed the government. The alliance with England was finally ratified at Berwick by Randolph. James, at the instigation of Gray, wrote a harsh letter to his mother, and at the instance of Elizabeth he allowed George Douglas, who had been concerned in Darnley's murder, to return to Scotland. The exiled Protestant ministers were restored to their livings, but James was resolute in maintaining Episcopacy and enforcing the laws against all who denied the royal supremacy. Adamson was indeed forced by a general assembly to disclaim any authority as archbishop not allowed by God's Word, and an Act was passed again dividing Scotland into presbyteries, but the king refused to subject the bishops to their jurisdiction. Mary, desecrated by her son, now allowed herself through her immediate confidants, especially her secretaries Nan and Curle, to take an active though secret part in the Jesuit plots which embraced both Scotland and England in their ramifications. That which had for its aim the assassination of Elizabeth was discovered by Walsingham's spies, and, though forgery was resorted to, it is difficult to doubt that Mary was cognizant of the design. The trial at Fotheringhay could have but one result under a statute according to which any attempt against the queen's life was treason in this person for whom it was made as well as in the actual perpetrators. The execution (8th February 1587) of Mary naturally roused the anger of the Catholic powers and some indignation in Scotland, which James professed to share, yet he did nothing but expostulate. In truth his own crown was threatened by the same enemies. Mary had disinherited him in favour of Philip of Spain, unless he adopted the Catholic faith. The defeat of the Spanish Armada by the sovereign and people of both countries was felt to be a providential deliverance. Nothing could have served better to efface the memory of Mary and extinguish pity for her fate. The fall of Gray, who was tried and condemned for treason during his English embassy and for correspondence with Catholic princes, left James, now of full age, without what was almost a necessity to his weak nature, —a favourite, though Sir John Maitland, a younger brother of Lethington, was secretary and exercised the chief influence in the government. Advantage was taken of the royal majority to pass an Act annexing to the crown all church lands under certain limited reservations. But, as all prior grants to lay improprators were saved, and

the king was still allowed to grant feus of church lands, the nobles and landed gentry really profited most by this measure, which gave a parliamentary title to their estates derived from the church and the hope of future spoils. The Act was accompanied by a general revocation of all gifts made during the king's minority or by Mary after his accession. Another statute of constitutional importance renewed, and for the first time carried into effect, the law of James I. by which the lesser barons in the counties were excused from personal attendance and allowed to send representatives to parliament. This was a check on the nobles who had hitherto almost exclusively attended and ruled parliament. It was the first and only large deviation of the Scottish parliament from the feudal model of the *cum a regis*.

Projects for the king's marriage had been on foot at an earlier period, but at last the choice fell upon Anne of Denmark. Elizabeth opposed the match, but James, perhaps tempted by the offer to surrender the Danish claim to Orkney and Shetland, perhaps also not unwilling to show he could choose for himself, was married to Anne by proxy. Anne set sail for Scotland, but was driven back by a storm. Accordingly James himself went to claim his bride, when the actual marriage was at once celebrated at Copenhagen, where he spent the winter. It was a political advantage both to the king and to Scotland to form a connexion with a kingdom which, though small, stood comparatively high at that time in Europe, and was completely independent both of England and of France. After the king's return the Presbyterian party was in the ascendant. It has been doubted whether the favour shown to it by James at this time was genuine, but without reason. He had been married, and the queen was crowned, by Robert Bruce, a leading minister, for whom he had a personal liking. Shortly before going to Denmark James had published a tract interpreting the Apocalypse in the well-known Protestant sense. Notwithstanding the failure of the Armada, the air was still full of Jesuit intrigues and Spanish plots. At no moment of his life was James less inclined towards the English form of the Reformation, which he described in a celebrated speech as retaining the superstition of the mass "without the liftings." A severe blow was given to Episcopacy in Scotland by Archbishop Adamson shortly before his death retracting in a published confession his writings against Presbyterianism. In 1592 parliament, led by Melville, according to James Melville by Maitland, now Lord Thirlston, re-established Presbyterian church government. General assemblies were to meet once a year, and provincial assemblies or synods, presbyteries, and sessions were confirmed. The Act of 1584 conferring jurisdiction on bishops was rescinded, but there was no formal abrogation of the office. The assembly had asked for the repeal of the Act of Annexation of 1587, but this was not conceded. The landed interests were too powerful to allow of the Reformed Church receiving the patronage of its predecessor. Shortly after the termination of the parliament the discovery of the plot of "the Spanish blanks" showed that the danger of a Catholic rising and foreign invasion was real. The conspiracy proved abortive, and two of its chief promoters (Huntly and Erroll) left Scotland, on their return three years later they publicly renounced Catholicism and conformed to the Protestant faith.

From the king's majority to his accession to the English throne, his relations to the nobles on the one hand and to the Presbyterian party led by the ministers on the other, require to be kept in view as giving the key to a singularly and confused and changing course of events. After the death of Thirlstone in 1595, the king had to rely on his own counsel, of the value of which he had an overweening

Majority
of James

opinion. He had studied the theory of kingship and wrote the *Basiliroa Doctrina* expounding it. He fancied that he really governed, while he was in fact drawn this way or that by the contending forces which emerged in this revolutionary epoch. In spite of occasional displays of resolution, his character was at bottom weak. It was the destiny which conducted him to the English throne that saved him from the dangers of his situation in Scotland. A nobleman, who, although only connected by his mother with Mary's Bothwell, seemed to inherit the reckless daring of his predecessor in the title, three attempted and once for a short time succeeded in seizing the royal person and assuming the reins of government. But James, who was not without adroitness in baffling plotters by arts similar to their own, escaped from his custody. Towards the Catholic lords his policy was not to proceed to extremities, but to keep them in hand as a counterpoise to the extreme Protestant party. He prudently allowed the finances to be managed after Thistlethorn's death by a committee, called from its number the Octavians, on which both Catholics and Protestants acted.—Seton, afterwards Lord Dunfermline, the president of the session, and Lindsay of Balcarres being the leading members. With their advice James set himself against any measures which the Protestant ministers proposed for the restoration or increase of the revenues of the church. It was this critical point of money, the assertion of the royal supremacy in spiritual matters, and the favour the king showed to the Catholics which led to the quarrel between him and the ministers. At a convention of the estates at Falkland and then more strongly as one of a deputation sent by the ministers from Cupar, Andrew Melville, in the spirit and manner of Knox, made his well-known speech to "God's silly vassal" on the two kingdoms and the two kings. Although James, frightened by this vehement language, made promises that he would do nothing for the Catholic lords till they had made terms with the church, it was impossible that a quarrel, whose roots were so deep, as to the limits of the royal authority and jurisdiction in matters ecclesiastical could be appeased. Neither party to it could see how far each overstepped the bounds of reason. The king was blind to the right of freedom of conscience which Protestantism had established as one of its first principles. Melville and the ministers were equally blind to the impossibility of any form of monarchy yielding to the claim that the members of an ecclesiastical assembly should use the name of Christ and the theory of His headship over the church to give themselves absolute power to define its relations to the state. Other occasions quickly arose for renewing the controversy. A violent sermon by Black at St Andrews gave a favourable opportunity to James of invoking the jurisdiction of the privy council, and the preacher was banished north of the Tay. Soon afterwards a demand made on the king in consequence of a sermon of another minister, Balcanquhall, and a speech of Bruce, the king's former favourite, that he should dismiss the Octavians, led to a tumult in Edinburgh, which gave James a pretext for leaving the town and removing the courts of justice to Lanthigow. Supported by the nobles, he returned on New-Year's Day 1597, received the submission of the town, levying a severe fine before he would restore its privileges as a corporation and withholding from it the right of electing its own magistrates or ministers without the royal consent. Emboldened by this success, James now addressed himself to the difficult problem of church and state. He did not yet feel strong enough to restore Episcopacy, perhaps had not quite determined on that course. The ingenious scheme due to Lindsay of Balcarres was fallen on of introducing representatives of the church into parliament without naming them bishops. This would have the twofold effect of

diminishing the authority of the general assemblies and of conferring on parliament a competency to deal with matters ecclesiastical. Parliament in 1597 passed an Act that all ministers promoted to prelates (i.e., bishops or abbacies) should have seats in parliament, and remitted to the king with the general assembly to determine as to the office of such persons in the spiritual policy and government of the kirk. Accordingly James summoned successive assemblies at Perth and Dundee, where there were two sessions in 1597, and finally at Montrose in 1600, selecting those towns in order to procure a good attendance from the north, always more favourable to royalty and Episcopacy and less under the influence of the Edinburgh clergy. By this and other manoeuvres he obtained some concessions, but not all that he desired (see PRESBYTERIANISM, vol. XIX pp. 681-682). It was the Gowrie conspiracy (5th August 1600) whose failure gave him the courage and the ground for finally abandoning the Presbyterians and casting in his lot with the bishops. Repeated investigations at the time and since cannot be said to have completely cleared up the mystery of this outrage. The most probable solution was afforded by the discovery several years afterwards of a correspondence between Gowrie and Logan of Restalrig which pointed to the seizure of the person rather than the murder of James as the object of the plot. More important than this object, which failed, was the sequel. The Ruthvens, who were chiefly implicated, were amongst the most prominent of the Protestant nobility, and the Presbyterian ministers with few exceptions refused to accept James's own account of what had happened, confirmed though it was by depositions of various noblemen who were with the king at the time. They even insinuated that the plot had not been by but against Gowrie at the king's instance. Although James by arguments and threats at last extorted an acknowledgment of the truth of his account from all the ministers except Bruce, who was deprived of his benefice and banished for his contumacy, the insult and the injurious suspicions were never forgotten.

In October, with the consent of the convention of estates, he appointed three bishops to vacant sees, and they sat in parliament, though as yet without any place in the government of the church, which was still Presbyterian, and with no sanction of course from the assembly or the ministers. James had to assume the English crown before Episcopacy could really be restored. This crisis of his career was not long delayed. Already Elizabeth's death was being calculated on, and her courtiers from Cecil downwards were contending for the favour of her heir. She died on 24th March 1603 and James was at once proclaimed her successor in accordance with her own declaration that no minor person should ascend her throne but her cousin the king of Scots. Leaving Edinburgh on 5th April, James reached London on 6th May, being everywhere received with acclamation by the people. Thus peacefully at a memorable epoch in the history of Europe was accomplished the union of South and North Britain. Often attempted in vain by conquest, it was now attained in a manner soothing the pride of the smaller country, without at first exciting the jealousy of the larger, whose interest was, as Henry VII. prophesied, sure to predominate. To James it was a welcome change from nobles who had threatened his liberty and life, and from ministers who withstood his will and showed little respect for his person or office, to the courtier statesmen of England trained by the Tudors to reverence the monarch as all but absolute, and a clergy bound to recognize him as their head. To Scotland, a poor country, and its inhabitants, poor also but enterprising and eager for new careers, it opened prospects of national prosperity which, though not at once, were ultimately realized. It was an immediate gain that

1603-1615] border was and English and French intrigues were at an end. This more than counterbalanced the loss of the court, a loss which probably favoured the independent development of the nation. For the present no change was made in its constitution, its church, or its laws. The Reformation had continued the work of the War of Independence. Scotland no longer consisted only of the nobles, the nobles, and the landed gentry. The commons, imperfectly represented in parliament by the burghs, not yet wealthy enough to be powerful, had found a voice in the assemblies of the church and leaders in its ministers and elders.

Superstition did not fall with the fall of the church of Rome nor licence with the decline of the nobility. Rather, both took new forms of extreme virulence and threatened to impede the national progress, but both were exposed to the light of public discussion and the growth of public opinion. The contact with the more cultured south was of immense value. Scotland, now beginning to use in the services of the church, in the proceedings of the courts, and in printed books the vulgar tongue, which differed only as a dialect from that of England, was admitted to the freedom of the noblest language and literature in Europe, then in its prime. The arts which increase the convenience and pleasure of daily life spread northward with the increase of wealth. Science, starting on a new method taught by the great English philosopher, was introduced and after a time eagerly prosecuted. Commerce, for which the Scots had a natural aptness, found new fields. And all these benefits were procured without any sacrifice of the independent spirit which had been derived from their forefathers. Even the separate intercourse with the Continent—with France, Germany, Holland, and Scandinavia—from which Scotland had already received so much advantage, though not quite so intimate with France as before, continued. But before the blessings of the union could be fully realized a century was to intervene, which at times seemed to hide if not to bury them,—a century of civil war and religious controversy. At the moment when James ascended the throne and proclaimed the virtues of peace it required no far-sighted observer to discern elements of discord which might at any moment burst in storm. To hold Papal Ireland, Episcopal England, and Presbyterian Scotland united under one sceptre was a task of infinite difficulty, not lessened because in each there was a minority who dissented strongly from the prevailing opinion as to church government and doctrine. The sudden separation from Rome gave birth to every variety of religious opinion, and Scotland became even more than England a land of sects. The constitution of the civil government was a problem not yet solved. In England the Tudor sovereigns had sapped the principles of the parliamentary constitution established in the times of the Plantagenets, and fortunately recorded in writings which could not be forgotten. In Scotland such principles had never yet been practically adopted. Ireland was ruled as a dependency on the principle of subjection.

At this point in the treatment of some historians the history of Scotland ends. Juster views now prevail. Neither the union of crowns nor of parliaments really closes the separate record of a nation which retained separate laws, a separate church, a separate system of education, and a well-marked diversity of character. But a great part of the subsequent history of Scotland is necessarily included in that of Great Britain, and has been treated under ENGLAND (*q.v.*). Considerations of space and proportion make it necessary that what remains should be told even more rapidly than the narrative of what preceded the accession of James to the English throne. James during the first half of his reign as sovereign of Great Britain allowed himself to be mainly guided by Robert

Cecil, Lord Salisbury, the son of Burghley, an hereditary statesman of great ability as an administrator. But on two subjects closely connected with Scotland the king had decided opinions of his own. He desired to see Scotland bound to England, not merely by the union of the crowns, but by a union of the parliaments and laws, and if not an immediate ultimate union of the churches. He was equally determined that the church in both countries should combine a moderate Protestant doctrine—a *via media* between Rome and Geneva—with Episcopal government. Both desires were founded on prudent policy and might possibly have been accomplished by a stronger and wiser monarch. But the former was opposed by the jealousy of England and the pride of Scotland. The latter could not be accomplished in Scotland without force, so deep were the roots which Presbyterianism had struck. James attempted to carry both measures in a manner calculated to raise rather than to overcome opposition. The union scheme was brought before his first English parliament, and commissioners were appointed to treat with the Scottish commissioners nominated somewhat reluctantly by the parliament of Perth. The commissioners met, but differences at once emerged on the topics of freedom of trade between the two countries, to which the English were averse, and the acceptance of the laws of England, which the Scots objected to. Two important points were carried by a declaration of the law rather than agreement of the commissioners,—that subjects born in either country after the accession (*post nati*) should have the full privileges of subjects and not be deemed aliens, and that those born before should be capable of denization and so of inheriting or acquiring land in England, though not of political rights or offices. The English parliament of 1607, however, refused to sustain the decision of the Exchequer Chamber in favour of the *post nati*, although it consented to abolish the laws which treated Scotland as an enemy's country and made arrangements for the extradition of criminals. The religious or ecclesiastical question was first brought to a point in England at the Hampton Court conference, which met on 14th January 1604, in which trifling concessions were made to the Puritans, chiefly as to the observance of Sunday and the removal of the Apocrypha from the Authorized Version. In Scotland Episcopacy was restored by a series of steps which were gradual only for the purpose of overcoming opposition, not because James hesitated as to the end in view. At length the parliament of 1613 repeated the Act of 1592, so that Episcopacy was now once more established in Scotland by law, but contrary to the wish of the majority of the nation and under circumstances which made it the symbol of absolute government. While thus resolute in favour of Episcopacy, James showed no sign of leaning to the Roman Church, although efforts to convert him had been made at an earlier period in Scotland. The Armada, now followed by the Gunpowder Plot, convinced him that he had nothing to hope for from the Papists but open war or secret conspiracy.

After the death of Cecil James gave way to that influence of favourites to which he had shown himself prone in his younger years, but in the affairs of Scotland, which produced much trouble and little profit, Somerset and Duckingham took no interest and James was his own master. After an absence of fourteen years he visited his native country. He had promised to return every three years, but the business and pleasures of the English court detained him. His main object was to carry out still further the uniformity of the church, in which the bishops had not succeeded in establishing the same service as in England. This object was apparently attained in 1618 by the adoption of the Five Articles of Perth (see vol. xix. p. 682), Articles but at the cost of sowing the seed of religious war. From of Perth.

James's
destructive
political
union

Re-establishment
of Episcopacy

this time to James's death little occurred worthy of note in the history of Scotland. A parliament in 1621, held under the marquis of Hamilton as commissioner, confirmed the Five Articles, though by a majority that is narrow when the power of the king in a Scottish parliament is kept in view, and only on an assurance from the commissioner that no further ecclesiastical innovations would be proposed. It also introduced a new mode of electing the Lords of the Articles, which practically gave the whole influence to the bishops, the nominees of the crown. As this body prepared the entire business of a parliament in which there was no power of bringing in Bills by private members, this was a long step in the direction of absolute government. James, in fact, declared in one of his speeches to the English parliament that, according to the Scottish constitution, he was master of its whole proceedings, with the absolute power of initiative as well as of veto. His declaration was an exaggeration, for there were well-known precedents of the estates passing laws without the royal assent, but the Scottish constitution was in a fluid state without the guarantee of written charters or clearly defined rules as to the refusal of supplies, and above all without an independent House of Commons to represent the wishes of the people and demand redress for their grievances. The only part of the policy of James on which it is possible to look back with satisfaction was that which concerned colonization, then called "plantation." This gave an outlet to the increasing population, while it advanced the civilization of the countries to which the settlers went. The earliest of these schemes, the "plantation" of the Hebrides by a number of gentlemen of life called "undertakers," had comparatively little effect, but, apart from it, some progress was made in introducing order and law in the Highlands and islands, where the people were still in a semi-barbarous condition. More important was the plantation of Ulster, chiefly by Scottish farmers, whose descendants still retain a Scottish dialect and a Presbyterian church. But as an arguement of the future the colonization of Nova Scotia, though attempted in an arbitrary manner, was of the greatest consequence. It was a commencement of the great migration to the New World across the Atlantic and to the other colonial possessions of Great Britain, in which, equally to their own profit and that of the empire, the Scottish nation in the two following centuries was to play so great a part. On 22d March 1625 James died, leaving to his son Charles a burden of government heavier than when he had himself undertaken it. His apparent success in carrying to a further point the absolute and arbitrary principles of the Tudor sovereigns scarcely concealed the real failure. Ireland, with difficulty kept down, was not really subdued. The parliament of England had given unmistakable signs that it was only waiting an opportunity to restore the constitution on the old basis. The religious and political instincts of the Scottish nation, suppressed by force, were gathering strength to reassert themselves if necessary by revolutionary methods. An exhausted exchequer, which James had attempted to fill by monopolies, and by the sale of offices and honours and so-called benevolences, added to the other difficulties of carrying on the government, but was fortunately, as in the time of the Plantagenets, to afford the occasion for maintaining the constitutional struggle.

8 *Period of Civil Wars, Charles I to Revolution*—Eight years after his accession Charles I revisited Scotland (1633). During these he had pursued his father's policy. No Scottish parliament sat, though a nominal one was adjourned annually between 1628 and 1633. No general assembly met, but the restoration of Episcopacy and the uniformity of the churches were steadily prosecuted by royal influence and the exercise of the royal prerogative.

In spite of the opposition of a convention of the estates, which nearly ended in bloodshed, the king carried out the resumption of tithes for the benefit of the clergy from then lay impropricators. The revocation in 1625 of all grants in prejudice of the crown, whether before or after the Act of Annexation of 1587, was superseded by a new measure, ratified by parliament in 1633, declaring the terms on which the tithes might still be acquired and valued by the heritors. Few measures have been of greater importance in their bearing on Scottish history. The revocation alienated the nobles and landed gentry, who decided that when so much had been, still more might be, taken from their profits in the Reformation. The new valuation left the parochial clergy in the position of a poor class, with interests antagonistic to the gentry, whose income was diminished whenever the ministers attempted to raise their scanty stipends. The loyalty for which the Scots had been distinguished had received a shock by the removal of the court, and this was a second and more serious blow. Yet when Charles came to Edinburgh and received the crown at Holyrood (18th June 1633) he was well received. The disaffection still lay beneath the surface. Although the Five Articles of Perth were not rigidly enforced, all the court could do was done to introduce the most obnoxious,—the practice of kneeling at the communion, which Presbyterians deemed a relic of the mass. The question of a liturgy was not allowed to rest. It was brought before the Scottish bishops in 1629, their draft was submitted to Laud, who, detecting in it Low Church doctrine as to baptism and traces of Knox's *Book of Common Order*, refused his approval and advocated the introduction of the English Prayer Book, by which uniformity would be secured. Though this was not yet attempted, Charles took the same view as the zealous and ambitious churchman who was now his guide in ecclesiastical matters. When he came to Scotland Laud was in his suite, and the coronation was conducted with a ritual which "had great fear of unbending of Popery." Edinburgh was created a bishopric. The parliament over which Charles presided passed thirty-one Acts, "not three of which," says a contemporary, but were most "hurtful to the liberty of the subject." One in particular declared in a large sense the royal prerogative, and by an ill-omened conjunction gave the king power to regulate the apparel of churchmen. It was disputed in parliament whether this Act was carried, but the presence of the king, who took notes of the votes, overruled opposition. About a year after Charles left Scotland the trial of Lord Balmerino, which grew out of the Acts of this parliament, gave the first impulse to the Scottish revolution. That nobleman, who had possessed a copy of a petition protesting against the Acts then carried, was tried under the old Acts against leasing-making or sedition and condemned by a majority of one upon a single charge,—that of not revealing the petition and its author (March 1635). Although Charles respited the capital sentence, the condemnation deeply stung the people, who saw almost the only mode of constitutional redress, that by petition, declared illegal and an act capable of innocent interpretation treated as a heinous crime. Before the trial the appointment of Spotswood as chancellor, the first ecclesiastic who held the office since the Reformation, and the admission of nine bishops to the privy council, increased the disaffection. In 1636 the *Book of Canons*, ratified by the king the year before, was published at Aberdeen, containing the most distinct assertion of the royal supremacy and a complete Episcopal organization.

At last on Sunday, 23d July 1637, the much-dreaded introduction of the use of which had been enjoined by the *Canons* of 1547 and announced on the preceding Sunday, was introduced.

1637 1639 in the service of St Giles Cathedral, Edinburgh. For the most part a transcript of the English Prayer Book, it deviated slightly in the direction of the Roman ritual. Its use provoked an uproar, of which the stool flung at the dean by a woman, Jenny Geddes or Anne Men, was the symbol, and brought the service to a close.—Lindsay, the bishop, being with difficulty saved from the violence of the mob. A similar riot took place in Greyfriars church, where the bishop of Ayr attempted to use the book. There had been no such tumult since the Reformation. The privy council arrested a few rioters, but suspended the use of the service book until the king's pleasure was known, and when Laud at the king's request wrote that its use should be continued no one dared to read it in Edinburgh or throughout Scotland except in a few cathedrals. Meantime numerous supplications against it and the *Canons*, joined with accusations against the bishops, were sent to Charles. His only answer was the removal of the courts and privy council to Linlithgow and an order to all ministers who signed the supplications to leave Edinburgh. There followed fresh supplications and protests, in which some of the nobility, especially Rothes, Balmerino, London, Montrose, and a prominent lawyer, Johnston of Warriston, joined with the ministers. Hope, the king's advocate, secretly favoured them. Taquair, a leading member of the privy council, went to London to press on Charles and Laud the gravity of the situation, but, though ambiguous concessions were made, the king and his advisers were determined to insist on the service book. In a proclamation issued at Stirling (20th February 1638) the king assumed the responsibility of its introduction, but the opposition was too powerful to be put down by words. Its organization, begun by commissioners headed by Rothes, continued in committees of the nobles, lesser barons, ministers, and burghs, was now called "the Tables" from those in the Parliament House, where they sat sometimes separately, sometimes collectively, and formed a standing assembly which defied the king's council. The Covenant, prepared by Alexander Henderson, leader of the ministers, and Johnston of Warriston, was revised by Rothes, London, and Balmerino, and accepted by upwards of two hundred ministers who had gathered in Edinburgh. It was signed at Greyfriars church on 1st March 1638, first by many of the nobles and gentry, then by three hundred ministers and a great multitude of the people. Copies were at once despatched throughout the country, and with few exceptions, chiefly in St Andrews and Aberdeen, it was accepted by all ranks and classes. Its form was suggested by the bonds for material aid of which Mary's reign had given so many examples, but the new name pointed to a Biblical origin, and the parties were not the nobles and their retainers but God and His people. While nominally professing respect for the royal office, it was entered into, as it anxiously reiterated, for "the defence of the true religion (as reformed from Popery) and the liberties and laws of the kingdom." The spirit in which it was signed was that of a religious revival. Many subscribed with tears on their cheeks, and it was commonly reported that some signed with their blood. Charles could not relish a movement which opposed his deepest convictions as to church government and under the form of respect repudiated his supremacy, but, destitute of power to coerce the Covenanters, he was compelled to temporize. Hamilton as his commissioner offered to withdraw the service book and *Book of Canons*, to give up the Court of High Commission, and to allow the Articles of Perth to remain in abeyance. A new confession called the "negative," framed on that of 1580, and a new covenant called the "king's," on the model of one drawn in 1590, which bound the signers only to stand by the king in suppressing Papists and

promoting the true religion, were devised, but failed to satisfy even the least zealous Covenanters.

An assembly at last met in Glasgow, over which Hamilton presided, with faint hope that matters might still be accommodated. Hamilton had orders to dissolve it if it proved to be intractable. The members had been chosen by the influence of the Tables, according to a mode invented in 1597. Three ministers represented each presbytery and an elder the laity of the district. The burghs also sent representatives. The Covenanters had declared their intention of prosecuting the bishops, and a libel laid before the presbytery of Edinburgh was read in the churches. Charles on his side announced that he challenged the mode of election and would not allow the prosecutions. He was already preparing for war. At the first sitting Alexander Henderson was chosen moderator, and Johnston of Warriston clerk. In spite of the commissioner's attempt to raise the question of the validity of elections, the assembly declared itself duly constituted. A letter from the bishops was read declining its jurisdiction, and the commissioner, while offering redress of grievances and that bishops should be responsible to future assemblies of clergy, declared that the present assembly was illegal in respect of the admission of lay representatives. Discussion was useless between a commissioner and an assembly whose power to act he denied. He accordingly dissolved it in the name of the king and left Glasgow, but this only stimulated its members. It annulled the pretended assemblies between 1606 and 1628, condemned the service book, *Book of Canons*, *Book of Ordinance*, and the High Commission Court, deposed the bishops on separate libels which set forth various acts of immorality or crime, many of which were false, declared Episcopacy to have been abjured in 1580, and condemned the Five Articles of Perth. It concluded its month's labours by restoring Presbyterian church government.

The distance from such an assembly to the field of arms was short, and on 7th June 1639 the army of the Covenanters under Alexander Leslie, a general trained in the service of Gustavus Adolphus, met the royal troops led by the king at Dunse Law. Charles, though slightly superior in numbers, had an undisciplined army and no money to maintain it, while Leslie had trained officers and troops animated by religious zeal. Their colours were stamped with the royal arms, and the motto "For Christ's Crown and Covenant" in golden letters. Councils of war as well as religious meetings were held daily, and the militant fervour of the Covenanting troops steadily rose. Charles declined to engage such an army and general, and by the Pacification of Berwick (18th June) both parties agreed to disband, and Charles to issue a declaration that all ecclesiastical matters should be regulated by assemblies, and all civil by parliament and other legal courts. On 1st August a free general assembly was to be held at Edinburgh, and on the 20th a free parliament in which an Act of Oblivion was to be passed. The assembly met as appointed and, without explicitly conforming, re-enacted the principal resolutions of that of Glasgow, and declared that the Covenant should be subscribed by every one in office and authority. Before it separated it condemned the *Large Declaration*, a pamphlet by Balcanquhall, dean of Durham, published in the king's name, which gave an adverse narrative of recent events in Scotland. The parliament effected little legislation, but showed its disposition by abolishing Episcopacy and reforming the election of the Lords of the Articles, of whom eight were henceforth to be chosen by the nobles, lesser barons, and burghs respectively. The predominance of the king and the church was thus removed from the body which initiated all legislation. Charles had beforehand determined not to sanction the abolition of Episcopacy, and the parliament was prematurely adjourned (14th

November) without the royal assent to its Acts. It was evident that the struggle between the king and the Scots would be renewed, and both parties reluctantly had recourse to allies whose choice showed their sense of the crisis. Charles summoned an English parliament, but the three weeks' session of the Short Parliament was spent in a vain attempt to obtain redress for its own grievances. It separated without granting supplies, and the king had to depend on private loans. The Scots negotiated with the French king, but Richelieu prevented the unnatural alliance of the Catholic king and the Covenanters. The Scots took the first step in the war. The army under Leslie crossed the Tweed and, forcing the passage of the Tyne at Newburn, occupied Newcastle. Charles, who had his headquarters at York, paralysed by the want of money and new demands to summon an English parliament, was driven to accept a truce at Ripon (2d September 1640), under which the Scottish army was to receive a subsidy to relieve the northern counties from contributions. Parliament was summoned to Westminster for 3d November, but its first act was the impeachment of Strafford. Until a pledge was given by his death that Charles would recognize the limits of monarchy, the Parliamentary leaders thought it safer that the Scots should hold the north of England. Peace was concluded by the Act immediately following that of Strafford's attainder, by which £300,000 was ordered to be raised as "friendly assistance and relief promised to our brethren in Scotland."

Charles's
concessions
to the Scots

The king now made up his mind to revisit Scotland, hoping there to find a way out of his English troubles. He had received a letter from Montrose (*q.v.*), urging him to come and gain the Scots by a moderate policy. He came to Edinburgh early in August 1641 and a parliament met under his presidency, when he not only ratified the Acts substituting a Presbyterian for the Episcopal form of church government but sanctioned important reforms. The Lords of the Articles were in future to be elected by each of the three estates separately, the burghs taking the place of the bishops, the Court of High Commission was abolished, arbitrary proclamations were prohibited; the officers of state and the judges were to be chosen with the advice of parliament, and, following an English Bill, parliament was to meet every third year. During his stay in Scotland occurred "the Incident,"—still spoken of as mysterious by historians, some of whom liken it to the English incident of the arrest of the five members. Argyll and Hamilton had led the party which carried all the measures of this parliament. Montrose had been committed to the castle by the estates before the arrival of Charles on a charge of plotting against Argyll by false accusations to the king. From his prison he renewed his charges against both Argyll and Hamilton, whom he accused of treason. Charles about this time unwisely attended parliament with an unusual guard of 500 men, which gave Hamilton and Argyll a pretext for asserting that their lives were in danger and to quit Edinburgh. They soon returned and a favourable committee of investigation let the matter drop. Argyll was now more powerful than ever. In November the king returned to London, which became during the next year the centre of the events which led to the Civil War.

Civil
War

The progress of the Civil War belongs to English history. Here only the part taken by the Scots can be stated. They were now courted by king and Parliament alike. The campaign of 1642-43 under Essex proved indecisive, and the Parliament sent commissioners headed by Sir Henry Vane to Edinburgh in the autumn of 1643, who agreed to the "Solemn League and Covenant" already accepted by the Scottish assembly and parliament, and now ratified by the English parliament and the assembly of divines

at Westminster. This memorable document, whose name 1639-1640 showed its descent from the National Covenant, bound the parties to it "to preserve the Reformed Church in Scotland and effect the reformation of that in England and Ireland in doctrine, worship, discipline, and government according to the Word of God and the example of the best Reformed Churches." But the alliance with the Scottish Covenanters did not produce the advantage expected from it. The victory of Marston Moor was due to Cromwell and his Ironsides, who were Puritans and Independents. The Scots, who formed the centre of the Parliamentary army, were repulsed. In the autumn, although the Scots took Newcastle, the king gained ground in the west, where Essex, the general who represented the Presbyterians, narrowly escaped capture. Next year Montrose, in the brilliant campaign on which his military fame rests, made a formidable diversion in the Highlands. With dazzling rapidity, at first supported only by a handful of followers, but gathering numbers with success, he erected the royal standard in Dumfries, then, passing to the Highlands, after the victory of Tippermuir he took Perth, and defeated Lord Lewis Gordon at the Bridge of Dee. Next, after ravaging the county of Argyll, he marched to Inverness, but returned to defeat Argyll at Inverlochy, won further victories at Alderman near Nairn and Alford on the Don, and by that of Kilsyth appeared to have recovered Scotland for Charles. The fruit of all these victories was lost by his defeat at Philiphaugh (13th September 1644) by Leslie. Meantime Charles had lost the battle of Naseby, and next year was forced to take refuge at Newark with Leslie, whom he had created earl of Leven. As the result of his surrender he ordered Montrose, who was again raising the Royalists in the Highlands, to lay down his arms, and the Scottish army in England, no longer on good terms with the Parliament, returned to Newcastle, that, being nearer home, it might dictate the terms of its services. Here it remained eight months, during which a strenuous attempt was made to force Charles to accept the Covenant. Alexander Henderson argued the matter with him in a singularly temperate correspondence. But the king was bound to Episcopacy by hereditary sentiment and personal conviction. Another negotiation was going on at the same time between the Scottish army and the English Parliament for arrears of pay. On 30th January 1646 they surrendered the king to the English commissioners, the question of pay having been settled by the receipt of £200,000 a few days before and a like sum a few days after that date. There was no express condition which bound the two circumstances together, but their concurrence cannot have been accidental.

Charles
I's negoti-
ations with the
Scots

In his captivity Charles renewed his negotiations with the Scottish estates, over which Hamilton had now acquired influence, and a compromise was at last agreed to at Newport in the Isle of Wight by which he promised to confirm the League and Covenant by Act of Parliament, to establish Presbyterianism and the Westminster Confession, which as well as the Directory had been adopted by the Scottish parliament for three years. After that period it was to be fixed by the king and parliament what form of church government was most agreeable to the Word of God, and this after consultation with the assembly was to be established. The Scots consented that in the meantime the Covenant should not be enforced on those who had conscientious scruples, and that the king might continue to use the English service. The Covenanters who accepted these terms, and who formed the most moderate section, received the name of Engagers. Relying on the promised support from Scotland, Charles rejected the proposals of the English Parliament. That body had now broken with the army, in which the Independents and Cromwell were

1647-1664

fast acquiring supremacy. Their division afforded an opportunity for renewing the war, and Hamilton invaded England in the following year, but was routed at Preston (17th August 1648) by Cromwell. A party led by Argyll had opposed the compromise with Charles effected by Hamilton. They were chiefly strong in the south-west, and in the autumn of this year a band of them raised by Lord Eglinton marched to Edinburgh and were met by Argyll, who put himself at their head. Their numbers had risen to 6000, a sufficient force to give them supreme influence over the Government. It was from this—the "Whiggamore" raid—that the name of Whigs took its rise. The meeting of estates now resolved to renew the Solemn League and Covenant, and by an Act called the Act of Classes removed from the courts and all places of public trust those who had accepted the "late unlawful engagement." The English Parliament at this point took an exactly opposite course and showed signs of conciliation with the king, but the frustration of its action by the energetic policy of Cromwell was quickly followed by the trial and execution of the king. Hamilton, who had been taken after Preston, soon after shared the same fate.

Charles II's acceptance of Covenantant

The death of Charles altered in a moment the relations between England and Scotland. In the former Cromwell became all powerful, while in the latter the moderate Presbyterians attached to the principle of monarchy and the hereditary line at once proclaimed Charles II. Charles II. had been brought up with different views of royalty from those of the Covenanters, and Scotland was not prepared to accept a king except on its own terms. A commission from the estates and from the assembly was at once sent (March 1649) to The Hague, where the young king was. Charles promised to maintain the government of Scotland in church and state as settled by law, and particularly the Covenant, Confession of Faith, and Presbyterian system, but declared that he could not impose the Solemn League and Covenant on England and Ireland without the consent of their parliaments. The commissioners returned dissatisfied with this answer and with the presence at court of Montrose, by whom it had probably been framed. But in October Ormonde's Irish expedition failed, and Cromwell, already master of England, had reduced Ireland by force of arms, both parties felt inclined to renew the treaty. At length it was agreed that Charles should be accepted as king on condition of his subscribing the Covenant, establishing Presbyterian church government and worship, sanctioning the Acts of Parliament passed in his absence, and putting in force the law against Catholics. In return he stipulated for the free exercise of his royal authority, the security of his person, and the aid of a Scottish army. The treaty was closed in these terms on 9th May 1650, and early in June Charles set sail for Scotland. On the voyage he was forced to consent to further conditions which the Scottish parliament ordered the commissioners to impose, in particular to exclude from his court all persons within the first and second classes of the Acts of 1646 and 1649, and to keep the duke of Hamilton, brother of the late duke, and certain other persons out of Scotland. On Sunday, 23d June, at the mouth of the Spey he subscribed the Covenant and landed. Whilst Charles was negotiating with the commissioners, the expedition of Montrose, which he had encouraged but afterwards disowned, had come to an end by the capture of its gallant leader in Cuthness. He was executed in Edinburgh a month before Charles reached Scotland.

Cromwell's invasion of Scotland

Alarmed at the prospect of another Scottish invasion, Cromwell with wonderful rapidity transferred his forces from Ireland, and within a month after Charles landed crossed the Tweed and advanced to Edinburgh. Baffled in all attempts against the town by the tactics of David

Leslie, the nephew of Leven, he was forced from want of supplies to retire. His retreat was nearly cut off, but he gained an unexpected victory at Dunbar (3d September 1650) over that able general, who had been induced by the over-confidence of the ministers in his camp to descend from the Doon Hill and attack the English on level ground. So complete was the defeat that the south of Scotland fell into Cromwell's hands. Meantime Charles had attempted to escape from the restraints of the Presbyterian camp by "the Start," as it was called, from Perth to Clova, where he hoped to raise the loyal Highlanders, but, not getting the support expected, he returned. In the beginning of next year, after renewing his subscription to the Covenant and submitting to the imposition of a day of fasting and humiliation on account of the sins of his family, he was crowned at Scone on 1st January 1651. Argyll, still the leader of the Covenanters, placed the crown on his head, a circumstance which he recalled when he lost his own. The invasion of England was now determined on, and, Cromwell having been unable to intercept the royal army, it advanced as far as Worcester. Here, after effecting a junction with Fleetwood, Cromwell with a much smaller force routed the king's army on the anniversary of Dunbar. Charles had a hairbreadth escape from capture, and after many adventures crossed from Brighton to France. The last great battle of the Civil War played England in the hands of the army and its general.

Scotland offered more resistance, but Monk, whom Monk's Cromwell had left in command, stormed Dundee and terrified the other towns into submission. Although a nominal union was proclaimed and Scotland was allowed members in the English parliament, it was really governed as a conquered country. In 1653 the general assembly was summarily dissolved by Colonel Cotterell. Next year Monk was sent by the Protector to quell a Royalist rising, which, first under the earl of Glencairn and afterwards under Middleton, a soldier of fortune, began to show head in the Highlands. Monk, as usual, carried out effectually the work he was sent for and, partly by an indemnity which many leading Royalists accepted and partly by the defeat of Middleton at Lochgarry (25th July 1654), reduced the Highlands. He also dispersed the general assembly, which made another attempt to sit. Strong forts were built at Leith, Ayr, Inverness, and Glasgow, and Monk with an army of 10,000 men garrisoned the country. A Protectorial council of state, containing only two Scottish members, was appointed, but matters of importance were referred to Cromwell and his English council. The administration of justice was committed to four English and three Scottish judges in place of the Court of Session, with the view of introducing English law. The use of Latin in legal writs was abolished. A sequestration court to deal with the forfeited estates sat at Leith. A separate commission was issued for the administration of criminal justice, and theft and highway robbery were stringently inquired into.

Protestant Scotland

¹ With the view of procuring forces for the expedition, a reconciliation was effected between the Royalists and the more moderate Covenanters by a resolution to the effect that all persons not excommunicated should be allowed to serve in the army. This new party, now called "Resolutioners," was practically the same as that formerly known as the "Engagers." A minority, on the other hand, became known as the "Protectors" or "Remonstrants" (compare vol. xix p. 688). This division of the Covenanters into a moderate and an extreme section continued throughout the whole of the 17th century. The Engagers and Resolutioners were the ancestors of the Established Presbyterian Church, the Protectors or Remonstrants of the Seceders or Dissenting churches, each of which maintained with unabated confidence, however small its numbers, that it was the true church of Scotland, the only church really faithful to the Covenant and Christ as the head of the church. Both parties for long regarded Episcopalians and Romanists alike as "malignants," standing without the pale of the church, with whom no compromise could be made.

and punished. In the church the Presbyterian form of service and the system of presbyteries and synods were allowed to continue, but the stipends of ministers depended on their being approved by a commission appointed by Cromwell. Justices of the peace were introduced for local business. Free trade and an improved postal system between the two countries were established. The universities were visited. In all departments of government there was vigour and the spirit of reform, so that it was admitted even by opponents that the eight years of Cromwell's usurpation were a period of peace and prosperity. There was undoubtedly one exception. The taxation was severe. A land-tax of £10,000 a month, afterwards reduced to £8000, and levied upon the valued rent under a valuation of Charles, far exceeded any subsidy before granted to the crown. Customs and also excise duties, recently introduced from England, were diligently levied, so also were the rents of the crown and bishops' lands. Altogether it was estimated that a revenue of £143,000 was collected in Scotland. But this had to be supplemented by an equal sum from England to meet an expenditure of £286,000. As nearly the whole was spent in Scotland and the burden of taxation fell on the upper classes, the nation generally did not feel it so much as might have been expected. It was a maxim of Cromwell's policy to improve the condition of the commons, and in one of his last speeches he claimed in memorable words to have effected this in Scotland. In this respect the Commonwealth and protectorate continued the political effect of the Reformation. The commonalty for the first time since the War of Independence acquired a consciousness of its existence and hope for the future of Cromwell, like former powerful rulers, aimed at uniting Scotland with England, but his proposals in this direction were premature. To Barebone's Parliament (1653), which met after the dissolution of the Long Parliament, five Scottish members were summoned, there being 134 from England, Wales, and Ireland. By the Instrument of Government and an ordinance following on it, Scotland was granted 30, while England had 400 members; but only 20 Scottish attended the parliament of 1654, and care was taken by Monk that they should be men attached to Cromwell's interest. When in his second parliament in 1656 he tried the experiment of a House of Lords, three Scotsmen were summoned, the quota of members to the Commons remaining as before. Cromwell's idea of a parliament was an assembly to ratify, not to discuss, his measures, and this, like his other parliaments, was speedily dissolved. Had it continued the Scottish representatives would have had little weight. Scotland continued to be governed by the council of state. On the death of the Protector his son Richard was proclaimed his successor in Scotland as well as in England, and 80 members were again returned to the new parliament, which, however, was almost immediately afterwards dissolved. The Restoration soon followed, though in Scotland there was no need of it, for Charles II. was already king. However beneficial the rule of Cromwell may be deemed, it had a fatal defect in the eyes of a people proud of their freedom. It was imposed and maintained by force. His death and the restoration of the ancient line of kings were looked on as a deliverance from oppression.

The hopes of the Scots from Charles II. were doomed to speedy disappointment. So far from being grateful for the support they had given him in adversity, he looked back with disgust as his grandfather had done, on the time when he was under the yoke of the Presbyterian ministers. Cromwell had shown the possibility of governing Scotland by military force and of raising a considerable revenue from it, and Charles took advantage of both lessons. From this date rather than from the earlier or

later union Scottish history assumes a provincial character. Scotland was governed without regard to its interest or wishes according to the royal pleasure or the advice of the nobles who for the time had the ear of the king. The power of the clergy had been broken by Cromwell's policy and their own divisions. The party of the Resolutioners or moderate Presbyterians, some of whom now lean to Episcopacy, and the party of the Remonstrants were still irreconcilable, and their mutual hatred rendered the task of government easier. The burghs were not yet sufficiently organized to be a power in the state, and the nobles again resumed their old position as leaders with no rivals, for the bishops were shorn of their revenues and dependent on royal favour. For the first two years after the Restoration the government of Scotland was in the hands of Middleton, who had been created an earl. The measures of retaliation were few but signal. Argyll was tried and beheaded on a charge of treason, which could not have been established but for the treachery of Monk, who gave up private letters written to him when they both were supporting the Commonwealth. Guthrie, a leading minister of the Remonstrants, was hanged. Johnston of Warriston, two years later, was brought back from France and executed. No hesitation was shown as to the mode of governing Scotland. Parliament, under the presidency of Middleton, passed the Rescissory Act, annulling the Acts of all parliaments since 1640, declaring the Covenant no longer binding, and imposing an oath on all persons in office, not only of allegiance but of acknowledgment of the royal prerogative restored in all its fulness over all persons and in all causes. In August Lauderdale, who acted as secretary for Scotland in London, wrote to the privy council announcing the royal intention to restore Episcopacy, and, regardless of his oath, Charles sanctioned this by the first Act of the parliament of 1662. James Sharp, minister of Crail, who had been sent on behalf of the Resolutioners to Charles before his return, allowed himself to be easily converted to Episcopacy and was rewarded by his appointment as archbishop of St Andrews, his example was followed by other ministers of the same party. But the majority and all the Remonstrants stood firm, 350 were deprived of their livings, each of which became a centre of disaffection towards the Government, while their attachment to the Covenant was every day strengthened by persecution. The Covenant and Solemn League and Covenant were declared unlawful oaths, and all persons speaking or writing against the royal supremacy in matters ecclesiastical were incapacitated from office. Middleton had the immediate responsibility for these measures, and the condemnation and forfeiture of the new earl of Argyll, whose estates he coveted, under the old law against leasing-making increased the hatred with which he was regarded. His fall was due to an attempt to supplant his rival Lauderdale by the Act of Billenting, under which the Scottish parliament named by ballot twelve persons with Lauderdale at their head as incapable of holding public office. This and other Acts were carried out without the previous consent of Charles, Lauderdale persuaded Charles that his personal authority was in danger, and Middleton was called to court and sent as governor to Tangier, where he soon after died. The earl of Rothes was now appointed commissioner, but the chief influence was in the hands of Lauderdale, who continued to act as Scottish secretary in London.

The change in its rulers brought no relief to Scotland. The declaration that the Covenants were illegal oaths was re-enacted and imposed on all persons in office who had not yet taken it. The old mode of electing the Lords of the Articles, which placed the election in the hands of the bishops, the nominees of the king, was restored. Sharp,

Restoration of Episcopacy

Union of Scottish and English parliaments.

Restoration.

1664-1681 not warned by the fate of Laud, procured the restoration of the Court of High-Commission to enforce the laws against ecclesiastical offenders. Fines were imposed on all who absented themselves from their parish churches or attended the sermons of the deposed ministers. Sir James Turner was sent by the privy council to the western shires to prevent conventicles and field preaching and to enforce the law as to conformity, and his exactions, with the burden of maintaining his soldiers quartered upon all persons suspected of favouring the ousted ministers, led to risings in Galloway, Clydesdale, and Ayr. With their ministers and a few of the gentry at their head the Covenanters marched to Edinburgh, but were defeated at Rullion Green in the Pentlands by Dalziel, a Scottish officer whom Charles had recalled from the service of the czar. The executions which followed, and especially that of Hugh McKail, a young and enthusiastic preacher, sank deeply into the spirit of the people. He was the first martyr of the Covenant as Wishart had been of the Reformation. The use of torture, before this rare, now became frequent, and bonds of law-burrows were wrested from their original use to compel the principal landowners to be sureties for the peace of the whole district. Large fines continued to be extorted from all persons who refused to conform to the ecclesiastical laws. Next year a change in the Scottish administration, the cause of which is not well explained, but which was probably due to the fall of Clarendon and the rise of the Cabal ministry, led to a milder but undecided policy in Scotland. Lauderdale, one of the Cabal, still directed Scottish affairs, but Rothes and Sharp were treated as responsible for the rising in the west and suspended. An indemnity was offered to all who would appear before the council and subscribe bonds to keep the peace. A rash attempt to assassinate Sharp in Edinburgh prevented this policy from being adhered to in 1668, but it was renewed in the following year. An indulgence was granted which allowed the deposed ministers who had lived peaceably to return to their manse and glebe, and to receive such a stipend as the privy council might allow. The grace of this concession was undone by a severe Act against conventicles. It favoured a conciliatory policy that schemes for union were in the air. Leighton, the good bishop of Dunblane, proposed a union of the churches upon the basis that the bishops were no longer to exercise jurisdiction, but to act only as perpetual moderators of presbyteries, subject to censure by the synods, and that ministers should be ordained by the bishops, but with consent of the presbyters. There was a meeting at Holyrood with some of the leading ministers, but they would listen to no compromise. The name of bishop was hateful whatever was his functions. It may be doubted whether Charles and his English advisers would have submitted to a curtailment of the bishop's office and dignity. The subject of the union of the kingdoms was again brought forward in the parliament of 1669, to which Lauderdale was sent as commissioner, and though it was not well received commissioners were appointed in the following year, who went to London in autumn to discuss with English commissioners certain specified points proposed by the king. After several meetings the conference broke up in consequence of a demand by the Scottish members that Scotland should have the same number of members in the united as in its own parliament. The arbitrary government favoured by the want of a settled constitution in Scotland was more to the taste of the king and his advisers. Lauderdale openly boasted, as James VI had done, that nothing could be proposed in the Scottish parliament except what the king through the Lords of the Articles approved. The "indulgence" entirely failed of the desired effect. The ministers who took advantage of

Policy of
indul-
gence

it were despised by the people, who continued to attend the conventicles. In 1672 an Act was passed punishing preachers at such conventicles with death and imposing fines, imprisonment, and exile for having children baptized by deposed ministers and for absence for three Sundays from the parish church. In 1675 letters of intercommuning were issued against about a hundred of those who attended the conventicles, both ministers and laymen, forbidding their friends and relations to have any dealings with them under the same penalties as if they had themselves been present at the conventicles. In 1678 Mitchell, a fanatical preacher, who had ten years before attempted the life of Sharp and mortally wounded the bishop of Orkney, was tried and executed. The feeling of the times, and the cruel manner in which a confession had been wrung from him by torture, led to his being regarded as a martyr. Prior to this year 17,000 persons had suffered fines or imprisonment for attending conventicles. A host of 10,000 men, chiefly Highlanders, was quartered in the western shires in order to force the landowners who favoured the Covenanters to enter into bonds of law-burrows.

It appears to have been the design of Lauderdale, Rising of
who still governed Scotland absolutely through the privy council (no parliament having been summoned since 1674), to force the Scots to rebel. "When I was once saying to him," relates Burnet, "'Was that a time to drive them into a rebellion?'" "Yes," said he, "'would to God they would rebel that he might bring over an army of Irish Papists to cut their throats.'" One part of his wish was speedily fulfilled. In 1679 the rebellion so long smouldering broke out. The murder of Sharp (3d May) by Hackson of Rathillet and a small band of Covenanters was followed by a still more stringent proclamation against field conventicles, which were declared treasonable, and the possession of arms was prohibited. This severity provoked a rising in the west. A small party led by Hamilton, a youth educated by Bishop Burnet at Glasgow, who had joined the Covenanters, burnt at Rutherglen the statutes and acts of privy council on the anniversary of the Restoration, and being allowed to gather numbers defeated Graham of Claverhouse at Loudon Hill (1st June). The duke of Monmouth, the favourite natural son of Charles, sent with troops from England to suppress the rising, gained an easy victory at Bothwell Bridge (22d June). His desire was to follow it up by a policy of clemency, and a new indulgence was issued, but its effect was counteracted by Lauderdale. All officers, ministers, and landowners, as well as those who had taken part in the rising and did not surrender within a short space, were excepted from the indulgence. Several preachers were executed and many persons sent to the colonies, while fines and forfeitures multiplied. A new and fiercer phase of the rebellion was originated by Cargill and Cameron, two preachers who escaped at Bothwell Bridge, and, assembling their followers at Sannagar, published a declaration renouncing allegiance to Charles as a perjured king. They were soon surprised and Cameron was killed, but Cargill continued to animate his followers, called the "Society Men" or "Cameronians," by his preaching, and at a conventicle at Torwood in Ayrshire excommunicated the king, the duke of York, Lauderdale, and Rothes.

The duke of York, who had become a Roman Catholic. Continu-
during his residence abroad, was now sent to Scotland, and
partly to avoid the discussion raised by his conversion as
to his exclusion from the succession. During a short stay
of three months he astonished the Scots by the mildness of
his administration, but on his return in the following year
he revealed his true character. The privy council renewed
his proclamations against conventicles and increased the
fines, which were levied by the sheriff or other magistrate
under the pain of liability if they were remiss in their

ance of
severities.

exaction Military commissions were issued to Claverhouse and other officers in the southern and western shires empowering them to quarter their troops on recusants and administer martial law. Torture was freely resorted to by the privy council and the duke himself took pleasure in witnessing it. A parliament summoned in 1681, after passing a general Act against Popery to lull suspicion, proceeded to declare the succession to be in the ordinary line of blood and unalterable on account of difference of religion by any future law. The Test Act was then carried, not without many attempts to modify it. Its ambiguous and contradictory clauses make it an admirable instrument of tyranny, a shelter for the lax and a terror to the upright conscience. It was at once enforced, and Argyll, who declared he took it only so far as it was consistent with itself and the Protestant religion, was tried and condemned to death for treason, but escaped from prison to Holland. Dalrymple, the president of the Court of Session, and many leading Presbyterian ministers and gentry followed his example, and found a hospitable refuge in the republic which first acknowledged toleration in religion. They there met a similar band of English exiles. The next two years were spent in plots, of which the centre was in Holland, with branches in London and Edinburgh. The failure of the Rye House Plot in 1683 led to the execution of Russell and Sidney and the arrest of Spence, a retainer of Argyll, Carstares, Bailie of Jerviswood, and Campbell of Cessnock. Against Campbell the proof of complicity failed, and Spence and Carstares, though cruelly tortured, revealed nothing of moment. Bailie, however, was condemned and executed upon slender proof. The Cameronians, who kept alive in remote districts the spirit of rebellion, were treated with ruthless cruelty. Although doubt has been cast on the death of Brown the carrier, shot down in cold blood by Claverhouse, and the Wigtown martyrs, two poor women tied to a stake and drowned in the Bay of Luce, the account of Wodrow has, after a keen discussion, been sustained as accurate. The conduct of the Government in Scotland gained for this period the name of the "Killing Times."

Killing
Times
James
VII

The short reign of James VII. is the saddest period in the history of Scotland. He succeeded in the brief space of three years in fanning the revolutionary elements in both England and Scotland into a flame which he was powerless to quench. He declined to take the Scottish coronation oath, which contained a declaration in favour of the church then established. A submissive parliament held (28th April 1685) under the duke of Queensberry as commissioner not only overlooked this but expressed its loyalty in terms acknowledging the king's absolute supremacy. The excuse was granted to the crown for ever and the land-tax to James for life. The law against conventicles was even extended to those held in houses, if five persons besides the family attended domestic worship, while, if the meeting was outside the house, at the door or windows, it was to be deemed a field conventicle, punishable by death. The class of persons subject to the test was enlarged. Underterred or provoked by these terrors of the law, Argyll made a descent upon the western Highlands and tried to raise his clansmen, but, being badly supported by the officers under him, his troops were dispersed and he himself taken prisoner, when he was brought to Edinburgh, condemned, and executed under his former sentence. Next year Perth the lord chancellor, Melfort his brother, and the earl of Moray became converts to the Popish faith. The duke of Queensberry, who did not follow their example, was enabled only by the most servile submission in other points to the royal wishes to save himself and his party in the privy council from dismissal. James sent a letter to parliament offering free trade with England and an indemnity for political offences, in return for which it was required

that the Catholics should be released from the test and the penal laws. But the estates refused to be bribed. Even the Lords of the Articles declined to propose a repeal of the Test Act. The burghs almost for the first time in a Scottish parliament showed their independence. The refractory parliament was at once adjourned and soon after dissolved, and James had recourse in Scotland as in England to the dispensing power. Under a pretended prerogative he issued a proclamation through the privy council, granting a full indulgence to the Romanists, and by another deprived the burghs of the right of electing magistrates. A more limited toleration was granted to Quakers and Presbyterians, by which they were allowed to worship according to their consciences in private houses. This was followed by a second and a third indulgence, which at last gave full liberty of worship to the Presbyterians and was accepted by most of their ministers, but the laws against field conventicles continued to be enforced. In February 1688 Renwick was executed under them at Edinburgh. A band of his followers, including women and children, were marched north and imprisoned with great cruelty in Dunnotar.

Meantime the rapid series of events which led to the Revolution in England had reached its climax in the trial and acquittal of the seven bishops. William of Orange, who had long watched the progress of his father-in-law's tyranny, saw that the moment had come when almost all classes in England as well as Scotland would welcome him as a deliverer. But the Revolution was differently received in each part of the United Kingdom. In England there was practically no opposition, in Catholic Ireland it was established by force. Scotland was divided. The Catholics, chiefly in the Highlands, and the Episcopalians led by their bishops adhered to James and formed the Jacobite party, which kept up for half a century a struggle for the principle of legitimacy. The Presbyterians—probably the most numerous, certainly the most powerful party, especially in the Lowlands and burghs—supported the new settlement, which for the first time gave Scotland a constitutional or limited monarchy. Shortly before his flight James had summoned his Scottish troops to England, but Douglas, brother of the duke of Queensberry, their commander-in-chief, went over to William. Claverhouse, now Viscount Dundee, the second in command, who had the spirit of his kinsman Montrose, after vain urging James to fight for his crown, returned to Scotland, followed by some thirty horsemen. In Edinburgh the duke of Gordon still held the castle for James, while the convention parliament, presided over by the duke of Hamilton, was debating on what terms the crown should be offered to William. Dundee passed through Edinburgh unmolested, and encouraged Gordon to hold out, while he himself gathered the Highland chiefs round his standard at Lochaber. Mackay, a favourite general of William, sent to oppose him, was defeated at Killicrankie (25th July 1689), where the spirited leadership of Dundee and the dash of the Highlanders' attack gained the day, but success was turned into defeat by a bullet which killed Dundee almost at the moment of victory. No successor appeared to take his place and keep the chiefs of the clans together. The Cameronians, organized into a regiment under Cleland, repulsed Cannon, the commander of the Highland army, at Dunkeld, and the success of Livingston, who defeated the remnant under Cameron and Buchan at the Haughs of Cromdale on the Spey, ended the short and desultory war. The castle of Edinburgh had been surrendered a month before the battle of Killicrankie. Three forts, at Fort William, Fort Augustus, and Inverness, sufficed to keep the Highlands from rising for the next two reigns.

689-1705. William III's acceptance of Scottish crown

carried the necessary measures for the transfer of the government of Scotland to William and Mary. It declared in bolder terms than the English parliament that James had forfeited the crown and that the throne was vacant. The fifteen articles which contained the reasons for this resolution were included in a Declaration and Claim of Right,—a parallel to the English Declaration and Bill of Rights. Besides the declarations against the Papists with which it commenced—that no Papist could be king or queen, that proclamations allowing mass to be said, Jesuit schools and colleges to be erected, and Popish books to be printed were contrary to law—it detailed each of the unconstitutional acts of James and pronounced it contrary to law. This formidable list included imposing oaths without the authority of parliament, grants without the consent of parliament, employing officers of the army as judges throughout the kingdom, imposing exorbitant fines, imprisoning persons without expressing the reason, and delaying trials, forfeiture upon insufficient grounds, especially that of Argyle, the nomination by the king of the magistrates of burghs, sending of royal letters to courts of justice with reference to pending cases, granting protections for debt, forcing the lieges to depone against themselves in capital crimes, the use of torture without evidence in ordinary crimes, quartering an army in time of peace upon any part of the kingdom; the use of law-burows at the king's instance, putting garrisons in private houses in time of peace without the consent of the owners and of parliament, and flogging husbands for their wives. It closed with asserting that Prelacy and the superiority of any office in the church above presbyters were insupportable grievances and ought to be abolished, and that it was the right and privilege of subjects to protest to parliament for "remed^y" of law and to petition the king, and that for redress of grievances it was necessary parliament should frequently be called, with freedom of speech secured to members. As a conclusion from these premises the estates resolved that William and Mary should be declared king and queen of Scotland during their lives, but with the right of exercising regal power in William alone as long as he lived. After their death the crown was to pass to the heirs of the queen's body, and failing her to Anne of Denmark and her heirs, failing whom to the heirs of William. Commissioners were despatched to London to present the declaration and statement of grievances and take the royal oath to the acceptance of the crown on their terms. This was done at Whitehall in the following March (1689), but William, before taking the oath, required an assurance that persecution for religious opinion was not intended and made a declaration in favour of toleration.

By desire of William the convention was superseded by a parliament which met in June; but, with the exception of an Act abolishing Prelacy, it transacted no business of importance. The parliament of 1690 was more fruitful. It abolished the committee of the Articles, which had become an abuse inconsistent with the freedom of parliament, and, while it retained a committee on motions and overtures in its place, declared that the estates might deal with any matter without referring it to this committee. The Act of Supremacy was resumed. The Presbyterian ministers deposed since 1661 were restored and the Westminster Confession approved, though not imposed as a test except on professors. With more difficulty a solution was found for the question of church government. The Presbyterian Church was re-established with the Confession as its formula, and patronage was placed in the hands of the elders with a small compensation to the patrons. These prudent measures were due to the influence of Carstairs, the chief adviser of William in Scottish ecclesiastical matters. He was not so well advised in the conduct of

the civil government by the master of Stair, who became sole secretary for Scotland. The proclamation for calling out the militia may have been a necessary precaution, but it raised much opposition amongst the landed gentry, and the militia was not then embodied. The massacre of the Macdonalds at Glencoe by Campbell of Glenlyon was contrary to the spirit of the indemnity offered to the Highlanders. While the treachery with which it was executed may be attributed to Glenlyon, it was too plainly proved before the committee of inquiry which the Scottish parliament insisted on that it had been designed by Stair and Breadalbane, and, now that the whole documents have been published, it is also proved that it had been sanctioned by William. It was intended to strike terror, but its partial success was dearly bought, for it kept alive the Jacobite disaffection and gained for it much sympathy. The unfair treatment of the Scots in the matters of free trade and navigation, in which the new Government appeared to follow the policy of Charles rather than that of Cromwell, and acted with an exclusive regard to the prejudices and supposed interests of England, reached a climax in the abandonment of the Scottish settlement at Darien when attacked by the Spaniards. The over-sanguine hopes of Paterson and the Scottish colonists and capitalists who supported his enterprise, so suddenly transformed into a financial disaster overwhelming to a poor country, accompanied by the loss of many lives, embittered the classes on which the Revolution settlement mainly depended for its support. It was the anxious wish of William to have effected the legislative union, but, although he twice attempted it, the last time a month before his death, the temper of the English parliament and of the Scottish people appeared to give small chance of its realization.

9 *The Union and its Consequences.*—The reign of Anne, so far as it relates to Scotland, centred in the accomplishment of the union. In spite of the disparity of numbers, both nations now met to treat on equal terms. Still there were grave difficulties, and it required all the wisdom of the ministers of the early years of Anne, aided by the glory of Marlborough's arms, to overcome national prejudices and secure an object plainly for the benefit of both. The memories of Glencoe and Darien and the refusal of equal rights of trade led the Scottish parliament, the year after Anne's accession, to pass an Act of Security, by which, if the queen died without issue, the Scottish estates were to name a successor from the Protestant descendants of the royal line, but the successor to the English crown was expressly excluded unless there were "such conditions of government settled and enacted as may secure the honour and sovereignty of the crown and kingdom, the freedom, frequency, and power of parliament, the religious freedom and trade of the nation from English or any foreign influence." Political economy had not yet taught the reciprocal advantage of free trade, and the English jealousy of Scottish traders was intense. An incident about this time warned the English ministers that Scotland might easily revert to its old attitude of enmity. A Scottish ship of the African or Darien Company having been seized in the Thames at the suit of the English East India Company, the "Worcester," an English East Indiaman, was taken in the Forth by way of retaliation, and Green, its captain, with two other officers, was executed at Leith on a charge of piracy insufficiently proved. An attempt had been already made to complete the union by a commission, which sat from 10th November 1702 to 3d February 1705; but this miscarried through the refusal to grant free trade between the kingdoms. But again in 1705 the English parliament sanctioned the appointment of other commissioners, and new officers of state were nominated for Scotland with the express purpose of press-

ing the scheme forward in the Scottish parliament. Though opposed on contrary grounds by the Jacobites and the party of Fletcher of Salton, the Scottish ministry of Queensberry succeeded, by the aid of a third party nicknamed the "Squadron Volante," in getting the consent of parliament to the appointment of commissioners by the crown. The Act expressly excepted the church from the matters with which the commission was to deal. The commissioners, thirty-one from each country, met at Whitehall on 16th April and concluded their sittings on 23d July. The nomination by the crown had secured persons anxious to accomplish the union; experience had disclosed the cause of former failures, and the commissioners were guided by the statesmanship of Somers. It had been recognized from the first that the only settlement of the ecclesiastical question possible was to leave to each country its own church. It was wisely decided to treat the law and the courts in the same manner. These two subjects being removed from the scope of the treaty narrowed the debates to four main points,—the succession, trade, taxation, and the composition of the future parliament. The Scottish commissioners yielded on the first, the English on the second, and the remaining two were adjusted by a skilful compromise. The chief articles of the treaty were the settlement of both crowns according to the English Act of Succession on Anne and her descendants, and failing them on the electress Sophia, and the Hanoverian line, the establishment of free trade between England and Scotland, and the admission of the Scots to equal privileges as regards trade with other countries, the national debt and taxation were adjusted by the imposition on Scotland of a moderate share (£48,000) of the land-tax, of which England was still to bear £200,000, and there was to be a uniform rate of custom and excise, Scotland being compensated by an equivalent of about £400,000 for becoming liable to a proportion of the English national debt, which already amounted to £18,000,000, forty-five representatives of Scotland were to be admitted to the House of Commons and sixteen elected peers to the House of Lords. Although the terms were on the whole favourable to Scotland, their announcement was received with dissatisfaction, especially in Edinburgh. The loss was immediate, from the abolition of an independent parliament, the reduction of the capital to a provincial town, and the increase of taxation to pay the growing national debt. The gain was in the future and in part doubtful. No one contemplated the rapid and enormous extension of trade. A proud people was unwilling to admit the advantage consequent upon free intercourse with a country in which wealth and civilization were more widespread. It had a natural attachment to its own institutions, though these were less popular than the English. It feared that, notwithstanding the most solemn guarantees, neither its church nor its laws could resist the influence of a country so much larger and more populous, in which henceforth was to be the sole seat of government, and that much of its wealth and talent would be attracted to the south and become English. The last parliament of Scotland was preceded by a stormy agitation against the union, and began its session with numerous addresses praying that the treaty should not be ratified, while none were presented in its favour. The popular feeling was embodied in the speeches of Lord Belhaven from a sentimental and patriotic point of view, and of Fletcher of Salton, who represented the democratic or republican element latent in a portion of the nation. But common sense aided by ministerial influence prevailed. The vote on the first article was prudently taken with a proviso that it was to be dependent on the rest being carried, but it really decided the fate of the measure. The Government commanded a large majority of the peers,

perhaps more amenable to influence. They were accused by the Jacobites of being bribed, but the sums received in name of payment of arrears of pension and of debts were too small to justify the charge. The lesser barons or county members and the representatives of the burghs were nearly equally divided, but there was a majority of four of each of these estates in favour of the article. The whole estates voted together and the total majority was thirty-five. This was increased when the last vote was taken to 41, the numbers being 110 for and 69 against, and the Act of Ratification took effect from 1st May 1707 was carried. The Presbyterian Church received an additional guarantee in an Act passed for "securing the Protestant religion and the Presbyterian Establishment."

In the English parliament there was less serious opposition, proceeding chiefly from the High Church party, which was conciliated by an Act for the security of the Church of England. On 6th March 1707 the Scottish and English Acts ratifying the union received the royal assent.

Two Acts of the British parliament naturally followed. The Act of Union. The Scottish privy council was abolished in 1708. A secretary of state for Scotland continued until 1746 to manage the Scottish department in London but the lord advocate, the adviser of the crown on all legal matters both in London and Edinburgh, gradually acquired a large, and after the suppression of the office of the Scottish secretary a paramount influence in purely Scottish affairs, though he was nominally a subordinate of the home secretary. In 1709 the law of treason was assimilated to that of England, being made more definite and less liable to extension by construction in the criminal courts. In the later years of Anne, when after the fall of Marlborough power passed from the Whig to the Tory party, two statutes were passed of a different character. Patronage was restored in the Presbyterian Church notwithstanding the protests of the assembly, and proved a fertile source of discord. A limited toleration Act in favour of the Episcopalians, permitting them to worship in private chapels, was opposed by the Presbyterians but carried.

With the union of the parliaments Scotland lost its legislative independence. Its representation in the British results of parliament for more than a century, based on the freehold franchise in the counties and in the burghs controlled by town councils, which were close corporations, was a representation of special classes and interests rather than of the nation. It almost appeared as if the prophecy of Belhaven would be accomplished and there would be an end of an old song. But Scottish history was not destined yet to end. The character of the people, though their language and manners gradually became more like those of England, remained distinct. They retained a separate church and clergy. Independent courts and a more cosmopolitan system of law opened a liberal profession and afforded a liberal education to youthful ambition. A national system of parish schools, burgh schools, and universities, though inadequately endowed and far from reaching the ideal of Knox and Melville, gave opportunities to the lower as well as the higher classes of receiving at a small cost an education suited for practical uses and the business of everyday life. The Scot had been from the earliest times more inclined to travel, to migrate, to colonize than the Englishman, not that he had a less fervent love of home, but a soil comparatively poor made it necessary for many to seek their fortune abroad. This tendency which had led Scottish monks, soldiers, and professors to embrace foreign service, now found new openings in trade, commerce, colonial enterprise in America, the East, and the West Indies, in the southern hemisphere and the exploration of unknown parts

¹ In 1885 a secretary for Scotland was again appointed with a separate office at Dover House, London.

of the globe. Accustomed to poverty, Scottish emigrants acquired habits of frugality, industry, and perseverance, and were rewarded by success in most of their undertakings. Nor, if war be regarded as necessary to the continued existence of a nation, was it altogether absent, but the cause with which the name of Scotland became identified was the losing one. The two rebellions proved the devoted loyalty which still attached many of the Highland clans, the Catholics, and some of the Episcopalians to the descendants of the Stuarts. But that in 1715, preceded by an abortive attempt in 1708, was put down by a single battle, Sheriffmuir, if it could scarcely be claimed as a victory by Argyle, led to the speedy dispersal of the clans which had gathered round the standard of Mar. Thirty years later the romantic rising of the Highlanders under the Young Pretender found the Government unprepared. Once more for a brief space Holyrood was a royal court. The defeat of Cope at Prestonpans and the rapid march of the Scottish army, slightly reinforced by Catholics from the northern and midland shires of England, to Derby, by which it cut off the duke of Newcastle's forces from the capital, made London tremble. Divided counsels, the absence of any able leader, and the smallness of their number (not more than 5000) prevented the daring policy of attacking London, which Charles himself favoured, and a retreat was determined on. It was skillfully effected, and on 26th December the little army, which had left Edinburgh on 31st October and reached Derby on 4th December, arrived in Glasgow. It was not favourably received, the south-west of Scotland being the district least inclined to the Stuarts, and it marched on Stirling to assist Lord John Drummond and Lord Strathallan, who had commenced its siege, which General Hawley threatened to raise. His defeat at Falkirk was the last success of the Jacobites. The duke of Cumberland was sent to command the royal forces, and Charles Edward was forced by Lord George Murray and the Highland chiefs to abandon the siege of Stirling and retreat to Inverness. He was at once pursued by the duke, and his defeat at Culloden (16th April 1746) scattered his followers and compelled him to seek safety in flight to the Hebrides, from which, after five months' wanderings, he escaped to France. The last rebellion within Great Britain was put down with severity. Many soldiers taken in arms were shot and no consideration was shown to the wounded. The chief officers and even some privates taken prisoners were tried and executed at various places in the north of England. The earls of Cromarty and Kilmarnock and Lord Balmerino were reserved for the judgment of their peers in London, and having pleaded guilty were beheaded at Tower Hill. The crafty Lovat, who had avoided appearing in arms, but was really at the bottom of the rising, though he pretended to serve both sides, was the last to suffer. An Act of indemnity was passed a few weeks after his execution. But effective measures were taken to prevent any renewal of the rebellion. The estates and titles of all who had been privy to it were forfeited. An Act was passed prohibiting the use of arms and the Highland dress, and the abolition of the military tenure of ward-holding, unfortunately preserved at the union, rooted out the remnants of feudal and military power till then left in the hands of the nobles and chiefs. These changes in the law had the willing consent of the Lowland and burghal population in Scotland, to whom the lawless and freebooting habits of the Highlanders had been a cause of frequent loss and constant alarm. Somewhat later the masterly policy of Pitt enlisted the Scottish Celts in the service of the crown by forming the Highland regiments. The recollection of Glencoe and Culloden was forgotten after the common victories of the British arms in India, the Peninsula, and Waterloo. In one direction the Jacobite cause survived

its defeat. Poetry seized on its romantic incidents, idealized the young prince who at least tried to win his father's crown, satirized the foreign and German, the Whig and Covenanting, elements opposed to the Stuart restoration, and substituted loyalty for patriotism. Self-sacrifice and devotion to a cause believed right, though deserted by fortune (qualities rare amongst the mass of any nation), dignified the Jacobites like the cavaliers with some of the nobler traits of chivalry, and the Jacobite ballads have their place in literature as one of the last expiring notes of mediæval romance. Music and tradition fortunately preserved their charm before the cold hand of history traced the sad end of Charles Edward, the pensioner of foreign courts, wasting his declining years in ignoble pleasures. It might be hard to say whether the first Hanoverians or the last Stuarts least deserved that men should fight and die for them, but the former represented order, progress, civil and religious liberty, the latter were identified with the decaying legend of the divine right of kings and the claim of the Roman Church not merely to exclusive orthodoxy but to temporal power and jurisdiction inconsistent with the independence of nations and freedom of conscience. Although a larger minority in Scotland than in England clung to the traditions of the past, an overwhelming majority of the nation, including all its progressive elements, were in favour of the new constitution and the change of dynasty.

During the remaining half of the 18th century and the commencement of the 19th a period of prosperity was enjoyed by Scotland, during and the good effects of the union, intercepted by the rebellions, 18th cent. became visible. The Scottish nation, without losing its individuality, was stimulated by contact and friendly rivalry with its English neighbour in the arts of peace. It advanced in intellectual as well as material respects more than in any part of its previous history. It became, through commerce, manufactures, and improved agriculture, a comparatively rich nation of a poor country. Skillful engineering made the Clyde a successful competitor with the Thames and the Mersey, and Glasgow became one of the most populous cities in Great Britain. The industrial arts made rapid progress, and the fine arts began to flourish. The art of saving capital and using it as a source of credit was reduced to a system. Banks, not unknown in other countries and at an earlier date, are in their modern form a Scottish invention. Banks of a kind which sprang up in Scotland itself, the national banks of England and France owed their origin to two Scotsmen. A safe system of life insurance represented the prudent habits and business talents of the nation. Adam Smith shines with the French economists the honour of founding political economy as the science of the wealth of nations. Mental philosophy became a favourite study, and a distinctively Scottish school produced thinkers who deeply influenced the later systems of the Continent. The history not of Scotland only but of England and some portions of that of Europe were written by Scotsmen in works equal to any existing before Gibbon. The dawn of the scientific era of the 19th century was foreshadowed by Scottish men of science, the founders of modern geology, chemistry, anatomy, physiology, and the practice of medicine. In Scotland was made the first of the great lists of discoveries in the practical application of science by the use of steam as a motive-power. The same period—so varied and so rich—gave birth to two Scottish poets, of world-wide fame. Burns expressed the feelings and aspirations of the people; Scott described both in verse and prose their history and the picturesque scenes in which it had been transacted. During the last half-century the material progress continued, but the intellectual was too brilliant to last. The preponderant influence of England even threatened to extinguish native Scottish genius by centring the political and social life of the island in the English capital. Only two standards of importance occurred. The political institutions of Scotland were reformed by a series of Acts which placed the franchise on a broader basis and made the representation of the people real. The Established Church, already weakened by secessions, was further divided by a disruption largely due to the ignorance of political leaders as to the deep-seated aversion of the nation to any interference with the independence of the church, especially in matters of patronage. Educational reform has also in recent years raised the standard of the universities and schools without impairing their popular character. While it would be incorrect to say that Scotland has had no independent history since the union, that history must be chiefly read in the annals of its church, its law, and its literature. Its political existence has been absorbed in that of Great Britain. (A. M.)

PART II—PHYSICAL FEATURES

Scotland forms the northern portion of Great Britain and is divided from England by the rivers Solk, Liddell, and Kershope (an affluent of the Liddell), the Great Tyne, the river Tyne, and the liberties of Hexham. The mainland lies between $55^{\circ} 40' 30''$ (at Dunnet Head, Caithness) and $64^{\circ} 38' N$ lat (Mull of Galloway) and $1^{\circ} 45' 30''$ (Peterhead) and $6^{\circ} 14' W$ long (Arnamuchan Point, Argyllshire). Including the islands, the extreme N lat is $60^{\circ} 51' 30''$ (Outskack, Shetland) and the extreme W long $8^{\circ} 35' 30''$ (St Kilda). Its greatest length from north to south, from Durness in Sutherland to Buncaw Head in Wigtownshire, is 272 miles, and the greatest breadth from east to west, from Peterhead in Aberdeenshire to Applecross in Ross-shire, is 155, while the narrowest part, from Garganmouth in Sutherland to Bowling in Dumbartonshire, is only 30½ miles wide. The total area in 1881, according to the Ordnance Survey, was 19,777,400 acres or 30,902 square miles, —the area of foreshore being 310,413 acres or 485 square miles, of water 408,648 acres or 631 square miles, and of land-surface 19,068,281 acres or 29,766 square miles. But of the water area the average included under lakes and rivers respectively has not been ascertained.

GEOLOGY

In the article GEOLOGY (vol. x) descriptions will be found of most of the geological formations of Scotland. All that need therefore be inserted here is a succinct summary of these formations with references to the pages of that article where fuller details are given.

The oldest rocks of Scotland and of the British Islands, known as Archaean, consist chiefly of gneiss (Fundamental, Lewisian, Hebridean), which varies from a coarsely crystalline granitoid mass to fine schist. The coarse varieties are most abundant, intermingled with bands of hornblende-rock, hornblende-schist, pegmatite, quartz, mica-schist, mica-schist, and other schistose accompaniments. In a few places limestone has been observed. No trace of any organism has ever been detected in any of these rocks. Over wide areas, particularly on the mainland, the bands of gneiss have a general north-west trend and undulate in frequent phacons with variable inclination to north-east and south-west. The largest tract of Archaean rock is that which forms almost the whole of the Outer Hebrides, from Lewis Head to the point of Lewis. Other areas more or less widely separated from each other run down the western parts of Sutherland and Ross, and are probably continued at least as far as the Island of Rum. How far Archaean rocks reappear to the east of this western belt has not yet been ascertained.

Above the Archaean gneiss has a series of red and chocolate-coloured sandstones, conglomerates, and breccias (Cambrian or Torridon sandstone), which form a narrow belt of gneiss and Lewisian. North of the southern part of Sutherland and Ross, across Skye, and as far as the Island of Rum (GEOLOGY, vol. x p. 330). They rise into prominent pyramidal mountains, which, as the stratification is usually almost horizontal, present in their terraced sides a singular contrast to the neighbouring heights, composed of highly plicated crystalline schists. In the Torridon district these sandstones can be seen towering bed above bed to a height of about 4000 feet, and their thickness is still greater. They have not yet yielded any recognizable fossil, their geological age is accordingly doubtful, though from their relation to the overlying fossiliferous rocks and from their own lithological characters they have with much probability been classed with the Cambrian system of Wales. They are not met with anywhere else in Scotland than in the north-west Highlands.

Rocks belonging to the Silurian system occur in two distinct regions and in two very strongly contrasted conditions. They constitute nearly the whole of the southern uplands (GEOLOGY, vol. x pp. 333, 337). In that belt of country they consist for the most part of greywacke, grit, shale, and other sedimentary rocks, but in the south-west of Argyllshire they include some thick lenticular bands of limestone. They have been thrown into many plications, the long axes of these plications generally trending north-easterly. It is this structure which has determined the trend of the southern uplands. The plications of the Highlands and the chief dislocations of the country have followed the same general direction, and hence the parallelism and north-easterly trend of the main topographical features. Abundant fossils in certain parts of the Silurian rocks have shown that representatives of both the Lower and Upper divisions are present. By far the larger part of the uplands belongs to the former. The Silurian schists and sandstones appear only along the northern and southern margins.

In the north-west Highlands the Cambrian red sandstones are overlain unconformably by several hundred feet of white quartzite with annular tubes, followed by fossiliferous limestones and shales (GEOLOGY, vol. x p. 338). The abundant fossils in these strata prove them to be of Lower Silurian age. It was believed by Murchison that, as the dip is generally easterly, the Silurian and various schists which spread eastwards into the rest of the Highlands, they demonstrate the crystalline rocks of the Highlands to

be of later than Silurian age. Recently, however, the structure of Sutherland has been investigated anew with minute care and the result is to show that the schists believed to overlie the Silurian strata conformably have been really pushed over them and carried in part of the Archaean gneiss. It has been ascertained that from the mouth of Loch Erriboll on the north coast of Sutherland southwards to the Isle of Skye, a distance of more than 100 miles, a gigantic system of earth-movements has taken place, whereby the Silurian, Cambrian, and Archaean rocks have been crumpled, inverted, dislocated, and have pushed over each other. In some places the horizontal displacement of these shifted masses has been not less than 10 miles. So intense has been the shearing of the rocks that their original structure has in many places been entirely destroyed. They have acquired a new schistosity, which is in a general sense parallel with the bedding of the Silurian rocks to the west of the line of disturbance. Hence the apparent conformability of the schists overlying these rocks. The total thickness of recognizable Silurian strata is about 2000 feet. The rocks that overlie them to the east of the line of disturbance in Sutherland and Ross are fine flaggy schists, quite unlike any part of the Archaean gneiss and often strangely suggestive of altered sandstones. What are the true age and history remains still to be determined. There can be no doubt, however, that they have acquired their present schistosity since the Lower Silurian period, and hence that the present condition of the metamorphic rocks of the central Highlands does not go back to Archaean time. That portions of the Silurian schists may have been pushed up in different parts of the Highlands is quite conceivable. But that much of the Highlands consists of altered sedimentary rocks like those of the Silurian uplands admits of no question. The solution of this difficult but interesting problem has the most important bearing upon the theory of metamorphism, but it can only be attained by patient and laborious mapping of the ground such as is being prosecuted by the Geological Survey.

As Scotland is the typical European region for the Old Red Old Red Sandstone a full account of this series of rocks has already been Sand-given in the article GEOLOGY (vol. x pp. 343, 344). These rocks are grouped in two divisions, Lower and Upper, both of which appear to have been deposited in the same sea, with its abundant intercalated lavas and tuffs, extends continuously from the belt along the northern margin of the midland valley, reappears in detached tracts along the southern border, is found again on the south side of the uplands in Berwickshire and the Cheviot Hills, occupies a tract of Lorne in Argyllshire, and on the north side of the Highlands underlies most of the low ground on both sides of the Moray Firth, stretches across Caithness and through nearly the whole of the Orkney Islands, and is probably continued to the Upper Old Red Sandstone covers a more restricted space in most of the areas just mentioned, its chief development being on the flanks of the north-eastern part of the southern uplands, where it spreads out over the Lammermuir Hills and the valleys of Berwickshire and Roxburghshire.

The areas occupied by Carboniferous rocks are almost entirely Carbon-restricted to the midland valley, but they are also to be found in various skirting the southern uplands from the mouth of the Tweed to that of the North. The subdivisions of this important system, its coal-fields and igneous rocks, have been described in the article GEOLOGY (vol. x pp. 346, 348, 349).

Rocks assignable to the Permian system occupy only a few small Permian areas in Scotland. Extending from Cumberland under the Solway Firth they fill up the valley of the North for a few miles north of Dumfries, and reappearing again in the same valley a little farther north, run up the narrow valley of the Carron Water to the Lovat Hills. Other detached tracts of similar rocks cover a considerable space in Annandale, one of them ascending the deep defile at the head of that valley. Another isolated patch occurs among the Lead Hills, and lastly, a considerable space in the heart of the Argyllshire coal-field is occupied by Permian rocks. Though these separate basins the prevailing rock is red sandstone, varied in the narrow valleys with intercalated masses of breccia (GEOLOGY, vol. x p. 351). There can be no doubt that the valleys in which these patches of red rocks lie already existed in Permian time. They seem then to have been occupied by small lakes or ulets, not unlike fjords. Numerous amphibian tracks have been found in the red sandstone of Annandale and also rocks of Dumfries, but the life of the fish of the time. One of the most striking features of the Scottish development of the Permian system is the occurrence of intercalated bands of contemporaneously erupted volcanic rocks in the Carron Water, Nithsdale, and Argyllshire. The actual vents which were the sites of the small volcanoes still remain distinct, and the erupted lavas form high ground in the middle of Argyllshire.

The Triassic system appears to be only feebly represented in Triassic Scotland. To this division of the geological record are assigned the yellow sandstones of Elgin, which have yielded remains of rep-

tiles, but which at the same time cannot be satisfactorily separated from similar underlying strata which contain Upper Old Red Sandstone fishes. There occur also below the Las on some parts of the west coast unfossiliferous red sandstones, conglomerates, and breccias which may possibly belong to the same system. These rocks attain their greatest thickness at Grumard Bay on the west coast of Ross, where they must be several hundred feet thick. On the east side of the country, where so many fragments of the Secondary rocks occur as boulders in the glacial deposits, a large mass of strata was formerly exposed at Linkfield near Elgin containing fossils which appear to show it to belong to the Rhaitic beds at the top of the Thas. But it was not in place, and was almost certainly a mass transported by ice. Rhaitic strata no doubt exist to a large extent at great distances under the North Sea.

Jurassic

The Jurassic system is well represented on both sides of the Highlands. Along the east coast of Sutherland good sections are exposed showing the succession of strata. Among these the Lower and Middle Lias can be identified by their fossils. The Lower Oolite is distinguished by the occurrence in it of some coal-seams, one of which, $\frac{1}{2}$ ft. in thickness, has been worked at Brora. The Middle Oolite consists mostly of sandstones with beds of shales and limestones and includes fossils which indicate the English horizons from the Kallaways Rock up to the Coral Rag. The lower part of the Kimmeridge Clay is probably represented by sandstones and conglomerates, forming the highest beds of the series in Sutherland. On the west side of the Highlands Jurassic rocks are found in many detached areas from the Shiant Isles to the southern shores of Mull. Over much of this region they owe their preservation in great measure to the mass of lavas poured over them in Tertiary time. They have been uncovered, indeed, only at a comparatively recent geological date. They comprise a consecutive series of deposits from the bottom of the Lias up to the Oxford Clay. The Lower Malm and Upper Lias consist chiefly of shales and shelly limestones, with some sandstones, well seen along the shores of Roadford Bay in Skye and in some of the adjacent islands. The Lower Oolite is made up of sandstones and shales with some limestones, and are overlaid by several hundred feet of an estuarine series of deposits consisting chiefly of thick white sandstones, below and above which lie shales and shelly limestones. These rocks form a prominent feature underneath the basalt terraces of the east side of Skye, Raasay, and Elgg. They form the highest members of the Jurassic series, representing probably some part of the Oxford clay. The next Secondary rocks (Cretaceous) succeed them unconformably.

Cret.

Oolite

Rocks belonging to the Cretaceous system undoubtedly at one time covered considerable areas on both sides of the Highlands, but they have been entirely stripped off the eastern side, while on the western they have been reduced to a few fragmentary patches, which have no doubt survived because of the overlying sheets of basalt that have protected them. Some greenish sandstones containing recognizable ammonite fossils are the equivalents of the Upper Greensand of the south of England. These rocks are found on the south and west coasts of Mull and on the west coast of Argyllshire. They are covered by white sandstones and these by white chalk and marly beds, which represent the Upper Chalk of England. Enormous numbers of flints and also less abundant fragments of chalk are found in glacial deposits bordering the Moray Firth. These transported relics show that the Chalk must once have been placed at no great distance, if indeed it did not actually occupy part of Aberdeenshire and the neighbouring counties.

Basaltic

plateaux

Above the highest Secondary rocks on the west coast come terraced plateaux of basalt, which spread out over wide areas in Skye, Elgg, Mull, and Morven, and form most of the smaller islets of the chain of the Inner Hebrides (GEOLOGY, vol. x p. 362). These plateaux are somewhat horizontally bedded, and consist of basalt, tuffaceous, amorphous, or amygdaloidal—which in Mull attain a thickness of more than 3000 feet. They are prolonged southwards into Antrim (Ireland), where similar basalts overlying Secondary strata cover a large territory. Occasional beds of tuff are intercalated among these lavas, and likewise seams of fine clay or shale which have preserved the remains of numerous land-plants. The presence of these fossils indicates that the eruptions were subaerial, and a comparison of them with those elsewhere found among the Tertiary strata shows that they probably belong to what is now called the Ohgocene stage of the Tertiary series of formations, and therefore that the basalt eruptions took place in early Tertiary time. The volcanic episode to which these plateaux owe their origin was one of the most important in the geological history of Great Britain. It appears to have been combined in its main features those remarkable outpourings of basalt which have deluged so many thousand square miles of the western territories of the United States. The eruptions were connected with innumerable fissures up which the basalt rose, and from numerous points on which it flowed out at the surface. These fissures with the basalt that solidified in them now form the vast assemblages of dykes which in our Scotland, the north of England, and the north of Ireland (GEOLOGY, vol. x p. 312). That the

volcanic period was a prolonged one is shown by the great denudation of the plateaux before the last eruptions took place. In the Isle of Elgg, for example, the basalts had already been deeply eroded by river-action and into the river-course a cleft of glassy lava (pitchstone) flowed. Denudation has continued active ever since, and now, owing to greater hardness and consequent power of resistance, the glassy lava stands up as the prominent and picturesque ridge of the Soum, while the basalts which formerly rose high above it have been worn down into terraced declivities that slope away from it to the sea. A remarkable feature in the volcanic phenomena was the disruption of the basaltic plateaux by large bosses of gabbro and of various granitoid rocks. These intrusive masses now tower into conspicuous groups of hills,—the Colins in Skye, the mountains of Rum and Mull, and the rugged heights of Arran and Mull.

Under the Post-Tertiary division some of the records of the Ice Age, Youngest when Scotland was buried under sheets of ice which ground down, formed, and polished the harder rocks over the whole country and then left behind them the widespread accumulations of clay, gravel, and sand known as glacial deposits. The nature of the evidence and the deductions drawn from it have been already stated (GEOLOGY, vol. x pp. 345-365). The youngest geological formations are the tundra heaths, river-terraces, lake-deposits, peat-mosses, and other accumulations, which are related to the present configuration of the country and contain remains of the plants and animals still living on its surface (GEOLOGY, vol. x pp. 256, 290, 362).

PHYSICAL FEATURES

The physical features of Scotland may be best realized by regarding the country as composed of three distinct belts of territory, differing from each other in their geological structure and consequently presenting striking contrasts in their scenery.

1. The Highlands, for convenience of description, are here regarded as embracing all that part of the country which lies west of and north of a line drawn along the Firth of Clyde, and thence lands diagonally in a north-easterly direction from the mouth of the river Clyde to the east coast at Stenhousemuir. Nearly the whole of the country is high ground, deeply trenching with valleys and penetrated by long arms of the sea. The only considerable area of lowland lies in the north-eastern counties, embracing the eastern part of Aberdeenshire and the northern parts of Banff, Elgin, and Nairn. Along both sides of the Moray Firth a strip of lowland intervenes between the foot of the hills and the sea, while farther north the country of Caithness is one wide plain. Farther west the Orkney Islands. Seen from beyond its southern margin, the sea of the Highlands presents a well-defined chain of hills, which rise abruptly from the plains of the Lowlands. This is best observed in Stenhousemuir, but it is also conspicuous in the estuary of the Clyde, where the low hills on the south contrast well with the broken line of rugged mountains to the north. From any of the islands of the chain of the Inner Hebrides the Highlands along then western seafront rise up as a vast rampart, indicated by many wind-furrows rising up to a singularly uniform general level, which sinks here and there and allows glimpses to be had of still higher summits in the interior. The northern margin is hardly less striking when looked at from the Moray Firth, or from the plains of Caithness or Orkney.

From a commanding summit in the interior the Highlands are highest seen to differ from a mountain chain such as the Alps, not merely land in their inferior elevation, but essentially in their geological structure. They are made up of a succession of more or less nearly transverse parallel confined ridges, which have, on the whole, a trend from north-east to south-west. These ridges are separated by longitudinal valleys, and each of them is likewise furrowed by transverse valleys. The portions of ridge thus isolated rise into what are termed mountains. But all the inferior eminences in the Highlands are a few upland parts of ridges along which they prolong their structure is prolonged. It is singular to observe how the general average of level of the summits of the ridges is maintained. From some points of view a mountain may appear to tower above all the surrounding country, but looked at from a sufficient distance to take in its environment, it may be found not to rise much above the general uniformity of elevation. There are no gigantic dominant masses that must obviously be due to some special terrestrial disturbance. A few upland parts are excepted to the general level of the country and seaboard of Sutherland, in Skye, and elsewhere, but an examination of their structure at once explains the reason of their prominence and confirms the rule.

The general surface of the Highlands is rugged. The rocks project in innumerable bosses and crags, which roughen the sides and of high crests of the ridges. The forms and colours of these ruggedness lands depend on the nature of the rock underneath. Where the latter is a hard and jointed, weathering into large quadrangular blocks, the hills are more especially distinguished for the quiet bossy character of their declivities, as may be seen in Ben Ledi and the chain of heights to the north-east of it formed of massive grits and mica-schists. Where, on the other hand, the rock decays into smaller debris, the hills are apt to assume smoother contours, as in

the slate hills that run from the Kyles of Bute to Loch Lomond. Wherever any mass of rock occurs differing much from those around it in its power of resisting decomposition it affects the scenery, rising into a prominence where it is durable, or sinking into lower ground where it is not. This relation between relative destructibility and external configuration is traceable in every part of Scotland, and indeed may be regarded as the law that has mainly determined the present topography of the country.

Two regions of Highlands.

The Highlands are separated into two completely disconnected and in some respects contrasted regions by the remarkable line of the Great Glen, which runs from Loch Lomond to Inverness. In the northern portion the highest ground rises along the west coast, mounting steeply from the sea, to an average height of perhaps between 2000 and 3000 feet. The watershed consequently keeps close to the Atlantic seaboard, indeed in some places it is not more than a mile and a half distant from the beach. From these heights, which catch the first downpour of the western rains, the ground falls eastwards, but with numerous heights that prolong the mountainous character, to the edge of the North Sea, and the line of the Great Glen. The best conception of the difference in the general level on the two sides of the watershed may be obtained by comparing the contrast between the lengths of their streams. On the western side the drainage is poured into the Atlantic Ocean after flowing only a few miles, while on the eastern side it has to run at least 30 or 40. At the head of Loch Ness the western stream is only 3 miles long, that which starts from the eastern side has a course of some 18 to the Great Glen. Throughout the northern or north-western region a general uniformity of feature characterizes the scenery, between the sea, to a distance of some miles, in the structure of the underlying schists. But the sameness is relieved along the western coast of Sutherland and Ross by angular groups of cones and stacks (to be afterwards referred to), and farther south by the terraced plateaus and abrupt conical hills of Skye, Rum, and Mull. The valleys run for the most part in a north-west and south-east direction, and this is also generally true of the sea lochs.

The south-eastern region of the Highlands, being more diversified in geological structure, presents greater contrasts of scenery. In the first place, its valleys chiefly run in a south-west and north-east direction and so also do most of the lakes and sea lochs. This feature is strikingly exhibited in the western part of Argyllshire. But there are also numerous and important transverse valleys, of which that of the Garry and Tay is the most conspicuous example. Again, the watersheds are more diversified and somewhat irregular. It first strikes eastward round the head of Loch Lomond and then swings southward, pursuing a sinuous course till it emerges from the Highlands on the east side of Loch Lomond. But the streams flowing westward are still short, while those that run north-east and east have long courses and drain wide tracts of high ground. The Tay in particular pours a larger body of water into the sea than any other river in Great Britain. Moreover, the occurrence of many bosses of granite and other eruptive rocks gives rise to various interruptions in the monotonous scenery of the crystalline schists which constitute the greater part of the country. But a marked contrast may be traced between the configuration of the north-eastern district and the other parts of this region. In that area the Gampians rise into wide flat-topped heights or elevated moors often over 3000 and sometimes exceeding 4000 feet in height and bounded by steep declivities not infrequently by precipices. Seen from an eminence on their surface, these plateaus look like fragments of an original broad tableland, which has been trenched into segments by the formation of the transverse and longitudinal valleys. Farther to the south-west in Pethshires, Inverness-shire, and Argyllshire, they give place to the ordinary hummocky crested ridges of Highland scenery, some summits on which, however, exceed 4000 feet in elevation. For the probable meaning of this transition from broad flat-topped heights to narrow crests and isolated peaks, see below (pp. 529-538).

Besides the principal tracts of low ground in the Highlands already referred to, there occur numerous long but narrow strips of flat land in the more important valleys. Each strath and glen is usually provided with a floor of detritus which, spread out between the bases of the bounding hills, has been levelled into meadow-land by the rivers, and furnishes as a rule the only arable ground in each district.

Southern uplands.

The southern uplands form the most southerly of the three transverse belts in Scottish topography. Extending from St. Patrick's Channel to St. Abb's Head, they constitute a well-defined belt of hilly ground, but present a striking contrast to the scenery of the Highlands. The rocks which underlie them consist almost wholly of Silurian grits, greywackes, and shales, which have been greatly plasticated, the general axis of the folds running parallel with that of the whole belt, from south-west to north-east. These uplands, though much less elevated than the Highlands (their highest point is not more than 2764 feet above the sea), rise with scarcely less abruptness above the lower tracts that bound them. Their north-western margin for the most part springs boldly above

the fields and moorlands of the midland valley, and its boundary for long distances continues remarkably straight. Their southern and south-eastern limits are in general less prominently defined, except to the west of the Nith, where they plunge into the sea between the Solway Firth and the Cheviot Hills they pass under a line of high and picturesque escarpments which runs from Buteenark in a north-east direction. In Bewickshire, however, they again tower boldly above the plain of the Merse. These uplands are distinguished above all by the smoothness of their surface. They may be regarded as a rolling tableland or moorland, traversed by innumerable valleys which with gentle undulating declivities conduct the drainage to the sea. This character is impressively seen from the heights of Tweedsmuir. Wide mossy moors, lying 2000 feet or more above the sea and sometimes covered as a laceous, spread out on all sides. Then continuity, however, is interrupted by numerous intervening valleys which separate them into detached flat-topped hills. Unlike the Highlands, these southern heights comparatively seldom present precipices of naked rock. Where the rock projects it more usually appears in low crags and knolls, from which long tracts of grey or purple débris descend the slopes till they are lost among the grass. Hence, besides being smooth, the uplands are pre-eminently verdant. They form indeed excellent pasture-land, while the alluvial flats in the valleys and even some of the lower slopes of the hills are fitted for corn and green crops.

This uniformity of external aspect is doubtless traceable to the prevalence of the same kind of rocks and the same geological structure. The Silurian greywackes and shales that underlie almost logical the whole of these uplands weather generally into a similar structure débris, and at a tolerably uniform rate of disintegration. But slight differences may readily be detected even where no features interfere in a marked way with the general monotony. The bands of massive grit and coarse greywacke, for example, break up into larger blocks and from their greater hardness are apt to project above the general surfaces of the other and softer rocks. Hence their line of trend, which like that of all the other strata is in a north-easterly direction, may be followed on hill and dale even at a distance by their more jagged contours. Only in the highest tracts of these uplands are any rugged features to be seen that remind one of the more savage character of Highland scenery. In the heights of Hartfell (2651 feet) and Whitesome (2695), whence the Clyde, Tweed, Annan, and Moffat Waters descend, the high moorlands have been scarped into gloomy coverts, with crags and talus-slopes, which form a series of ledges and cliffs, and starting from the abrupt and unexpected contrast they present to everything around them. In Galloway, also, the highest portions of the uplands have acquired a ruggedness and wildness more like those of the Highlands than any other district in the south of Scotland. For this, however, there is an obvious geological reason. In that region the Silurian rocks have been invaded by large bosses of granite and have undergone a valuable amount of metamorphism which has in some places altered them into hard crystalline schists. These various rocky masses, presenting great differences in their powers of resisting decay, have yielded unequally to disintegration the harder portions project in rocky knolls, crags, and cliffs, while the softer parts have been worn down into more flowing outlines. The highest summit in the south of Scotland—Munich (2764 feet)—consists of Silurian strata much altered by proximity to the granite, while the rest of the more prominent heights in the south (Kinkorlbrighgash)—Riins of Kells (2698 feet), Cairnmore of Carlsburn (2612), and Cairnmore of Fleet (2831)—are formed of granite.

The watershed of the southern uplands is of much interest in Water-relation to their geological history. It runs from the mouth of sheet of Loch Ryan in a sinuous north-easterly direction, keeping near the southern limit of the region till it reaches the basin of the Nith, uplands here the waters of the uplands altogether flow to the south-east of Argyshire, and, after curving round the headwaters of the Nith, strikes south-eastwards across half the breadth of the uplands, then sweeps north and eastwards between the basins of the Clyde, Tweed, and Annan, and then through the moors that surround the sources of the Etrick, Tavor, and Jed, into the Cheviot Hills. Here again the longest slope is on the east side, where the Tweed bears the whole drainage of that side into the sea. Although the rocks throughout the southern uplands have a persistent north-east and south-west strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and greywackes, nevertheless geological structure has been much less effective in determining the lines of ridge and valley than in the Highlands. On the southern side of the watershed, in Dumfriesshire and Galloway, the valleys run generally transversely from north-west to south-east. But in the eastern half of the uplands the valleys do not appear to have any relation to the geological structure of the ground underneath.

Between the two belts of high ground lie the broad lowlands Central of central Scotland, on the midland valley, bounded on the north lowlands side by the range of heights that extends from the mouth of the

Clyde to Stonehaven, on the south side by the pastoral uplands that stretch from Givran to Dunbar. The simplest conception of the general aspect and structure of this important part of the kingdom is obtained by regarding it as a long trough of younger rocks let down by parallel dislocations between the older masses of the high grounds to the south and north. The lowest of these younger rocks are the various sedimentary and volcanic members of the Old Red Sandstone. These are covered by the successive formations of the Carboniferous system. The total thickness of both these groups of rock cannot be less than 30,000 feet, and, as most of them bear evidence of having been deposited in shallow water, it is manifest that they could only have been accumulated during a prolonged period of depression. The question arises whether this depression affected only the area of the midland valley itself, or whether it extended also over the regions to the north and south. Materials do not yet exist for a definite answer to this question; but so far as the evidence now before us goes, there is ground for the inference that, while the depression had its maximum along the line of the lowlands, it also involved some portion at least of the high grounds on either side. In other words, the Old Red Sandstone and Carboniferous rocks, though chiefly accumulated in the lowland valley, crept also over some part at least of the hills on either side, where a few outliers are left of them from extension. The central Lowlands of Scotland as thus of great geological antiquity. During and since the deposition of the rocks that underlie them the tract has been the scene of repeated terrestrial disturbances. Long dislocations, running like the ridges of the Highlands and the southern uplands from south-west to north-east, have shaped its northern and southern limits. By other fractures and unequal movements of upheaval or depression portions of the older rocks have been brought up within the bounds of the younger, and areas of the younger have been enclosed by the older. On the whole, these terrestrial disturbances have followed the same prevalent north-easterly trend, and hence a general tendency may be observed among the main ridges and valleys to run in that direction. The chains of the Ochil, Ballaw, Pentland, Benlawrie, and Fintry Hills, and the valleys of Strathmore, Forth of Tay, and the basin of Muthill, may be cited as examples. But, undoubtedly, the dominant cause in the determination of the topographical prominence and depressions of the district has been the relative hardness and softness of the rocks. Almost the whole of the eminences in the Lowlands consist of hard igneous rocks, forming not only chains of hills like those just referred to, and others, Ayr, Galloway, Lanarkshire, but isolated crags and hills like those of Benlurgie, Edinburgh Castle, and other conspicuous in the scenery of Fife and the Lothians.

Of the three chief valleys in the central Lowlands, two, those of the Tay and the Forth, descend from the Highlands, and one, that of the Clyde, from the southern uplands. Though on the whole transverse, these depressions furnish another notable example of that independence of geological structure already mentioned.

We now proceed to consider the leading physical features of the country with especial reference to their distinctive aspects and their respective modes of origin. Though an eminently hilly country, Scotland is not dominated by any leading mountain chain on which all the other topographical features are dependent. Its leading features are not the monotonous ridges of the high grounds but the valleys that have been opened through them. If these valleys were filled up, the high grounds would once, but become what they probably never are, elevated plains or plateaus, with no strongly marked features, — no eminences rising much above no hollows sinking much below the general surface.

Valleys. — Even apart from any knowledge of their origin, the valleys of the country are thus seen to be its fundamental topographical element, and to deserve the first consideration in any attempt to describe and explain its physical features. The longitudinal valleys, running in the same general direction as the ridges — that is, north-east and south-west — have had their trend defined by geological structure, such as a line of dislocation (the Great Glen), or the relations of the rocks (Lochs Riecht, Tay, and Ayr, and most of the sea lochs of Argyllshire). The transverse valleys run north-west or south-east and are for the most part independent of geological structure. The valley of the Gairn and Tay crosses the strike of all the Highland rocks, traverses the great fault on the Highland border, and finally leaves through the chain of the Ochil Hills at Perth. The valley of the Clyde crosses the strike of the Silurian phanites in the southern uplands, the boundary fault, and the ridges of the Old Red Sandstone, and pursues its north-westerly course across the abundant and often powerful dislocations of the Carboniferous system.

Origin of Scottish valleys. — That valleys are essentially due to erosion and not to dislocation or subsidence of the earth's surface is a fact which has now been demonstrated by so over-whelming a mass of evidence from all parts of the globe that it may be accepted as one of the axioms of geology. The phenomena of the earth's crust which folded the rocks of the Highlands and southern uplands not improbably expressed above the sea a series of longitudinal ridges having a general north-easterly

direction. The earliest rain that fell upon these ridges would run off them, first in transverse watercourses down each short slope and then in longitudinal depressions wherever such had been formed during the terrestrial disturbance. Once chosen, the pathways of the streams would be gradually deepened and widened into valleys. Hence the valleys are of higher antiquity than the mountains that rise from them. The mountains in fact have emerged out of the original bulk of the land in proportion as the valleys have been excavated. The denudation would continue so long as the ground stood above the level of the sea, but there have been prolonged periods of depression, when the ground, instead of being eroded, lay below the sea-level and was buried sometimes under thousands of feet of accumulated sediment, which completely filled up and obliterated the previous drainage-lines. When the land reappeared a new and independent series of valleys would at once begin to be etched, and the subsequent degradation of these overlying sediments might reveal portions of the older topography, as in the case of the Great Glen, Landeildale, and other ancient valleys. But the new drainage-lines have usually little or no reference to the old ones. Determined by the inequalities of surface of the overlying mantle of sedimentary material, they would be wholly independent of the geological structure of the rocks lying below that mantle. Slowly sinking deeper and deeper into the land, they might eventually reach the older rocks, but they would keep in these the lines of valley that they had followed in the overlying deposits. In process of time the whole of these deposits might be denuded from the area. The valleys would then be seen running in utter disregard of the geological structure of the rocks around them, and these might even remain no trace of the younger formations on which they began and which guided their excavation. This is probably the explanation of the striking independence of geological structure exhibited by the Tweed and the Nith.

Among the valleys of Scotland certain prevailing characteristics General have been recognized in the popular names bestowed upon them characteristic. "Straths" are broad expanses of low ground between bounding toasts hills usually traversed by one main stream and its tributaries. — Strath Tay, Strath Spey, Strath Comrie. The name, however, has also been applied to wide tracts of lowland which embrace portions of several valleys, but are defined by lines of heights on either side, the best example is afforded by Strathmore — the "great strath" — between the southern margin of the Highlands and the line of the Ochil and Sillad Hills. This long and wide depression, though it looks like one great valley, strictly speaking, includes portions of the valleys of the Tay, Isla, North Esk, and South Esk, each of which crosses it. Elsewhere in central Scotland such a wide depression is known as a "howe," as in the Howe of Fife between the Ochil and Lomond Hills. A "glen" is usually a narrower and steeper-sided valley than a strath, though the names have not always been applied with discrimination. Most of the Highland valleys are true glens. The hills rise rapidly on either side, sometimes in grassy slopes, sometimes in rocky bosses and precipitous cliffs, while the bottom is occupied by a flat platform of alluvium through which a stream meanders. Frequently the bottom of some part of the valley is occupied by a lake. In the south of Scotland the large streams flow in wide open valleys called "dales," as in Clydesdale, Tweeddale, Teviotdale, Liddesdale, Eskdale, Nithdale. The strips of alluvial land bordering a river are known as "hangings," and where in streams they expand into wide plains they are termed "caves." The valleys of the Forth extend seawards as far as Bonningtonness and consist of the Gairn and Muthill. The Canal of Gowrie is the strip of low ground intervening between the Forth of Tay and the line of hills that stretches from Perth to Dundee.

River-gorges are characteristic features in many of the valleys of River-Scotland. In the Old Red Sandstone they are particularly prominent, where that formation has lain in the pathway of the streams sweeping down from the Highlands. In the basin of the Moray Forth some fine examples may be seen on the Nairn and Firthnairn, while on the west side of the Gairn and Muthill, some of the small streams descending from the high grounds of the east of Ross-shire have cut out defiles in the conglomerate, remarkable for their depth and narrowness. On the south side of the Highlands still more notable instances of true "cañons" in the Old Red Sandstone are to be seen where the Riecht, Isla, and North Esk enter that formation. The well-known gorge in which the Falls of Clyde are situated is the best example in the midland valley.

Types of Moors and Hills. — While the topography of the Flat-country is essentially the result of prolonged denudation, we may truly reasonably infer that the oldest surfaces likely to be in any measure unaltered or indicated are portions of some of the platforms of mass erosion which have successively been produced by the wearing away of the land down to the sea-level. Relics of these platforms seem to be recognizable both in the Highlands and among the southern uplands. Allusion has already been made to the remarkable flat-topped moorlands which in the eastern Grampians reach heights 1. For the principal rivers, the Tay, Spey, Forth, Clyde, and Tweed, see the separate articles, and for the Doon (Abdon, Kilmadock), &c., see articles on the respective counties.

of 8000 to 4000 feet above the sea. Their most familiar example perhaps is the top of Lochnaun, where when the level of 3500 feet has been gained the traveller finds himself on a broad undulating moor, more than a mile and a half long, sloping gently southwards towards Glen Muck and terminating on the north at the edge of a range of granite pinnacles. The top of Ben Macdui stands upon nearly a square mile of moor exceeding 4000 feet in elevation. These mountains lie within granite areas, but not less striking examples may be found among the schists. The mountains at the head of Glen Esk and Glen Isla, for instance, sweep upward into a broad moor some 3000 feet above the sea, the more prominent parts of which have received special names,—Dunsh, Mayra, Tom Buidhe, Tolmount, Cairn na Giech. It would hardly be an exaggeration to say that there is more level ground on the tops of these mountains than in areas of corresponding size in the valleys below. That these high plateaus are planes of erosion is shown by their independence of geological structure, the upturned edges of the vertical and contorted schists having been abruptly shorn off and the granite having been wasted and levelled along its exposed surface. They look like fragments of the original tableland of erosion out of which the present valley-systems of the Highlands have been carved. Among the southern uplands traces of a similar tableland of erosion are in many places to be detected. The top of Broad Law in Peeblesshire, for example, is a level moor comprising between 300 and 400 acres above the contour line of 2500 feet and lying upon the upturned edges of the greatly denuded Silurian grits and shales. An instructive example of the similar destruction of a much younger uniform is to be found in the tableland plateau of Skye, Gigg, Canna, Muck, Mull, and Morven, which are portions of what was probably originally a continuous plain of basalt. Though dating back only to older Tertiary time, this plain has been so deeply trenched by the forces of denudation that it has been reduced to mere scattered fragments. Thousands of feet of basalt have been worn away from many parts of its surface, deep and wide valleys have been carved out of it, and so continuously has it been wasted that it has been almost entirely stripped from wide tracts which it formerly covered and where only scattered outcrops remain to prove that it once existed.

It is a curious fact, to which allusion has already been made, that broad flat-topped mountains are chiefly to be found in the eastern parts of the country. Traced westwards these forms gradually give place to narrow ridges and crests. No contrast, for instance, can be greater than that between the wide elevated moors of the eastern Gairns, Gigg, Canna, Muck, Mull, and Morven, Larness-shire and Arrylshire—Loch Hourn, Glen Ners, Glencoe; or that between the broad uplands of Peeblesshire and the precipitous heights of Galloway. No satisfactory reason for these contrasts can be found in geological structure alone. Perhaps the key to them is to be sought mainly in differences of rainfall. The western mountains, exposed to the face dash of the Atlantic rains, sustain the heaviest and most constant precipitation. Their sides are seamed with torrents which tear down the solid rock and sweep its detritus into the glens and sea lochs. The eastern heights, on the other hand, experience a less rainfall and consequently a diminished rate of erosion. There is no reason to doubt that the present preponderance of rainfall in the west has persisted for an enormous duration of time.

Regarding the existing flat-topped heights among the eastern Gairns as a representative of what they have been, a general character of the surface out of which the present Highlands have been carved, we can trace every step in the gradual obliteration of the tableland and in the formation of the most rugged and individualized forms of isolated mountain. In fact, in journeying westward across the tops of the Highland mountains we pass, as it were, over successive stages in the history of the origin of Highland scenery. The oldest types of form lie on the east side and the newest on the west. From the larger fragments of the denuded tableland we advance to ridges with narrow tops, which pass by degrees into sharp rugged crests. The ridges, too, are more and more trenched until they become groups of detached hills or mountains. In the progress of this erosion full scope has been afforded for the modification of form produced by variations in geological structure. Each ridge and mountain has been cut into its shape by denudation, but its actual outline has been determined by the nature of the rocks and the manner in which they have yielded to decay. Every distinct variety of rock has imposed its own characters upon the landscape in which it plays a part. Hence, and the monotonous succession of ridge beyond ridge and valley after valley, considerable diversity of detail has resulted from the varying composition and grouping of the rocks.

The process by which the ancient tablelands of the country have been trenched into the present system of valleys and confuent ridges is most instructively displayed among the higher mountains, where erosion proceeds at an accelerated pace. The long "scies" or talus-slopes at the foot of every crag and cliff bear witness to the continual waste of the mountain sides. The headwaters of a river cut into the slopes of the parent hill. Each valley is consequently

lengthened at the expense of the mountain from which it descends. Where a number of small torrents converge in a steep mountain recess, they cut out a crescent-shaped hollow or half-canyon, which in the Scottish Highlands is known as a "coiry." Whether Corries the convergent action of the streams has been the sole agency concerned in the erosion of these striking concavities, or whether snow, glaciers, and glacier-sea may have had a share in the task, is a question that cannot at present be satisfactorily solved. No feature in Highland scenery is more characteristic than the corries, and in none can the influence of geological structure be more instructively seen. Usually the upper part of a corrie is formed by a descent of naked rock, from which long lands of debris descended to the bottom of the hollow. Every distinct variety of rock is of one type of corrie, the same characteristics being marked both in the details of the upper cliffs and crags and in the amount, form, and colour of the scies. The Scottish corries have been occupied by glaciers. Hence their bottoms are generally well ice-worn or strewed over with moraine stuff. Not infrequently also a small tarn fills up the bottom, ponded back by a moraine. It is in these localities that we can best observe the last relics left by the retreat of the glaciers that once covered the country. Among these high grounds also the gradual narrowing of ridges into sharp, narrow, knife-edge crests and the lowering of these into cols or passes can be admirably studied. Where two glens begin opposite to each other on the same ridge, then corries are gradually cut back until only a sharp crest separates them. This crest, attacked on each front and along the summit, is lowered with comparative rapidity, until in the end merely a low col or pass may separate the heads of the two glens. The various stages in this kind of denudation can be traced in the underlying rock is of granite or some similar material which possesses considerable toughness, while at the same time it is apt to be split and splintered by means of its numerous transverse joints. The granite mountains of Arian furnish excellent illustrations.

Where a rock yields with considerable uniformity in all directions Formative to the effects of the weather it is to assume a regular form in the progress of denudation. Sometimes this uniformity is attained, however, by a general disintegration of the rock into fine debris, which rolls down the slopes in long scies. In other cases it is secured by the cones intersection of joints, whereby a rock, in itself hard and durable, is divided into small angular blocks, which are separated by the action of the elements and slide down the declivities. In many instances the beginning of the formation of a cone may be detected in ridges which have been deeply trenched by the action of the weather, isolated portions, attacked on all sides, have broken up under the influence of the weather. Layer after layer has been stripped from their sides, and the flat or rounded top has been narrowed until it has now become the apex of a cone. The mountain Schiehallion (3547 feet) is a noble instance of a cone not yet felled by its parent ridge. Occasionally a ridge has been carved into a series of cones united at their bases, as in the chain of the Pentland Hills. A further stage in denudation brings us to isolated groups of cones completely separated from the rest of the rocks among which they once lay buried. Such groups may be carved out of a continuous band of rock which extends into the regions beyond. The Paps of Jura, for instance, rise out of a long belt of quartzite which stretches through the islands of Isla, Jura, and Scarba. In many cases, however, the groups point to the existence of some boss of rock of greater solidity than those in the immediate neighbourhood, as in the Cuachullins and Red Hills of Skye and the group of granite cones of Ben Loyal, Sutherland. The most impressive form of solitary cone is that wherein after vast denudation a thick overlying formation has been reduced to a single outlier, such as Morven in Caithness and the two Ben Gairs in Sutherland, and still more strikingly the pyramids of red sandstone on the western margin of Sutherland and Ross-shire. The horizontal stratification of some of these mountain groups gives them a curiously architectural aspect, which is further increased by the effect of the numerous vertical joints by which the rock is cleft into buttresses and recesses along the fronts of the precipices and into pinnacles and finials along the summits. Solitary or grouped pyramids of red sandstone, rising to heights of between 3000 and 4000 feet above the sea, are mere remnants of a once continuous sheet of red sandstone that spread far and wide over the western Highlands.

Stratified rocks when they have not been much disturbed from Escarpment their original approximate horizontal weather into what are meant called "escarpments,"—lines of cliff or steep bank marking the edge or outcrop of harder bands which lie upon softer or more easily eroded layers. Such cliffs may run for many miles across a country, rising one above another into lofty terraced hills. In Scotland the rocks have for the most part been so dislocated and disturbed as to prevent the formation of continuous escarpments, and the interesting form of rock-scenery is consequently almost entirely absent, except locally and for the most part on a comparatively small scale. The most extensive Scottish escarpments are found among the igneous rocks. Where lava has been piled up in successive nearly horizontal sheets, with occasional layers of turf

or other softer rock between them, it offers conditions peculiarly favourable for the formation of escarpments. In the wide basalt plateaus of the Inner Hebrides these conditions have been manifested on a great scale. The Carboniferous lavas of the Campsie and Fintry Hills and of the south of Dumfriesshire and Roxburghshire likewise lie in lines of bold escarpment.

Lakes—These important features in the landscapes of Scotland present the general characters of the water-basins so profusely scattered over the northern parts of Europe and North America. They may be classified in four groups, each of which has its own peculiar scenery and a distinct mode of origin—(1) glen lakes, (2) rock-tarns, (3) moraine-tarns, (4) lakes of the plains.

Glen lakes.

(1) Glen lakes are those which occupy portions of glens. They are depressions in this strata, not due to mere local heaving up of detritus, but true rock-basins, often of great depth. Much discussion has arisen as to their mode of origin. They have been regarded as caused by special subsidence of their areas, open fissures of the ground, general depression of the central part of each mountain district from which they radiate, and by the erosive action of glacier ice. That they are not open fissures and cannot be explained by any general subsidence of a neighbouring region is now generally admitted. That glaciers have occupied the glens where these lakes exist and have worn down the rocks along the sides and bottom cannot be doubted, but whether the ice would be capable of eroding hollows so deep as many of these lakes is a question which has been answered with equal confidence affirmatively and negatively. On the other hand, to suppose that each of these hollows has been caused by a special local subsidence would involve a complete and sufficient disturbance, for which some better evidence than the mere existence of the basins is required. Under any circumstances it is quite certain that the lakes must be of recent geological date. Any such basins belonging to the time of the elevation of the crystalline schists would have been filled up and effaced long ago. So rapid is the infilling by the torrents which sweep down detritus from the surrounding heights that the present lakes are being rapidly diminished, and they cannot, therefore, be of high geological antiquity. It is worthy of remark that the glen lakes are almost wholly confined to the western half of the Highlands, where they form the largest sheets of fresh water. Hardly any lakes are to be seen east of a line drawn from Inverness to Perth. West of that line, however, they abound in both the longitudinal and the transverse valleys. The most remarkable line of them is the chain of lakes up the Great Glen. Loch Ness, the largest, is upwards of 20 miles long, about 13 miles broad, and not less than 774 feet deep in the deepest part. This great depression exceeds the general depth reached by the floor of the North Sea between Great Britain and the opposite shores of the Continent. Other important longitudinal lakes are the Lochs Tay, Ave, Erioch, and Rhel. The most picturesque glen lakes, however, are in transverse valleys, which being out across the strike of the rocks present greater variety, and are usually also more abruptness of outline. Lochs Lomond, Katrine, and Lubnaig in the southern Highlands, and Lochs Mace and More in the north, are conspicuous examples.

Rock-tarns.

(2) Rock-tarns are small lakes lying in rock-basins on the sides of mountains or the summits of ridges, and on rocky plateaus or plains. Unlike the glen lakes, they have no necessary dependence upon line of valley. On the contrary, they are scattered as if they were broadcast over the districts in which they occur, and are by far the most abundant of all the lakes of the country. Dispersed over all parts of the western Highlands, they are most numerous in the north-west, especially in the Outer Hebrides and in the west of Ross-shire and Sutherland. The surface of the Archaean gneiss is so thickly sprinkled with them that many tracts consist almost as much of water as of land. They almost invariably lie on strongly up-turned platforms, where the protrusion of the rocks is so marked, that diversely their surface have been powerfully glaciated. They cannot be due to either fracture or subsidence, but are obviously hollows produced by erosion. They have accordingly with much probability been assigned to the gouging action of the sheets of land-ice by which the general glaciation of the country was effected. In the southern uplands, owing probably to the greater softness and uniformity of texture among the rocks, rock-tarns are comparatively infrequent, except in Galloway, where the protrusion of granite and the action of metamorphism have given rise to conditions of rock-structure more like those of the Highlands. Over the rocky hill-ranges of the central Lowlands rock-tarns occasionally make their appearance.

Moraine-tarns.

(3) Moraine-tarns—small sheets of water ponded back by some of the last moraines shed by the retreating glaciers—are confined to the more mountainous tracts. Among the southern uplands many beautiful examples may be seen, probably the best known and certainly one of the most picturesque being the wild lonely Loch Skeen lying in a recess of Whithorn at the head of the Moffat Water. Others are sprinkled over the higher parts of the valleys in Galloway. None occur in the central Lowlands. In the Highlands they may be counted by hundreds, nestling in the bottoms of the corries. In the north-western counties, where the

glaciers continued longest to descend to the sea-level, lakes retained by moraine-barriers may be found very little above the sea.

(4) The lakes of the plains lie in hollows of the glacial detritus. Lakes which is strewn so thickly over the lower grounds. As these of the hollows were caused by original irregular deposition rather than plans, by erosion, they have no intimate relation to the present damage-lines of the country. The lakes vary in size from mere pools up to wide sheets of water several square miles in area. As a rule they are shallow in proportion to their extent of surface. Though still sufficiently numerous in the Lowlands, they were once greatly more so, for, partly from natural causes and partly by artificial means, they have been made to disappear. The largest sheets of fresh water in the mainland valley are of this class, as Loch Leven and the Lake of Menteith.

Coast-Lines—The eastern and western seabords of Scotland Coast-present a singular contrast. The former is indented by a series of time broad arms of the sea, but is otherwise tolerably unbroken. The land slopes gently down to the margin of the sea or to the edge of cliffs that have been cut back by the waves. The shores are for the most part low, with few islands in front of them, and cultivation comes down to the water-line. The western side of the country, on the contrary, is firm and end to end intersected with long narrow sea lochs or fjords. The land shelves down rapidly into the sea and is flanked by chains and groups of islands. This contrast has sometimes been erroneously referred to greater erosion by the waves on the western than on the eastern coast. The true explanation, however, must be sought in the geological structure of the land. The west coast of Scotland, as we have seen, has been most widely eroded than the eastern. The glens are more numerous there and on the whole deeper and narrower. Many of them are prolonged under the sea, in other words, the narrow deep fjords which wind so far into the land are seaward continuations of the glens which emerge from their upper ends. The presence of the sea in these fjords is an accident. If they could be raised out of the sea they would become glens, with lakes filling up their deeper portions. That this has really been their history is proved by the nature of the question. They are submerged land-valleys, and as they run down the whole western coast they show that side of the country to have subsided to a considerable depth beneath its former level. The Scottish sea lochs must be viewed in connexion with those of western Ireland and of Norway. The whole of this north-western coast-line of Europe bears witness to recent submergence. The bed of the North Sea, which at no distant date must have been a land surface across which plants and animals migrated freely into Great Britain, sank beneath the sea-level, while the Atlantic advanced upon the western margin of the continent and filled the sea ends of what had previously been valleys open to the sun. Not improbably the amount of subsidence was greater towards the west.

Nearly the whole coast-line of Scotland is rocky. On the east side of the country, indeed, the shores of the estuaries are generally low, but the land between the mouths of these rivers is more or less precipitous. On the west side the coast is for the most part either a steep rocky declivity or a sea-wall, though strips of low ground are found in the bays. The sea-cliffs everywhere vary in their characters according to the nature of the rock out of which they have been carved. At Cape Wrath precipices nearly 800 feet high have been cut out of the Archaean gneiss. The varying texture of this rock, its irregular foliation and jointing, and its lamifying veins of pegmatite conspire to give it very unusual powers of resistance in different parts of its mass. Consequently its projects in irregular bastions and buttresses and retreats into deep recesses and tunnels, showing everywhere a ruggedness of aspect which is eminently characteristic. In striking contrast to these precipices are those of the Cambrian red sandstone a few miles to the east.

Vertical walls of rock shoot up from the waves to a height of 800 feet, or by their perpendicularity into quadrangular piers and projections, some of which even stand out alone as cathedral-like islets in front of the main cliff. The sombre colouring is relieved by lines of vegetation along the edges of the nearly flat beds which project like vast cornices and serve as nesting-places for crowds of sea-fowl. On the west side of the country the most notable cliffs south from those of Cape Wrath and the Cambrian sandstone of Sutherland are to be found among the basaltic islands, particularly in Skye, where a magnificent range of steep escarpments to 1000 feet bounds the western coast-line. The highest cliffs in the country are found among the Shetland and Orkney Islands. The sea-wall of Foula, one of the Shetland group, and the western front of Hoy in Orkney are like walls to heights of 1100 or 1200 feet above the waves that tunnel their base. Continuity is one wide moor, terminating almost everywhere in a range of sea-pinnacles of Old Red Sandstone. Along the eastern coast-line most of the cliffs are formed of rocks belonging to the same formation. Beginning at Stonehaven, an almost unbroken line of precipice varying up to 200 feet in height runs southwards to the mouth of the estuary of the Tay. The southern uplands plunge abruptly into the sea near St Abb's Head in a noble range of precipices 800 to 600 feet in height, and on the western side the same high grounds

terminate in a long broken line of sea-wall, which begins at the mouth of Loch Ryan, extends to the Mull of Galloway, and reappears again in the southern headlands of Wigtown and Kirkcubright. One of the most picturesque features of the Scottish seascapes is the numerous "stacks" or columns of rock which, during the demolition and recession of the sea-pieces have been isolated and left standing amidst the waves. These remnants attain their most colossal size and height on the cliffs of Old Red Sandstone. Thus the Old Man of Hoy in Orkney is a huge column of yellow sandstone between 400 and 500 feet high, forming a conspicuous landmark in the north. The coast of Caithness abounds in out-standing pillars and obelisks of flagstone.

The low shores on the west coast are not infrequently occupied by sand-dunes. Such accumulations form the western margin of North and South Uist, and are found in many bays from the north of Sutherland to the coast of Ayrshire. They are more abundant on the east coast, especially on the shores of Aberdeenshire, between the mouths of the two Eiks, on both sides of the mouth of the Firth of Tay, and at various places in the Firth of Forth. Raised sea-beaches likewise play a part in the coast scenery of the country. These alluvial terraces form a strip of low fertile land between the edge of the sea and the rising ground of the interior, and among the western firths sometimes supply the only arable soil in their neighbourhood, though flat green surfaces presenting a strong contrast to the brown and barren moors that rise from them. Most of the seaport towns of the country stand upon platforms of raised beach. Considerable deposits of mud, silt, and sand are accumulating in most of the estuaries. In the Tay, Forth, and Clyde, where important harbours are situated, considerable expense is involved in dredging to remove the sediment continually brought down from the land and carried backward and forward by the tides. Wide alluvial flats are these exposed at low water.

Islands

While no islands except mere solitary rocks like May Island, the Bass Rock, and Inchkeith diversify the eastern seaboard, the western side of Scotland presents a vast number, varying in size from such extensive tracts as Skye down to the smallest sea-stack or skerry. Looked at in the broadest way, these numerous islands may be regarded as belonging to two groups or series,—the Outer and the Inner Hebrides. The Outer Hebrides, extending from Barra Head to the Butt of Lewis, consist of a continuous chain of islands composed (with the exception of a small tract in the east of Lewis) entirely of Archaean rocks. Most of the ground is low, rocky, and plentifully dotted over with lakes, but it rises into mountainous heights in the south, some of the summits attaining elevations of 2000 feet. The general trend of this long belt of islands is north-north-east. The Inner Hebrides form a much less definite group. They may be regarded as beginning with the Shiant Isles in the Minch and stretching to the southern headlands of Isla, the most important members being Skye, Mull, Iona, Jura, Rum, Eigg, Coll, Tiree, and Colonsay. The irregularity of this fringe of islands has no doubt been in chief measure brought about by its remarkable diversity of geological structure. Archaean gneiss, Cambrian sandstone, Silurian quartzite, limestone, and schist, Jurassic sandstone and limestone, Cretaceous sandstone, and Tertiary basalt, gabbro, and granitic rocks all enter into the composition of the islands.

Influences of topography on inhabitants.

Within the limits of this article it is only possible to allude to some of the more important influences of the topography on the history of the island. How powerfully the configuration of the country affects the climate is shown in the remarkable differences between the rainfall of the mountainous west and of the lowland east. This difference has noticeably affected the character and employments of the people, leading to the development of agriculture on the one side and the raising of sheep and cattle on the other. The fertile low grounds on the east have offered facilities for the invasions of Romans, Norsemen, and English, while the mountainous fastnesses of the interior and the west have served as secure retreats for the old Celtic population. While, therefore, Teutonic people have spread over the one area, the earlier races has to this day maintained its ground in the other. Not only the external configuration but the internal geological structure of the country has profoundly influenced the progress of the inhabitants. In the Highlands no mineral wealth has been discovered to stimulate the industry of the natives or to attract the labour and capital of strangers. These facts remain still as of old, scarcely unaltered and given over to the breeding of stock and the pursuit of game. In the Lowlands, on the other hand, rich stores of coal, iron, lime, and other minerals have been found. The coal-fields have gradually drawn to them an ever-increasing share of the population. Villages and towns have there sprung recently into existence and have rapidly increased in size. Manufactures have been developed and commerce has advanced with accelerated pace. Other influences have of course contributed largely to the development of the country, but among them all the chief place must undoubtedly be assigned to that fortunate geological structure which, amid the revolutions of the past, has preserved in the centre of Scotland those fields of coal and ironstone which are the foundations of the national industry. (A. B. E.)

Climate.—In considering the climate of Scotland the first place must be assigned to the temperature of the various districts during the months of the year, it being this which gives the chief characteristics of climate and not the mean temperature of the whole year. Thus, while the annual temperature of the west and east coasts are nearly equal, the summer and winter temperatures are very different. At Portree (on east coast of Skye) the mean temperatures of January and July are 39° and 56° F., whereas at Perth they are 37° 5 and 56° 0. The prominent feature of the isothermals of the winter months is their north and south direction, thus pointing not to the sun but to the warm waters of the Atlantic as the more powerful influence in determining the Scottish climate at this season through the agency of the prevailing westerly wind. The Atlantic is thus the great repository of heat, in which the higher temperature of summer and that of more southern latitudes are treasured up against the rigours of winter, and in exceptionally cold seasons the ocean protects all places in its most immediate neighbourhood against the severe frosts which occur in inland situations. While this sufficiency of the ocean is felt at all seasons, it is most strikingly seen in winter, and it is more decidedly in proportion as the locality is surrounded by the warm waters of the Atlantic. At Edinburgh the temperature is 27° 0 and at Levenick 32° 5 higher than what would otherwise be the case, in other words, that for the moderating influence of the Atlantic the temperature of Edinburgh in mid-winter would only be 17° 5 and of Levenick 7° 5, or such winters as characterize the climates of Greenland and Iceland. The influence of the North Sea is similarly apparent, but in a less degree. Along the whole of the eastern coast, from the Firth of Forth southwards, the temperature is higher than what is found a little inland to the west. The lowest temperature yet observed in the British Isles was -16° 0, which occurred near Kelso in December 1879. In summer, everywhere, latitude for latitude, temperature is lower in the west than in the east and inland situations. In winter the inland climates are the coldest, but in summer the warmest. The course of the isothermal lines at this season is very instructive. Thus the line of 60° passes from the Solway directly northwards to the north of Perthshire and thence on a westerly course towards the Scotch Firth. From Terravale to the Grampians temperature falls only one degree, but for the same distance farther northwards it falls three degrees. The isothermal of 56° marks off the districts where the finer cereals are most successfully raised. This distribution of the temperature shows that the influence of the Atlantic in moderating the heat of summer is very great and is felt a long way into the interior of the country. On the other hand, the slight influence of western districts by rubbing the westerly winds of their mountains, thus clearing the skies of eastern districts, exercise an equally striking effect in the opposite direction,—in raising the temperature.

There is nearly twice as much wind from the south-west as from the north-east, but the proportions vary greatly in different months. The south-west prevails most from July to October, and again from December to February, accordingly in these months the rainfall is heaviest. These are the summer and winter portions of the year, and an important result of the prevalence of these winds, with their accompanying rains, which are coincident with the annual extremes of temperature, is to impart a more strictly usual character on the Scottish climate, by moderating the heat of summer and the cold of winter. The north-east winds acquire their greatest frequency from March to June and in November, which are accordingly the driest portions of the year.

The mountainous regions of Scotland are most massed in the west and the generally north and south, or approximately perpendicular to the main-binging winds from the Atlantic. Hence the westerly winds are turned out of their horizontal course, and, being thrust up into the higher regions of the atmosphere, their temperature is lowered, when the vapour is condensed into cloud and deposits in rain the water they can no longer hold in suspension. Thus the climates of the high lands are generally wet. On the other hand, the climates of the east are dry, because the surface is lower and more level, and the breezes blow thither from the west, being robbed of most of their superabundant moisture in crossing the western hills, are therefore drier and precipitate a greatly diminished rainfall. It thus happens that the driest climates in the east are those which have to south-westwards the broadest extent of mountainous ground, and that the wettest eastern climates are those which are least protected by high lands on the west. The breakdown of the watershed between the Firths of Clyde and Forth exposes southern Perthshire, the counties of Clackmannan and Kinross, and nearly the whole of Fife to the clouds and rains of the west, and their climates are consequently wetter than those of any other of the eastern slopes of the country. The driest climates of the east, on the other hand, are in Tweeddale about Kelso and Jedburgh, the low grounds of East Lothian, and those on the Moray Firth from Elgin round to Dornoch. In these districts the annual rainfall for the twenty-four years ending 1883 was about 26 inches, whereas over extensive breadths in the west it exceeds 100 inches, in Glenelg being nearly 130 inches and on the top of Ben Nevis 150 inches. (A. B. E.)

PART III.—STATISTICS

Population, Vital and Social Statistics.—At the end of the 15th century it is supposed that the population of Scotland did not exceed 500,000.—Edinburgh having about 20,000 inhabitants, followed by Perth with about 9000, and Aberdeen, Dundee, and St Andrews each with about 4000. By the time of the Union in 1707 it is supposed to have reached 1,000,000, while according to the returns furnished by the clergy to Dr Webster in 1765 it was 1,265,320. At the time of the first Government census in 1801 it had reached 1,608,420. The increase through all the succeeding decades has been continuous, though fluctuating in amount, and in 1881 it had reached 3,735,573 (males 1,799,475, females 1,936,098),—an increase within the eighty years of 182 per cent. During the same period the population of England and Wales had increased 192 per cent, while the population of Ireland, owing to a rapid decrease since 1841, does not now differ greatly from what it was at the beginning of the century. The following table (I) gives the areas of the various counties and of the whole of Scotland, the population in 1871 and 1881, the number of persons to the square mile of land-surface in the latter year, and the increase or decrease per cent between 1871 and 1881.

Counties	Area in Acres	Population		Pop. per Sq. Mile, 1881	Increase or Decrease per cent 1871-1881
		1871	1881		
Aberdeen	1,203,098	344,003	397,009	137	+ 0.66
Argyll	5,131,371	75,073	76,646	34	+ 1.04
Ayr	733,203	200,609	217,019	109	+ 8.32
Banff	418,701	62,028	68,798	68	+ 1.15
Berwick	297,156	55,456	55,577	77	+ 0.22
Bute	145,907	10,077	11,067	81	+ 4.03

Table II (see below) affords a comparison of the numbers of the population in 1801, 1871, and 1881 as grouped in towns, villages, and rural districts. The returns do not afford a means of comparison between earlier years than those given. A striking fact deserving mention is that in every county in Scotland the population increased between 1801 and 1841, the increase being more than

10 per cent in each county, with the exception of Argyll, Perth, and Sutherland. The census returns for these years do not supply materials for an accurate estimate as to the increase of the purely rural or agricultural population, but it must have been considerable. Between 1841 and 1881 the following counties declined in population.—Argyll, Inverness, Kinross, Perth, Ross and Cromarty, Sutherland, and Wigtown,—all chiefly agricultural, and five of them in the Highlands, where much of the land was held by cotters. Only one county, Kinross, has a smaller population in 1881 than in 1801. Between 1801 and 1881 the island population, chiefly cotters, decreased by 4866, and the rural population between 1801 and 1881 by 125,633. In the following Highland counties the diminution in rural population between 1801 and 1881 was as follows.—Argyll from 61,109 to 46,651, Caithness from 28,379 to 24,309, Inverness from 74,439 to 87,555, Perth from 69,480 to 57,016, Ross and Cromarty from 59,147 to 49,832, and Sutherland from 21,560 to 18,699. In the total population of Scotland the rate of increase was considerably less between 1841 and 1881 than during the first forty years of the century,—43.5 to 62.9 per cent. The rates per cent of increase in the several decades from 1801 have been as follows.—12.27, 15.82, 13.94, 10.82, 10.25, 5.97, and 11.18. The high rate of increase between 1871 and 1881 was due to an exceptional increase of towns, and unless it has been maintained (which is not probable) the estimate of the registration, which makes the population in 1885 number 3,907,736, must be regarded as much too sanguine. Table III (see below) gives the population of the eight largest towns of Scotland at decennial periods since 1801. It is a curious fact that each of these towns has maintained its place in the eight, although several towns now stand closely on the heels of Perth, whose rate of progress with that of Paisley has lagged greatly behind that of the other six.

While in England and Wales the number of persons to the square mile in 1881 was 452 and in Ireland 159, in Scotland the number now was only 125. The small density of Scotland is due chiefly to the large proportion of mountainous land. In the north-western counties the density was only 23 to the square mile, in the northern 34, in the west midland 68, in the southern 68, while in the north-eastern it was 116, in the east midland 149, in the south-eastern 299, and in the south-western—Renfrew, Ayr, and Leven—614. Table IV (see p. 529) shows by the excess of births over deaths the increase that should have taken place between 1861 and 1871, and between 1871 and 1881 (but for the balance of emigration over immigration), compared with the actual increase. The increase in towns with over 25,000 inhabitants, towns between 10,000 and 25,000, towns under 10,000 and above 8000, and rural districts. It is impossible to make a comparison between 1861 and 1881 inasmuch as the proportion of large and small towns and rural districts has varied. It must also be explained that in comparing 1861 and 1871 the census of 1861 is taken as the authority for the grouping and in comparing 1871 and 1881 the census of 1871. This table shows in both decades an actual increase in the large and in the principal towns greater than that resulting from excess of births over deaths. It is the result not only of migration from the small towns and rural districts but of the immigration of English, Irish, and foreigners, and the return of natives of Scotland from abroad. By a comparison with Table II it will be observed that the increase in the rural districts between the decades in Table IV occurs only in the villages, and not in the rural districts. Table IV further shows that any seeming increase is really delusive, and arises from the fact that there is no provision for the increase in

TABLE II

Paisley	10,888	16,664	18,107	19,558	20,407	26,835	25,430	26,556	29,000	31,322

the number of small towns. Thus according to the grouping of 1871 the rural population of 1871 was nearly 28,000 less than the rural population of 1861 according to the grouping of 1861. It is from the villages and small towns that the large towns are principally recruited, the purely rural population preferring as a rule to emigrate.

Table V shows the nationalities of the people of Scotland in 1871 and 1881, with the nationalities in 1881 in those burghs which had a population of 10,000 and upwards—

Nationalities	Scotland 1871		Scotland 1881		Burghs 1881	
	Number	Per-centage to Pop.	Number	Per-centage to Pop.	Number	Per-centage to Pop.
Scots	8,001,521	91.117	8,307,759	90.867	1,499,019	87.116
Irish	207,770	0.184	218,745	0.236	141,626	0.684
English	69,401	0.008	90,017	0.010	51,402	0.124
British colonies	9,740	0.000	15,979	0.000	7,768	0.073
British subjects						
From abroad	5,068	0.001	7,024	0.001	4,984	0.004
Foreigners	4,088	0.000	15,979	0.001	4,771	0.000
Welsh	1,061	0.000	8,068	0.000	882	0.004
From Channel Isles	739	0.001	919	0.000	646	0.003
Totals	8,800,018	100.000	9,788,578	100.000	1,640,300	100.000

This table indicates not merely an actual but a proportional increase in non-natives, there being an actual increase but a proportional decrease of natives of Ireland, and both an actual and a proportional increase of natives of England. Over the whole of Scotland the proportion of non-natives is a little over 9 per cent, while in the burghs it is nearly 13 per cent. The number of persons of Scottish birth in Ireland in 1881 was 22,828, and in England it was 253,528,—a total in the two countries of 276,356. On the other hand, the natives of the two countries in Scotland in 1881 were together 303,769, so that there is a small migration from Scotland to these countries than from these countries to Scotland.

The following table (VI) shows the emigration of persons of Scottish origin from the United Kingdom at various periods since 1855—

Years	1855-59	1860-64	1865-69	1870-74	1875-79	1880-84	1885-89
Emigrants	62,514	50,016	62,411	83,621	96,055	70,590	135,897

Comparing 1856-60 with 1881-85 it will be seen that the number of emigrants has more than doubled,—an increase of course proportionately much greater than the population. There are no statistics as to the number of immigrants into Scotland, and the significance of Table VI is further lessened by the fact that it includes persons who may have been for some time resident in England or Ireland, or who may have been born there of Scottish parents, and also supplies no information regarding emigration to the Continent. Only the principal ports, moreover, are included in the return.

Vital statistics. The male population in 1881 was 1,799,475, an increase since 1871 of 12.9 per cent., the female population 1,836,088, an increase of only 10.2 per cent. Since 1811, when there were 118.5 females to every 100 males, the proportion has been continuously diminishing, and in 1881 it was 107.6, but still greater than prevails either in England, which was 106.6, or in Ireland, which was 104.3. The proportion differs greatly in different counties, being as high as 184.7 in Shetland, chiefly on account of the number of males at sea. In Scotland the proportion of female births is smaller than that of male births. In 1885 it was 100 to 105, and males preponderate in the population up till the age of twenty-five, clearly showing that the excess of females is due to male emigration or the greater mortality of male occupations. The percentage

of illegitimate to the total number of births in 1855 was 7.8, and reached its maximum in 1865, when it was 10.2, while in 1885 it was 8.46. It is much higher in the lowland rural districts than in the Highland rural districts, and lowest in the large towns. The percentage of births, deaths, and marriages to population in the annual reports of the Registrar General are in a great degree misleading, inasmuch as the estimated population generally differs greatly from the actual. They place it, however, beyond doubt that the greatest birth, marriage, and mortality rates are in the town districts, that the smallest birth and marriage rates are in the lowland districts, after which come the mainland rural districts, and that the mortality is not so high in the rural as in the mainland rural districts. Table VII (see below) gives the percentage of single, married, and widowed to the total of each sex in Scotland, England and Wales, and Ireland respectively in 1881.

The number of blind persons in Scotland in 1881 was 3153 Blind, (males 1556, females 1602), the proportion to the total population &c being 1 in 1189 (males 1156 females 1205), the proportion in 1871 was 1 in 1112. The deaf and dumb in 1881 numbered 2142 (males 1146, females 996), the proportion to the total population being 1 in every 1744 as against 1 in every 1610 in 1871. The number of lunatics was returned as 8408 (males 3639, females 4467) or 1 in every 444 of the total population, the proportion in 1871 being 1 in every 494. In addition to this there were 6991 imbeciles (males 3596, females 3095), or 1 to every 623 of the population, the proportion in 1871 being 1 in every 727.

Table VIII gives a classification of the population according to Occupations in 1871 and 1881—

Classes of Occupation	1871	1881	Per cent of Total Pop	
			1871	1881
1 Professional	73,311	90,108	3.17	3.57
2 Domestic	150,408	170,555	4.74	4.78
3 Commercial	174,084	183,126	3.41	3.94
4 Agricultural	270,383	264,487	8.08	7.70
5 Industrial	751,281	982,058	29.38	34.07
6 Unproductive	1,961,721	2,125,669	69.28	59.98

It should be explained that the apparent diminution in the proportion of the unproductive class may be accounted for by the fact that in 1871 paupers were returned in this class, whereas in 1881 they were returned under the occupation at which they used to work. The increase in the proportion of the professional and commercial classes is at least a slight indication of higher average property, but this is more conclusively established by the fact that the number of paupers has for many years been steadily on the decline, the proportion being now (1889) only 2.4 of the population. The average cost of maintenance is, however, on the increase, owing entirely to the increased cost of the maintenance of the lunatic poor.

Crime, like pauperism, is also steadily declining, as is shown Crime by Table IX—

Offences	Average				1884		Total
	1880-1883	1871-75	1876-80	1880-84	Males	Females	
Against person	721	1014	851	983	905	75	980
Against property with violence	530	523	520	624	616	80	596

Roads

Consolidation—In the 12th century an Act was passed providing that the highways between market towns should be at least 20 feet broad. Over the principal rivers at this early period there were bridges near the most populous places, as even the Dee near Aberdeen, the Esk at Brechin, the Tyne at Perth, and the Forth near Stirling. Until the 16th century, however, traffic between distant places was carried on chiefly by pack-horses. The first stage-coach in Scotland was that which ran between Edinburgh and Leith in 1610. In 1658 there was a fortnightly stage coach between Edinburgh and London, but afterwards it would appear to have been discontinued for many years. Separate Acts empowering the justices of the peace, and afterwards also laws with them the commissioners of supply, to take measures for the maintenance of roads were passed in 1617, 1669, 1676, and 1686. These provisions had reference chiefly to what afterwards came to be known as "statute labour," intended primarily to supply a means of communication within the several parishes. They were kept in repair by the tenants and cottagers, and, when their labour was not sufficient, by the landlords, who were required to "stent" (assess) themselves, customs also being sometimes levied at bridges, ferries, and causeways. By separate local Acts the "statute labour" was in many cases converted into a payment called "conversion money," and the General Roads Act of 1845 made the alteration universal. By the Roads and Bridges (Scotland) Act of 1878 the old organization for the management of these roads was entirely superseded in 1883. The Highlands had good (military) roads earlier than the rest of the country. The project, begun in 1725, took ten years to complete, and the roads were afterwards kept in repair by an annual parliamentary grant. In the Lowlands the main lines of roads have been constructed under the Turnpike Acts, the earliest of which was obtained in 1750. Originally they were maintained by tolls exacted from those who used them, but this method was—after several counties had obtained separate Acts for its abolition—superseded throughout Scotland in 1853 by the general Act of 1878, providing for the maintenance of all classes of roads by annual rates levied by the county and district councils.

Canals

Scotland possesses two canals constructed primarily to abridge the sea passage round the coast,—the Caledonian and the Cramond. The Caledonian Canal, extending from south-west to north-east, a distance of 60 miles along the line of lochs from Loch Linnhe on the west coast to the Moray Firth on the east coast, was begun in 1803, opened while yet unfinished in 1822, and completed in 1847, the cost having been about £1,800,000. Constructed originally to afford a quicker passage for ships to the east coast of Scotland and the coasts of Europe, it has, owing to the increased size of vessels, ceased to fulfil this purpose, its chief service having been in opening up a picturesque route for tourists, assisting local trade, and affording a passage for fishing boats between the east and west coasts. The Cramond Canal, stretching across the Mull of Cantyre from Lewis to June 2nd, is 9 miles long, and admitting the passage of vessels of 300 tons burden, was opened in 1801 at a cost of over £100,000. The principal boat canals are the Forth and Clyde or Great Canal, begun in 1798, between Grangemouth on the Forth and Bowling on the Clyde, a distance of 30½ miles, with a branch to Port Dundas, making the total distance 83½ miles; the Union Canal between Edinburgh and the Forth and Clyde Canal at Port Dundas, near Glasgow, completed in 1822; and the Monkland Canal, completed in 1791, connecting Glasgow with the Monkland mineral district and communicating with a lateral branch of the Forth and Clyde Canal at Port Dundas. Several other canals in Scotland have been superseded by railway routes.

Railways.

The first railway in Scotland for which an Act of Parliament was obtained was that between Kilmarnock and Troon (9½ miles), opened in 1812, and of course worked by horses. A similar railway, of which the chief source of profit was the passenger traffic, was opened between Edinburgh and Dalkeith in 1825, branches being afterwards extended to Leith and Musselburgh. By 1840 the length of the railway lines in Scotland for which Bills were passed was 161½ miles, the capital being £3,122,133. The chief railway companies in Scotland are the Caledonian, formed in 1845, total capital in 1884-85 £27,999,938, in the North British, of the same date, total capital £28,821,526, the Glasgow and South-Western, formed by amalgamation in 1850, total capital £21,230,849,

the Highland formed by amalgamation in 1865, total capital £4,445,816, and the Great North of Scotland, 1846, total capital £4,806,983. The management of the small branch lines belonging to local companies is generally undertaken by the larger companies. By 1849 there were 796 miles of railway in Scotland. The following table (X) shows the progress since 1857 (see also RAILWAY, vol. xv pp. 226-230).—

Year	Mile Length	Passenger			Total	Receipts from Passenger Traffic	Receipts from Goods Traffic	Total
		First Class	Second Class	Third and Mixed Classes				
1857	1243	828,542	2,180,884	10,729,677	14,738,608	916,697	1,584,781	2,501,478

Total	182,186	15,966,094	18,098,504	1	0	100

Scotland, as compared with other England or Ireland, is comparatively a country of large proprietors. Taking the population of 1871 as the basis of comparison, a little over 9 per cent. of the population of Scotland have a share in the ownership of the soil, the proportion in England and Wales being about 5 per cent., while in Ireland it is only about 17. On an average each owner in England possesses 38 acres, in Scotland 148, and in Ireland 298. While in Ireland, however, only a little over one-half of the number of proprietors possess less than 1 acre, and in England about five-sevenths, this class in Scotland amounted to about five-sixths of the whole. They possessed only 1 per cent. of the total area, the remaining 99 per cent. being possessed by 19,131 persons, while 171 persons held 68.8, and 68 persons 42.1. Whereas in England 1 and in Ireland only 3 proprietors held upwards of 100,000 acres each, in Scotland there were 24 persons who each held more than this amount, and together they possessed 251 per cent. of the total area. The excessive size of the properties of Scotland may be partly accounted for by the fact that a large proportion of the land is so mountainous and unproductive as to be unsuitable for division into small properties, but two other causes have also powerfully co-operated with this, viz. the wide territorial authority exercised by some of the lowland nobles, as the Scotts and Douglasses, and such powerful Highland nobles as the Argylls and Bendlanses, and the strict rule of entail introduced by the Act of 1685 (see ENTAIL, vol. viii p. 452). The largest estates are thus in the hands of the old hereditary families. The almost absolute power anciently wielded by the landlords, who within their own territories were lords of regality, tended to hinder independent agricultural enterprise, and it was not till after the abolition of hereditary jurisdictions in 1746 that agriculture in Scotland made any real progress.

The following table (XII) gives a classification of the Holdings, Holdings of Scotland in 1875 and 1880.—

Years.	50 Acres and under.		From 50 to 100 Acres.		From 100 to 300 Acres.		From 300 to 500 Acres.		From 500 to 1000 Acres.		Above 1000 Acres.		Total.	
	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.
1875	56,811	666,665	19,787	697,620	11,828	1,360,081	1,907	739,855	601	427,476	126	100,075	80,700	4,611,000
1880	55,280	655,285	17,750	721,844	12,318	2,082,014	2,007	750,203	601	418,650	126	114,208	80,700	4,701,290

It will be observed that nearly one half of the total area of the holdings is occupied by those possessing from 100 to 300 acres each. The holdings over 300 acres are generally sheep farms, and it is to the enterprise of the medium class of holders that the agricultural progress of Scotland is chiefly due. A society of improvers in the knowledge of agriculture was founded in 1723, but ceased to

exist after the Rebellion of 1745, and the introduction of new and improved methods, where not the result of private enterprise, has been chiefly associated with the efforts of the Highland Society, instituted in 1783, and latterly known as the Highland and Agricultural Society. A great stimulus was also afforded in the beginning of the 19th century by the high prices obtained during the

Land-
lord and
tenant

Continental wars, and, although periods of occasional severe depression have occurred since then, not only has the science of agriculture continued impudently to advance but the position of the large farmer has until within recent years been one of increasing prosperity. The system of nineteen years' lease had proved, as regards both agricultural progress and the interests of the farmer, a much superior arrangement to the system of yearly tenancy so largely prevailing in England, but it was coupled with customs and modified by conditions which during the period of agricultural distress prevailing since 1872 have caused the relations between landlord and tenant to become severely strained. The more prominent grievances of the farmer were the difficulty of obtaining sufficient compensation for improvements, the movements resulting from the law of hypothec (see HYPOTHEC, vol. xii. p. 698), and the hardships suffered from the existence of the game laws. Hypothec was abolished in 1879, except as regards the Act of Sederunt, a ground game Act was passed in 1880, and, succeeding the report of the duke of Richmond's commission in 1882, the Agricultural Holdings Act was passed in 1883, containing provisions for securing to the tenant control in the disposition of his lease, and also compensation for improvements, but already it is evident that these reforms have failed to meet the difficulties created by the altered conditions of things, due to the increasing scarcity of land and the importation of foreign produce.

Crofters. While the relations between the landlord and the large farmer cannot be regarded as satisfactory, the difficulties of the crofters—small holders now chiefly to be found in the western Highlands and the islands to the north and west of Scotland—have reached a more acute stage. The crofter system prevailing in Orkney and Shetland—described in the article on those islands—has a totally different origin from that prevailing in the Highlands. On account of the ancient relations between the Highlanders and his chief, the maintenance is claimed by the Highland crofters of an inalienable

right to security of tenure, but when the old feudal system of the Highlands was suddenly abolished after the Rebellion of 1745 no legal steps were taken for the recognition of this right, and from the beginning of the 19th century wholesale clearances of tenants were carried out in many districts even by the heirs of the old Highland chiefs. In the words of the report of the crofters' commission of 1884—"The crofts of the present time has through past evictions been confined within narrow limits, sometimes on inferior land and exhausted soil. He is subject to arbitrary augmentations of money rent, he is without security of tenure, and has only recently received the concession of compensation for improvements." The crofters in Scotland are now estimated to number 40,000 families of 200,000 persons, and many of them support themselves partly by fishing. In the several towns to which they have had to contend against the tendency towards the creation of large farms, the demand for sporting estates, the desire of landlords to escape the burden of poor rates, and the fact that they have absolutely no choice as regards the conditions imposed on them by the landlord. In March 1883 a commission was appointed to inquire into the condition of the crofters and crofting in the Highlands and islands of Scotland; this commission gave in its report in 1884, and an Act based on their recommendations was passed in 1885.

Notwithstanding the unsatisfactory condition of agricultural affairs in Scotland at present, there is no country in the world to-day where farming is prosecuted with more skill and enterprise. On crops account of the great variety of soil and climate the methods in operation differ greatly in different districts, and for special details the reader is referred to the articles on the several counties. The following table (XIII.) shows the cultivated area and the areas under each kind of crop in different years, with the proportion of the acreage under each kind of crop, &c., to every 1000 acres of cultivated land for 1885 in Scotland, England, and Ireland—

	Yearly Averages				Average per 1000 Acres 1885					
	1867-70	1871-75	1880	1885	Scotland	England	Ireland	Scotland	England	Ireland

Grasses under rotation	1,248,747	1,388,106	1,455,745	1,571,745	324	110	184			
Flax	1,417	731	183	41	0	8	7			
Hay	1	1	1	1	0	0	0			
Fallow	61,899	21,400	21,514	22,908	5	21	1			

The earliest year included in this table (1867) is the date at which the agricultural statistics began to be collected and published by the Board of Trade. The work previous to this had been undertaken by the Highland and Agricultural Society of Scotland, but their returns were necessarily less complete and accurate. The return for 1857, for example, gives the arable acreage ("acreage under a rotation of crops") as 3,776,572, but this is clearly too much, as it exceeds that of 1885, and since 1867 there has been a gradual increase. Only a little over one-fourth of the area of Scotland is cultivated, while in England only one-fourth is left uncultivated. It must, however, be taken into consideration that in the agricultural returns "permanent pasture" does not include the mountainous districts which form such a large portion of the surface of Scotland, where heaths and natural grasses occupy the soil and yield a scanty herbage for sheep and cattle. In the return "permanent pasture" is represented as occupying an area little more than a third as large as that occupied by arable land, while in England the two areas are pretty nearly equal, but as a matter of fact pasturage plays a much more important part in the economy of the Scottish than of the English farmer. It will be observed that as regards the main divisions of arable land the total area under both corn crops and green crops have been slightly decreasing, while there has been a considerable increase in the area under rotation grasses. The following table (XIV.) shows the yield of the principal crops in

1857, 1884, and 1885, with the average yield per acre in the yield of last two years—

			1857	1884	1885	Average per Acre	
						1854	1885
Wheat	Bushels	6,154,888	2,548,261	1,893,501	34.17	34.17	34.83
Barley	"	7,226,207	7,701,300	8,265,820	34.27	34.27	34.72
Oats	"	22,760,708	56,118,921	85,497,137	35.10	35.10	35.10
Beans	"	1,037,760	705,298	707,677	32.22	32.22	32.67
Pease	"	6,090,100	1,38,561	57,454	34.74	34.74	34.41
Turnips	Tons	7,533,770	7,533,770	7,533,770	16.05	16.05	16.05
Potatoes	"	430,408	989,955	808,028	6.02	6.02	5.80

This table being founded on estimates can, of course, only be regarded as approximately correct. The average yield of both wheat and barley is higher than that of England, while the average yield of both oats and potatoes is lower, which may be accounted for by the fact that the first two crops occupy the best soils of Scotland, while the last two occupy every variety of soil in the country. Wheat is grown chiefly in the sea-coast districts and the fertile river-valleys. The area under wheat has declined more than a half since 1857, the combined areas of this being very seasons and increased foreign competition. Barley, for which the distilleries keep up a steady demand, and oats, the staple crop of the country, have rather increased in area since 1857. The area under potatoes—a very uncertain crop—has rather declined within recent years, and

that under turnips has considerably declined, partly owing to the increased use of artificial stuffs in cattle feeding. The following table (XV) shows the number of live stock in different years, with the average number for every 1000 acres of cultivated land in 1885 in Scotland and England—

Live stock.

	Yearly Average		1880	1885	Average per 1000 Acres 1885	
	1867-70	1871-73			Scotland	England
Horses (including ponies)— Used solely for agricultural purposes	138,364	136,689	141,238	141,522	30	80
Unbroken horses and mares kept for breeding	184,907	41,968	52,681	46,770	10	18
Total horses	1172,871	178,656	194,018	188,299	89	48
Cattle— Cows and heifers in milk or in calf	830,490	303,252	387,106	419,210	87	74
Other cattle—two years old and above	249,541	207,020	323,907	210,500	54	48
„ „ under two years	392,736	467,145	423,124	406,289	102	72
Total cattle	1,022,838	1,137,337	1,000,338	1,175,000	243	189
Sheep— Over a year old and above	4,582,885	1,785,058	4,551,116	4,506,436	941	407
Under one year old	2,855,142	2,436,114	2,435,972	2,966,765	495	309
Total sheep	7,437,977	7,361,122	7,077,088	7,467,199	1436	676
Pigs	128,009	106,148	129,152	130,984	81	82

This table does not indicate any constant decrease on increase in any of the classes of live stock. It will be observed that the average number of cattle to the acreage of cultivated land in Scotland is about a third more than in England, and of sheep more than double as many, but the number of pigs in England is more than double as many to the acreage of cultivated land as it is in Scotland, and the number of horses is greater. The special breeds of horses in Scotland are the Shetland ponies, the Highland ponies, and the Clydesdale draught horses, the latter originally bred in the Clydesdale district from crossing with Flemish stallions imported about the beginning of the 18th century. The breeds of cattle include the Ayrshire, which, since they are chiefly noted for their yield of milk, and are specially adapted for dairy farms (which prevail especially in the south-west of Scotland), have in a great measure supplanted the Galloway, the native district, except where these are kept for feeding purposes, the polled Angus or Aberdeen, fine milkers, but chiefly valuable for their beef-making qualities, and on this account, as well as their hardiness, in especial favour in the north-east of Scotland, where the art of cattle-feeding has reached its greatest perfection, and the west Highland breed, noted for their long horns, their shagginess, the decided character of their various colours—black, red, dun, cream, and buff—and their power of thriving on wild and heathy pasture. The special breeds of sheep are the fine-woolled, peculiar to Shetland, the blackfaced, native to the Highland districts, and the Cheviots, native to the range of hills of that name, and now the favourite breed in the south of Scotland, although border Leicesters and other English breeds, as well as a variety of crosses, are kept for winter feeding on the lowland farms.

Forests.

The area under plantation as situated on 4th June 1885 was 1392 acres and under nursery grounds 1654. Orchards, chiefly for apples, are most numerous in the Gairne and Gairne and the neighbourhood of Perth, and along the banks of the Clyde above Hamilton. The area under woods in 1812 was 907,695 acres, of which 501,469 acres were natural woods and 406,226 planted, by 1872 it had declined to 734,470, but by 1881 (i.e., by the latest return) it had increased to 928,476, the principal increase having been in Aberdeen, Perth, and Inverness, the growth of which is the largest. The Board of Woods returns do not distinguish between planted and natural woods, but it is well known that large cuttings have been made in the indigenous forests of the Highlands, while at the same time considerable attention has been paid within the present century to the growth of plantations in the Lowlands, partly as a covert for game, the science of forestry has made great advances within recent years owing to the encouragement and guidance of the Scottish Arboricultural Society, established in 1864, and of the Highland and Agricultural Society. The modern plantations are formed chiefly of Scotch fir with a sprinkling of larch. On the botany of Scotland H. C. Watson's *Topographical Botany* (1883) may be consulted.

According to the report of the crofters commission, the area under deer forests in Scotland is 1,675,269 acres, or about one-tenth of the whole area of the country. The species of deer peculiar to the Scottish Highlands is the red deer, the fallow deer is not uncommon

in the Lowlands, especially in the hilly south-western districts. The grouse moor of Scotland occupies a much more extensive area, and as a much greater number of persons. The grouse and blackcock are abundant in many districts, and pheasants and partridges, as well as hares, are carefully preserved on many estates in the cultivated districts. Rabbits are common throughout the whole country. Fox-hunting is a fashionable sport in most of the Lowland counties, but otter-hunting has almost died out. The beaver, and beaver, at one time common in Scotland, have become extinct. The last wolf, it is said, was killed by Sir Ewen Cameron of Lochiel in 1680. The wild cat is still to be found in the Highlands, and the reddest cat, and pine marten exist in considerable numbers. The golden eagle and the white-tailed eagle tenant the widest mountainous districts, but other large birds of prey, as the osprey and the kite, are becoming scarce. In all there are more than 300 species of birds in Scotland, including a great variety of water-fowl in the sea and inland lochs.

Fisheries.—Details regarding the Scottish fisheries will be found in *Fisheries* (vol. ix, pp. 257-262). The former Board of White Herring Fishery was abolished in 1882 and the Fishery Board of Scotland established, which has devoted more systematic attention to the collection of statistics and the general encouragement of the industry. In 1885 the herring and deep-sea fisheries engaged only about 30,000 persons in Scotland, but in 1884 they employed directly or indirectly 108,804 persons, while the total estimated produce in 1884 was valued at £3,851,545—the value of cod, haddock, ling, &c., being £2,279,414 (harrings, £2,121,946, cod, ling, and haddock, £149,467, ditto pickled, £3881), of white fish sold fresh, £716,295 (haddocks, £300,712, harrings, £150,720, cod, ling, and hake, £97,443, toad and saithe, £10,481, whiting, £32,808, sprats, £5252, mackerel, £5288, turbot, £2868, hohbait, £71824, flounders, £47,723, skate, £14,171, sole and other flat fish, £24,727), of shell-fish, £30,839, and of salmon, £275,000.

Mining Industries.—The chief sources of the mineral wealth of Scotland are coal and iron, which are generally found in convenient juxtaposition. The principal coal-fields are described under COAL (vol. vi, p. 52 sq.). The privilege of digging coal in the lands of Pittencrieff was conferred by charter on the abbot and convent of Dunfermline in 1291, and at a very early period the monks of Newbattle Abbey dug coal from surface-pits on the banks of the Esk. *Æneas Sylvius* (afterwards Pope Pius II.), who visited Scotland in the 15th century, refers to the fact that the people recovered at the church doors a species of stone which they burned in place of wood, but, although the value of coal for smith's and artificer's work was early recognized, it was not generally employed for domestic purposes till about the close of the 16th century. In 1606 an Act was passed binding colliers to perpetual service at the works at which they were engaged, and then full emancipation did not take place till 1759. An Act was passed in 1849 forbidding the employment of children of ten years and of women in underground mines. According to the census of 1851, the number of persons engaged in connexion with coal-mining was 36,973 males and 358 females (the latter employed above ground), and in 1881 the numbers were 53,340 and 401. According to the mineral statistics of 1885 there were 69,425 persons employed in the coal-mines of Scotland,—45,082 in the western and 24,343 in the eastern districts. The output within twenty years has been more than doubled. In 1854 it was 7,488,000 tons, by 1865 it had increased to 12,084,688, and in 1884 it was 21,186,688.

The rise of the iron industry in Scotland dates from the establishment in 1760 of the Carron Ironworks near Falkirk. The number of persons employed in non-mining in 1851 was 7648, and in non-manufacture 13,296, and by 1881 the numbers had increased respectively to 16,478 and 38,309. The total output of iron ore and non-ore in Scotland in 1884 was 1,855,376 tons, valued at £354,416, less than the estimated amount in 1858, which was 2,312,000 tons, valued at £750,000. There has been no increase in the manufacture of pig-iron since about 1866. The imports of iron ore were 356,380 tons in 1883, valued at £359,918, and in 1884 406,007 tons, valued at £356,451. The production of pig-iron increased with great rapidity after the introduction of railways. In 1796 the quantity produced was 15,840 tons, and in 1830 only 37,500, in 1840 it had risen to 211,000, in 1845 to 475,000, in 1865 to 1,164,000; but in 1884 it was only 938,200, the industry being confined to Ayrshire, Fife, and Lanarkshire. The iron-mills and forges in operation are confined to the last county, there being in 1884 22 works, 384 puddling furnaces, and 82 rolling mills. In 1884 there were 63 open-hearth steelworks in operation, of which 46 were in Glasgow, 10 in Holytown, 4 in Motherwell, and 3 in Wishaw, the quantity made in 1884 being 208,650 tons.

Since about the years 1850-55 shale-mining has become an important industry, especially in Lanthorn, where the shale being the total quantity mined in Scotland in 1884 being 1,469,849 tons, valued at £270,034. Lead ore is worked at Abington in Lanarkshire and Wainlockhead in Dumfriesshire, the dressed lead ore obtained amounts to 4927 tons, valued at £24,997, and yielding

1 These figures are for 1870 only

8219 tons of lead and 20,011 ounces of silver. The amount of fire-dug in 1884 was 463,294 tons, valued at £55,237. Stone quarrying, especially of granite, sandstone, flagstone, slate, and limestone, is extensively carried on, but the returns of the several amounts named annually are incomplete. The number of persons engaged in quarries in 1881 was 13,742, and the value of the materials raised in 1884 was estimated at £21,030,650. The principal granite works occur in Aberdeenshire and Kinkeddingishie, while freestone quarries are common throughout the greater part of the Lowland district, although whinstone also is frequently used for building purposes. Large quantities of paving stones are exported from Caithness and Forfarshire, and there is very extensive slate-quarries at Ballachulish and elsewhere in Argyleshire.

Woolen
cloth

Manufactures.—Although a company of woollen weavers was incorporated by the town council of Edinburgh in 1476, the cloth worn by the wealthier classes down to the beginning of the 17th century was of English or French manufacture, the lower classes wearing "coarse cloth made at home," in the fashion still prevailing in the remoter districts of the Highlands. In 1601 seven Flemings were brought to Edinburgh by commissioners from the bairns to instruct the people in the manufacture of wares and handicrafts, and eight years later a company of Flemings was established in the Canongate (Edinburgh) for the manufacture of cloth under the special protection of the king, but, notwithstanding also the establishment in 1681 of an English company for the manufacture of woollen fabrics near Haddington, the industry for more than fifty years after this made very tardy progress in the country. In fact its importance dates from the introduction and improvement of machinery in the 18th century. The most important branch of the trade, that of tweeds, first began to attract attention shortly after 1830, though still having its principal seat in the district from which it takes its name, including Galashiels, Hawick, Inverlothian, and Selkirk; it extends to a large number of towns throughout Scotland, especially to Aberdeen, Elgin, Inverness, Stirling, Bannockburn, and Paisley. The chief seat of the hosiery trade is Hawick. Carpet manufacture has had its principal seat in Kilnarnock since 1817, but is also carried on in Aberdeen, Ayr, Bannockburn, Glasgow, Paisley, and other towns. Tatties are largely manufactured in Tiltchoultry, Bannockburn, and Kilnarnock, and shawls and plaids are largely manufactured in several towns. In 1850 there were in Scotland 188 woollen and worsted factories, with 238,533 spindles and 247 power-looms, employing 16,210 persons. Twenty-eight years later (1878) the total number of factories was 246, in which there were 559,021 spinning spindles, 23,013 doubling spindles, and 6234 power-looms; the number of persons employed being 22,037, of whom 10,083 were males and 12,654 females.

Linon
and jute

The manufacture of cloth from flax is of very ancient date in Scotland, and towards the close of the 16th century besides linen cloths were largely exported to foreign countries, besides having an extensive sale in England. Regulations in regard to the manufacture were passed in 1641 and 1661. In a petition presented to the privy council in 1684, complaining of the severe treatment of Scotsmen selling linen in England, it was stated that 12,000 persons were engaged in the manufacture. Though the intercession of the secretary of state with the king those restrictions were removed. To further encourage the trade it was enacted in 1686 that the bodies of all persons, with the exception of poor tenants and cotters, should be buried in plain linen only, and that the same rule should be applied to the bodies of the poor. The act was repealed in 1693 and 1695, and in the former year another Act was passed prohibiting the export of hat and permitting its import free of duty. At the time of the Union the annual amount of linen cloth manufactured in Scotland is supposed to have been about 1,500,000 yards. The Union gave a considerable impetus to the manufacture, as did also the establishment of the Board of Manufactures in 1727, which applied an annual sum of £2550 to its encouragement, and in 1729 established a colony of French Protestants in Edinburgh, on the site of the present Trinity Place, to teach the spinning and weaving of cambric. From 1st November 1727 to 1st November 1728 the amount of linen cloth stamped in Scotland was 2,183,978 yards, valued at £108,312, but by the year ending 1st November 1771 it had increased to 13,672,545 yards, valued at £632,389, during the year ending 1st November 1798 to 21,397,059, valued at £2560,405, and by the year ending 1st November 1829, when the regulations as to the inspection and stamping of linen ceased, to 36,265,530 yards, valued at £1,396,096. The counties in which the manufacture is now most largely carried on are Forfar, Perth, Fife, Kinross, and Clackmannan; but Aberdeen, Renfrew, Lanark, Edinburgh, and Ayr are also in a considerable degree associated with it. Dundee is the principal seat of the coarse fabrics, Dunfermline of the table and other finer linens, while Paisley is widely known for its sewing threads. The allied industry of jute is the staple industry of Dundee. The number of persons employed in the flax-factories of Scotland in 1837 was 15,492. The following table (XVI) gives particulars of these factories for the years 1856, 1867, and 1878:—

Years	Factories	Spindles		Power Looms	Persons employed
		Spinning	Doubling		
1856	108	278,304		4,011	31,722
1867	197	487,070		10,017	57,145
1878	145	205,308	18,406	16,746	59,476

Primarily owing to foreign competition, the linen manufacture has within recent years been in a very languid condition.

The first cotton-mill in Scotland was built at Rotherley by an Cotton

English Company in 1778. It was soon afterwards acquired by David Dale, who was the agent in Scotland for Arkwright, and had the valuable aid of his counsel and advice. Dale also established cotton-factories in 1788 at New Lanark, afterwards so closely associated with the socialistic schemes of his son-in-law, Robert Owen, and thus laid the foundation of the industry in the two counties, Lanark and Renfrew, which are now its principal seats in Scotland. Nine-tenths of the cotton-factories of Scotland are now concentrated in Glasgow, Paisley, and the neighbouring towns, but the industry extends into other districts of the west of Scotland and is also represented in the counties of Aberdeen, Perth, and Stirling. The following table (XVII) gives particulars for 1850, 1861, 1875, and 1885:—

Years	Factories	Spindles	Power Looms	Persons employed
1850	108	1,432,078	23,641	84,835
1861	166	1,916,978	33,110	104,897
1875	96	1,711,214	20,171	85,529
1885	147	1,146,514	29,691	87,167

For further particulars regarding the manufacture in Scotland, see *Corrigan*, vol. vi pp 601-603.

Silk is manufactured in Paisley and Glasgow, but the industry Silk, &c. is of minor importance, employing only about 600 persons. Floor-cloth is manufactured at Kirkcaldy, where also the first linoleum factory in Scotland was established in 1877.

Near to the most important manufacture in Whisky. Scotland is that of whisky, in which it has Ireland for its only competitor. Distillation was introduced into Scotland from England, but by 1771 large quantities of spirits were sent to England from Scotland. The legal manufacture of whisky was greatly checked in the 15th century by occasional excessive advances in the rates of duty, but after the reduction to 2s 4d per gallon in 1828 the number of licensed distillers rapidly increased, and illegal distillation became much less common. The following table (XVIII) shows the number of gallons made in various years since 1824:—

Year	Gallons	Year	Gallons	Year	Gallons
1824	5,108,873	1865	11,583,605	1878	17,070,466
1840	6,022,343	1866	13,448,752	1881	20,104,007

Ale was a common beverage in Scotland as early as the 12th Beer century, there being one or more brew-houses attached to every religious house and burgh. So important was the use of the beverage even in the beginning of the 15th century that a threatened imposition of a tax on malt in 1726 led to serious riots in Glasgow and a proposal to repeal the Union. Though ale has been superseded by whisky as the national beverage, Scotland still possesses several large breweries, and Edinburgh alone exports with those of Burton-on-Trent. The number of barrels charged with duty in Scotland in 1885 was 1,237,823, this number in England being 24,619,173.

The first sugar-refinery in Scotland was erected in 1765 in Macclesfield, where the industry made rapid progress and has still numerous its principal seat, although it is extensively carried on in other parts, and in a lesser degree in Glasgow and Dundee. Glass-making, introduced in 1610 by Sir John Hay at Wemyss in Fife, is now of considerable importance, Edinburgh being celebrated for the finer branches of the manufacture. A paper-mill was erected in 1675 at Dalry Mills on the Water of Leith, in which French workmen were employed to give instruction, with the result, as was reported by the owners, that "grey and blue paper was produced much finer than ever was done before in the kingdom." The most important seat of the industry is now Valleyfield near Penicuik, where it was introduced in 1709. Edinburgh has since the time of the Ballantynes enjoyed a widely-extended fame for the excellence and beauty of its printing. The other manufactures prevailing in different parts of Scotland, such as those of leather, soap, earthenware and hardware, carriages, and the various implements and utensils in general use, do not call for special characterization.

Commerce and Shipping.—That Scotland had a considerable trade Shipping with foreign countries at a very early period may be inferred from the importation of rich dresses by Malcolm III. and the enjoyment of Oriental luxuries by Alexander I. David I. receives the special praise of Forthun for enriching "the ports of his kingdom with foreign merchandise." In the 13th century the Scots had

acquired a considerable celebrity in shipbuilding, and a powerful French barge had a ship specially built at Inverness in 1249 to convey him and his vessels to the Holy Land. The principal shipowners at this period were the clergy, who embarked the wealth of their religious houses in commercial enterprises. Definite statements regarding the number and tonnage of shipping are, however, lacking till the 18th century. From two reports printed by the Scottish Barge Board Society in 1881, it appears that the number of vessels belonging to the principal ports—Leith, Dundee, Glasgow, Kirkcaldy, and Montrose—in 1666 was 58, the tonnage being 3140, and that by 1692 they had increased to 97 of 5905 tons. These figures only represent a portion of the total shipping of the kingdom. At the time of the Union in 1707 the number of vessels was 215 of 11,435 tons. The following table (XIX.) gives the number for various years from 1850—

	1850		1860		1870		1884	
	No	Tons	No	Tons	No	Tons	No	Tons
Sailing vessels	3193	470,893	3172	422,213	2716	727,942	3036	527,295
Steam vessels	106	60,687	254	71,673	282	149,360	340	280,540
Total	3301	531,580	3426	493,791	2997	877,302	3376	807,835

Table XX shows the progress of the coasting and foreign trade since 1855—

Year	Coasting		Colonial and Foreign		Total	
	Entered	Cleared	Entered	Cleared	Entered	Cleared
1855	1,944,512	2,017,746	98,073	3,041,196	3,055,686	5,058,942
1880	6,025,724	4,991,148	1,270,919	3,068,897	7,296,643	8,060,045
1884	7,167,330	6,094,938	8,054,761	6,585,424	15,222,091	12,680,362

Commerce

Table XXI. shows the great expansion of the foreign and colonial trade since 1755—

Year	Imports	Exports	Year	Imports	Exports
1755	446,411	235,570	1825	2,491,804	2,546,276
1760	1,048,087	1,271,068	1831	8,920,108	5,676,116
1765	1,266,520	779,741	1874	31,012,750	17,418,943
1800	2,312,770	2,849,600	1880	81,997,623	16,346,078
1825	5,447,828	6,997,780	1884	96,000,526	23,421,565

The value of the imports into Scotland is only about a tenth of that of England, but this does not represent the proper proportion of foreign import to be used or consumed in Scotland, as large quantities find their way to Scotland from England by rail,—nearly all the tea, for example, consumed in Great Britain being imported into London, while various other goods have almost a monopoly of certain other imports. Reckoning by the combined value of their imports and exports, the principal ports of Scotland are Glasgow, Leith, Greenock, Dundee, Dumbarton, and Aberdeen, in the order named, but for particulars regarding the trade of these and other ports reference must be made to the articles on the several towns.

Ship-building

For many of the most important improvements in the construction of ships, especially steam vessels, that Britain is indebted to the enterprise and skill of the Clyde shipbuilders. From the time of the construction by Mr Robert Napier of the steamers for the Cunard line, founded in 1840, the shipbuilders on the Clyde have enjoyed an unrivalled reputation for the construction of large ocean steamers, both as regards mechanical appliances and the beauty and convenience of the internal arrangements. Shipbuilding is also carried on to a considerable extent at Dundee, Leith, and Aberdeen, and to a certain degree at most of the ports of the king-

dom, but within recent years the industry has been in a very fluctuating condition, the tonnage of the vessels constructed annually varying between 1880 and 1885 from a little over 100,000 to nearly 300,000.

National Wealth.—The immense increase in the wealth of National Scotland within the last 200 years is sufficiently noted by the fact, which, while in 1674 the value of the land was only £2,656,408 Scots or £204,700 sterling, the gross annual value of the land according to the estimate in the return of 1873 was £18,698,804, or more than sixty times as much, and about fifteen times as great as the proportional increase of population. This increase is of course partly due to agricultural improvements and partly to the discovery and development of the mineral wealth of Scotland, and may also be accounted for by the smaller representative value of money, and by the fictitious increase in rents in towns, which does not represent an increase in absolute value. The annual value of real property assessed for income-tax under schedule A in 1845 was £29,481,000, the average value for the three years ending 5th April 1883 was £16,995,718, and for the year ending 5th April 1884 the value was £17,066,716. For the year ending 5th April 1887 the amount of property and income charged with duty was £22,643,238, and during the following twenty-five years it was more than doubled, the average amount for the three years ending 5th April 1883 being £48,069,765, and for the year ending 5th April 1884 £49,600,348. This is less than a tenth of that for the United Kingdom. The total amount of money lying in deposit in savings banks in 1884 was £7,408,471,—about a seventh part of the whole amount deposited in the savings banks of the United Kingdom. Notices of the rise and progress of banking in Scotland will be found under BANKING (vol. in pp. 332-336). The total paid-up capital of the Scottish banks at the dates of balance in 1885 was £9,052,000 and then total liabilities £107,882,595.

Education.—Notices of the existence of schools in the principal elements occur as early as the 13th century. They were under the very supervision of the churches of each diocese and were chiefly schools devoted to studies preparatory for the church. Previous to the Reformation schools for general education were attached to many religious houses. In the *First Book of Discipline*, 1560, a comprehensive scheme of general education was promulgated, but neither this proposal nor an Act passed in 1616 by the privy council for the establishment of a school in every parish was carried into effect, and the system of parochial schools which prevailed until the passing of the Education Act of 1872 remained the same. Previous to 1616, and May in 1698 providing for the maintenance of a school in every parish at the cost of the heritors. The various religious sects in Scotland led to the founding of a large number of denominational and subscription schools, and at the Disruption in 1843 the Free Church made provision for the supply of secular education as well as religious instruction to its adherents. The Education Act of 1872 abolished the old system of parochial schools, and provided for the creation of districts under the management of school boards elected for three years by the ratepayers, male and female. These boards have the power to levy rates for the maintenance and erection of schools for primary instruction, elect the teachers, and enforce the clause in regard to compulsory attendance. The maintenance of schools is also aided by a Government grant, and the salary of the teacher is paid partly by school fees and partly by a grant dependent upon the result of the examination of the scholars by the Government inspectors, the school board having the power, however, to make their own terms with the teacher. Denominational schools are permitted to receive a Government grant. The following table (XXII.) shows the proportion of persons in the receipt of education in Scotland in 1801, 1871, and 1881.—

Year	Population at different Ages			Persons in Receipt of Education			Percentages to the Population at each Age		
	0-5 years	5-15 years	15 and above	0-5 years	5-15 years	15 and above	0-5 years	5-15 years	15 and above
1801	417,239	685,912	1,999,121	3,662,294	8,506	49,488	0.88	61.00	0.06
1871	459,020	770,871	2,157,627	8,260,018	10,025	641,971	2.40	67.11	1.61
1881	610,501	855,015	2,996,907	3,785,573	14,128	676,111	3.00	69.77	1.70

Particulars in regard to schools under school board management are given in the following table (XXIII.)—

Year	Total Expenditure	Number of Scholars	School Places	Schools Inspected	Rate per Scholar	Openings	Attendance	Estimated	in Higher	Orphaned	Assistant Teachers	Pupil Teachers
1871	474,146	311,164	391,388	2785	41.15	92	19,068	8811	129	4092		
1881	938,229	656,072	656,072	3181	29.15	2	41,429	6020	1012	3039		

All the training colleges for teachers in bond schools are connected with religious denominations—those with the Established Church, those with the Free Church, and one with the Episcopal Church.

Secondary schools

As early as the 11th century some of the burghs had grammar-schools partly under the control of the magistrates. In 1496 an

Act was passed enjoining the attendance at the schools of the oldest sons of barons and freeholders until "they be founded in perfect Latin, and thereafter to remain at the schools of arts and law (where schoolmasters were trained). The grammar or burgh schools enjoyed a monopoly of teaching certain branches, and private schools were frequently prohibited as interfering with their rights. Grammar-schools were chiefly devoted to instruction in Latin, and the course usually extended to five years. According to the report of the education commissioners, the number of burgh schools in 1867 was twenty-six. By the Act of 1872 their management was transferred to the school board, but they were excluded from participation in the school fund, and no provision was made for their inspection. The Act of 1873 authorized certain grants of money, and contained certain provisions for inspection, which, however, have been practically inoperative. The *Provisional Memorandum* Act of 1882 provides for a more comprehensive scheme for the

promotion of secondary education, and also for a scheme of systematic inspection. These educational endowments—the result of private bequest—yield an annual income of £175,000, and, on account of the changed conditions of society, the primary objects of the donors were in a great degree frustrated by the manner in which they were being administered. Some of the best secondary schools in Scotland are under the management of trustees. For the four universities of Scotland (St Andrews, Aberdeen, Glasgow, and Edinburgh) see the articles on these cities, also *UNIVERSITIES*. University College in Dundee and Anderson's College in Glasgow have similar courses of instruction to the universities, but possess no power to grant degrees and are not Government aided. A notice of the various medical schools and scientific colleges may be found in the articles on the towns in which they are situated.

Religion.—For an historical account of the more important religious denominations of Scotland the reader is referred to the articles *SCOTLAND, CHURCH OF*, *FREE CHURCH OF SCOTLAND*, *UNITED PRESBYTERIAN CHURCH*, and *PRESBYTERIANISM*. The bulk of the population is Presbyterian, and the following table (XXIV) gives particulars reported in 1885 regarding the Church of Scotland, and other churches originated by secession from it at various times,—the “contributions” indicating the amount raised by the churches for all purposes, and of course excluding the endowments of the Established Church.—

	Church of Scotland	Free Church	U.P. Church	Evangelical	Original Secedists	Reformed Presby
Comm. congregations	1,470	1,007	643	87	97	12
Members	546,931	546,928	18,210	8,246	2,606	220
Contributions	£206,431	£208,687	£687,956	£1,700		

The Roman Catholic Church has 327 “churches, chapels, and stations,”—the estimated population connected with it being over 340,000. The Episcopal Church in Scotland has about 250 churches with 50,000 members (of all ages) and nearly 80,000 communicants. The churches in connection with the Congregational Union number 101, 73 of which report a membership of 10,869, the money raised for all purposes in 1884-85 being £28,027. The Baptist Union has 88 churches with 9988 members, and the Wesleyan Methodists have 26 “circuits” with 4653. There are a few other religious denominations, such as the Primitive Methodists, the Catholic Apostolic Church, and the Glasites, but the membership of each is comparatively small.

Government, Law, and Local Administration.—By the Act of Union in 1707 Scotland ceased to have a separate parliament and its government was assimilated to that of England. In the parliament of Great Britain its representation was fixed at sixteen peers (the same number as at present) elected by the peers of Scotland at each new parliament, in the House of Lords, and at forty-five members in the House of Commons,—the counties returning thirty and the burghs fifteen. The power of the sovereign to create new Scottish peers lay with the Union, and then number has already diminished by nearly one-half. By the Reform Act of 1832 the number of Scottish representatives in the Commons was raised to fifty-three, the counties under a slightly altered arrangement returning thirty members as before, and the burghs, reinforced by the creation of various towns into parliamentary burghs, twenty-three, the second Reform Act (1868) increased the number to thirty-five, and the third Reform Act (1885) to twenty-two members, while three additional members were assigned to the counties and two to the burghs; by the Redistribution of Seats Act of 1885 an addition of six members was made to the representation of the counties and six to that of the burghs, the total representation being raised to seventy-two. The management of Scottish business in parliament has since 1885 been under the charge of the secretary for Scotland.

As the Union Scotland retained its old system of law and legal administration, a system modelled on that of France, but since the Union the laws of England and Scotland have been on many points assimilated, the criminal law of the two countries being now practically identical, although the methods of procedure are in many respects different. The Court of Session, as the supreme court in civil causes is called, dates from 1532, and was formed on the model of the parliament of Paris; it is held at Edinburgh, the capital. Since the Union it has undergone certain modifications. It consists of thirteen judges, acting in an Inner and an Outer House. The Inner House has two divisions, with four judges each, the first being presided over by the lord president of the whole court, and the second by the lord justice clerk. In the Outer House five judges, called lords ordinary, sit in separate courts. Appeals may be made from the lords ordinary to either of the divisions of the Inner House, and, if the decision demands, the opinion of all the judges of the Court of Session may be called for, but whether this be done or not the decision is regarded as a decision of the Court of Session. Appeals may be made from the Court of Session to the House of Lords. The lord justice general (lord president), the lord justice clerk, and five other

judges form the High Court of Justiciary, instituted in 1872, for criminal cases, which sits at Edinburgh for the trial of cases from the three Lothians and of cases referred from the circuit courts. The latter meet for the south at Jedburgh, Dumfries, and Ayr, for the west at Glasgow, Inverary, and Stirling, and for the north at Perth, Aberdeen, Dundee, and Inverness. The law agents who undertake cases to be decided before the supreme courts are called solicitors before the supreme courts or *advocates* to the signet, the latter of whom possess certain special privileges. The lawyer authorized to plead before the supreme courts is termed an advocate. The principal law officer of the crown is the lord advocate, who is assisted by the solicitor-general and by advocates-depute. The lord advocate has since 1865 resided in the city of Edinburgh, in the House of Commons. See *ADVOCATE*, vol. 1 178. The subordinate legal courts and officials are described under the next heading.

The largest administrative area is that of the county, but for local purposes of registration Scotland is partitioned into eight divisions, admitted to each of which an examiner for inspection of registers is appointed, chosen by the registrar-general, and for the carrying out of the provisions of the Land-tax Act it is divided into twenty-two districts. The registration counties date from the Act of 1854 providing that for purposes of registration the areas of the counties may be altered. For the purposes of the General Police Act of 1862 part of the area of one county may also be brought into the area of another. Certain counties have been united for parliamentary or other purposes, and certain others have been divided for parliamentary purposes, while others again for certain administrative purposes have been divided into sub-divisions, Lanark for assessment purposes being still divided into wards. The civil counties were originally synonymous either with sheriffdoms or stewartries. Stewartries ceased with the abolition of hereditary jurisdictions in 1746, but Kirkcaldy still retains the designation. The office of sheriff, which formerly implied a much less limited authority than at present, was in existence in the reign of David I., when the greater part of the kingdom was divided into twenty-four sheriffdoms. In the latter part of the 18th century they numbered thirty-four. The counties now number thirty-three, of which Ross and Cromarty constitute one, while Edinburgh is a “county of a city.” The highest county dignitary is the lord-lieutenant, the office being instituted in 1782. It is nominated by the crown, holds office for life, except in cases of misconduct, represents the crown in military matters, recommends for commissions and the peace, holds the peace, appoints the high sheriff, and is a member of the police committee. The sheriff, however, the office is little more than honorary, and the real administration of county affairs is in the hands of commissioners of supply, who were originally appointed to apportion and collect the national revenue, but who now regulate the land-tax, control the county police, raise the militia, and levy rates to meet the county expenditure. In 1878 an Act was passed for the election of lord trustees, who have the power to levy rates for the maintenance throughout the county of roads and bridges (see p. 530 above). The practical administration of the law in the county is under the control of the sheriff. See *SHERIFF*. A large proportion of his duties are, however, delegated to the sheriff-substitute. At one time the functions of the sheriff-priest were confined to one county, but by an Act passed in 1855 it was arranged that as sheriffdoms fell vacant certain counties should be grouped into districts, each under the control of one sheriff-priest, and in 1870 this arrangement was further modified by the enactment of the sheriff-clerk, appointed by the crown, has, under the Ballot Act of 1872, the charge of ballot papers in connection with the parliamentary elections, and is *custos rotulorum*. The public prosecutor for counties is the procurator-fiscal, who takes the initiative in regard to suspected cases of sudden death, although in this respect the law of Scotland is less strict than that of England. Justices of the peace, who are unpaid, and require no special education, but who, as they are recommended by the lord-lieutenant, are generally persons of position in the county, exercise a certain subordinate jurisdiction. Their office expires on the demise of the crown. In every commission of the peace certain public officials are included. The justices of the peace hold quarter sessions, take affidavits and declarations (such as declarations of marriage), sign warrants, try petty criminal cases (such especially as poaching and assault), and regulate public-house licenses. Under the Poor-law Act of 1834 (vol. 1 p. 58-64) will be found an account of the history and constitution of the three classes of ancient burghs in Scotland,—royal burghs, burghs of regality, and burghs of barony. Police burghs, which may include any of the other classes of burghs, are formed of those places which have adopted the General Police and Improvement Acts (18 and 14 Viet. c. 83 and 25 and 26 Viet. c. 101). They are governed by police commissioners, who have power to regulate all sanitary matters. They may include more than one of the other burghs and may be added into another county. Under the Improvement Act (25 and 26 Viet. c. 101) most of the burghs with over 7000 inhabitants maintain their own police. The parliamentary burghs do not now include all the royal burghs and include various other towns in addition to them. The number of royal

had shown that if they acted in this way their nominee, while legally minister of the parish, could not claim the stipend. To the risk of such sacrifices the church, led by the Moderate party, refused to expose herself. By the new policy inaugurated by Dr Robertson, which led to the second secession, the assembly compelled presbyteries to give effect to presentations, and in a long series of disputed settlements the "call," though still held essential to a settlement, was less and less regarded, until it was declared that it was not necessary, and that the church courts were bound to induct any qualified presentee. The substitution of the word "concurrence" for "call" about 1764 indicates the subsidiary and ornamental light in which the assent of the parishioners was now to be regarded. The church could have given more weight to the wishes of the people, she professed to regard patronage as a grievance, and the annual instructions of the assembly to the commission (the committee representing the assembly till its next meeting) enjoined that body to take advantage of any opportunity which might arise for getting rid of the grievance of patronage, an injunction which was not discontinued till 1784. It is not likely that any change in the law could have been obtained at this period, and disregard of the law might have led to an exhausting struggle with the state, as was actually the case at a later period. Still it was in the power of the church to give more weight than she did to the feelings of the people, and her working of the patronage system drove large numbers from the Establishment. A melancholy catalogue of forced settlements marks the annals of the church from 1749 to 1780, and wherever an unpopular presentee was settled the people quietly left the Establishment and erected a meeting-house. In 1763 there was a great debate in the assembly on the progress of schism, in which the popular party laid the whole blame at the door of the Moderates, while the Moderates rejoined that patronage and Moderatism had made the church the dignified and powerful institution she had come to be. In 1764 the number of meeting-houses was 120, and in 1773 it had risen to 190. Nor was a conciliatory attitude taken up towards the seceders. The ministers of the Relief desired to remain connected with the Establishment, but were not suffered to do so. Those ministers who resigned their parishes to accept calls to Relief congregations, in places where forced settlements had taken place, and who might have been and claimed to be recognized as still ministers of the church, were deposed and forbidden to look for any ministerial communion with the clergy of the Establishment. Such was the policy of the Moderate ascendancy, or of Principal Robertson's administration, on this vital subject. It had the merit of success in so far as it completely established itself in the church. The presbyteries ceased to disregard presentations, and lay patronage came to be regarded as part of the order of things. But the growth of dissent steadily continued and excited alarm from time to time; and it may be questioned whether the peace of the church was not purchased at too high a price. The Moderate period is justly regarded as in some respects the most brilliant in the history of the church. Her clergy included many distinguished Scotsmen, of whom an account is given under their respective names. See REID (Thomas), CAMPBELL (George), FRERSON (Adam), HOME (John), BLAIR (Hugh), ROBERTSON (William), and ERSKINE (John). The labours of these men were not mainly in theology; in religion the age was one not of advance but of rest; they gained for the church a great and widespread respect and influence.

Another salient feature of the Moderate policy was the consolidation of discipline. It is frequently asserted that discipline was lax at this period and that ministers of scandalous lives were allowed to continue in their charges. It cannot, however, be shown that the leaders of the church

at this time sought to procure the miscarriage of justice in dealing with such cases. That some offenders were acquitted on technical grounds is true, it was insisted that in dealing with the character and status of their members the church courts should proceed in as formal and punctilious a manner as civil tribunals and should recognize the same laws of evidence, in fact, that the same securities should exist in the church as in the state for individual rights and liberties.

The religious state of the Highlands, to which at the period of the Union the Reformation had only very partially penetrated, occupied the attention of the church during the whole of the 18th century. In 1725 the gift called the "royal bounty" was first granted,—a subsidy amounting at first to £1000 per annum, increased in George IV's reign to £2000, and continued to the present day, its original object was to assist the reclamation of the Highlands from Roman Catholicism by means of catechists and teachers. The Society for Propagating Christian Knowledge, incorporated in 1709, with a view partly to the wants of the Highlands, worked in concert with the Church of Scotland, setting up schools in remote and destitute localities, while the church promoted various schemes for the dissemination of the Scriptures in Gaelic and the encouragement of Gaelic students. In consequence of these efforts Roman Catholicism now lingers only in a few islands and glens on the west coast. In these labours as well as in other directions the church was sadly hampered by poverty. The need of an increase in the number of parishes was urgently felt, and though chapels began to be built about 1796, they were provided only in wealthy places by local voluntary liberality, for the supply of the necessities of poor outlying districts no one as yet looked to any agency but the state. In every part of the country many of the ministers were miserably poor, there were many stipends, even of important parishes, not exceeding £40 a year, and it was not till after many debates in the assembly and appeals to the Government that an Act was obtained in 1810 which made up the poorer livings to £150 a year by a grant from the public exchequer. The churches and manse were frequently of the most miserable description, if not falling to decay.

With the close of the 18th century a great change passed over the spirit of the church. The new activity which sprang up everywhere after the French Revolution produced in Scotland a revival of Evangelicalism which has not yet spent its force. Moderatism had cultivated the ministers too fast for the people, and the church had become to a large extent more of a dignified ruler than a spiritual mother. About this time the brothers Robert and James Haldane devoted themselves to the work of promoting Evangelical Christianity, James making missionary journeys throughout Scotland and founding Sunday schools, and in 1798 the eccentric preacher Rowland Hill visited Scotland at their request. In the journals of these evangelists dark pictures are drawn of the religious state of the country, though their censorious tone detracts greatly from their value; but there is no doubt that the efforts of the Haldanes brought about or coincided with a quickening of the religious spirit of Scotland. The assembly of 1799 passed an Act forbidding the admission to the pulpits of laymen or of ministers of other churches, and issued a manifesto on Sunday schools. These Acts helped greatly to discredit the Moderate party, of whose spirit they were the outcome; and that party further injured their standing in the country by attacking Leslie, afterwards Sir John Leslie, on frivolous grounds,—a phrase he had used about Hume's view of causation—when he applied for the chair of mathematics in Edinburgh. In this dispute, which made a great sensation in the country, the popular party successfully defended Leslie, and thus obtained the sympathy of

the enlightened portion of the community. In 1810 the *Christian Inquirer* began to appear under the editorship of Dr Andrew Thomson, a churchman of vigorous intellect and noble character. It was an ably written review, in which the theology of the Haldanes asserted itself in a somewhat dogmatic and confident tone against all unsoundness and Moderatism, clearly proclaiming that the former things had passed away. The question of pluralities began to be agitated in 1813, and gave rise to a long struggle, in which Dr Chalmers took a notable part, and which terminated in the regulation that a university chair or professorship should not be held along with a parish which was not close to the university seat.

The growth of Evangelical sentiment in the church, along with the example of the great missionary societies founded in the end of the 18th and the beginning of the 19th century, led to the institution of the various missionary schemes still carried on, and then history forms the chief part of the history of the church for a number of years. The education scheme, having for its object the planting of schools in destitute Highland districts, came into existence in 1824. The foreign mission committee was formed in 1825, at the instance of Dr Inglis, a leader of the Moderate party, and Dr Duff went to India in 1829 as the first missionary of the Church of Scotland. The church extension committee was first appointed in 1828, and in 1834 it was made permanent. The colonial scheme was inaugurated in 1836, and the Jewish mission in 1838, Mr Cheyne and Andrew Bonar setting out in the following year as a deputation to inquire into the condition of the Jews in Palestine and Turkey and on the Continent of Europe.

Of these schemes that of church extension has most historical importance. It was originally formed to collect information regarding the spiritual wants of the country, and to apply to the Government to build the churches found to be necessary. As the population of Scotland had doubled since the Reformation, and its distribution had been completely altered in many counties, while the number of parish churches remained unchanged, and meeting-houses had only been erected where seceding congregations required them, the need for new churches was very great. The application to Government for aid, however, proved the occasion of a "Voluntary controversy," which raged with great fierceness for many years and has never completely subsided. The union of the Burgher and the Anti-burgher bodies in 1820 in the United Secession—both having previously come to hold Voluntary principles—added to the influence of these principles in the country, while the political excitement of the period disposed men's minds to such discussions. The Government built forty-two churches in the Highlands, providing them with a slender endowment; and these are still known as parliamentary churches. Under Dr Chalmers, however, the church extension committee struck out a new line of action. That great philanthropist had come to see that the church could only reach the masses of the people effectively by greatly increasing the number of her places of worship and abolishing or minimizing seat-rents in the poorer districts. In his powerful defence of establishments against the voluntaries in both Scotland and England, in which his ablest assistants were those who afterwards became, along with him, the leaders of the Free Church, he pleaded that an established church to be effective must divide the country territorially into a large number of small parishes, so that every corner of the land and every person, of whatever class, shall actually enjoy the benefits of the parochial machinery. This "territorial principle" the church has steadily kept in view ever since. With the view of realizing this idea he appealed to the church to provide funds to build a large number of new churches, and personally

carried his appeal throughout the country. By 1835 he had collected £65,626 and reported the building of sixty-two churches in connexion with the Establishment. The keenness of the conflict as it approached the crisis of 1843 checked the liberality of the people for this object, but by 1841 £303,747 had been collected and 222 churches built.

The zealous orthodoxy of the church found at this period several occasions to assert itself. Mr Leod Campbell, minister of Row, was deposed by the assembly of 1830 for teaching that assurance is of the essence of faith and that Christ died for all men. He has since been recognized as one of the profoundest Scottish theologians of the 19th century, although his deposition has never been removed. The same assembly condemned the doctrine put forth by Edward Irving, that Christ took upon Him the sinful nature of man and was not impeccable, and Irving was deposed five years later by the presbytery of Annan, when the outburst of supposed miraculous gifts in his church in London had rendered him still more obnoxious to the strict censures of the period. In 1841 Wright of Bothwick was deposed for a series of heretical opinions, which he denied that he held, but which were said to be contained in a series of devotional works of a somewhat mystical order which he had published.

The influence of dissent also acted along with the rapidly rising religious favour of the age in quickening in the church that sense of a divine mission, and of the right and power to carry out that mission without obstruction from any worldly authority, which belongs to the essential consciousness of the Christian church. An agitation against patronage, the ancient root of evil, and the formation of an anti-patronage society, helped in the same direction. The Ten Years' Conflict, which began in 1833 with the passing by the assembly of the Veto and the Chapel Acts, is treated in the article FREE CHURCH OF SCOTLAND. It is not therefore necessary to dwell further in this place on the consequences of those Acts. The assembly of 1843, from which the exodus took place, proceeded to undo the Acts of the church during the preceding nine years. The Veto was not repealed but ignored, as having never had the force of law, the Strathgogie ministers were recognized as if no sentence of deposition had gone forth against them. The protest which the moderator had read before leaving the assembly had been left on the table, and an Act of Separation and deed of demission were received from the ministers of the newly formed Free Church, who were now declared to have severed their connexion with the Church of Scotland. The assembly addressed a pastoral letter to the people of the country, in which, while declining to "admit that the course taken by the seceders was justified by irresistible necessity," they counselled peace and goodwill towards them, and called for the loyal support of the remaining members of the church.

Two Acts at once passed through the legislature in answer to the claims put forward by the church. The Scottish Benefices Act of Lord Aberdeen, 1843, gave the people power to state objections personal to a presentee, and bearing on his fitness for the particular charge to which he was presented, and also authorized the presbytery in dealing with the objections to look to the number and character of the objectors. Sir James Graham's Act, 1844, provided for the erection of new parishes, and thus created the legal basis for a scheme under which chapel ministers might become members of church courts.

The Disruption left the Church of Scotland in a sadly diminished condition. Of 1203 ministers 451 left her, and among these were many of her foremost men. A third of her membership is computed to have gone with them. In Edinburgh many of her churches were nearly empty. The 1843 Gaelic-speaking population of the northern counties com-

pletely deserted her. All her missionaries left her but one. She had no gale of popular enthusiasm to carry her forward, representing as she did not a newly arisen principle but the opposition to a principle which she maintained to be dangerous and exaggerated. For many years she had much obloquy to endure. But she at once set herself to the task of filling up vacancies and recruiting the missionary staff. A lay association was formed, which raised large sums of money for the missionary schemes, so that then income was not allowed sensibly to decline. The good works of the church, indeed, were in a few years not only continued but extended. All hope being lost that parliament would endow the new churches built by the church extension scheme of Dr Chalmers, it was felt that this also must be the work of voluntary liberality. Under Dr James Robertson, professor of church history in Edinburgh, one of the leading champions of the Moderate policy in the Ten Years' Conflict, the extension scheme was transformed into the endowment scheme, and the church accepted it as her duty and her task to provide the machinery of new parishes where they were required. By 1854 30 new parishes had been added at a cost of £130,000, and from this time forward the work of endowment proceeded still more rapidly. In 1860 61 new parishes had been endowed, in 1870 150, in 1876 250, while in 1886 there were 351.¹ In 1843 the number of parishes was 924. Of 42 parliamtary churches existing at that time 40 have been erected into parishes *quoad sacra*, hence the total number of parishes in Scotland at midsummer 1886 was 1315. By the Poor Law Act of 1845 parishes were enabled to remove the care of the poor from the minister and the kirk-session, in whom it was formerly vested, and to appoint a parochial board with power to assess the ratepayers. The Education Act of 1872 severed the ancient tie connecting church and school together, and created a school board having charge of the education of each parish. At that date the Church of Scotland had 300 schools, mostly in the Highlands. The church, however, continues to carry on normal schools for the training of teachers in Edinburgh, Glasgow, and Aberdeen.

In 1874 patronage was abolished. The working of Lord Aberdeen's Act had given rise to many unifying scenes and to lengthy struggles over disputed settlements, and it was early felt that some change at least was necessary in the law. The agitation on the subject went on in the assembly from 1857 to 1869, when the assembly by a large majority condemned patronage as restored by the Act of Queen Anne, and resolved to petition parliament for its removal. The request was granted, and the right of electing parish ministers was conferred on the congregation, thus a grievance of old standing, from which all the ecclesiastical troubles of a century and a half had sprung, was removed and the church placed on a thoroughly democratic basis. This Act, combined with various efforts made within the church for her improvement, has secured for the Scottish Establishment a large measure of popular favour, and during the last quarter of a century she has grown rapidly both in numbers and in influence. This revival is largely due on the one hand to the improvement of her worship which began with the efforts of Dr Robert Lee (1804-1868), minister of Old Geyfrins, Edinburgh, and professor of Biblical criticism in Edinburgh university. By introducing into his church a printed book of prayers

and also an organ Dr Lee stirred up vehement controversies in the church courts, which resulted in the recognition of the liberty of congregations to improve their worship. A church service society, having for its object the study of ancient and modern liturgies, with a view to the preparation of forms of prayer for public worship, was founded in 1865, it has published five editions of its "Book of Common Order," which, though at first regarded with suspicion, is now recognized as a useful and respected adjunct. Church music has been cultivated and improved in a marked degree, a fine collection of hymns has been introduced to supplement the psalms and paraphrases. And architecture has restored the larger churches from their disfigurement by partition walls and galleries—though much still remains to be done in this way—and has erected new churches of a style favourable to devotion.

The favour of the church has, on the other hand, found Committee on a channel in the operations of a "Committee on Christian Life and Work," appointed in 1869 with the aim of exercising some supervision of the work of the church throughout the country, stimulating evangelistic efforts, and organizing the labours of lay agents. This committee publishes a magazine of "Life and Work," which has a circulation of about 100,000, and has lately been seeking to organize young men's guilds in connexion with congregations. It was to reinforce this element of the church's activity, as well as to strengthen her generally, that Mr James Baird in 1873 made the munificent gift of £500,000. This fund is administered by a trust which is not under the control of the church, and the revenue is used mainly in aid of church building and endowment throughout the country.

The church has greatly increased of late years in liberality of sentiment, and there has been no disposition for heresy since 1843. A volume of *Scottish Sermons* published in 1880 by ministers holding liberal views brought out the fact that the church would not willingly be led into such prosecutions. An agitation on the part of the Dissenters for disestablishment sprang up afresh after the passing of the Patronage Act and has continued ever since, while a counter-movement was represented by a Bill, introduced into parliament in 1886 to declare the spiritual independence of the Church of Scotland, which, if successful, would, it was understood, have opened the way for a reunion of the Presbyterian bodies.²

Church Membership.—The Church of Scotland has now (1886) Statistics 1315 parishes, 160 non-parochial churches, and 121 preaching and of mission stations, in all 1696 charges. The number of presbyteries therein, is 84, and there are 16 provincial synods. The general assembly consists of 323 clerical and 113 lay members elected by presbyteries, with 73 representatives of royal burghs and universities, and 4 representatives of churches abroad, in all 447 members. In 1873 the number of communicants as returned to parliament in 1874 was 460,626, in 1878 the number as returned to parliament in 1879 was 514,786, in 1883 the number returned to the assembly of 1884 was 643,969, in 1885, 664,435. The professors of divinity at the four Scottish universities must be ministers of the church, and students aspiring to the ministry are required to attend one of the divinity halls of the universities for three sessions, after an average course of three years. A large number of ministers of the church are employed elsewhere than in Scotland. The Church of Scotland in England consists of 16 charges. There are 31 chaplains ministering to Presbyterians in the army and navy, 15 of these being stationed in India. The foreign mission employs 15 ordanet and 11 unordained European missionaries, with a large number of native agents, in India, East Africa, and China. The Jewish mission employs 6 ordained ministers, with other agents, at Constantinople, Smyrna, Salomica, Beyrout, and Alexandria. The colonial committee supplies religious ordinances to emigrants from Scotland in India, Fiji, Cyprus, Mauritius, Ceylon, and the West Indies, besides assisting Presbyterian colleges in Canada and Australia. A minister of the church presides over a Scots church of old standing at Amsterdam. Two lectureships have been founded in recent times in connexion with the church—one by Mr James Baird (already mentioned),

¹ Those branches of the church extension scheme which dealt with church building, and with the opening of new missions to meet the wants of increasing populations, were taken up by a new department, called the home mission scheme. The home mission as the pioneer in opening up new fields of labour, and the endowment scheme which renders permanent the religious centres that the mission has founded, are both traceable to Dr Chalmers.

² For the period since 1843 the most useful book is Dr Story's *Life of Dr Robert Lee*, 1870.

Abolition of patronage

Improvements in public worship

the other by Mr. John Croall of Southfield—and these have already produced several notable contributions to Scottish theology.

An association for augmenting the smaller livings was formed in 1886, and the church now has a smaller livings scheme, which aims at bringing up to £200 a year all livings that fall below that sum. Such numbered 311 in 1885, and the sum distributed among them was £2537, which, however, was £5000 short of the sum necessary to accomplish fully the desired object.

In the following details of the income of the church we give first the value of her endowments and then some figures showing the growth of her voluntary liberality.

Finance

Means from Endowments—(1) From a parliamentary return obtained in 1874 the church is seen to derive from tithes, including the value of manse and glebe, the annual sum of £259,113. Augmentations have been obtained since that date amounting to upwards of £10,000, but the rates have declined during the same period by nearly 25 per cent., so that the total amount so derived has not increased. The manse-housed tithes amounted in 1880 to £134,418. (2) The exchequer pays to 1900 parishes and to 42 Highland churches, from which property in the hands of the crown, £17,040. (3) From local sources the church derives £23,661. (4) The endowments raised by the church for 322 new parishes amount to £42,550. The total endowments, not counting church buildings, amount to £353,041.

Means from Voluntary Liberality—The following table (I) gives a view of the financial progress of certain of the schemes of the church since the secession —

Year	Foreign Mission	Education	Colonial Scheme	Jewish Mission	Home Mission
1842	£6,748	£200	£3,753	£498	
1845	8,673	368	5,461	1367	£2,615
1850	6,047	4019	5,797	3473	5,507
1855	8,715	4400	8,002	3919	8,593
1860	4,578	4587	8,328	2884	4,558
1865	5,522	4024	8,496	3259	5,539
1870	7,754	4645	8,684	4101	7,093
1875	12,815	9645	8,871	6644	11,163
1880	13,370		11,674	4718	15,004
1885	18,346		4,700	8138	9,459

No attempt was made until 1878 to collect statistics of the whole liberality of the church; and changes introduced from time to time in the mode of stating the various sums make it impossible to give a complete comparative statement since that date. The following table (II) shows the amount of quinquennial periods down to 1885, the church-door collections and seat-tithes probably affording the most accurate indication of the general progress of the body. The building operations of which the values are given include only such building as is the result of voluntary effort. Under the head of "general church objects" are included the collections for missions, for small livings, aged and infirm ministers, *seminars missiones*, &c. These figures do not include income from trust funds or endowments; they state what was given in the year referred to. A number of objects of liberality are not included in the table.

Year	Church-door Collections	Seat Tithes	Church or Manse Building or Repairs	General Church Objects	Other Objects	Total
1872	£41,561	£38,225	£31,881	£48,018	£27,224	£235,510
1877	65,557	50,094	60,550	46,117	34,872	378,715
1882	76,359	65,559	67,184	51,220	61,328	388,061
1885	80,887	65,197	60,365	60,110	61,738	378,507

The following sums were raised during the thirteen years 1872-84—congregational and charitable purposes, £1,462,061, support of ordinations and supplement of stipends, £238,406, education (exclusive of sums raised for training colleges), £161,931, home mission work, £238,543, church building, £737,775; endowment of new parishes, £456,869, foreign mission work, £376,528; total, £3,815,962. Mr James Baird's gift is not included in this statement. (A. M.*)

SCOTLAND, LITERATURE OF. Literature in Scotland, as distinct from England, dates from the time of COLUMBA (*q.v.*). Adamnan, abbot of Iona, who in 690 wrote in Latin the life of his predecessor, may be regarded as the first author that Scotland produced. In addition to his biography of St Columba, a long extract from a work of his on the "Holy Places" is incorporated by Bede in his *Ecclesiastical History*. The greater part of Scotland was at that time inhabited by a Celtic population and the period from the 7th to the 13th century has left but few literary remains (see CELTIC LITERATURE, vol. v. p. 313). In the latter part of the 13th century what may be called the ancient literary language of Scotland was used in the district between the Humber and the Forth and coastwise as

far north as Aberdeen. Its earliest writer is Thomas of Erlandsone, or Thomas the Rhymer, who reached the height of his fame in 1280. The fairy tale or romance that bears his name may be regarded as the earliest example of romance poetry in Britain. Nearly contemporary with the Rhymer were two other distinguished Scots, Michael Scott (*q.v.*) and John of Dunis, or DUNS SCOTTS (*q.v.*), both of whom, however, wrote in Latin. Three Athanasian Athanasian romances taken from Anglo-Norman sources relating to Sir Gawain, one of the most celebrated knights of the Round Table, seem to have been composed about the end of the 13th century. These were—*Syn Gawayn and the Grene Knyght*, the *Knighly Tale of Golagros and Gawayne*, and the *Awmyrs of Arthun at the Tennewethelme*. Sir Gawain's exploits were so popular in the south of Scotland that he was claimed by the people as one of their own chieftains and called the lord of Galloway. The *Awmyrs of Arthun*, or the adventures of King Arthur at the Tennywading, a small lake near Carlisle, and the *Pythil of Sweete Susan*, a version of the apocryphal story of Susanna, are supposed to have been the productions of Sir Hew of Eghintoun about that period. The *Taill of Raif Colvair*, in which the adventures of the emperor Charlemagne in the house of a charcoal-burner named Ralph in the neighbourhood of Paris are related with much poetic humour, and the fairy tale of *Orfeo and Hewodras* were written in the early part of the 14th century and were very popular in Scotland in former times.

The War of Independence gave a new impetus to Scottish nationality and produced a corresponding effect on the literature of the country. The *Brus*, or metrical account of the deeds of Robert Bruce, was written by John BARBAROU (*q.v.*), archdeacon of Aberdeen, in the latter part of the 14th century. To him we owe a translation of a mediæval romance on the *Trojan War*, nearly 3000 lines in length, and a large collection of metrical lives of saints, which, after being long preserved in manuscript, have recently been printed by Dr Horstmann. About this time was compiled the first formal history of Scotland by John of FORTHUM (*q.v.*), which was written in Latin and brought FORTHUM down to the death of David I. He, however, left materials for the completion of the work, the last date of which is 1385. In 1441 a continuation of it was made by Walter Bower or Bownmaker. The whole work was then styled *Bower's Scotchichronicon*, and brings the history of Scotland down to 1437. A metrical history was written between 1420 and 1424 by Andrew of Wyntoun, a canon regular of St Wyn-Andrews and prior of St Serf's Inch in Loch Leven. This work, known as the *Ormyngale Cronykil of Scotland*, is prefaced by an account of the human race from the creation, and, although for the most part its verse is homely and dull, its author occasionally describes stirring incidents with considerable power. The beautiful poem of James I. called *The Kingis Quhair*, written about this period, was far in advance of the contemporary metrical chronicles. It possesses a melody of verse unknown before and gives the king a conspicuous place in early Scottish literature. He is supposed to have also written *A Ballad of Good Counsel* and a song *On Absence*; but two poems, *Christie Kirk of the Grene* and *Pellis to the Play*, believed to have been his composition, have been recently shown by the Rev. W. W. Skeat to be by some other early poet. An allegorical poem called *The Buke of the Howlat* was written about 1450 by Sir Richard Holland, an adherent of the noble family of Douglas. It is a warning against pride, exemplified by the owl, decked out in the splendour of borrowed feathers, compelled on account of his insolence to resume his original form. The poem displays some inventive and descriptive power, though marred by its alteration. The exploits of Sir William Wallace found

Blind
Harry

about 1460 a worthy chronicler in Henry the Minstrel, or Blind Harry, who, born with such a serious defect, must be regarded as one of the most extraordinary individuals recorded in the annals of literature. His well-known poem, which bears the name of his hero, is in versification, expression, and poetic imagery a remarkable production for that period. The grave and thoughtful poetry of Robert HENRYSON (*q.v.*), notary public and preceptor in the Benedictine convent at Dunfermline, who flourished about 1470, contrasts favourably with that of his English contemporaries. His *Testament of Cresseid* was often incorporated in the old editions of the works of Chaucer, to whose poetry it is not inferior. His *Robene and Makynne* is the earliest specimen of pastoral poetry in the Scottish language. These, with his *Fables* and other works, entitle him to a high place among the early Scottish poets. Nearly coeval with Henryson was Sir Gilbert Hay, chamberlain to Charles VI. of France, who made several translations from the works of French authors. One of these, taken from a popular French romance of Alexander the Great, extends to upwards of 20,000 lines. A long anonymous poem called *Charnodous* belongs to this period. It is a romance founded on a French original, the more material incidents of which are supposed to have happened at the English court. It abounds with illustrations of the manners and customs peculiar to the age of chivalry. Being nearly 3000 lines in length, it is, like the last-mentioned, an extensive specimen of the language and versification of the time. The *Three Tales of the Three Priests of Pebbs* (1490), the authorship of which is unknown, are moral tales possessing considerable freshness. As a fragment of an old version of them occurs in the Asloan MS., written in 1490, they must have existed long before the edition printed by Henry Charters in 1603, in which form only they are now accessible. The *Ledger* of Andrew Halyburton, conservator of the privileges of the Scottish nation in the Netherlands, 1492-1503, is a valuable source of information regarding the early trade of Scotland.

Dunbar

The close of the 15th century exhibited a considerable growth of literary ability in the writings of William DUNBAR (*q.v.*) and his contemporaries. His works were so highly esteemed at the time he wrote that he was raised to the dignity of "the makar" or poet-laureate of Scotland. Such of Dunbar's writings as have come down to the present time are of a miscellaneous character, in which there is much power of description and command of verse. The *Thistle and the Rose* and the *Golden Targe* are excellent specimens of his poetic power. His satirical poems, such as the *Two Mavis Wemen* and the *Wedo and the Flyting with Kennedie*, contain much coarse humour. Seven of his poems were the first specimens of Scottish typography, having been printed by Cheyman and Myllar at Edinburgh in 1508, followed in 1509 by the well-known *Breviary* for the church of Aberdeen. A humorous poem called the *Freiris of Berneik* has been attributed to Dunbar and is usually printed with his works. Contemporary with Dunbar were a number of minor Scottish poets, of whose works only a few specimens have come down to the present time. These were Walter Kennedie, with whom he had his "flyting" or poetical contest, Sir John Rowll, Quintyne Shaw, Patrick Johnstone, Mersair, James Affick, and others.¹ The most classical of the Scottish poets was Gawyn or Gavin DOUGLAS (*q.v.*), bishop of Dunkeld, whose great literary work was the translation of the *Æneid* of Virgil into Scottish verse. To each book he prefixed a prologue;

Gavin
Douglas.

the one before the twelfth is an admirable descriptive poem of the beauties of May. His *Palace of Honour* and *Kyng Har*, two allegorical poems, are able productions, the latter of which is full of diomatic vigour. Contemporary with Douglas was Sir David LINDSAY (*q.v.*), Lyon king-of-arms in the reign of James V., who may be regarded as the most popular of the early Scottish poets. His *Monarchie*, or *ane Dialog betwix Experience and aue Courtour of the Muserabyll Estait of the Warld* gives a short survey of sacred and classical history which rendered it very popular in its time. His *Salve of the Thrie Estaitis* is a skillfully written attempt to reform the abuses of the period, especially those of the church. While some of its characters recite long and erudite political speeches, he introduces interludes of a farcical kind suited to the tastes of the times. This work may be considered the first dramatic effort of any British author. In his *Testament of Square Meldrum* he relates the adventures of his hero with much poetic fire. Lindsay's other poems consist of appeals to the king for advancement and some *jeux d'esprit* of no great length. One of the best scholars and teachers of this period was John Major or Maier, a native of Haddington, who was principal of St Salvator's College, St Andrews. Besides being the author of learned commentaries on Aristotle, he wrote a well-known work, *De historia gentis Sctorum libri sex*, printed in 1521. Another Scottish author that wrote in Latin with considerable elegance was Hector BOECE (*q.v.*), principal of King's College, Aberdeen. His great work, *Historia gentis Sctorum, a prima gentis origine*, was published in Paris in 1536. It was translated into Scottish by John Bellenden, archdeacon of Moray, under the title of the *Hystory and Cronikis of Scotland*, printed at Edinburgh in 1536. Bellenden also translated the first five books of Livy into Scottish. The *Chronicle* of Boece was versified in Scottish in 1531-35 by William Stewart, a descendant of the first earl of Buchan. It was written by command of Margaret, sister of Henry VIII. of England, for the instruction of her son, the youthful James V. A Latin poem of much merit, entitled *De animi tranquillitate*, was published in 1543 by Florence Wilson, master of Carpentras School. It is in the form of a dialogue and displays much variety of knowledge, while its Latinity has long been celebrated. In an anonymous work, written in 1548 or 1549, and called the *Complaynt of Scotland*, the author deplores the calamities to which Scotland was then subject. These are stated to be the wrongs done to the Scottish labourers at the hands of the landholders and the clergy, the difficulties with England, and the treachery of the Scottish nobility. The work is valuable as affording a glimpse of the literature then popular in Scotland, some pieces of which are no longer to be found,—such as *The Tayle of the Reyde Eytym* [red giant] with *The Hyldeys*, *The Tayl of the Vofe of the Varidis End*, *The Tayl of the Gendie that en Quyk Men*, *The Tayl of the thrie futtit Dog of Norrooy*, and *Robyn Hude and Lital Jhone*.

In 1552 there was printed at St Andrews a *Catechism*, that is to say *ane Commane and Catholik Instructions of the Christian People in Maters of our Catholike Faith and Religion*, written by John Hamilton, archbishop of St Andrews, the last primate of the Roman Catholic faith in Scotland. The poems of Sir Richard Maitland, which are ^{many} of a somewhat satirical kind, are valuable, as they, like those of Lindsay, contain much information about the abuses of the time (1560), such as the oppressive conduct of the landholders, vexatious lawsuits, and the depredations of the Border thieves. Sir Richard deserves the thanks of posterity for the large manuscript collection of poems by Scottish authors which he and his daughter formed, and which is now preserved in the Pepysian Library, at Magdalene College, Cambridge. The name of George

¹ Kennedie wrote *The Pines of Aige* and *The Passoun of Christ*; Rowll, *The Churing on the Steilers of his Poebis*; Shaw, *Advice to a Courtier*; Johnstone, *The Three Dead Poems*; Mersair, *Perrell in Paramours*; and Affick, *The Quene of Jelousy*.

- Bannatyne.** Bannatyne is inseparably connected with the history of Scottish poetry, as in 1568 he too formed an extensive collection of Scottish poetry which is certainly the most valuable now extant. It was written by him at Edinburgh in the time of the plague, when the dread of infection confined him closely at home. The *Bannatyne MS* now preserved in the Advocates' Library extends to 800 pages, folio, and includes several of Bannatyne's own poems, of which the two most considerable are of an anatomy character. The works of Alexander Scott, consisting principally of love poems, embrace also a spirited account of a *Justing betwix Adamson and Sym* at the Drum, a place a little to the south of Edinburgh. The author, who was one of the most elegant poets of this period, has sometimes been called the "Scottish Anacreon." Two poems of some merit—the *Praises of Women* and the *Miseries of a Poor Soldier*—were written by Alexander Aithubnot, principal of King's College, Aberdeen, about 1570. A poem of considerable length, called the *Sege of the Castell of Edinburgh*, published in 1573, was by Robert Semple, who also wrote an attack on Archbishop Adamson, called the *Legend of the Bishop of Sanct Andrews Lyfe*.
- Rolland.** To this period belong two poems of considerable length—the *Court of Venus* (1575), an imitation of the *Palves of Honour* of Gawayn Douglas, and the romance of the *Seaven Seages* (1578), a Scottish version of one of the most remarkable mediæval collections of stories belonging to the same class as the *Arabian Nights*, in which one single story is employed as a means of stringing together a multitude of subsidiary tales. These poems were written by John Rolland, notary in Dalketh. One of the best Latin scholars that modern Europe has produced was George BUCHANAN (*qv*), who flourished in the middle of the 16th century. He wrote several Latin tragedies and an untravalled translation of the Psalms. His *De jure regis apud Scotos* was composed to instruct James VI., to whom he had been tutor, in the duties belonging to his kingly office. His last and most important labour was his *History of Scotland*, originally printed in 1582, of which seventeen editions have appeared. An excellent specimen of the ancient vernacular language is the *Chronicle of Scotland* by Robert Lyndsay of Pit-scottie. It includes the period from 1436 to the marriage of Mary to Darnley in 1565. Although its author was a simple-minded and credulous man, he describes events of which he was an eye-witness with circumstantiality and great prolixity of detail. Another historical work of greater importance was the *De origine, nobilitate, et rebus gestis Scotorum* (1578) by John Lesley, bishop of Ross. A translation of this work made by Father James Dalrymple, a religious in the Scottish cloister of Ratisbon, 1596, is in course of publication by the Rev. Father E. B. Cody for the Scottish Text Society. Lesley also wrote in Scottish a *History of Scotland* from the death of James I. in 1436 to the year 1561. This work, intended for the perusal of Mary while in captivity in England, is written in an elegant style. The bishop was the champion of that unfortunate queen, and in 1569 wrote a *Defence of the Honour of Marie Qween of Scotland and Dowager of France*, with a declaration of her right, title, and interest to the succession of the crown of England.
- The Reformation exerted a considerable influence on Scottish literature. Amongst the earliest Protestant writers of the country may be mentioned Alexander Aleo or Alesmus, a native of Edinburgh, who published several controversial works and commentaries on various parts of the Bible. But the most eminent promoter of the reform was John KNOX (*qv*), who wrote several controversial pamphlets and some religious treatises; his great work was the *History of the Reformation of Religion in Scotland*, first printed in 1586. One of the principal opponents of Knox was Ninian Winzet, a priest of considerable ability and one familiar with the scholastic learning of the age. He began life as master of Lamlithgow school and subsequently became abbot of St James's at Ratisbon. He wrote several tracts in which he strenuously recommended the observance of certain popish festivals. In 1562 he published his *Dike of Four Score Thrie Questions touching Doctrine, Ordour, and Manners propounit to the Pechouris of the Protestantis in Scotland and delivert to Thome Knox the 20th day of February 1562*. The writings of James VI., who was a James man of scholarly attainments, embrace several works both in poetry and prose. His earliest production, published in 1584, when he was only eighteen, was the *Essays of a Prentice in the Divine Art of Poetrie*. This was followed by his poetical *Exercises at Vacant Houres* (1591). He also wrote a great many sonnets and a translation of the Psalms. His prose works are *Demonologie* (1597), *Βασίλειον Δάρον* (1599), *Counterblast to Tobacco*, *Paraphrase on Revelation*, *Law of Free Monachies*, &c. Among the Scottish poets who frequented his court were William Fowler, the elegant translator of the *Thymistes* of Petrarich, and Stewart of Baldhumes (Peith), a translation of Anacreon. Both these poets wrote other works which exist in MS., but are still unpublished. The zeal of Sir David Lyndsay Ralsh and others for the reformation of the church initiated a religious revival, and in 1597 was published the collection known as *Ane Compendious Booke of Godly and Spiritual Songs for wounding of Sinnes and Hawltrie*. This very curious work is attributed to John and Robert Wedderburn, the latter of whom was vicar of Dundee. A number of religious poems were written about the end of the 16th century by James Melville, minister of Anstruther, afterwards of Kilsenny, both in Fife. His *Morning Vision*, printed in 1598, consists of paraphrases of the Lord's Prayer, the Shorter Catechism, and the Ten Commandments. He also wrote the *Black Bostell*, a lamentation over the Church of Scotland, which is dated 1611. Another religious poet was James Cockburn, a native of Lanarkshire, who wrote *Gabriel's Salutation to Marie* (1605), and some other poems not destitute of merit. An eminent theological writer of this era, Robert Rollock, first principal of the university of Edinburgh, wrote many commentaries on the Scriptures which show extensive learning. Most are in Latin, but one or two are in the Scottish language. A very popular poem, the *Cherry and the Star*, first printed Montby Waldegrave at Edinburgh in 1597, afterwards went through many editions. Its author was Alexander Montgomerie, who also wrote some translations of the Psalms and the *Flying betwix Montgomerie and Pelwarth*, in imitation of Dunbar's *Flying with Kennedie*. In 1599 was published an interesting volume of poems written by Alexander Hume, entitled *Hymnes or Sacred Songs, wherein the Right Use of Poetrie may be espied*. One is on the defeat of the Spanish Armada. To the beginning of the 17th century belongs a comedy in rhyming stanzas, the authorship of which is unknown,—*Ane verie Excellent and Delightfull Treatise intituled Philotas, galatrina we may perceive the Greit Inconveniencies that fallis out in the Marriage betwix Aye and Youth* (1603). Its versification is easy and pleasant, and its plan a nearer approximation to the modern drama than the satire of Lyndsay. In the same year appeared the poems of Sir William ALEXANDER (*qv*), earl of Stirling. One, called *Doomsday*, or the *Great Day of the Lord's Judgment*, consists of 11,000 verses. His *Monarchie's Twiggies*, four in number, were not intended for representation on the stage. His exhortation or *Parænesis to Prince Henry* (1604) is his best poem. He also wrote *Reverations with the Muses* (1637), which is of a somewhat philosophical character. One of the most distinguished writers of this era was William DUNMURDO (*qv*) of Hawthornden, who

Drummond of Hawthornden published *Poems, anonaus, funeral, divine, pastorall* (1616), and *Flowers of Zion, or Spiritual Poems* (1623). He also wrote a *History of Scotland during the Reigns of the Five Jameses* (1655), some political tracts, and the *Cypres Grove*, a moral treatise in prose. As a writer of sonnets he has always been highly esteemed. Nearly contemporary with Drummond was Patrick Hannay, a native of Galloway, who seems to have followed James to England. He published his poems in 1623, the principal of which are *Phaetone the Nightingale* and *Sheretene and Marana*. He occupies a favourable position amongst the minor Scottish poets. After the removal of the Scottish court to London and the union of the crowns in 1603, the old language began to be considered as a provincial dialect, and the writers subsequent to Drummond, who was the first Scottish poet that wrote well in English, take their places amongst British authors.

To the short sketch above given may be added a notice of the early Scottish writers on mathematics, philosophy, jurisprudence, and medicine. In mathematical science the name of Jacques Saco Bosco (John Holywood or Holybush) may be mentioned, as he is believed to have been a native of Nithsdale and a canon of the monastery of Holywood, from which he took his name. He flourished about the beginning of the 13th century, and his treatise *De Sphaera Munda* was very generally taught in colleges and schools. The system of astronomy and the other mathematical treatises of James Baskantie, who taught at Paris about 1560 with much success, were celebrated in their time. The greatest of the Scottish mathematicians, however, was John NAPIER (*q.v.*) of Merchiston, who wrote on various kindred subjects, and in 1614 astonished the world by his discovery of logarithms.

In philosophy, besides the voluminous works of Duns Scotus and John Major already mentioned, various learned commentaries on Aristotle, of which Scottish philosophy then almost entirely consisted, were published by Robert Ballon, principal of the college of Guenne, by John Rutherford, professor of philosophy at St. Andrews (under whom Admirable Crichton was a pupil), and by James Cheyne, professor of philosophy at Douai. In jurisprudence a celebrated treatise on the *Feudal Law* was written by Sir Thomas Craig about 1608. It was not, however, published till about half a century after his death, as the printing of any thing of the law of Scotland while he lived was to have been considered as out of the question. Commentaries on some of the titles of the *Frondees* of Justinian, and a treatise *De Potestate Papae* (1809), in opposition to the usurpation of temporal power by the pope, were written by William Barclay, professor of law in the university of Angers. Another early legal work was a treatise *On the Connection between Government and Religion*, by Adam Blackwood, judge of the parliament of Forth, who was the antagonist of Beiliani and a strenuous defender of Mary queen of Scots.

In medicine the principal early Scottish works were written by Duncan Liddell, a native of Aberdeen, who in 1605 published at Helmstadt his *Disputations medicinales*, containing the theses or disputations maintained by himself and his pupils from 1592 to 1606. He also published other works, which contain an able digest of the medical learning of his age. Henry Blackwood, dean of Faculty to the college of physicians at Paris, wrote various treatises on medicine, of which it will be found in Mackenzie's *Lives of the Scottish Writers*, but which are now only historically interesting. (J. S. M.)

SCOTT, DAVID (1806-1849), historical painter, was born at Edinburgh in October 1806, and studied under his father, Robert Scott, an engraver of repute in the city. For a time in his youth he occupied himself with the burin, but he soon turned his attention to original work in colour, and in 1828 he exhibited his first oil picture, the *Hopes of Early Genus* dispelled by Death, which was followed by Cain, Nimrod, Adam and Eve singing their Morning Hymn, Sarpedon carried by Sleep and Death, and other subjects of a poetic and imaginative character. In 1829 he became a member of the Scottish Academy, and in 1832 visited Italy, where he spent more than a year in study. At Rome he executed a large symbolical painting, entitled the *Agony of Discord*, or the Household Gods Destroyed. On his return to Scotland he continued the strenuous and unwearying practice of his art; but his productions were too reconcile and abstract in subject ever to become widely popular, while the defects and exaggerations of their draftsmanship repelled connoisseurs. So the

gravity which had always been characteristic of the artist passed into gloom, he shrank from society and led a secluded life, hardly quitting his studio, his mind constantly occupied with the great problems of life and of his art. The works of his later years include *Vasco da Gama* encountering the Spirit of the Storm, a picture—immense in size and most powerful in conception—finished in 1842, and now preserved in the Trinity House, Leith, the Duke of Gloucester entering the Water Gate of Calais (1841), an impressive subject, more complete and harmonious in execution than was usual with the artist, the Alchemist (1838), Queen Elizabeth at the Globe Theatre (1840), and Peter the Hermit (1845), remarkable for their varied and elaborate character-painting, and Ariel and Caliban (1837) and the Triumph of Love (1846), distinguished by their beauty of colouring and depth of poetic feeling. The most important of his religious subjects are the Descent from the Cross (1835) and the Crucifixion—the Dead Rising (1844). In addition to his works in colour Scott executed several remarkable series of designs. Two of these—the Monograms of Man and the illustrations to Coleridge's *Ancient Mariner*—were etched by his own hand, and published in 1831 and 1837 respectively, while his subjects from the *Pilgrim's Progress* and Nichol's *Architecture of the Heavens* were issued after his death. Among his literary productions are five elaborate and thoughtful articles on the characteristics of the Italian masters, published in *Blackwood's Magazine*, 1839 to 1841, and a pamphlet on *British, French, and German Painting*, 1841. He died in Edinburgh on the 5th of March 1849. As a colourist David Scott occupies a high place in the Scottish school, but the most distinctive merit of his works lies in the boldness of their conception and their imaginative and poetic power.

See W. B. Scott, *Memoir of David Scott, R.S.A.* (1850), and J. M. Gray, *David Scott, R.S.A., and his Works* (1884).

SCOTT, SIR GEORGE GILBERT (1811-1878), one of the most successful ecclesiastical architects of the 19th century, was born in 1811 at Gwotest near Buckingham, where his father was rector, his grandfather was Thomas Scott (1747-1821), the well-known commentator on the Bible. In 1827 young Scott was apprenticed for four years to an architect in London named Edmeston, and at the end of his pupilage acted as clerk of the works at the new Fishmongers' Hall and other buildings in order to acquire a knowledge of the practical details of his profession. In Edmeston's office he became acquainted with a fellow-pupil, named Moffat, a man who possessed considerable talents for the purely business part of an architect's work, and the two entered into partnership. In 1834 they were appointed architects to the union workhouses of Buckinghamshire, and for four years were busily occupied in building a number of cheap and ugly unions, both there and in Northamptonshire and Lincolnshire. In 1838 Scott built at Lincoln his first church, won in an open competition, and this was quickly followed by six others, all very poor buildings without chancels, that was a period when church building in England had reached its very lowest point both in style and in poverty of construction. About 1839 his enthusiasm was aroused by some of the eloquent writings of Pugin on mediæval architecture, and by the various papers on ecclesiastical subjects published by the Camden Society. These opened a new world to Scott, and he thenceforth studied and imitated the architectural styles and principles of the Middle Ages with the utmost zeal and patient care. The first result of this new study was his design for the Martyrs' Memorial at Oxford, erected in 1840, a clever adaptation of the late 13th-century crosses in honour of Queen Eleanor. From that time Scott became the chief ecclesiastical architect in

England, and in the next twenty-eight years completed an almost incredibly large number of new churches and "restorations," the fever for which was fomented by the Ecclesiological Society and the growth of ecclesiastical feeling in England.

In 1844 Scott won the first premium in the competition for the new Lutheran church at Hamburg, a noble building with a very lofty spire, designed strictly in the style of the 13th century. In the following year his partnership with Moffat was dissolved, and in 1847 Scott was employed to renovate and refit Ely cathedral, the first of a long series of English cathedral and abbey churches which passed through his hands. In 1851 Scott visited and studied the architecture of the chief towns in northern Italy, and in 1855 won the competition for the town-house at Hamburg, designed after the model of similar buildings in north Germany. In spite of his having won the first prize, another architect was selected to construct the building, after a very inferior design. In 1856 a competition was held for designs of the new Government offices in London, Scott obtained the third place in this, but the work was afterwards given to him on the condition (insisted on by Lord Palmerston) that he should make a new design, not Gothic, but Classic or Renaissance in style. This Scott very unwillingly consented to do, as he had little sympathy with any styles but those of England or France from the 13th to the 16th century. In 1862-63 he was employed to design and construct the Albert Memorial, a very costly and elaborate work, in the style of a magnified 13th-century reliquary or ciborium, adorned with many statues and reliefs in bronze and marble. On the partial completion of this he received the honour of knighthood. In 1866 he competed for the new London law-courts, but the prize was adjudged to his old pupil, G. E. Street. In 1873, owing to illness caused by overwork, Scott spent some time in Rome and other parts of Italy. The mosaic pavement which he designed for Durham cathedral soon afterwards was the result of his study of the 13th-century mosaics in the old basilicas of Rome. On his return to England he resumed his professional labours, and continued to work almost without intermission till his short illness and death in 1878. He was buried in the nave of Westminster Abbey, and an engraved brass, designed by G. E. Street, was placed over his grave. In 1838 Scott married his cousin, Caroline Oldrid, who died in 1870; they had five sons, two of whom have taken up their father's profession.

Scott's architectural works were more numerous than those of any other architect of the century, unfortunately for his fame, he undertook far more than it was possible for him really to design or supervise with thought and care. He earned out extensive works of repair, refurnishing, and restoration in the following buildings—the cathedrals of Ely, Hereford, Lichfield, Salisbury, Chichester, Durham, St. David's, Bangor, St. Asaph, Chester, Gloucester, Ripon, Worcester, Exeter, Rochester, the abbey of Westminster, St. Albans, Tewkesbury, and countless minor churches. He also built the new Government offices (India, Foreign, Home, and Colonial), the Midland Railway terminus and hotel, and a large number of private houses and other buildings. His style was (with the one exception of the Government offices) a careful copy of architectural periods of the Middle Ages, next with a profound knowledge of detail, but without much real inventive power, and consequently rather dull and uninteresting in effect. As a "restorer" of ancient buildings he was guilty of an immense amount of the most irreparable destruction, but any other architect of his generation would probably have done as much or even more harm. While a member of the Royal Academy Scott held for many years the post of professor of architecture, and gave a long series of able lectures on mediæval styles, which were published in 1878. He wrote a work on *Domestic Architecture*, and a volume of *Personal and Professional Recollections*, which, edited by his eldest son, was published in 1879, and also a large number of articles and reports on many of the ancient buildings with which he had to deal. Owing to his numerous pupils, among whom have been many leading architects, his influence was for some time very widely spread; but it is now rapidly passing away, mainly owing to the growing reaction against the somewhat

narrow mediævalism of which he, both in theory and practice, was the chief exponent.

SCOTT, JOHN. See ELDON, EARL OF.

SCOTT, MICHAEL. See SCOT, MICHAEL.

SCOTT, SIR WALTER (1771-1832), poet and novelist, was born at Edinburgh on 15th August 1771. His pedigree, in which he took a pride that strongly influenced the course of his life, may be given in the words of his own fragment of autobiography: "My birth was neither distinguished nor sordid. According to the prejudices of my country it was esteemed *gentle*, as I was connected, though remotely, with ancient families both by my father's and mother's side. My father's grandfather was Walter Scott, well known by the name of *Beardie*. He was the second son of Walter Scott, first laird of Raeburn, who was third son of Sir William Scott, and the grandson of Walter Scott, commonly called in tradition *Auld Watt* of Harden. I am therefore lineally descended from that ancient chieftain, whose name I have made to ring in many a ditty, and from his fair dame, the Flower of Yarrow,—no bad genealogy for a Border minstrel."

Scott's desire to be known as a cadet of the house of Harden, and his ruling passion—so disastrous in its ultimate results—to found a minor territorial family of Scotts, have been very variously estimated. He himself, in a notice of John Home, speaks of pride of family as "natural to a man of imagination," remarking that, "in this motley world, the family pride of the north country has its effects of good and of evil." Whether the good or the evil preponderated in Scott's own case would not be easy to determine. It tempted him into courses that ended in commercial ruin, but throughout his life it was a constant spur to exertion, and in his last years it proved itself as a working principle capable of inspiring and maintaining a most chivalrous conception of duty. If the ancient chieftain Auld Watt was, according to the anecdote told by his illustrious descendant, once reduced in the matter of live stock to a single cow, and recovered his dignity by stealing the cows of his English neighbours, Professor Veitch is probably right in holding that Scott's Border ancestry were, as a matter of literal fact, sheep-farmers, who varied their occupation by "lifting" sheep and cattle, and whatever else was "neither too heavy nor too hot." The Border lairds were really a race of shepherds in so far as they were not a race of robbers. Professor Veitch suggests that Scott may have derived from this pastoral ancestry an hereditary bias towards the observation of nature and the enjoyment of open-air life. He certainly inherited from them the robust strength of constitution that carried him successfully through so many exhausting labours. And it was his pride in their real or supposed feudal dignity and their rough marauding exploits that first directed him to the study of Border history and poetry, the basis of his fame as a poet and romancer. His father, a writer to the signet (or attorney) in Edinburgh—the original of the elder Fairford in *Redgarnet*—was the first of the family to adopt a town life or a learned profession. His mother was the daughter of Dr. Rutherford, a medical professor in the university of Edinburgh, who also traced descent from the chiefs of famous Border clans. The ceilings of Abbotsford display the arms of about a dozen Border families with which Scott claimed kindred through one side or the other. His father was conspicuous for methodical and thorough industry; his mother was a woman of imagination and culture. The son seems to have inherited the best qualities of the one and acquired the best qualities of the other.

The details of his early education are given with great precision in his autobiography. Stuart Mill was not more minute in recording the various circumstances that shaped

his habits of mind and work. We learn from himself the secret—as much at least as could be ascribed to definite extraneous accident—of the “extempore speed” in romantic composition against which Carlyle protested in his famous review of Lockhart’s *Life of Scott*¹. The indignant critic assumed that Scott wrote “without preparation”; Scott himself, as if he had foreseen this cavil, is at pains to show that the preparation began with his boyhood, almost with his infancy. The current legend when Carlyle wrote his essay was that as a boy Scott had been a dunce and an idler. With a characteristically conscientious desire not to set a bad example, the autobiographer solemnly declares that he was neither a dunce nor an idler, and explains how the misunderstanding arose. His health in boyhood was uncertain,² he was consequently irregular in his attendance at school, never became exact in his knowledge of Latin syntax, and was so belated in beginning Greek that out of bravado he resolved not to learn it at all.

Left very much to himself throughout his boyhood in the matter of reading, so quick, lively, extensible, and uncertain in health that it was considered dangerous to press him and prudent rather to keep him back, Scott began at a very early age to accumulate the romantic lore of which he afterwards made such splendid use. As a child he seems to have been an eager and interested listener and a great favourite with his elders, apparently having even then the same engaging charm that made him so much beloved as a man. Chance threw him in the way of many who were willing to indulge his delight in stories and ballads. Not only his own relatives—the old women at his grandfather’s farm at Sandyknowe, his aunt, under whose charge he was sent to Bath for a year, his mother—took an interest in the precocious boy’s questions, told him tales of Jacobites and Border worthies of his own and other clans, but casual friends of the family—such as the military veteran at Prestonpans, old Dr Blacklock the blind poet, Home the author of *Douglas*, Adam Ferguson the martial historian of the Roman republic—helped forward his education in the direction in which the bent of his genius lay. At the age of six

he was able to define himself as “a virtuoso,” “one who wishes to and will know everything.” At ten his collection of chap-books and ballads had reached several volumes, and he was a connoisseur in various readings. Thus he took to the High School, Edinburgh, when he was strong enough to be put in regular attendance, an unusual store of miscellaneous knowledge and an unusually quickened intelligence, so that his master “pronounced that, though many of his schoolfellows understood the Latin better, *Gualterus Scott* was behind few in following and enjoying the author’s meaning.”

Throughout his school days and afterwards when he was apprenticed to his father, attended university classes, read for the bar, took part in academical and professional debating societies, Scott steadily and ardently pursued his own favourite studies. His reading in romance and history was really study, and not merely the indulgence of an ordinary schoolboy’s promiscuous appetite for exciting literature. In fact, even as a schoolboy he specialized. He followed the line of overpowering inclination, and even then, as he frankly tells us, “fame was the spur.” He acquired a reputation among his schoolfellows for out-of-the-way knowledge, and also for story-telling, and he worked hard to maintain this character, which compensated to his ambitious spirit his indifferent distinction in ordinary school-work. The youthful “virtuoso,” though he read ten times the usual allowance of novels from the circulating library, was carried by his enthusiasm into fields much less generally attractive. He was still a schoolboy when he mastered French sufficiently well to read through collections of old French romances, and not more than fifteen when, attracted by translations to Italian romantic literature, he learnt the language in order to read Dante and Ariosto in the original. This willingness to face dry work in the pursuit of romantic reading affords a measure of the strength of Scott’s passion. In one of the literary parties brought together to honor Burns, when the peasant poet visited Edinburgh, the boy of fifteen was the only member of the company who could tell the source of some lines affixed to a picture that had attracted the poet’s attention,—a slight but significant evidence both of the width of his reading and of the tenacity of his memory. The same thoroughness appears in another little circumstance. He took an interest in Scottish family history and genealogy, but, not content with the ordinary sources, he ransacked the MSS. preserved in the Advocates’ Library. By the time he was one and twenty he had acquired such a reputation for his skill in deciphering old manuscripts that his assistance was sought by professional antiquaries.

This early, assiduous, unintermittent study was the main secret, over and above his natural gifts, of Scott’s extempore speed and fertility when at last he found forms into which to pour his vast accumulation of historical and romantic lore. He was, as he said himself, “like an ignorant gamester who keeps up a good hand till he knows how to play it.” That he had vague thoughts from a much earlier period than is commonly supposed of playing the hand some day is extremely probable, if, as he tells us, the idea of writing romances first occurred to him when he read Cervantes in the original. This was long before he was out of his teens, and, if we add that his leading idea in his first novel was to depict a Jacobite Don Quixote, we can see that there was probably a long interval between the first conception of *Waverley* and the ultimate completion.

Scott’s preparation for painting the life of past times was probably much less unconsciously such than his equally thorough preparation for acting as the painter of Scottish manners and character in all grades of society. With all

¹ Latest edition in 10 vols fcap. 8vo, Edinburgh, 1847-48.

² Dr Charles Crichton supplies us with the following medical note on Scott’s early illness.—“Scott’s lameness was owing to an arrest of growth in the right leg in infancy. When he was eighteen months old he had a feverish attack lasting three days, at the end of which time it was found that he ‘had lost the power of his right leg,’—i.e., the child instinctively declined to move the ailing member. The malady was a swelling at the ankle, and either consisted in or gave rise to arrest of the bone-forming function along the growing line of cartilage which connects the lower epiphysis of each of the two leg-bones with its shaft. In his fourth year, when he had otherwise recovered, the leg remained ‘much shrunk and contracted.’ The limb would have been blighted very much more if the arrest of growth had taken place at the upper epiphysis of the tibia or the lower epiphysis of the femur. The narrowness and peculiar depth of Scott’s head point to some more general congenital error of bone-making allied to rickets but certainly not the same as that malady. The vault of the skull is the typical ‘scaphoid’ or boat-shaped formation, due to premature union of the two parietal bones along the sagittal suture. When the bones of the cranium are universally affected with that arrest of growth along their formative edges, the sutures become prematurely fixed and effaced, so that the brain-case cannot expand in any direction to accommodate the growing brain. This universal synostosis of the cranial bones is what occurs in the case of microcephalic skulls. It happened to me to show to an eminent French anthropologist a specimen of a mature or microcephalic skull preserved in the Cambridge museum of anatomy; the French *savant*, holding up the skull and pointing to the ‘scaphoid’ vault of the crown and the effaced sagittal suture, exclaimed, ‘Voilà Walter Scott!’ Scott had fortunately escaped the early closure or arrest of growth at other cranial sutures than the sagittal, so that the growing brain could make room for itself by forcing up the vault of the skull bodily. When his head was closed after death, it was observed that ‘the brain was not large, and the cranium thinner than it is usually found to be.’ In favour of the theory of congenital liability it has to be said that he was the ninth of a family of whom the first six died in ‘very early youth.’”

the extent of his reading as a schoolboy and a young man he was far from being a cloistered student, absorbed in his books. In spite of his lameness and his serious illnesses in youth, his constitution was naturally robust, his disposition genial, his spirits high. He was always well to the front in the fights and frolics of the High School, and a boon companion in the "high jinks" of the junior bar. The future novelist's experience of life was singularly rich and varied. While he lived the life of imagination and scholarship in sympathy with a few choice friends, he was brought into intimate daily contact with many varieties of real life. At home he had to behave as became a member of a Puritan, somewhat ascetic, well-ordered Scottish household, subduing his own inclinations towards a more graceful and comfortable scheme of living into outward conformity with his father's strict rule. Through his mother's family he obtained access to the literary society of Edinburgh, at that time electrified by the advent of Burns, full of vigour and ambition, rejoicing in the possession of not a few widely known men of letters, philosophers, historians, novelists, and critics, from racy and eccentric Monboddo to refined and scholarly Mackenzie. In that society also he may have found the materials for the manners and characters of *St. Ronan's Well*. From any tendency to the pedantry of over-culture he was effectually saved by the rougher and manlier spirit of his professional comrades, who, though they respected *belles lettres*, would not tolerate anything in the shape of affectation or sentimentalism. The atmosphere of the Parliament House (the Westminster Hall of Edinburgh) had considerable influence on the tone of Scott's novels. His peculiar humour as a story-teller and painter of character was first developed among the young men of his own standing at the bar. They were the first mature audience on which he experimented, and seem often to have been in his mind's eye when he enlarged his public. From their forthright companionship by the stove, where the briefcase congregated to discuss knotty points in law and help one another to enjoy the humours of judges and litigants, "Duns Scotus" often stole away to pore over old books and manuscripts in the library beneath; but as long as he was with them he was first among his peers in the art of providing entertainment. It was to this market that Scott brought the harvest of the vacation rambles which it was his custom to make every autumn for seven years after his call to the bar and before his marriage. He scoured the country in search of ballads and other relics of antiquity; but he found also and treasured many traits of living manners, many a lively sketch and story with which to amuse the brothers of "the mountain" on his return. His staid father did not much like these escapades, and told him bitterly that he seemed fit for nothing but to be a "gangrel scrape-gut." But, as the companion of "his Laddesdale raids" happily put it, "he was makin' himself at the time, but he didna ken maybe what he was about till years had passed: at first he thought o' hitle, I daresay, but the queerness and the fun."

We may as well dispose at once of Scott's professional career. His father intended him originally to follow his own business, and he was apprenticed in his sixteenth year, but he preferred the upper walk of the legal profession, and was admitted a member of the faculty of advocates in 1792. He seems to have read hard at law for four years at least, but almost from the first to have limited his ambition to obtaining some comfortable appointment such as would leave him a good deal of leisure for literary pursuits. In this he was not disappointed. In 1799 he obtained the office of sheriff-depute of Selkirkshire, with a salary of £300 and very light duties. In 1806 he obtained the reversion of the office of clerk of

session. It is sometimes supposed, from the immense amount of other work that Scott accomplished, that this office was a sinecure. But the duties, which are fully described by Lockhart, were really serious, and kept him hard at fatiguing work, his biographer estimates, for at least three or four hours daily during six months out of the twelve, while the court was in session. He discharged these duties faithfully for twenty-five years, during the height of his activity as an author. He did not enter on the emoluments of the office till 1812, but from that time he received from the clerkship and the sheriffdom combined an income of £1600 a year, being thus enabled to act in his literary undertakings on his often-quoted maxim that "literature should be a staff and not a crutch."

Scott's profession, in addition to supplying him with a competent livelihood, supplied him also with abundance of opportunities for the study of men and manners. Characters of all types and shades find their way into counts of law. The wonder is that so much technical drudgery did not crush every particle of romance out of him, but such was the elasticity and strength of his powers that this daily attendance at the transaction of affairs in open court face to face with living men—under a strain of attention that would have exhausted an ordinary man's allowance of energy—seems rather to have helped him in giving an atmosphere of reality to his representations of the life of the past.

It was not, however, as a prose writer that he was first to make a reputation. The common notion is that Scott, having made a reputation as a poet, was led to attempt romances in prose by a chance impulse, hitting upon the new vein as it by accident. The truth seems rather to be that, as it is his prose romances which give the fullest measure of his genius, so the greater part of his early life was a conscious or unconscious preparation for writing them, whereas his metrical romances, in every way slighter and less rich and substantial, were, comparatively speaking, a casual and temporary deviation from the main purpose of his life. According to his own account, he was led to adopt the medium of verse by a series of accidents. The story is told by himself at length and with his customary frankness and modesty in the *Essay on Imitations of the Ancient Ballad*, prefixed to the 1830 edition of his *Border Minstrelsy*, and in the 1830 introduction to the *Lay of the Last Minstrel*. The first link in the chain was a lecture by Henry Mackenzie on German literature, delivered in 1788. This apprized Scott, who was then a legal apprentice and an enthusiastic student of French and Italian romance, that there was a fresh development of romantic literature in German. As soon as he had the burden of preparation for the bar off his mind he learnt German, and was profoundly excited to find a new school founded on the serious study of a kind of literature his own devotion to which was regarded by most of his companions with wonder and ridicule. We must remember always that Scott quite as much as Wordsworth created the taste by which he was enjoyed, and that in his early days he was half-ashamed of his romantic studies, and pursued them more or less in secret with a few intimates. While he was in the height of his enthusiasm for the new German romance, Mrs. Barbauld visited Edinburgh, and recited an English translation of Bürger's *Lenore*. Scott heard of it from a friend, who was able to repeat two lines—

"Tramp, tramp, across the land they speed;
Splash, splash, across the sea!"

The two lines were enough to give Scott a new ambition. He could write such poetry himself! The impulse was strengthened by his reading Lewis's *Monk* and the ballads in the German manner interspersed through the work. He hastened to procure a copy of Bürger, at once executed

translations of several of his ballads, published two of them in a thin quarto in 1796 (his ambition being perhaps quickened by the unfortunate issue of a love affair), and was much encouraged by the applause of his friends. Soon after he met Lewis personally, and his ambition was confirmed. "Finding Lewis," he says, "in possession of so much reputation, and conceiving that if I fell behind him in poetical powers, I considerably exceeded him in general information, I suddenly took it into my head to attempt the style of poetry by which he had raised himself to fame." Accordingly, he composed *Glenfinlas, The Eve of St John*, and the *Gray Brother*, which were published in Lewis's collection of *Tales of Wonder*. But he soon became convinced that "the practice of ballad-writing was out of fashion, and that any attempt to revive it or to found a poetical character on it would certainly fail of success." His study of Goethe's *Gotz von Berlichingen*, of which he published a translation in 1799, gave him wider ideas. Why should he not do for ancient Border manners what Goethe had done for the ancient feudalism of the Rhine? He had been busy since his boyhood collecting Scottish Border ballads and studying the minutest details of Border history. He began to cast about for a form which should have the advantage of novelty, and a subject which should secure unity of composition. He was engaged at the time preparing a collection of the *Minstrelsy of the Scottish Border*. The first instalment was published in 1802, it was followed by another next year, and by an edition and continuation of the old romance of *Sir Tristram*, and Scott was still hesitating about subject and form for a large original work. It seems probable from a conversation recorded by Gillies that he might have ended by casting his meditated picture of Border manners in the form of a prose romance. But chance at last threw in his way both a suitable subject and a suitable metrical vehicle. He had engaged all his friends in the hunt for Border ballads and legends. Among others, the countess of Dalkeith, wife of the heir-apparent to the dukedom of Buccleuch, interested herself in the work. Happening to hear the legend of a tricky hobgoblin named Gilpin Horner, she asked Scott to write a ballad about it. He agreed with delight, and, out of compliment to the lady who had given this command to the bard, resolved to connect it with the house of Buccleuch. The subject grew in his fertile imagination, till incidents enough had gathered round the goblin to furnish a framework for his long-designed picture of Border manners. Chance also furnished him with a hint for a novel scheme of verse. Coleridge's fragment of *Christabel*, though begun in 1797—when he and Wordsworth were discussing on the Quantock Hills the principles of such ballads as Scott at the same time was reciting to himself in his gallops on Musselburgh sands—was not published till 1816. But a friend of Scott's, Sir John Stoddart, had met Coleridge in Malta, and had carried home in his memory enough of the unfinished poem to convey to Scott that its metre was the very metre of which he had been in search. Scott introduced still greater variety into the four-beat couplet; but it was to *Christabel* that he owed the suggestion, as one line borrowed whole and many unimitated rhythms testify.

The *Lay of the Last Minstrel* appeared in January 1805, and at once became widely popular. It sold more rapidly than poem had ever sold before. Scott was astonished at his own success, although he expected that "the attempt to return to a more simple and natural style of poetry was likely to be welcomed." Many things contributed to the extraordinary demand for the *Lay*. First and foremost, no doubt, we must reckon its simplicity. After the abstract themes and abstruse, elaborately allusive style of the 18th century, the public were glad of verse that

could be read with ease and even with exhilaration, verse in which a simple interesting story was told with brilliant energy, and simple feelings were treated not as isolated themes but as incidents in the lives of individual men and women. The thought was not so profound, the lines were not so polished, as in *The Pleasures of Memory* or *The Pleasures of Hope*, but the "light-horseman sort of stanza" carried the reader briskly over a much more diversified country, through boldly outlined and strongly coloured scenes. No stanza required a second reading, you had not to keep attention on the stretch or pause and construe laboriously before you could grasp the writer's meaning or enter into his artfully condensed sentiment. To remember the pedigrees of all the Scotts, or the names of all the famous chiefs and hardy retainers "whose gathering word was Bellenden," might have required some effort, but only the conscientious reader need care to make it. The only puzzle in the *Lay* was the goblin page, and the general reader was absolved from all trouble about him by the unanimous declaration of the critics, led by Jeffrey in the *Edinburgh Review*, that he was a grotesque excessiveness, in no way essential to the story. It is commonly taken for granted that Scott acquiesced in this judgment, his politely ironic letter to Miss Seward being quoted as conclusive. This is hardly fair to the poor goblin, seeing that his story was the germ of the poem and determines its whole structure, but it is a tribute to the lively simplicity of the *Lay* that few people should be willing to take the very moderate amount of pains necessary to see the goblin's true position in the action. The supernatural element was Scott's most risky innovation. For the rest, he was a cautious and conservative reformer, careful not to offend established traditions. He was far from raising the standard of rebellion, as Wordsworth had done, against the great artistic canon of the classical school.

"True art is nature to advantage dressed"

To "engraft modern refinement on ancient simplicity," to preserve the energy of the old ballad without its rudeness and bareness of poetic ornament, was Scott's avowed aim. He adhered to the poetic diction against which Wordsworth protested. His rough Borderers are "dressed to advantage" in the costume of romantic chivalry. The batonial magnificence of Branksome, Deloraine's "shield and jack and acorn," the elaborate ceremony of the combat between the pseudo-Deloraine and Musgrave, are concessions to the taste of the 18th century. Further, he disarmed criticism by putting his poem into the mouth of an ancient minstrel, thus pictorially emphasizing the fact that it was an imitation of antiquity, and providing a scapegoat on whose back might be laid any remaining sins of rudeness or excessive simplicity. And, while imitating the antique romance, he was careful not to imitate its faults of rambling, discursive, disconnected structure. He was scrupulously attentive to the classical unities of time, place, and action. The scene never changes from Branksome and its neighbourhood, the time occupied by the action (as he pointed out in his proface) is three nights and three days; and, in spite of all that critics have said about the superfluity of the goblin page, it is not difficult to trace unity of intention and regular progressive development in the incidents.

The success of the *Lay* decided finally, if it was not decided already, that literature was to be the main business of Scott's life, and he proceeded to arrange his affairs accordingly. It would have been well for his comfort, if not for his fame, had he adhered to his first plan, which was to buy a small mountain-farm near Bowhill, with the proceeds of some property left to him by an uncle, and

divide his year between this and Edinburgh, where he had good hopes, soon afterwards realized, of a salaried appointment in the Court of Session. This would have given him ample leisure and seclusion for literature, while his private means and official emoluments secured him against dependence on his pen. He would have been laird as well as sheriff of the cairn and the scaur, and as a man of letters his own master. Since his marriage in 1797 with Miss Charpentier, daughter of a French refugee, his chief residence had been at Lasswade, about six miles from Edinburgh. But on a hint from the lord-lieutenant that the sheriff must live at least four months in the year within his county, and that he was attending more closely to his duties as quartermaster of a mounted company of volunteers than was consistent with the proper discharge of his duties as sheriff, he had moved his household in 1804 to Ashieston. When his uncle's bequest fell in, he determined to buy a small property on the banks of the Tweed within the limits of his sheriffdom. There, within sight of Newark Castle and Bowhill, he proposed to live like his ancient minstrel, as became the bard of the clan, under the shadow of the great dual head of the Scotts. But this plan was derailed by an accident. It so happened that an old schoolfellow, James Ballantyne, a printer in Kelso, whom he had already befriended, transplanted to Edinburgh, and furnished with both work and money, applied to him for a further loan. Scott declined to lend, but offered to join him as sleeping partner. Thus the intended purchase money of Broadmeadows became the capital of a printing concern, of which by degrees the man of letters became the overwrought slave, milch-cow, and victim.

When the *Lay* was off his hands, Scott's next literary enterprise was a prose romance—a confirmation of the argument that he did not take to prose after Byron had "bet him," as he put it, in verse, but that romance writing was a long-cherished purpose. He began *Waverley*, but a friend to whom he showed the first chapters—which do not take Waverley out of England, and describe an education in romantic literature very much like Scott's own—not unreasonably decided that the work was deficient in interest and unworthy of the author of the *Lay*. Scott accordingly laid *Waverley* aside. We may fairly conjecture that he would not have been so easily diverted had he not been occupied at the time with other heavy publishing enterprises calculated to bring grist to the printing establishment. His active brain was full of projects for big editions, which he undertook to carry through on condition that the printing was done by Ballantyne & Co., the "Co" being kept a profound secret, because it might have injured the lawyer and poet professionally and socially to be known as partner in a commercial concern. Between 1806 and 1812, mainly to serve the interests of the firm, though of course the work was not in itself unattractive to him, Scott produced his elaborate editions of Dryden, Swift, the Somers Tracts, and the Sadler State papers. Incidentally these laborious tasks contributed to his preparation for the main work of his life by extending his knowledge of English and Scottish history.

Marmion, begun in November 1806 and published in February 1808, was written as a relief to "graver cares," though in this also he aimed at combining with a romantic story a solid picture of an historical period. It was even more popular than the *Lay*. Scott's resuscitation of the four-beat measure of the old "gestours" afforded a signal proof of the justness of their instinct in choosing this vehicle for their recitations. The four-beat lines of *Marmion* took possession of the public like a kind of madness: they not only clung to the memory but they would not keep off the tongue: people could not help spouting them

in solitary places and muttering them as they walked about the streets. The critics, except Jeffrey, who may have been offended by the pronounced politics of the poet, were on the whole better pleased than with the *Lay*. Their chief complaint was with the "introductions" to the various cantos, which were objected to as vexatiously breaking the current of the story.

The triumphant success of *Marmion*, establishing him as *facile princeps* among living poets, gave Scott such a *heave*, to use his own words, "as almost lifted him off his feet." He touched then the highest point of prosperity and happiness. Presently after, he was irritated and tempted by a combination of little circumstances into the great blunder of his life, the establishment of the publishing house of John Ballantyne & Co. A coolness arose between him and Jeffrey, chiefly on political but partly also on personal grounds. They were old friends, and Scott had written many articles for the *Review*, but its political attitude at this time was intensely unsatisfactory to Scott. To complete the breach, Jeffrey reviewed *Marmion* in a hostile spirit. A quarrel occurred also between Scott's printing firm and Constable, the publisher, who had been the principal feeder of its press. Then the tempter appeared in the shape of Murray, the London publisher, anxious to secure the services of the most popular *littérateur* of the day. The result of negotiations was that Scott set up, in opposition to Constable, "the crafty," "the grand Napoleon of the realms of print," the publishing house of John Ballantyne & Co., to be managed by a dissipated and swaggering little tailor, whom he nicknamed "Rigdumfunnidos" for his talents as a mimic and low comedian. Scott interested himself warmly in starting the *Quarterly Review*, and in return Murray constituted Ballantyne & Co. his Edinburgh agents. Scott's trust in Rigdumfunnidos and his brother, "Aldiborontiphosphormio," and in his own power to supply all their deficiencies, is as strange a piece of infatuation as any that ever formed a theme for romance or tragedy. Their devoted attachment to the architect of their fortunes and proud confidence in his powers helped forward to the catastrophe, for whatever Scott recommended they agreed to, and he was too immersed in multifarious literary work and professional and social engagements to have time for cool examination of the numerous rash speculative ventures into which he launched the firm.

The *Lady of the Lake* (May 1810) was the first great publication by the new house. It was received with enthusiasm, even Jeffrey joining in the chorus of applause. It made the Perthshire Highlands fashionable for tourists, and raised the post-horse duty in Scotland. But it did not make up to Ballantyne & Co. for their heavy investments in unsound ventures. The *Edinburgh Annual Register*, meant as a rival to the *Edinburgh Review*, though Scott engaged Southey to write for it and wrote for it largely himself, proved a failure. In a very short time the warehouses of the firm were filled with unsaleable stock. By the end of three years Scott began to write to his partners about the propriety of "reefing sails." But apparently he was too much occupied to look into the accounts of the firm, and so far from understanding the real state of their affairs, he considered himself rich enough to make his first purchase of land at Abbotsford. But he had hardly settled there in the spring of 1812, and begun his schemes for building and planting and converting a bare moor into a richly wooded *pleasure*, than his business troubles began, and he found himself harassed by fears of bankruptcy. Rigdumfunnidos concealed the situation as

¹ See Mr Fytton's *Scott*, in *English Men of Letters Series*, p. 56, for a good defence of these introductions. Scott advertised them originally as a separate publication.

long as he could, but as bill after bill came due he was obliged to make urgent application to Scott, and the truth was thus forced from him item by item. He had by no means revealed all when Scott, who behaved with admirable good-nature, was provoked into remonstrating, "For heaven's sake, treat me as a man and not as a milch-cow." The proceeds of *Rokeby* (January 1813) and of other labours of Scott's pen were swallowed up, and bankruptcy was inevitable, when Constable, still eager at any price to secure Scott's services, came to the rescue. With his help three crises were tided over in 1813.

It was in the midst of these ignoble embarrassments that Scott opened up the rich new vein of the Waverley novels. He chanced upon the manuscript of the opening chapters of *Waverley*, and resolved to complete the story. Four weeks in the summer of 1814 sufficed for the work, and *Waverley* appeared without the author's name in July. Many plausible reasons might be given and have been given for Scott's resolution to publish anonymously. The quaintest reason, and possibly the main one, though it is hardly intelligible now, is that given by Lockhart, that he considered the writing of novels beneath the dignity of a grave clerk of the Court of Session. Why he kept up the mystification, though the secret was an open one to all his Edinburgh acquaintances, is more easily understood. He enjoyed it, and his formally initiated coadjutors enjoyed it, it relieved him from the annoyances of foolish compliment, and it was not unprofitable,—curiosity about "the Great Unknown" keeping alive the interest in his works. The secret was so well kept by all to whom it was definitely entrusted, and so many devices were used to throw conjecture off the scent, that even Scott's friends, who were certain of the authorship from internal evidence, were occasionally puzzled. He kept on producing in his own name as much work as seemed humanly possible for an official who was to be seen every day at his post and as often in society as the most fashionable of his professional brethren. His treatises on church, law, romance, and the drama, besides an elaborate work in two volumes on Border antiquities, appeared in the same year with *Waverley*, and his edition of Swift in nineteen volumes in the same week. *The Lord of the Isles* was published in January 1815; *Guy Mannering*, written in "six weeks about Christmas," in February; *Paul's Letters to his Kinsfolk* and *The Field of Waterloo* in the same year. *Harold's Ramblings*,¹ not to mention the historical part of the *Annual Register*, appeared in the same year with *The Antiquary*, *The Black Dwarf*, and *Old Mortality* (1816). No wonder that the most positive interpreters of internal evidence were mystified. It was not as if he had buried himself in the country for the summer half of the year. On the contrary, he kept open house at Abbotsford in the fine old feudal fashion and was seldom without visitors. His own friends and many strangers from a distance, with or without introductions, sought him there, and found a hearty hospitable country laird, entirely occupied to all outward appearance with local and domestic business and sport, building and planting, adding wing to wing, acre to acre, plantation to plantation, with just leisure enough for the free-hearted entertainment of his guests and the cultivation of friendly relations with his humble neighbours. How could such a man find time to write two or three novels a year, besides what was published in his own name? Even the few intimates who knew how early he got up to prepare his packet for the printer, and had some idea of the extraordinary power that he had acquired of commanding his faculties for the utilization of odd moments, must have

wondered at times whether he had not inherited the arts of his ancestral relation Michael Scott, and kept a goblin in some retired attic or vault.

Scott's fertility is not absolutely unparalleled, the late Mr Trollope claimed to have surpassed him in rate as well as total amount of production, having also business duties to attend to. But in speed of production combined with variety and depth of interest and weight and accuracy of historical substance Scott is still unrivalled. On his claims as a serious historian, which Carlyle ignored in his curiously narrow and splenetic criticism, he was always, with all his magnanimity, peculiarly sensitive. A certain feeling that his antiquarian studies were undervalued seems to have haunted him from his youth. It was probably this that gave the sting to Jeffrey's criticism of *Marmion*, and that tempted him to the somewhat questionable proceeding of reviewing his own novels in the *Quarterly* upon the appearance of *Old Mortality*. He was nettled besides at the accusation of having treated the Covenanters unfairly, and wanted to justify himself by the production of historical documents. In this criticism of himself Scott replied lightly to some of the familiar objections to his work, such as the feebleness of his heroes, Waverley, Bertram, Lovel, and the melodramatic character of some of his scenes and characters. But he argued more seriously against the idea that historical romances are the enemies of history, and he rebutted by anticipation Carlyle's objection that he wrote only to amuse idle persons who like to lie on their backs and read novels. His *apologia* is worth quoting. Historical romances, he admits, have always been failures, but the failure has been due to the imperfect knowledge of the writers and not to the species of composition. If, he says, anachronisms in manners can be avoided, and "the features of an age gone by can be recalled in a spirit of delineation at once faithful and striking. . . the composition itself is in every point of view dignified and improved; and the author, leaving the light and frivolous associates with whom a careless observer would be disposed to ally him, takes his seat on the bench of the historians of his time and country. In this proud assembly, and in no mean place of it, we are disposed to rank the author of these works. At once a master of the great events and minute incidents of history, and of the manners of the times he celebrates, as distinguished from those which now prevail, the intimate thus of the living and of the dead, his judgment enables him to separate those traits which are characteristic from those that are generic; and his imagination, not less accurate and discriminating than vigorous and vivid, presents to the mind of the reader the manners of the times, and introduces to his familiar acquaintance the individuals of the drama as they thought and spoke and acted." This defence of himself shows us the ideal at which Scott aimed, and which he realized. He was not in the least unconscious of his own excellence. He did not hesitate in this review to compare himself with Shakespeare in respect of truth to nature. "The volume which this author has studied is the great book of nature. He has gone abroad into the world in quest of what the world will certainly and abundantly supply, but what a man of great discrimination alone will find, and a man of the very highest genius will alone depict after he has discovered it. The characters of Shakespeare are not more exclusively human, not more perfectly men and women as they live and move, than those of this mysterious author."

The immense strain of Scott's double or quadruple life as sheriff and clerk, hospitable laird, poet, novelist, and miscellaneous man of letters, publisher and printer, though the prosperous excitement sustained him for a time, soon told upon his health. Early in 1817 began a series of

¹ This poem, like the *Bral of Triemadain*, did not bear his name on the title-page, but the authorship was an open secret, although he tried to encourage the idea that the author was his friend Baskine.

attacks of agonizing cramp of the stomach, which recurred at short intervals during more than two years. But his appetite and capacity for work remained unbroken. He made his first attempt at play-writing¹ as he was recovering from the first attack, before the year was out he had completed *Rob Roy*, and within six months it was followed by *The Heart of Midlothian*, which by general consent occupies the highest rank among his novels. *The Bride of Lammermoor*, *The Legend of Montrose*, and *Ivanhoe* were dictated to amanuenses, through fits of suffering so acute that he could not suppress cries of agony. Still he would not give up. When Laidlaw begged him to stop dictating he only answered, "Nay, Willie, only see that the doors are fast. I would fain keep all the cry as well as the wool to ourselves, but as to giving over work, that can only be when I am in woollen."

Throughout those two years of intermittent ill-health, which was at one time so serious that his life was despaired of and he took formal leave of his family, Scott's semipublic life at Abbotsford continued as usual,—swarms of visitors coming and going, and the rate of production on the whole suffering no outward and visible check, all the world wondering at the novelist's prodigious fertility. Mr Ruskin lately put forward the opinion that there is a distinct falling off in the quality of Scott's work traceable from the time of his first serious illness, arguing as a proof of the healthiness of Scott's organization that "he never gains anything by sickness; the whole man breathes or faints as one creature; the ache that stiffens a limb chills his heart, and every pang of the stomach paralyses the brain." Yet, when the world was not aware of the state of the novelist's health, and novel after novel was received without any abatement of enthusiasm, but rather with growing wonder and admiration, no critic was acute enough to detect this, and it is somewhat unfortunate for the theory that Mr Ruskin has mistaken the date of Scott's first illness and included among the masterpieces produced in perfect health *Rob Roy* and *The Heart of Midlothian*, both composed through recurrent fits of intense bodily pain. The first of the series concerning which there were murmurs of dissatisfaction was *The Monastery*, which was the first completed after the re-establishment of the author's bodily vigour. The failure, such as it was, was due rather to the subject than the treatment, and *The Abbot*, in which Mary Queen of Scots is introduced, was generally hailed as fully sustaining the reputation of "the Great Unknown." *Kennilworth*, *The Pirate*, *The Fortunes of Nigel*, *Peveril of the Peak*, *Quentin Durward*, *St. Ronan's Well*, *Redgauntlet*, followed in quick succession in the course of three years, and it was not till the last two were reached that the cry that the author was writing too fast began to gather volume. *St. Ronan's Well* was very severely criticized and condemned. And yet Mr Leslie Stephen tells a story of a dozen modern connoisseurs in the Waverley novels who agreed that each should write down separately the name of his favourite novel, when it appeared that each had without concert named *St. Ronan's Well*. There is thus certainly to be said for *St. Ronan's*, that, in spite of the heaviness of some of the scenes at the "hottie" and the artificial melodramatic character of some of the personages, none of Scott's stories is of more absorbing or more brilliantly diversified interest. Contradictions between contemporary popular opinion and mature critical judgment, as well as diversities of view among critics themselves, rather shake confidence in individual judgment on the

vexed but not particularly wise question which is the best of Scott's novels. There must, of course, always be inequalities in a series so prolonged. The author cannot always be equally happy in his choice of subject, situation, and character. Naturally also he dealt first with the subjects of which his mind was fullest. But any theory of falling off or exhaustion based upon plausible general considerations has to be qualified so much when brought into contact with the facts that very little confidence can be reposed in its accuracy. *The Fortunes of Nigel* comes comparatively late in the series and has often been blamed for its looseness of construction. Scott himself always spoke slightly of his plots, and humorously said that he proceeded on Mr Bayes's maxim, "What the dence is a plot good for but to bring in good things?" Yet so competent a critic as Mr Hutton has avowed that on the whole he prefers *The Fortunes of Nigel* to any other of Scott's novels. An attempt might be made to value the novels according to the sources of their materials, according as they are based on personal observation, documentary history, or previous imaginative literature. On this principle *Ivanhoe* and *The Tales of the Crusaders* might be adjudged inferior as being based necessarily on previous romance. But as a matter of fact Scott's romantic characters are vitalized, clothed with a verisimilitude of life, out of the author's deep, wide, and discriminating knowledge of realities, and his observation of actual life was coloured by ideals derived from romance. He wrote all his novels out of a mind richly stored with learning of all kinds, and in the heat of composition seems to have drawn from whatever his tenacious memory supplied to feed the fire of imagination, without pausing to reflect upon the source. He did not exhaust his accumulations from one source first and then turn to another, but from first to last drew from all as the needs of the occasion happened to suggest.

Towards the close of 1825, after eleven years of brilliant and prosperous labour, encouraged by constant tributes of admiration, homage, and affection such as no other literary potentate has ever enjoyed, realizing his dreams of paternal splendour and hospitality on a scale suited to his large literary revenues, Scott suddenly discovered that the foundations of his fortune were unsubstantial. He had imagined himself clear of all embarrassments in 1818, when all the unsaleable stock of John Ballantyne & Co was bargained off by Rigmum to Constable for Waverley copyrights, and the publishing concern was wound up. Apparently he never informed himself accurately of the new relations of mutual accommodation on which the printing firm then entered with the great but rashly speculative publisher, and drew liberally for his own expenditure against the undeniable profits of his novels without asking any questions, trusting blindly in the solvency of his commercial henchmen. Unfortunately, "lifted off their feet" by the wonderful triumphs of their chief, they thought themselves exempted like himself from the troublesome duty of inspecting ledgers and balancing accounts, till the crash came. From a diary which Scott began a few days before the first rumours of financial difficulty reached him we know how he bore from day to day the rapidly unfolded prospect of unsuspected liabilities. "Thank God," was his first reflexion, "I have enough to pay more than 20s. in the pound, taking matters at the worst." But a few weeks revealed the unpleasant truth that, owing to the way in which Ballantyne & Co. were mixed up with Constable & Co., and Constable with Hurst & Robinson, the failure of the London house threw upon him personal responsibility for £130,000.

How Scott's pride rebelled against the dishonour of bankruptcy, how he toiled for the rest of his life to clear

¹ *The Doom of Deirion*. Thus and his subsequent dramatic sketches, *Macbeth's Cross*, *Italian Dile*, and *The Agincourt Tragedy*, were slight compositions, dashed off in a few days, and afford no measure of what Scott might have done as a dramatist if he had studied the conditions of stage representation.

off this enormous debt, declining all offers of assistance and asking no consideration from his creditors except time, and how nearly he succeeded, is one of the most familiar chapters in literary history, and would be one of the saddest were it not for the heroism of the enterprise. His wife died soon after the struggle began, and he suffered other painful bereavements, but, though sick at heart, he toiled on indomitably, and, writing for honour, exceeded even his happiest days in industrious speed. If he could have maintained the rate of the first three years, during which he completed *Woodstock*, three *Chronicles of the Canongate*, *The Fair Maid of Penrhyn*, *Anne of Geierstein*, the *Life of Napoleon* (involving much research, and equal in amount to thirteen novel volumes), part of his *History of Scotland*, the Scottish series of *Tales of a Grandfather*, besides several magazine articles, some of them among the most brilliant of his miscellaneous writings, and prefaces and notes to a collected edition of his novels,—if he could have continued at this rate he might soon have freed himself from all his encumbrances. The result of his exertions from January 1826 to January 1828 was nearly £40,000 for his creditors. But the terrific labour proved too much even for his endurance. Ugly symptoms began to alarm his family in 1829, and in February of 1830 he had his first stroke of paralysis. Still he was undaunted, and not all the persuasions of friends and physicians could induce him to take rest. "During 1830," Mr Lockhart says, "he covered almost as many sheets with his MS as in 1829," the new introductions to a collected edition of his poetry and the *Letters on Demonology and Witchcraft* being amongst the labours of the year. He had a slight touch of apoplexy in November and a distinct stroke of paralysis in the following April, but, in spite of these warnings and of other bodily ailments, he had two more novels, *Count Robert of Paris* and *Castle Dangerous*, ready for the press by the autumn of 1831. He would not yield to the solicitations of his friends and consent to try rest and a change of scene, till fortunately, as his mental powers failed, he became possessed of the idea that all his debts were at last paid and that he was once more a free man. In this belief he happily remained till his death. When it was known that his physicians recommended a sea voyage for his health, a Government vessel was put at his disposal, and he cruised about in the Mediterranean and visited places of interest for the greater part of a year before his death. But, when he felt that the end was near, he insisted on being carried across Europe that he might die on his beloved Tweedside at Abbotsford, where he expired on 21st September 1832. He was buried at Dryburgh Abbey on 26th September following.

A complete list of Scott's works is given in the *Catalogue of Scott's Edition*, 1871, Edinburgh, 1872. The standard biography of Scott is that by Lockhart referred to above; see also Allan, *Life of Scott*, Edinburgh, 1884.

SCOTT, WILLIAM. See STOWELL, LORD.

SCOTT, WINFIELD (1786-1866), American general, was born near Petersburg, Virginia, 13th June 1786, the grandson of a Scottish refugee from the field of Culloden. He was a student at William and Mary College in 1805, and was admitted to the bar at Richmond, Virginia, in 1807. One of the sudden war excitements of the time changed the course of his life, and he obtained a captain's commission in the United States army in 1808. He served on the Niagara frontier throughout the war of 1812-15, and became one of its leading figures, rising rapidly through all the grades of the service to that of major-general, which was then the highest. Among other curious testimonials to his valour and conduct, he received from Princeton College in 1814 the honorary degree of doctor of laws, a distinction on

which he never ceased to look with peculiar satisfaction. In 1841 he became the senior major-general of the army, and in 1855, after he had passed out of political life, the exceptional grade of lieutenant-general was created for him. His most noteworthy military achievement was his conduct of the main campaign against Mexico in 1847 (Landing (9th March) at Vera Cruz with but 5500 men, he fought his way through a hostile country to the capital city of Mexico, which he captured 14th September, thereby practically ending the war. His service, however, was not confined to the army, from 1815 until 1861 he was the most continuously prominent public man of the country, receiving and justifying every mark of public confidence in his integrity, tact, and reasonableness. At a time (1823) when duelling was almost an imperative duty of an officer, he resisted successfully the persistent efforts of a brother officer (Andrew Jackson) to force him into a combat, and the simple rectitude of his intentions was so evident that he lost no ground in public estimation. In 1832, when ordered to Charleston by President Jackson during the "nullification" troubles, he secured every advantage for the Government, while his skilful and judicious conduct gave no occasion to South Carolina for an outbreak. In like manner, in the Black Hawk Indian troubles of 1832-33, in the Canadian "Patriot War" of 1837-38, in the boundary dispute of 1838 between Maine and New Brunswick, in the San Juan difficulty in 1859, wherever there was imminent danger of war and a strong desire to keep the peace, all thoughts tuned instinctively to Scott as a fit instrument of an amicable settlement, and his success always justified the choice. Such a career seemed a gateway to political preferment, and his position was strengthened by the notorious fact that, as he was a Whig, the Democratic administration had persistently tried to subordinate his claims to those of officers of its own party. In 1852 his party nominated him for the presidency, but, though his services had been so great and his capacity and integrity were beyond question, he had other qualities which counted heavily against him. He was easily betrayed into the most egregious blunders of speech and action, which drew additional zest from his portly and massive form and a somewhat pompous ceremoniousness of manner. He destroyed his chances of election in the North. The Southern Whigs, believing him to be under the influence of the Seward or anti-slavery wing of the party, cast no strong vote for him, and he was overwhelmingly defeated in both sections, completing the final overthrow of his party. In 1861 he remained at the head of the United States armies, in spite of the secession of his State, until November, when he retired on account of old age and infirmities. After travelling for a time in Europe, he published in 1864 his autobiography, a work which reveals the strong and weak points of his character,—his integrity and complete honesty of purpose, his inclination to personal vanity, his rigid precision in every point of military precedent and etiquette, and his laborious affection of an intimate acquaintance with *belles lettres*. He died at West Point, New York, 29th May 1866.

The *Autobiography of Lieutenant-General Winfield Scott, LL.D.*, in two volumes, gives the facts of his career at length. For his defeat in 1852, see Von Holst's *Constitutional History*, vol. iv p. 171 of the original, p. 206 of the English translation.

SCOTUS. See DUNS SCOTUS and SCHOLASTICISM.

SCRANTON, a city of the United States, capital of Lackawanna county, Pennsylvania, on a plateau at the junction of the Roaring Brook and the Lackawanna river, 162 miles north of Philadelphia. It is the centre of the great coal-mining district in the country and the seat of a large number of iron and steel works, rolling-mills, blast-furnaces, &c., and extensive factories for the production of

rails, locomotives, mining machinery, steam-boilers, stoves, carriages, edge-tools, &c. A public library, a theatre, an academy of music, a hospital, a public hall, a driving park, a Roman Catholic cathedral, a home for the friendless, and a museum of Indian stone relics are among the more prominent features of the place. The population was 9223 in 1860, 35,092 in 1870, and 45,850 in 1880.

Slocum Farm, as the site was called subsequent to 1798, saw its first blast-furnace erected in 1840 by George and Selden Scammon, who soon added a rolling-mill and the manufacture of rails. The opening of the railway in 1856 gave a great stimulus to the new town (1854), which obtained a city charter in 1866. It is divided into twenty-one wards, of which the 4th, 5th, 6th, 14th, 15th, and 18th are known as Hyde Park, the 1st, 2d, and 3d as Providence.

SCREAMER, a bird inhabiting Guiana and the Amazon valley, so called in 1781 by Pennant (*Gen. Birds*, p. 37) "from the violent noise it makes,"—the *Palamedea cornuta* of Linnaeus. First made known in 1648 by Maregrave under the name of "Anhima," it was more fully described and better figured by Buffon under that of *Kamohi*, still applied to it by French writers. Of about the size of a Turkey, it is remarkable for the curious "hoan" or slender caruncle, more than three inches long, it bears on its crown, the two sharp spurs with which each wing is armed, and its elongated toes. Its plumage is plain in colour, being of an almost uniform greyish black above, the space round the eyes and a ring round the neck being variegated with white, and a patch of pale rufous appearing above the capal joint, while the lower parts of the body are white. Closely related to this bird is another first described by Linnaeus as a species of *Pavva* (JAGANA, vol. xiii p. 531), to which group it certainly does not belong, but separated therefrom by Illiger to form the genus *Chauna*, and now known as *C. chavassa*, very generally in English as the "Crested Screamer,"¹ a name which was first bestowed on the *SARIREMA* (g v). This bird inhabits the lagoons and swamps of Paraguay and Southern Brazil, where it is called "Chaja" or "Chaka," and is smaller than the preceding, wanting its "hoan," but having its head furnished with a dependent crest of feathers. Its face and throat are white, to which succeeds a blackish ring, and the rest of the lower parts are white, more or less clouded with umereous. According to Mr Gibson (*Ibis*, 1880, pp. 165, 166), its nest is a light construction of dry rushes, having its foundation in the water, and contains as many as six eggs, which are white tinged with buff. The young are covered with down of a yellowish brown colour. A most singular habit possessed by this bird is that of rising in the air and soaring there in circles at an immense altitude, uttering at intervals the very loud cry of which its local name is an imitation. From a dozen to a score may be seen at once so occupying themselves. The young are often taken from the nest and reared by the people to attend upon and defend their poultry, a duty which is faithfully² and, owing to the spurs with which the Chaka's wings are armed, successfully discharged. Another very curious property of this bird, which was observed by Jacquin, who brought it to the notice of Linnaeus,³ is its emphysematous condition,—there being a layer of air-cells between the skin and the muscles, so that on any part of the body being pressed a crackling sound is heard. In Central America occurs another species, *C. derbiana*, chiefly distinguished by the darker colour of its plumage. For this a distinct genus, *Ischyrocris*, was proposed, but apparently without necessity, by Reichenbach (*Syst. Avium*, p. xxi.).

The taxonomic position of the *Palamedea*, for all will

¹ Under this name its curious habits have been well described by Mr W. H. Hudson (*Gentleman's Magazine*, Sept. 1885, pp. 280-287).

² Hence Latham's name for this species is "Faithful Chaka,"—he supposing it to belong to the genus in which Linnaeus placed it.

³ "Tacta manu cutis, sub pennis etiam laevis, crepitat ubique fortiter" (*Syst. Nat.*, ed. 12, i. p. 260).

allow to the Scameis the rank of a Family at least, has been much debated, and cannot be regarded as fixed. Their Anserine relations were pointed out by Prof. Parker in the *Zoological Proceedings* for 1863 (pp. 511-518), and in the same work for 1867 Prof. Huxley placed the Family among his *Chenomorphae*; but this view was contavened in 1876 by Gariod, who said, "The Screamers must have sprung from the primary avian stock as an independent offshoot at much the same time as did most of the other important families." Accordingly in 1880 Mr Selater regarded them as forming a distinct "Order," *Palamedea*, which he, however, placed next to the true *Anseres*, from the neighbourhood of which, as has been already stated (*ORNITHOLOGY*, vol. xvii p. 47), the present writer thinks the *Palamedeidae* can hardly be removed. (A. N.)

SCREW. The screw is the simplest instrument for converting a uniform motion of rotation into a uniform motion of translation (see *MECHANICS*, vol. xv. p. 754). Metal screws requiring no special accuracy are generally cut by taps and dies. A tap is a cylindrical piece of steel having a screw on its exterior with sharp cutting edges, by forcing this with a revolving motion into a hole of the proper size, a screw is cut on its interior forming what is known as a nut or female screw. The die is a nut with sharp cutting edges used to screw upon the outside of round pieces of metal and thus produce male screws. More accurate screws are cut in a lathe by causing the carriage carrying the tool to move uniformly forward, thus a continuous spiral line is cut on the uniformly revolving cylinder fixed between the lathe centres. The cutting tool may be an ordinary form of lathe tool or a revolving saw-like disk (See *MACHINE TOOLS*, vol. xv p. 153).

Errors of Screw.—For scientific purposes the screw must be so regular that it moves forward in its nut exactly the same distance for each given angular rotation around its axis. As the mountings of a screw introduced many quips, the final and exact test of its accuracy can only be made when it is finished and set up for use. A large screw can, however, be roughly examined in the following manner: (1) See whether the surface of the threads has a perfect polish. The more it departs from this, and approaches the rough torn surface as cut by the lathe tool, the worse it is. A perfect screw has a perfect polish. (2) Mount upon it between the centres of a lathe and the shop a short nut which fits perfectly. If the nut moves from end to end with equal friction, the screw is uniform in diameter. If the nut is loose, unequal resistance may be due to either an error of run or a bend in the screw. (3) Fix a microscope on the lathe carriage and focus its simple cross-hair on the edge of the screw and parallel to its axis. If the screw runs true at every point, its axis is straight. (4) Observe whether the short nut runs from end to end of the screw without a wobbling motion when the screw is turned and the nut kept from revolving. If it wobbles the screw is said to be drunk. One can see this error better by fixing a long pointer to the nut, or by attaching to it a mirror and observing an image in it with a telescope. The following experiment will also detect this error. (5) Put upon the screw two well-fitting and rather short nuts, which are kept from revolving by arms bearing against a straight edge parallel to the axis of the screw. Let one nut carry an arm which supports a microscope focused on a line ruled on the other nut. Screw this combination to different parts of the screw. If during one revolution the microscope remains in focus, the screw is not drunk; and, if the cross-hairs bisect the line in every position, there is no error of run.

Making Accurate Screws.—To produce a screw of a foot or even a yard long with errors not exceeding $\frac{1}{1000}$ of an inch is not difficult. Professor William A. Rogers of Harvard observatory has invented a process in which the tool of the lathe which cuts the screw is moved so as to counteract the errors of the lathe screw. The screw is then partly ground to get rid of local errors. But, where the highest accuracy is needed, we must resort in the case of screws, as in all other cases, to grinding. A long solid nut, tightly fitting the screw in one position, cannot be moved freely to another position unless the screw is very accurate. If grinding material is applied and the nut is constantly tightened, it will grind out all errors of run, drunkenness, crookedness, and irregularity of axis. The condition is that the nut must be long, rigid, and capable of being tightened as the grinding proceeds; also the screw must be ground longer than it will finally be needed so that the imperfect ends may be removed.

The following process will produce a screw suitable for ruling

gratings for optical purposes. Suppose it is our purpose to produce a screw which is finally to be 9 inches long, not including bearings, and $1\frac{1}{4}$ inches in diameter. Select a bar of soft Bessemer steel, which has not the hard spots usually found in cast steel, about $1\frac{1}{2}$ inches in diameter and 30 long. Put it between the ends and turn it down to 1 inch diameter everywhere, except about 12 inches in the centre, where it is left a little over $1\frac{1}{4}$ inches in diameter for cutting the screw. Now cut the screw with a triangular thread a little sharper than 60° . Above all, avoid a fine screw, using about 20 threads to the inch.

The grinding nut, about 11 inches long, has now to be made. Fig 1 represents a section of the nut, which is made of brass, or better

FIG 1—Section of grinding nut

of Bessemer steel. It consists of four segments, a, b, c , which can be drawn about the screw by two collars, b, b , and the screw c . Wedges between the segments prevent too great pressure on the screw. The final clamping is effected by the rings and screws, d, d , which enclose the flanges, a , of the segments. The screw is now placed in a lathe and surrounded by water whose temperature can be kept constant to 1°C , and the nut placed on it. In order that the weight of the nut may not make the ends too small, it must either be counterbalanced by weights hung from a rope passing over pulleys in the ceiling, or the screw must be vertical during the whole process. Emery and oil seem to be the only available grinding materials, though a softer silica powder might be used towards the end of the operation to clean off the emery and prevent fatigue wear. Now grind the softer end of the nut, making the nut pass backwards and forwards over the screw, its whole range being nearly 20 inches at first. Turn the nut end for end every ten minutes and continue for two weeks, finally making the range of the nut only about 10 inches, using finer washed emery and moving the lathe slower to avoid heating. Finish with a fine silica powder or lunge. During the process, if the screw becomes too blunt, recut the nut by *short cuts* so as not to change the pitch at any point. This must of course not be done less than five days before the finish. Now cut to the proper length; centre again in the lathe under a microscope; and turn the bearings. A screw so ground has less errors than from any other system of mounting. The periodic error especially will be too small to be discovered, though the mountings and graduation and centering of the head will introduce it, it must therefore finally be corrected.

Mounting of Screws.—The mounting must be devised most carefully, and is indeed more difficult to make without error than the screw itself. The principle which should be adopted is that no workmanship is perfect, the design must make up for its imperfections. Thus the screw can never be made to run true on its bearings, and hence the device of resting one end of the carriage on the nut must be used. Also, the carriage must be between the nut and the carriage must be avoided, as the screw can never be adjusted parallel to the ways on which the carriage rests. For many purposes, such as ruling optical gratings, the carriage must move accurately forward in a straight line as far as the horizontal plane is concerned, while a little curvature in the vertical plane produces very little effect. These conditions can be satisfied by making the ways V-shaped and grinding with a graver somewhat shorter than the ways. By constant reversal and by lengthening or shortening the stroke, they will finally become nearly perfect. The vertical curvature can be sufficiently tested by a short carriage carrying a delicate spirit level. Another and very efficient form of ways is V-shaped with a flat top and nearly vertical sides. The carriage rests on the flat top and is held by springs against one of the nearly vertical sides. To determine with accuracy whether the ways are straight, fix a flat piece of glass on the carriage and rule a line on it by moving it under a diamond, reverse and rule another line near the first, and measure the distance apart at the centre and at the two ends by a micrometer. If the centre measurement is equal to the mean of the two end ones, the line is straight. This is better than the method with a mirror mounted on the carriage and a telescope. The screw itself must rest in bearings, and the end motion can be prevented by a point bearing against its nut end, which is protected by hardened steel or a flat diamond. Collar bearings introduce periodic errors. The secret of success is so to

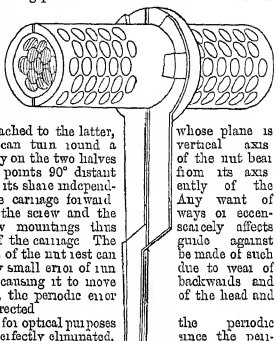

design the nut and its connections as to eliminate all adjustments of the screw and indeed all imperfect workmanship. The connexion must also be such as to give means of correcting any residual periodic errors or errors of run which may be introduced in the mountings or by the wear of the machine.

The nut is shown in fig 2. It is made in two halves, of wrought iron filled with boxwood or lignum vite plugs, on which the screw is cut. To each half a long piece of sheet steel is fixed which bears against a guiding edge, to be described presently. The two bearings are held to the screw by springs, so that each moves forward almost independently of the other. To join the nut to the carriage, a ring is attached to the latter, vertical and which can turn round a. The bars fixed midway on the two halves against this ring at points 90° distant. Hence each half does its share independently in moving the carriage forward parallelism between the screw and the fixity in the screw mountings thus the forward motion of the carriage is such which the steel pieces of the nut rest can form as to correct any small error of run the screw. Also, by causing it to move forwards periodically, the periodic error mountings can be corrected.

In making gratings for optical purposes error must be very perfectly done. The periodic displacement of the lines only one-fourth from their mean position will produce "ghosts" in the spectrum. Indeed this is the most sensitive method of detecting the existence of this error, and it is practically impossible to mount the most perfect of screws without introducing it. A very practical method of determining this error is to rule a short grating with very long lines on a piece of common thin plate glass, and to place it in two positions, one with the two halves with the rulings together and displaced sideways over each other one-half the pitch of the screw. On now looking at the plates in a proper light so as to have the spectral colours show through it, dark lines will appear, which are wavy if there is a periodic error and straight if there is none. By measuring the comparative amplitude of the waves and the distance apart of two lines, the amount of the periodic error can be determined. The phase of the periodic error is best found by a series of trials after setting the corrector at the proper amplitude as determined above.

A machine properly made as above and kept at a constant temperature should be able to make a scale of 6 inches in length, with errors at no point exceeding $\frac{1}{10000}$ of an inch. When, however, a grating of that length is attempted at the rate of 14,000 lines to the inch, four days and nights are required and the result is seldom perfect, possibly on account of the wear of the machine or changes of temperature. Gratings, however, less than 8 inches long are easy to make.

(H. A. R.)
SCRIBE, AUGUSTIN EUGENE (1791-1861), the most popular playwright of France, was born at Paris on 24th December 1791, and died there on 20th February 1861. His father was a silk merchant and he was well educated, being destined for the bar. But, having a real gift for the theatre (a gift which unfortunately was not allied with sufficient literary power to make his works last), he very soon broke away from professional study and at the age of twenty produced, in collaboration, as is common in France, the first of a series of dramas which continued for fifty years. *Les Dervis* (1811) is usually cited as the first play in which he took a hand, though, as for some time he did not sign his work, identification is somewhat difficult. He achieved no distinct success till 1816, when *Une Nuit de Garde Nationale* made him a very famous. Thenceforward his fertility was unceasing and its results prodigious. There may be in existence a complete list of Scribe's works, but we have never seen any that pretended to be such. He wrote every kind of drama—vaudevilles,

whose plane is vertical the axis of the nut bears from its axis entirely of the Any want of ways or eccentricity affects the periodic error must be made of such due to wear of backwards and of the head and

the periodic error must be very perfectly done. The periodic displacement of the lines only one-fourth from their mean position will produce "ghosts" in the spectrum.

Fig 2.

¹ In a machine made by the present writer for ruling gratings the periodic error is entirely due to the graduation and centering of the head. The uncorrected periodic error from this cause displaces the lines $\frac{1}{10000}$ of an inch, which is sufficient to entirely ruin all gratings made without correcting it.

comedies, tragedies, opera-hibretti. To one theatre alone he is said to have furnished more than a hundred pieces. But his life was entirely uneventful, and his election to the Academy in 1834 is almost the only incident which deserves chronicling. It ought to be said to Scribe's credit that, although he was the least original of writers and was more an editor of dramas than a dramatist, although he was for many years an object of the bitterest envy to impecunious geniuses owing to his pecuniary success, and although he never has pleased and never can please any critic who applies purely literary tests, his character stands very high for literary probity and indeed generosity. He is said in some cases to have sent sums of money for "copyright in ideas" to men who not only had not actually collaborated with him but who were unaware that he had taken suggestions from their work. His industry was untiring and his knowledge both of the mechanism of the stage and of the tastes of the audience was wonderful. Nevertheless he hardly deserves a place in literature, his style being vulgar, his characters commonplace, even his plots lacking power and grasp. He wrote a few novels, but none of any mark. The best known of Scribe's pieces after his first successful one are *Une Chaine* (1842), *Le Verre d'Eau* (1842), *Adrienne Lecouvreur* (1849), and the libretti of many of the most famous operas of the middle of the century, especially those of Auber and Meyerbeer.

SCRIBES. See ISRAEL, vol. xiv p. 419.

SCRIVENER'S PALSY. See CRAMP, vol. vi p. 543.

SCROFULA or STRUMA (formerly known in England as "king's evil," from the belief that the touch of the sovereign could effect a cure¹), a constitutional morbid condition generally exhibiting itself in early life, and characterized mainly by defective nutrition of the tissues and by a tendency to inflammatory affections of a low type with degenerative changes in their products. The subject has been considered in most of its features under PATHOLOGY (vol. xviii p. 405), and only a further brief reference is here necessary. Scrofula may be either inherited or acquired. Heredity is of all causes the most potent, and naturally operates with greater certainty where both parents possess the taint. As in all hereditary diseases, however, the liability may be scarcely perceptible for one or two generations, but may then reappear. Other causes referable to parentage may readily produce this constitutional state in children, as weakness or ill health in one or both parents, and, as seems probable, marriages of consanguinity. But, apart altogether from hereditary or congenital influences, the scrofulous habit is frequently developed, especially in the young, by such unfavourable hygienic conditions as result from overcrowding, cold, and dark dwellings, insufficient and improper food, exposure, and debauchery. Even among the old in such circumstances the evidences of scrofula may be seen to present themselves where before they had been absent.

There are two well-marked types of the scrofulous constitution to be often observed, especially among the young. In the one the chief features are a fair complexion with delicate thin skin, blue eyes, dilated pupils, long eyelashes, soft muscles, and activity of the circulatory and nervous system, while in the other the skin is dark, the features heavy, the figure stunted, and all the functions, physical and mental, inactive. In many instances, however, it will be found that both types are more or less mixed together in one individual. The manifestations of scrofula generally appear in early life, and are often exhibited in young

children during the first dentition by inflammatory skin eruptions of obstinate character, on the face and other parts, later on in youth there appear glandular swellings either externally, as on the neck, or affecting the gland structures of the chest or abdomen, while at the same time mucous membranes and bones may become implicated. The distinctive features of the scrofulous inflammatory affections are their tendency to chronicity and to suppurative and degenerative changes, the affected parts either healing slowly with resulting disfigurement, as on the neck, or continuing to retain traces of the products of the diseased action, which may set up serious disturbance of the health at some future time. Further, the scrofulous constitution always influences the duration and progress of any disease from which the individual may suffer, as well as its results. Thus in pneumonia, to which the scrofulous would seem to be specially liable, the products of the inflammation are not readily absorbed as in previously healthy persons, but, remaining in the lung-tissues, are apt to undergo caseous degenerative changes, which may issue in phthisis (see PNEUMONIA and PHTHISIS). The connexion of scrofula with tubercle is pointed out in the article PATHOLOGY (*loc. cit.*)

Scrofula may under favourable circumstances tend to improvement as age advances, and it occasionally happens that persons who in early life showed unmistakable evidences of this condition appear ultimately to outgrow it, and become in all respects healthy and vigorous. The treatment is essentially similar to that described for rickets or phthisis, and is partly preventive and partly curative. It consists mainly in hygienic measures to promote the health and nutrition of the young, and of suitable diet, tonics, &c., where evidences of the disease have declared themselves. See RICKETS, PHTHISIS.

SCRUB-BIRD, the name (for want of a better, since it is not very distinctive) conferred upon the members of an Australian genus, one of the most curious ornithological types of the many furnished by that country. The first examples were procured by the late Mr. Gilbert between Perth and Augusta in West Australia, and were described by Gould in the Zoological Society's *Proceedings* for 1844 (pp. 1, 2), as forming a new genus and species under the name of *Atrichia clamosa*, the great peculiarity observed by that naturalist being the absence of any bristles around the gape, in which respect alone it seemed to differ from the already known genus *Sphenura*. In March 1866 Mr. Wilcox obtained on the banks of the Richmond river on the eastern side of Australia some other examples, which proved the existence of a second species, described by Mr. Ramsay in the *Proceedings* for that year (pp. 438-440) as *A. rufescens*, but still no suspicion of the great divergence of the genus from the ordinary Passerine type was raised, and it was generally regarded as belonging to the *Maluridae* or Australian Warblers. However, the peculiar formation of the sternum in *Atrichia* attracted the present writer's attention almost as soon as that of *A. clamosa* was exhibited in the museum of the College of Surgeons, and at his request Mr. Ramsay a little later sent to the museum of the university of Cambridge examples in spirit of *A. rufescens*, which showed a common structure. One of the sternal peculiarities was noticed by Mr. Slater (*Ibis*, 1874, p. 191, note), and in the present work (*BIRDS*, iii. p. 741) the Scrub-birds were declared to form a distinct Family, *Atrichidae*, standing, so far as was known, alone with the Lyre-birds (see vol. xv. p. 115) as "abnormal *Passeres*." Much the same view was also taken the next year by Garrod, who, in the *Proceedings* for 1876 (pp. 516, 518, p. lii. figs. 4-7), further dwelt on the taxonomic importance of the equally remarkable characters of the syringeal muscles exhibited alike by *Menura* and *Atrichia*, which he accorded

¹ This superstition can be traced back to the time of Edward the Confessor in England, and to a much earlier period in France. Samuel Johnson was touched by Queen Anne in 1712, and the same prerogative of royalty was exercised by Prince Charles Edward in 1745.

ingly placed together in a division of the Acromyodian *Passeres*, differing from all the rest and since recognized, as has been said (ORNITHOLOGY, vol. xviii. pp. 40, 41), by Mr Sclater as a Sub-order *Pseudoscines*. A detailed anatomical description of *Atrichia* has, however, yet to be given, and a comparison of many other Australian types is needed¹ before it can be certainly said to have no nearer ally than *Menura*. Both the known species of Scrub-bird are about

West-Australian Scrub-bird (*Atrichia clamosa*).

the size of a small Thrush—*A. clamosa* being the larger of the two. This species is brown above, each feather barred with a darker shade; the throat and belly are reddish white, and there is a large black patch on the breast; while the flanks are brown and the lower tail-coverts rufous. *A. rufescens* has the white and black of the fore-parts replaced by brown, barred much as is the upper plumage. Both species are said to inhabit the thickest "scrub" or brushwood forest; but little has been ascertained as to their mode of life except that the males are noisy, imitative of the notes of other birds, and given to violent gesticulations. The nest and eggs seem never to have been found, and indeed no example of the female of either species is known to have been procured, whence that sex may be inferred to escape observation by its inconspicuous appearance and retiring habits. (A. N.)

SCUDÉRY is the name of a family which is said to have been of Italian origin and to have transferred itself to Provence, but which is only known by the singular brother and sister who represented it during the 17th century.

GEORGES DE SCUDÉRY (1601-1687), the elder of the pair, was born at Havre, whither his father had moved from Provence, in 1601. He served in the army for some time, and, though in the vein of gasconading which was almost peculiar to him he no doubt exaggerated his services, there seems little doubt that he was a stout soldier. But he conceived a fancy for literature before he was thirty, and during the whole of the middle of the century he was one of the most characteristic figures of Paris. Despite his own merit, which was not inconsiderable, and his sister's, which was more, he was unlucky in his suits for preferment. Indeed from some stories told by men not his friends he seems to have hurt his own chances by independence of spirit. He received, however, the governorship of the fortress of Notre Dame de la Garde near Marseilles in 1643, and in 1650 was elected to the Academy. Long before he had made

himself conspicuous by a letter attacking Corneille's *Cid*, which he addressed to that body. He was himself an industrious dramatist, *L'Amour Tyrannique* being the chief piece which (and that only partially) has escaped oblivion. His other most famous work was the epic of *Alaric* (1654). He lent his name to his sister's first romances, but did little beyond correcting the proofs. His death occurred at Paris on 14th May 1687. Scudéry's swashbuckler affectations (he terminates his introduction to the works of Théophile de Viaud by something like a challenge in form to any one who does not admit the supremacy of the deceased poet), the bombast of his style, and his various oddities have been rather exaggerated by literary gossip and tradition. Although probably not quite sane, he had some poetical power, a fervent love of literature, a high sense of honour and of friendship.

His sister MADELEINE (1607-1701), born also at Havre in 1607, was a writer of much more ability and of a much better regulated character. She was very plain and had no fortune, but her abilities were great and she was very well educated. Establishing herself at Paris with her brother, she was at once admitted to the Rambouillet coterie, afterwards established a salon of her own under the title of the *Société du Samedi*, and for the last half of the 17th century, under the pseudonym of "Sapho" or her own name, was acknowledged as the first blue-stocking of France and of the world. Her celebrated novels, *Artamène ou le Grand Cyrus*, *Clélie*, *Ibrahim ou l'Illustre Bassa*, *Almahide*, and others are known by quotation to every one, and were the delight of all Europe, including persons of the wit and sense of Madame de Sévigné. But for at least a century and a half they have lain unread, and their immense length has often been satirized even by persons well read in letters with the term "folio," when in fact they were originally issued in batches of small octavos, sometimes (allowing for two parts to each volume) running to a score or so. Neither in conception nor in execution will they bear criticism as wholes. With classical or Oriental personages for nominal heroes and heroines, the whole language and action are taken from the fashionable ideas of the time, and the personages can be identified either really or colourably with Mademoiselle de Scudéry's contemporaries. The interminable length of the stories is made out by endless conversations and, as far as incidents go, chiefly by successive abductions of the heroines, conceived and related in the most decorous spirit, for Mademoiselle de Scudéry is nothing if not decorous. Nevertheless, although the books can hardly now be read through, it is still possible to perceive their attraction for the wits, both male and female, of a time which certainly did not lack wit. In that early day of the novel prolixity did not repel. "Sapho" had really studied mankind in her contemporaries and knew how to analyse and describe their characters with fidelity and point. She was a real mistress of conversation, a thing quite new to the age at least as far as literature was concerned, and proportionately welcome. She could moralize—a favourite employment of the time—with sense and propriety, and the purely literary merits of the style which clothed the whole were considerable. Madeleine survived her brother more than thirty years (scandal says that she was not sorry to be relieved from his humours), and in her later days published numerous volumes of conversations (to a great extent extracted from her novels) and short moral writings. Dryden says that he had heard of an intention on her part to translate the *Canterbury Tales*, and it is not impossible. She never lost either her renown or her wits or her good sense, and died at Paris on 2d June 1701. It is unfortunate and rather surprising that no one has recently attempted an anthology from her immense work.

¹ Forbes shewed that ORNITHOLOGY (vol. xviii. p. 52) did not belong to the group as at one time supposed.

SCULPTURE

THE present article is confined to the sculpture of the Middle Ages and modern times; classical sculpture has been already treated of under *ARCHAEOLOGY* (*CLASSICAL*), vol. ii. p. 343 *sq.*, and in the articles on the several individual artists.

In the 4th century A.D., under the rule of Constantine's successors, the plastic arts in the Roman world reached the lowest point of degradation to which they ever fell. Coarse in workmanship, intensely feeble in design, and utterly without expression or life, the pagan sculpture of that time is merely a dull and ignorant imitation of the work of previous centuries. The old faith was dead, and

Early
Chris-
tian.

the art which had sprung from it died with it. In the same century a large amount of sculpture was produced by Christian workmen, which, though it reached no very high standard of merit, was at least far superior to the pagan work. Although it shows no increase of technical skill or knowledge of the human form, yet the mere fact that it was inspired and its subjects supplied by a real living faith was quite sufficient to give it a vigour and a dramatic force which raise it aesthetically far above the expiring efforts of paganism. Fig. 1 shows a very fine Christian relief of the 4th century, with a noble figure of an archangel holding an orb and a sceptre. It is a leaf from an ivory consular diptych, inscribed at the top ΔΕΧΟΥ ΠΑΡΟΝΤΑ ΚΑΙ ΜΑΘΩΝ ΤΗΝ ΑΙΤΙΑΝ, "Receive these presents and having learnt the occasion . . ." A number of large marble sarcophagi are the chief existing specimens of this early Christian sculpture. In general design they are close copies of pagan tombs, and are richly decorated outside with reliefs. The subjects of these are usually scenes from the Old and New Testaments. From the former those subjects were selected which were supposed to have some typical reference to the life of Christ: the Meeting of Abraham and Melchisedec, the Sacrifice of Isaac, Daniel among the Lions, Jonah and the Whale, are those which most frequently occur. Among the New Testament scenes no representations occur of Christ's sufferings;¹ the subjects chosen illustrate His power and beneficence: the Sermon on the Mount, the Triumphal Entry into Jerusalem, and many of His miracles are

Among the New Testament scenes no representations occur of Christ's sufferings;¹ the subjects chosen illustrate His power and beneficence: the Sermon on the Mount, the Triumphal Entry into Jerusalem, and many of His miracles are

¹ A partial exception to this rule is the scene of Christ before Pilate, which sometimes occurs.

frequently repeated. The Vatican and Lateran museums are rich in examples of this sort. One of the finest in the former collection was taken from the crypt of the old basilica of St Peter; it contained the body of a certain Junius Bassus, and dates from the year 359.² Many other similar sarcophagi were made in the provinces of Rome, especially Gaul; and fine specimens exist in the museums of Arles, Marseilles, and Aix; those found in Britain are of very inferior workmanship.

In the 5th century other plastic works similar in style were still produced in Italy, especially reliefs in ivory (to a certain extent imitations of the later consular diptychs), which were used to decorate episcopal thrones or the bindings of MSS. of the Gospels. The so-called chair of St Peter, still preserved (though hidden from sight) in his great basilica, is the finest example of the former class; of less purely classical style, dating from about 550, is the ivory throne of Bishop Maximianus in Ravenna cathedral (see fig. 2). Another very remarkable work of

FIG. 2.—Reliefs in ivory of the Baptist and the Four Evangelists in front of the episcopal throne of Maximianus in Ravenna cathedral.

the 5th century is the series of small panel reliefs on the doors of S. Sabina on the Aventine Hill at Rome. They are scenes from Bible history carved in wood, and in them much of the old classic style survives.³

In the 6th century, under the Byzantine influence of Justinian, a new class of decorative sculpture was produced, especially at Ravenna. Subject reliefs do not often occur, but large slabs of marble, forming screens, altars, pulpits, and the like, were ornamented in a very skilful and original way with low reliefs of graceful vine-plants, with peacocks and other birds drinking out of chalices, all treated in a very able and highly decorative manner (see fig. 3 and the upper band of fig. 2). Byzantium, however, in the main, became the birthplace and

Byzan-
tine.

FIG. 3.—Sixth-century capital from S. Vitale at Ravenna.

² See Dionysius, *Sac. Vat. Mus. Crypt.*, and Bunsen, *Besch. d. Stadt Rom*, 1840.

³ Various dates have been assigned to these interesting reliefs by different archaeologists, but the costumes of the figures are strong evidence that they are not later than the 5th century.

seat of all the mediæval arts soon after the transference thither of the headquarters of the empire. The plastic arts of Byzantium were for a while dominated by the survival of the dull classic art of the extreme decadence, but soon fresh life and vigour of conception were gained by a people who were not without the germinating seeds of a new æsthetic development. The bronze statue of St Peter in his Roman basilica is an early work which shows some promise of what was to come in the far-off future, though classical in its main lines and stiff in treatment, it possesses a simple dignity and force which were far beyond the powers of any mere copyist of classic sculpture.¹ Very early in the 5th or 6th century a school of decorative sculpture arose at Byzantium which produced work, such as carved foliage on capitals and bands of ornament, possessed of the very highest decorative power and executed with unrivalled spirit and vigour. The early Byzantine treatment of the acanthus or thistle, as seen in the capitals of S Sophia at Constantinople, the Golden Gate at Jerusalem, and many other buildings in the East, has never since been surpassed in any purely decorative sculpture, and it is interesting to note how it grew out of the dull and lifeless ornamentation which covers the degraded Corinthian capital used so largely in Roman buildings of the time of Constantine and his sons. It was, however, especially in the production of METAL-WORK (*ἔργα*) that the early Byzantines were so famous, and this notably in the manipulation of the precious metals, which were then used in the most lavish way to decorate and furnish the great churches of the empire. This extended use of gold and silver strongly influenced their sculpture, even when the material was marble or bronze, and caused an amount of delicate surface-ornament to be used which was sometimes injurious to the breadth and simplicity of their reliefs. For many centuries the art of Byzantium, at least in its higher forms, made little or no progress, mainly owing to the tyrannical influence of the church and its growing suspicion of anything less sensual beauty. A large party in the Eastern Church decided that all representations of Christ must be "without form or comeliness," and that it was impious to carve or paint Him with any of the beauty and nobility of the pagan gods. Moreover, the artists of Byzantium were fettered by the strictest rules as to the proper way in which to portray each sacred figure every saint had to be represented in a certain attitude, with one fixed cast of face and arrangement of drapery, and even in certain definitely prescribed colours. No deviation from these rules was permitted, and thus stereotyped patterns were created and followed in the most rigid and conventional manner. Hence in Byzantine art from the 6th to the 12th century a miniature painting in an illuminated MS. looks like a reduced copy of a colossal glass mosaic; and no design had much special relation to the material it was to be executed in, it was much the same whether it was intended to be a large relief sculptured in stone or a minute piece of silver-work for the back of a textus.

Influence of Byzantine art.

Till about the 12th century, and in some places much later, the art of Byzantium dominated that of the whole Christian world in a very remarkable way. From Russia to Ireland and from Norway to Spain any given work of art in one of the countries of Europe might almost equally well have been designed in any other. Little or no local peculiarities can be detected, except of course in the methods of execution, and even these were wonderfully similar everywhere. The dogmatic unity of the Catholic Church and its great monastic system, with constant interchange of monkish craftsmen between one country and another,

were the chief causes of this widespread monotony of style. An additional reason was the unrivalled technical skill of the early Byzantines, which made their city widely resorted to by the artist-craftsmen of all Europe,—the great school for learning any branch of the arts.

The extensive use of the precious metals for the chief works of plastic art in this early period is one of the reasons why so few examples still remain,—their great intrinsic value naturally causing their destruction. One of the most important existing examples, dating from the 8th century, is a series of colossal wall reliefs executed in hard stucco in the church of Cividade (Fiumi) not far from Trieste. These represent rows of female saints bearing jewelled crosses, crowns, and wreaths, and closely resembling in costume, attitude, and arrangement the gift-bearing mosaic figures of Theodora and her ladies in S Vitale at Ravenna. It is a striking instance of the almost petrified state of Byzantine art that so close a similarity should be possible between works executed at an interval of fully two hundred years. Some very interesting small plaques of ivory in the library of St Gall show a still later survival of early forms. The central relief is a figure of Christ in Majesty, and closely resembles those in the colossal apse mosaic of S Apollinare in Classe and other churches of Ravenna, while the figures below the Christ are survivals of a still older time, dating back from the best eas of classic art. A river-god is represented as an old man holding an urn, from which a stream issues, and a reclining female figure with an infant and a cornucopia is the old Roman Tellus or Earth-goddess with her ancient attributes.²

It will be convenient to discuss the sculpture of the mediæval and modern periods under the heads of the chief countries of Europe.

England.—During the Saxon period, when stone buildings were rare and even large cathedrals were built of wood, the plastic arts were mostly confined to the use of gold, silver, and gilt copper. The earliest existing specimens of sculpture in stone are a number of tall churchyard crosses, mostly in the northern provinces and apparently the work of Scandinavian sculptors. One very remarkable example is a tall monolithic cross, cut in sandstone, in the churchyard of Gosforth in Cumberland. It is covered with rudely carved reliefs, small in scale, which are of special interest as showing a transitional state from the worship of Odin to that of Christ. Some of the old Norse symbols and myths sculptured on it occur modified and altered into a semi-Christian form. Though rich in decorative effect and with a graceful outline, this sculptured cross shows a very primitive state of artistic development, as do the other crosses of this class in Cornwall, Ireland, and Scotland, which are mainly ornamented with those ingeniously intricate patterns of interlacing knotwork designed so skillfully by both the early Norse and the Celtic races.³ They belong to a class of art which is not Christian in its origin, though it was afterwards largely used for Christian purposes, and so is thoroughly national in style, quite free from the usual widespread Byzantine influence. Of special interest from their early date—probably the 11th century—are two large stone reliefs now in Chichester cathedral, which are traditionally said to have come from the pre-Norman church at Selsey. They are thoroughly Byzantine in style, but evidently the work of some very ignorant sculptor, they represent two scenes in the Raising of

¹ On early and mediæval sculpture in ivory consult Gon, *Thesaurus Veterum Dyptichorum*, Florence, 1759, Westwood, *Dyptichs of Consuls*, London, 1862; Didron, *Images sacrées du Levant*, Paris, 1871; Mackell, *Ivories in the South Kensington Museum*, London, 1879; Worsley, *Dyptichon Quirinanum ex Breconia*, Göttingen, 1868; Wyatt and Oldfield, *Sculpture in Ivory*, London, 1866.

² See O'Neill, *Sculptured Crosses of Ireland*, London, 1857.

Lazarus¹; the figures are stiff, attenuated, and ugly, the pose very awkward, and the drapery of exaggerated Byzantine character, with long thin folds. To represent the eyes pieces of glass or coloured enamel were inserted; the treatment of the hair in long ropelike twists suggests a metal rather than a stone design (see fig. 4).

FIG. 4.—Relief of Christ at the tomb of Lazarus, now in Chichester cathedral; 11th century, Byzantine style.

Norman period.

During the Norman period sculpture of a very rude sort was much used, especially for the tympanum reliefs over the doors of churches. Christ in Majesty, the Harrowing of Hell, and St George and the Dragon occur very frequently. Reliefs of the zodiacal signs were a common decoration of the richly sculptured arches of the 12th century, and are frequently carved with much power. The later Norman sculptured ornaments are very rich and spirited, though the treatment of the human figure is still very weak.²

Effigies.

The best-preserved examples of monumental sculpture of the 12th century are a number of effigies of knights-templars in the round Temple church in London.³ They are laboriously cut in hard Purbeck marble, and much resemble bronze in their treatment; the faces are clumsy, and the whole figures stiff and heavy in modelling; but they are valuable examples of the military costume of the time, the armour being purely chain-mail. Another effigy in the same church cut in stone, once decorated with painting, is a much finer piece of sculpture of about a century later. The head, treated in an ideal way with wavy curls, has much simple beauty, showing a great artistic advance. Another of the most remarkable effigies of this period is that of Robert, duke of Normandy (d. 1134), in Gloucester cathedral, carved with much spirit in oak, and decorated

¹ One of these reliefs is imperfect and has been clumsily mended with a fragment of a third relief, now lost.

² In Norway and Denmark during the 11th and 12th centuries carved ornament of the very highest merit was produced, especially the framework round the doors of the wooden churches; these are formed of large pine planks, sculptured in slight relief with dragons and interlacing foliage in grand sweeping curves,—perfect masterpieces of decorative art, full of the keenest inventive spirit and originality.

³ See Richardson, *Monumental Effigies of the Temple Church*, London, 1843.

with painting (fig. 5). Most rapid progress in all the arts, especially that of sculpture, was made in England in the second half of the 13th and the beginning of the 14th century, largely under the

FIG. 5.—Effigy in oak of Robert, duke of Normandy, in Gloucester cathedral; once painted and gilded.

patronage of Henry III., who handsomely rewarded a large number of English artists, and also imported others from Italy and Spain, though these foreigners took only a secondary position among the painters and sculptors of England. The end of the 13th century was in fact the culminating period of English art, and at this time a very high degree of excellence was reached by purely national means, quite equalling and even surpassing the general average of art on the Continent, except perhaps in France. Even Nicola Pisano could not have surpassed the beauty and technical excellence of the two bronze effigies in Westminster Abbey modelled and cast by William Torell, a goldsmith and William citizen of London, shortly before the year 1300. These Torell are on the tombs of Henry III. and Queen Eleanor, and, though the tomb itself of the former is an Italian work of the Cosmati school, there is no trace of foreign influence in the figures. At this time portrait effigies had not come into general use, and both figures are treated in an ideal way.⁴ The crowned head of Henry III., with noble well-modelled features and crisp wavy curls, resembles the conventional royal head on English coins of this and the following century, while the head of Eleanor is of remarkable, almost classic, beauty, and of great interest as showing the ideal type of the 13th century (see fig. 6).

FIG. 6.—Head of the effigy of Queen Eleanor in Westminster Abbey; bronze gilt, by William Torell.

In both cases the drapery is well conceived in broad sculptural folds, graceful and yet simple in treatment. The casting of these figures, which was effected by the *cire perdue* process, is technically very perfect. The gold employed for the gilding was got from Lucca in the shape of the current florins of that time, which were famed for their purity. Torell was highly paid for this, as well as for two other bronze statues of Queen Eleanor, probably of the same design.

Much of the fine 13th-century sculpture was used to Architectural decorate the façades of churches. The grandest example is the west end of Wells cathedral, of about the middle of the century. It is covered with more than 600 figures in the round or in relief, arranged in tiers, and of varying sizes. The tympana of the doorways are filled with reliefs, and above them stand rows of colossal statues of kings and queens, bishops and knights, and saints both male and female.

⁴ The effigy of King John in Worcester cathedral of about 1216 is an exception to this rule; though rudely executed, the head appears to be a portrait.

had settled in London, named Bartholomew Lambespring, assisted by several other skilful artists.

At the beginning of the 16th century sculpture in England was entering upon a period of rapid decadence, and to some extent had lost its native individuality. The finest series of statues of this period are those of life-size high up on the walls of Henry VII's chapel at Westminster and others over the various minor altars. These ninety-five figures, which represent saints and doctors of the church, vary very much in merit: some show German influence, others that of Italy, while a third class are, as it were, "archaistic" imitations of older English sculpture¹ (see fig. 7). In some cases the heads and general pose are graceful, and the drapery dignified, but in the main they are coarse both in design and in workmanship compared with the better plastic art of the 13th and 14th centuries. This decadence of English sculpture caused Henry VII to invite the Florentine Torrigiano (1472-1522) to come to England to model and cast the bronze figures for his own magnificent tomb, which still exist in almost perfect preservation. The recumbent effigies of Henry VII and his queen are fine specimens of Florentine art, well modelled with life-like portrait heads and of very fine technique in the casting. The altar-tomb on which the effigies lie is of black marble, decorated with large medallion reliefs in gilt bronze, each with a pair of saints—the patrons of Henry and Elizabeth of York—of very graceful design. The altar and its large baldachino and reredos were the work of Torrigiano, but were destroyed during the 17th century. The reredos had a large relief of the Resurrection of Christ executed in painted terra-cotta, as were also a life-sized figure of the dead Christ under the altar-slab and four angels on the top angles of the baldachino, a number of fragments of these figures have recently been found in the "pockets" of the nave vaulting, where they had been thrown after the destruction of the reredos. Torrigiano's bronze effigy of Margaret of Richmond in the south aisle of the same chapel is a very skilful but too realistic portrait, apparently taken from a cast of the dead face and hands. Another terra-cotta effigy in the Rolls chapel is also, from internal evidence, attributed to the same able Florentine. Another talented Florentine sculptor, Benedetto da Maiano, was invited to England by Cardinal Wolsey to make his tomb; of this only the marble sarcophagus now exists and has been used to hold the body of Admiral Nelson in St Paul's Cathedral. Another member of the same family, named Giovanni, was the sculptor of the colossal terra-cotta heads of the Caesars affixed to the walls of the older part of Hampton Court Palace.

During the troublous times of the Reformation sculpture, like the other arts, continued to decline. Of 17th-century monumental effigies that of Sir Francis Vere (d. 1607) in the north transept at Westminster is one of the best, though its design—a recumbent effigy overshadowed by a slab covered with armour, upborne by four kneeling

figures of men-at-arms—is almost an exact copy of the tomb of Engelbert II of Vianden-Nassau.² The finest bronze statues of this century are those of Charles Villiers, duke of Buckingham (d. 1634), and his wife at the northeast of Henry VII's chapel. The effigy of the duke, in rich armour of the time of Charles I., lies with folded hands in the usual mediæval pose. The face is fine and well modelled and the casting very good. The allegorical figures at the foot are caricatures of the style of Michelangelo, and are quite devoid of merit, but the kneeling statues of the duke's children are designed with grace and pathos. A large number of very handsome marble and alabaster tombs were erected throughout England during the 17th century. The effigies are poor and coarse, but the rich architectural ornaments are effective and often of beautiful materials, alabaster being mixed with various richly coloured marbles in a very skilful way. Nicholas Stone (d. 1647), who worked under the supervision of Inigo Jones, appears to have been the chief English sculptor of his time. The De Vere and Villiers monuments are usually attributed to him.³ One of the best public monuments of London is the bronze equestrian statue of Charles I at Charing Cross, which was overthrown and hidden during the protectorate of Cromwell, but replaced at the Restoration in 1660. It is very nobly modelled and was produced under Italian influence by a French sculptor called Hubert Le Sueur (d. 1670). The standing bronze statue of James II behind the Whitehall banqueting room, very poorly designed but well executed, was the work of Grinling Gibbons (1648-1721), a native of Holland, who was chiefly famed for his extraordinary skill in carving realistic fruit and flowers in pear and other white woods. Many rich and elaborate works of his exist at Trinity College, Oxford, at Cambridge, Chatsworth, and several other places in England. In the early part of the 18th century he worked for Sir Christopher Wren, and carved the elaborate friezes of the stalls and screens in St Paul's Cathedral and in other London churches.

During the 18th-century English sculpture was mostly in the hands of Flemish and other foreign artists, of whom Roubiliac (1695-1763), Scheemakers (1691-1773), and Ryssbrack (1694-1770) were the chief. The ridiculous custom of representing Englishmen of the 18th and 19th centuries in the toga or in the armour of an ancient Roman was fatal alike to artistic merit and æsthetic truth, and when, as was often the case, the periwig of the Georgian period was added to the costume of a Roman general the effect is supremely ludicrous. Nollekens (1737-1823), a pupil of Scheemakers, though one of the most popular sculptors of the 18th century, was a man of very little real ability.⁴ John Bacon (1740-1799) was in some respects an able sculptor. John Flaxman⁵ (1755-1826) was in England the chief initiator of the classical revival. For many years he worked for Josiah Wedgwood, the potter, and designed for him an immense number of vases covered with delicate cameo-like reliefs. Many of these, taken from antique groups and sculpture, are of great beauty, though hardly suited to the special necessities of fêlle ware. Flaxman's large pieces of sculpture are of less merit, but some of his marble reliefs are designed with much spirit and classic purity. His illustrations in outline to the poems of Homer, Æschylus, and Dante, based on drawings on Greek vases, have been greatly admired, but

¹ See Aeneas, *Château de Vianden*, Paris, 1884.

² The Villiers monument is evidently the work of two sculptors working in very opposite styles.

³ An interesting account of many English sculptors of this time is given by Smith, *Nollekens and his Time*, London, 1829.

⁴ See Flaxman, *Lectures at the Royal Academy*, London, 1829. His designs on a small scale are the best of his works,—as, for example, the silver shield of Achilles covered with delicate and graceful reliefs.

Sixteenth century

Torrignano

Seventeenth century

they are unfortunately much injured by the use of a thicker outline on one side of the figures,—an unsuccessful attempt to give a suggestion of shadow. Flaxman's best pupil was Baily (1788-1867), chiefly celebrated for his nude marble figure of Eve.

Nineteenth century

During the first half of the 19th century the prevalence of a cold lifeless pseudo-classic style was fatal to individual talent, and robbed the sculpture of England of all real vigour and spirit. Francis Chantrey (1782-1841) produced a great quantity of sculpture, especially sepulchral monuments, which were much admired in spite of their very limited merits. Allan Cunningham and Henry Weekes worked in some cases in conjunction with Chantrey, who was not wanting in technical skill, as is shown by his clever marble relief of two dead woodcocks. John Gibson (1790-1866) was perhaps after Flaxman the most successful of the English classic school, and produced some works of real merit. He strove eagerly to revive the polychromatic decoration of sculpture in imitation of the *acrolithos* of classical times. His *Venus Victrix*, shown at the exhibition in London of 1862 (a work of about six years earlier), was the first of his coloured statues which attracted much attention. The prejudice, however, in favour of white marble was too strong, and both the popular verdict and that of other sculptors were strongly adverse to the "tinted Venus." The fact was that Gibson's colouring was timidly applied: it was a sort of compromise between the two systems, and thus his sculpture lost the special qualities of a pure marble surface, without gaining the richly decorative effect of the polychromy either of the Greeks or of the mediæval period.¹ The other chief sculptors of the same very inartistic period were Banks, the elder Westmacott (who modelled the Achilles in Hyde Park), R. Wyatt (who cast the equestrian statue of Wellington, lately removed from London), Macdowell, Campbell, Marshall, and Bell.

During the last hundred years a large number of honorary statues have been set up in the Houses of Parliament, Westminster Hall and Abbey, and in other public places in London. Most of these, though modelled as a rule with some scholastic accuracy, are quite dull and spiritless, and, whilst free from the violently bad taste of such men as Bernini or Roubiliac, they lack the force and vigorous originality which go far to redeem what is offensive in the sculpture of the 17th and 18th centuries. The modern public statues of London and elsewhere are as a rule tamely respectable and quite uninteresting. One brilliant exception is the Wellington monument in St Paul's Cathedral, probably the finest plastic work of modern times. It was the work of Alfred Stevens (1817-1875), a sculptor of the highest talent, who lived and died almost unrecognized by the British public. The commission for this monument was given to Stevens after a public competition, and he agreed to carry it out for £20,000,—a quite inadequate sum, as it afterwards turned out. The greater part of his life Stevens devoted to this grand monument, constantly harassed and finally worn out by the interference of Government, want of money, and other difficulties. Though he completed the model, Stevens did not live to see the monument set up,—perhaps fortunately for him, as it has been placed in a small side chapel, where the effect of the whole is utterly destroyed, and its magnificent bronze groups hidden from view. The monument consists of a sarcophagus supporting a recumbent bronze effigy of the duke, over which is an arched marble canopy of late Renaissance style on delicately enriched shafts. At each

end of the upper part of the canopy is a large bronze group, one representing Truth tearing the tongue out of the mouth of Falsehood, and the other Valour trampling Cowardice under foot (see fig. 8). The two virtues are represented

FIG. 8.—Bronze group by Alfred Stevens from the Wellington monument

by very stately female figures modelled with wonderful beauty and vigour, the vices are two nude male figures treated in a very massive way. The whole is composed with great skill and largeness of style. The vigorous strength and sculpturesque nobility of these groups recall the style of Michelangelo, but they are far from being a mere imitation of him or any other master. Stevens's work throughout is original and has a very distinct character of its own. He also designed an equestrian statue of the duke to stand on the summit of the monument, but in its present cramped position there is not sufficient room for this.² Owing to the many years he spent on this one work Stevens did not produce much other sculpture. In Dorchester House, Park Lane, there is some of his work, especially a very noble mantelpiece supported by nude female caryatids in a crouching attitude, modelled with great largeness of style. He also designed mosaics to fill the spandrels under the dome of St Paul's. The value of Stevens's work is all the more conspicuous from the feebleness of most of the sculpture of his contemporaries.

In the present generation there are some signs of the development of a better state of the plastic arts. A bronze statue of an Athlete struggling with a Python, by Sir Frederick Leighton, is a work of great merit, almost

¹ Gibson bequeathed his fortune and the models of his chief works to the Royal Academy where the latter are now crowded in an upper room adjoining the Diploma Gallery. See Lady Eastlake, *Life of Gibson*, London, 1870.

² The great merit of this work can now only be seen at the South Kensington Museum, which possesses Stevens's models and (on a small scale) his design for the whole monument.

worthy to rank with the best examples of any period, and remarkable for a profound knowledge of human anatomy (see fig. 9). Unfortunately the real *cire perdue* process for metal casting is seldom practised in England, and this

FIG. 9.—Bronze statue of an athlete and python, by Sir Frederick Leighton, P.R.A., in the South Kensington Museum.

statue, as well as all other bronze works produced in England, suffers much from the disagreeable surface which results from the rude method of forming the moulds in sand. The colossal bronze lions in Trafalgar Square, designed by Sir Edwin Landseer, are a melancholy example of this.¹

France.—During the 12th and 13th centuries the sculpture of France was, on the whole, the finest in the world, and was there used in the greatest profusion. The façades of large cathedrals were completely covered with sculptured reliefs and thick-set rows of statues in niches. The whole of the front was frequently one huge composition of statuary, with only sufficient purely architectural work to form a background and frame for the sculptured figures. A west end treated like that of Wells cathedral, which is almost unique in England, is not uncommon in France. Even the shafts of the doorways and other architectural accessories were covered with minute sculptured decoration—the motives of which were often, especially during the 12th century, obviously derived from the metal-work of shrines and reliquaries studded with rows of jewels. The west façade of Poitiers cathedral is one of the richest examples; it has large surfaces covered with foliated carving

and rows of colossal statues, both seated and standing, reaching high up the front of the church. Of the same century (the 12th), but rather later in date, is the very noble sculpture on the three western doors of Chartres cathedral, with fine tympanum reliefs and colossal statues attached to the jamb-shafts of the openings (see fig. 10). These latter figures, with their exaggerated height and the long straight folds of their drapery, are designed with great skill to assist and not to break the main upward lines of the doorways. The sculptors have willingly sacrificed the beauty and proportion of each separate statue for the sake of the architectonic effect of the whole façade. The heads, however, are full of nobility, beauty, and even grace, especially those that are softened by the addition of long wavy curls, which give relief to the general stiffness of the form. The sculptured doors of the north and south aisles of Bourges cathedral are fine examples of the end of the 12th century, and so were the west doors of Notre Dame in Paris till they were hopelessly injured by "restoration." The early sculpture at Bourges is specially interesting from the existence in many parts of its original coloured decoration.

FIG. 10.—Statues on jamb of central west door of Chartres cathedral, 12th century; specially designed to suit vertical lines of columns behind; all once covered with painting and gold.

In France, as in England, the 13th century was the ^{Thir-}golden age of sculpture; while still keeping its early dignity ^{teenth}and subordination to its architectural setting, the sculpture ^{century.}reached a very high degree of graceful finish and even sensuous beauty. Nothing could surpass the loveliness of the angel statues round the Parisian Sainte Chapelle, and even the earlier work on the façade of Laon cathedral is full of grace and delicacy. Amiens cathedral is especially rich in sculpture of this date,—as, for example, the noble and majestic statues of Christ and the Apostles at the west end; and the sculpture on the south transept of about 1260-70, of more developed style, is remarkable for dignity combined with soft beauty.² The noble row of kings on the west end of Notre Dame at Paris has, like the earlier sculpture, been ruined by "restoration," which has robbed the statues of both their spirit and their vigour. To the latter years of the 13th century belong the magnificent series of statues and reliefs round the three great western doorways of the same church, among which are no less than thirty-four life-sized figures. On the whole, the single statues throughout this period are finer than the reliefs with many figures. Some of the statues of the Virgin and Child are of extraordinary beauty, in spite of their being often treated with a certain mannerism,—a curved pose of the body, which appears to have been copied from ivory statuettes in which the figure followed the curve of the elephant's tusk. The north transept at Rheims is no less rich: the central statue of Christ is a work of much grace and nobility of form; and some nude figures—for example, that of St Sebastian—show a knowledge of the human form which was very unusual at that early date. Many of these Rheims statues, like those by Torell at Westminster, are quite equal to this best work of Niccolò Pisano.

G. Scott, *Gleanings from Westminster*, London, 1862; Collier, *Art Portfolio*, London, 1865, with good examples of mediæval decorative sculpture; W. B. Scott, *British School of Sculpture*, London, 1872; W. M. Rossetti, "British Sculpture," in *Fraser's Mag.*, April 1861; many good illustrations of English mediæval sculpture are scattered throughout the volumes of *Archæologia*, the *Archæological Journal*, and other societies' "Proceedings."

² See Ruskin, *The Bible of Amiens*, 1878.

The abbey church of St Denis possesses the largest collection of French 13th-century monumental effigies, a large number of which, with supposed portraits of the early kings, were made during the rebuilding of the church in 1264; some of them appear to be "archaistic" copies of older contemporary statues.¹

In the 14th century French sculpture began to decline, though much beautiful plastic work was still produced. Some of the reliefs on the choir screen of Notre Dame at Paris belong to this period, as does also much fine sculpture on the transepts of Rouen cathedral and the west end of Lyons. At the end of this century an able sculptor from the Netherlands, called Claux Sluter, executed much fine work, especially at Dijon, under the patronage of Philip the Bold, for whose newly founded Carthusian monastery in 1399 he sculptured the great "Moses fountain" in the cloister, with six life-sized statues of prophets in stone, painted and gilt in the usual mediæval fashion.

Not long before his death in 1411 Sluter completed a very magnificent altar tomb for Philip the Bold, now in the museum at Dijon. It is of white marble, surrounded with arcading, which contains about forty small alabaster figures representing mourners of all classes, executed with much dramatic power. The recumbent portrait effigy of Philip in his dual mantle with folded hands is a work of great power and delicacy of treatment.

The latter part of the 15th century in France was a time of transition from the mediæval style, which had gradually been deteriorating, to the more florid and realistic taste of the Renaissance. To this period belong a number of rich reliefs and statues on the choir-screen of Chartres cathedral. Those on the screen at Amiens are later still, and exhibit the rapid advance of the new style. Fig. 11 shows a statuette in the costume of the end of the 15th century, a characteristic example of the later mediæval method of treating saints in a realistic way.

In the 18th century Italian influence, especially that of Benvenuto Cellini, was paramount in France. Jean Goujon (d. 1572) was the ablest French sculptor of the time; he combined great technical skill and refinement of modelling with the florid and affected style of the age. His nude figure of Diana reclining by a Stag, now in the Louvre, is a graceful and vigorous piece of work, superior in sculptural beauty to the somewhat similar bronze relief of a nymph by Cellini. Between 1540 and 1552 Goujon executed the fine monument at Rouen to Duke Louis de Brézé, and from 1555 to 1562 was mainly occupied in decorating the Louvre with sculpture. One of the most pleasing and graceful works of this period, thoroughly Italian in style, is the marble group of the Three Graces bearing on their heads an urn containing the heart of Henry II., executed in 1560 by Germain Pilon for Catherine de' Medici. The monument of Catherine and Henry II. at St Denis, by the same sculptor, is an inferior and coarser work. Maitre Ponce, probably the same as the Italian Ponce Jacquio, chiselled the noble monument of Albert of Carpi (1535), now in the Louvre. Another very fine portrait effigy of about 1570, a recumbent figure in full armour of the duke of Montmorency, preserved in the Louvre, is the work of

FIG. 11.—Statuette of St. Mary Magdalene, late 15th century; French work, painted and gilt.

Barthélemy Prieur. François Duquesnoy of Brussels (1594-1644), usually known as Il Fiamingo, was a clever sculptor, thoroughly French in style, though he mostly worked in Italy. His large statues are very poor, but his reliefs in ivory of boys and cupids are modelled with wonderfully soft realistic power and graceful fancy.

No sculptor of any great merit appears to have arisen even in France during the 17th century, though some, such as

the two Coustous, had great technical skill. Pierre Puget (1622-1694) produced vigorous but coarse and tasteless work, such as his Milo devoured by a Lion. Other sculptors of the time were Simon Guillain, François and Michel Anguier, and Chas. Ant. Coyzevox (1640-1720), the last a sculptor of Lyons who produced some fine portrait busts. Fig. 12 shows a group by Clodion, whose real name was Claude Michel (c. 1745-1814). He worked largely in terra-cotta, and modelled with great spirit and invention, though in the sensual unsculptural manner prevalent in his time.

FIG. 12.—Bacchante group by Clodion in terra-cotta.

In the following century Jean Antoine Houdon (1740-1828), a sculptor of most exceptional power, produced some works of the highest merit at a time when the plastic arts had reached a very low ebb. His standing colossal statue of S. Bruno in S. Maria degli Angeli at Rome is a most noble and stately piece of portraiture, full of commanding dignity and expression. His seated statue of Voltaire in the foyer of the Théâtre Français, though sculptural in treatment, is a most striking piece of lifelike realism. Houdon may in fact be regarded as the precursor of the modern school of French sculpture of the better sort. About the middle of the 18th century a revolution was brought about in the style of sculpture by the suddenly revived taste for antique art. A period of dull pseudo-classicism succeeded, which in most cases stifled all original talent and reduced the plastic arts to a lifeless form of archaeology. Regarded even as imitations the works of this period are very unsuccessful: the sculptors got hold merely of the dry bones not of the spirit of classic art; and their study of the subject was so shallow and unintelligent that they mostly picked out what was third-rate for special admiration and ignored the glorious beauty of the best works of true Hellenic art. Thus in sculpture, as in painting and architecture, a study which might have been stimulating and useful in the highest degree became a serious hindrance to the development of modern art, and this not only in France but in the other countries of Europe; in France, however, the victories of Napoleon I. and his arrogant pretension to create a Gaulish empire on the model of that of ancient Rome caused the taste for

¹ See Félibien, *Histoire de l'Abbaye de Saint-Denis*, Paris, 1706.

pseudo-Roman art to be more pronounced than elsewhere. Among the first sculptors of this school were Antoine Chaudet (1763-1810) and Joseph Bono (1769-1845). The latter was largely employed by Napoleon I. He executed with some ability the bronze spiral reliefs round the column of the Place Vendôme and the statue of Napoleon on the top, and also modelled the classical quadriga on the triumphal arch in the Place du Carrousel. Jacques Pradier (1790-1852) produced the Chained Prometheus of the Louvre and the Niobe group (1822). He possessed great technical ability, but aimed in most of his works at a soft sensuous beauty which is specially unsuited to sculpture. François Rude (1784-1855) worked in a style modelled on Greco-Roman sculpture treated with some freedom. His bronze Mercury in the Louvre is a clever work, but his statues of Marshal Ney in the Luxembourg Gardens and of General Cavagnac (1847) in the cemetery of Montmartre are conspicuously bad. The reliefs on the pediment of the Panthéon are by Pierre Jean David of Angers (1780-1856), his early works are of dull classic style, but later in life he became a realist and produced the most unsculpturesque results. A bronze statue of a Dancing Fish-lad modelled by François Joseph Duvet, now in the Luxembourg collection, is an able work of the *genre* class. Other French sculptors who were highly esteemed in their time were Othé, Courtet, Smart, Bêtex, and Carpeaux¹. The last was an artist of great ability, and produced an immense number of clever but often very offensive statues. He obtained the highest renown in France, and was a typical example of the sad degradation of taste which prevailed under the rule of Napoleon III.

Modern
era

The existing schools of French sculpture are by far the most important in the world. Technical skill and intimate knowledge of the human form are possessed by several living sculptors of France to a degree which has probably never been surpassed, and some of them produce works of very great power, beauty, and originality. Many of their works have a similar fault to that of one class of French painters: they are much injured by an excess of sensual realism, in many cases nude statues are simply life-studies with all the faults and individual peculiarities of one model. Very unsculpturesque results are produced by treating a statue as a representation of a *naked* person, — one, that is, who is obviously in the habit of wearing clothes, — a very different thing from the purity of the ancient Greek treatment of the nude. Thus the great ability of many French sculptors is degraded to suit the taste of the voluptuary. An extravagance of attitude and an undignified arrangement of the figures do much to injure some of the large groups which are full of technical merit, and executed with marvellous anatomical knowledge. This is specially the case with much of the sculpture that is intended to decorate the buildings of Paris. The group of nude dancers by Carpeaux outside the new opera-house is a work of astonishing skill and prominent imagination, utterly unsculpturesque in style and especially unfitted to decorate the comparatively rigid lines of a building. The egotism of modern French sculptors will not allow them to accept the necessarily subordinate reserve which is so necessary for architectural sculpture. Other French works, on the other hand, err in the direction of a sickly sentimentalism, or a petty realism, which is fatal to sculpturesque beauty. The real power and merits of the modern French school make these faults all the more conspicuous.²

Germany — Till the 12th century sculpture in Germany continued to be under the lifeless influence of Byzantium, tempered to some extent by an attempt to return to classical models. This is seen in the bronze pillar reliefs ^{Byzantine} and other works produced by Bishop Bernward after his work, visit to Rome (see METAL-WORK, vol. xvi. p. 77). Hildesheim, Cologne, and the whole of the Rhine provinces were the most active seats of German sculpture, especially in metal, till the 12th century. Many remarkable pieces of bronze sculpture were produced at the end of that period, of which several specimens exist. The bronze font at Liège, with figure-subjects in relief of various baptismal scenes from the New Testament, by Lambert Patias of Dinant, cast about 1112, is a work of most wonderful beauty and perfection for its time, other fonts in Osnabrück and Hildesheim cathedrals are surrounded by spirited reliefs, fine in conception, but inferior in beauty to those on the Liège font. Fine bronze candelabra exist in the abbey church of Comburg and at Aix-la-Chapelle, the latter of about 1165. Merseburg cathedral has a strange realistic sepulchral figure of Rudolf of Swabia, executed about 1100, and at Magdeburg is a fine effigy, also in bronze, of Bishop Frederick (d. 1152), treated in a more graceful way. The last figure has a peculiarity which is not uncommon in the older bronze reliefs of Germany: the body is treated as a relief, while the head sticks out and is quite detached from the ground in a very awkward way. One of the finest plastic works of this century is the choir screen of Hildesheim cathedral, executed in hard stucco, once rich with gold and colours; on its lower part is a series of large reliefs of saints modelled with almost classical breadth and nobility, with drapery of especial excellence.

In the 13th century German sculpture had made considerable artistic progress, but it did not reach the high ^{12th century} standard of France. One of the best examples is the "golden gate" of Freiburg cathedral, with sculptured figures on the jambs after the French fashion. The statues of the apostles on the nave pillars, and especially one of the Madonna at the east end (1260-70), possess great beauty and sculpturesque headship. The statues both inside and outside Bamberg cathedral, of the middle of the 13th century, are nobly designed; and an equestrian statue of Conrad III. in the market-place at Bamberg, supported by a foliated corbel, exhibits startling vigour and originality, and is designed with wonderful largeness of effect, though small in scale. The statues of Henry the Lion and Queen Matilda at Brunswick, of about the same period, are of the highest beauty and dignity of expression. Strasburg cathedral, though sadly damaged by restoration, still possesses a large quantity of the finest sculpture of the 13th century. One tympanum relief of the Death of the Virgin, surrounded by the sorrowing Apostles, is a work of the very highest beauty, worthy to rank with the best Italian sculpture of even a later period. Of its class nothing can surpass the purely decorative carving at Strasburg, with varied realistic foliage studied from nature, evidently with the keenest interest and enjoyment.

Nuremberg is rich in good sculpture of the 14th century. The church of St Sebald, the Frauenkirche, and the west facade of St Lawrence are lavishly decorated with reliefs and statues, very rich in effect, but showing the germs of ^{Nuremberg schools.}

Fourteenth century.

that mannerism which grew so strong in Germany during the 15th century. Of special beauty are the statues which adorn the "beautiful fountain," executed by Heinrich der Balier (1385-1396), and richly decorated with gold and colour by the painter Rudolf.¹ A number of colossal figures were executed for Cologne cathedral between 1349 and 1361, but they are of no great merit. Augsburg produced several sculptors of ability about this time; the museum possesses some very noble wooden statues of this school, large in scale and dignified in treatment. On the exterior of the choir of the church of Marienburg castle is a very remarkable colossal figure of the Virgin of about 1340-50. Like the Hildesheim choir screen, it is made of hard stucco and is decorated with glass mosaics. The equestrian bronze group of St George and the Dragon in the market-place at Prague is excellent in workmanship and full of vigour, though much wanting dignity of style. Another fine work in bronze of about the same date is the effigy of Archbishop Conrad (d. 1261) in Cologne cathedral, executed many years after his death. The portrait appears truthful and the whole figure is noble in style. The military effigies of this time in Germany as elsewhere were almost unavoidably stiff and lifeless from the necessity of representing them in plate armour; the ecclesiastical chasuble, in which priestly effigies nearly always appear, is also a thoroughly unsculpturesque form of drapery, both from its awkward shape and its absence of folds. Fig. 13 shows a characteristic example of these sepulchral effigies in slight relief. It is interesting to compare this with a somewhat similarly treated Florentine effigy, executed in marble at the beginning of the next century, but of very superior grace and delicacy of treatment (see fig. 16 below).

FIG. 13.—Sepulchral effigy in low relief of Günther of Schwarzburg (d. 1349), in Frankfurt cathedral.

Fifteenth century.

The 15th century was one of great activity and originality in the sculpture of Germany and produced many artists of very high ability. One speciality of the time was the production of an immense number of wooden altars and retables, painted and gilded in the most gorgeous way and covered with subject-reliefs and statues, the former often treated in a very pictorial style.² Wooden screens, stalls, tabernacles, and other church-fittings of the greatest elaboration and clever workmanship were largely produced in Germany at the same time, and on into the 16th century.³ Jörg Syrlin, one of the most able of these sculptors in wood, executed the gorgeous choir-stalls in Ulm cathedral, richly decorated with statues and canopied work, between 1469 and 1474; his son and namesake sculptured

the elaborate stalls in Blaubeuren church of 1493 and the great pulpit in Ulm cathedral. Veit Stoss of Nuremberg, though a man of bad character, was a most skilful sculptor in wood; he carved the high altar, the tabernacle, and the stalls of the Frauenkirche at Cracow, between 1472 and 1495. One of his finest works is a large piece of wooden panelling, nearly 6 feet square, carved in 1495, with central reliefs of the Doom and the Heavenly Host, framed by minute reliefs of scenes from Bible history. It is now in the Nuremberg town-hall. Wohlgemuth (1434-1519), the master of A. Dürer, was not only a painter but also a clever wood-carver, as was also Dürer himself (1471-1528), who executed a tabernacle for the Host with an exquisitely carved relief of Christ in Majesty between the Virgin and St John, which still exists in the chapel of the monastery of Landau. Dürer also produced miniature reliefs cut in boxwood and bone-stone, of which the British Museum (print room) possesses one of the finest examples. Adam Krafft (c. 1455-1507) was another of this class of sculptors, but he worked also in stone; he produced the great Schreyer monument (1492) for St Sebald's at Nuremberg,—a very skilful though mannered piece of sculpture, with very realistic figures in the costume of the time, carved in a way more suited to wood than stone, and too pictorial in effect. He also made the great tabernacle for the Host, 80 feet high, covered with statues, in Ulm cathedral, and the very spirited "Stations of the Cross" on the road to the Nuremberg cemetery.

The Vischer family of Nuremberg for three generations Vischer were among the ablest sculptors in bronze during the 15th and 16th centuries. Hermann Vischer the elder worked mostly between 1450 and 1505, following the earlier mediaeval traditions, but without the originality of his son. Among his existing works the chief are the bronze font at Wittenberg church (1457) and four episcopal effigies in relief, dated from 1475 to 1505, in Bamberg cathedral; this church also contains a fine series of bronze sepulchral monuments of various dates throughout the 15th and 16th centuries. Hermann's son Peter Vischer was the chief artist of the family; he was admitted a master in the sculptor's guild in 1489, and passed the greater part of his life at Nuremberg, where he died in 1529. In technique few bronze sculptors have ever equalled him; but his designs are marred by an excess of mannered realism and a too exuberant fancy. His chief early work was the tomb of Archbishop Ernest in Magdeburg cathedral (1495), surrounded with fine statues of the apostles under semi-Gothic canopies; it is purer in style than his later works, such as the magnificent shrine of St Sebald at Nuremberg, a tall canopied bronze structure, crowded with reliefs and statues in the most lavish way. The general form of the shrine is Gothic,⁴ but the details are those of the 16th-century Italian Renaissance treated with much freedom and originality. Some of the statues of saints attached to the slender columns of the canopy are modelled with much grace and even dignity of form. A small portrait figure of Peter himself, introduced at one end of the base, is a marvel of clever realism; he has represented himself as a stout, bearded man, wearing a large leathern apron and holding some of the tools of his craft. In this work, executed from 1508 to 1519, Peter was assisted by his sons, as is recorded in an inscription on the base—"Petter Vischer, Purger zu Nürnberg, machet das Werck mit seinen Sinnen, und ward folbracht in Jar M D M X I X . . ." This gorgeous shrine is a remarkable example of the uncommercial spirit which animated the artists of that time,

¹ See Baader, *Beläge zur Kunstgeschichte Nürnberg*; and Retberg, *Nürnberg Kunstleben*, Stuttgart, 1854.

² This class of large wooden retable was much imitated in Spain and Scandinavia. The metropolitan cathedral of Risskilde in Denmark possesses a very large and magnificent example covered with subject reliefs enriched with gold and colours.

³ See Waagen, *Kunst und Künstler in Deutschl.*, Leipzig, 1843-45.

⁴ This great work is really a canopied pedestal to support and enclose the shrine, not the shrine itself, which is a work of the 14th century, having the gabled form commonly used in the Middle Ages for metal reliquaries.

and of the evident delight which they took in their work. Dragons, grotesques, and little figures of boys, mixed with graceful scroll foliage, crowd every possible part of the canopy and its shafts, designed in the most free and unconventional way and executed with an utter disregard of the time and labour which were lavished on them. Other existing works by Peter Vischer and his sons are the Entombment relief, signed "P. V. 1522," in the Aegidienkirche, the monument of Cardinal Albert (1525) in the church at Aschaffenburg, and the fine tomb of Frederick the Wise (1527) in the castle chapel at Wittenberg.

Innsbruck.

Next to Nuremberg, the chief centres of bronze sculpture were Augsburg and Lübeck. Innsbruck possesses one of the finest series of bronze statues of the first half of the 16th century, namely twenty-eight colossal figures round the tomb of the emperor Maximilian, which stands in the centre of the nave, representing a succession of heroes and ancestors of the emperor. The first of the statues which was completed cost 3000 florins, and so Maximilian invited the help of Peter Vischer, whose skill was greater and whose work less expensive than that of the local craftsmen. Most of them, however, were executed by sculptors of whom little is now known. They differ much in style, though all are of great technical merit. The finest (see fig. 14) is an ideal statue of King Arthur of Britain, in plate armour of the 14th or early 15th century, very remarkable for the nobility of the face and pose. That of Theodorich is also a very fine conception. Some of the portrait figures of the Hapsburgs are almost ludicrously realistic, and are disfigured by the ugly German armour of the time.

FIG. 14.—Bronze statue of King Arthur at Innsbruck.

From
sixteenth
century
onwards.

In the latter part of the 16th century the influence of the later Italian Renaissance becomes very apparent, and many elaborate works in bronze were produced, especially at Augsburg, where Hubert Gerhard cast the fine "Augustus fountain" in 1593, and Adrian de Vries made the "Hercules fountain" in 1599; both were influenced by the style of Giovanni di Bologna, as shown in his magnificent fountain at Bologna.

In the following century Andreas Schlüter of Hamburg (b. about 1662) produced smaller bronze reliefs and accessories of great merit. His colossal statue of Frederick III. on the bridge at Berlin is less successful. On the whole the 17th and 18th centuries in Germany, as in England, were periods of great decadence in the plastic art; little of merit was produced, except some portrait figures. In the second half of the 18th century there was a strong revival in sculpture, especially in the classic style; and since then Germany has produced an immense quantity of large and pretentious sculpture, mostly dull in design and second-rate in execution. Johann Gottfried of Berlin (1764-1850) finished a number of portrait figures,

some of which are ably modelled, as did also Friedrich Tieck (1776-1851) and Christian Rauch (1777-1857); the works of Rauch are, however, mostly weak and sentimental in style, as, for example, his recumbent statue of Queen Louisa at Charlottenburg (1813) and his statues of Generals Bülow and Schamhorst at Berlin. Friedrich Drake was the ablest of Rauch's pupils, but he lived at a very unhappy period for the sculptor's art. His chief work is perhaps the colossal bronze equestrian statue of King William of Prussia at Cologne. Albert Wolff was a sculptor of more ability; he executed the equestrian portrait of King Ernest Augustus at Hanover, and a Horseman attacked by a Lion now in the Berlin Museum. Augustus Kiss (1802-1865) produced the companion group to this, the celebrated Amazon and Panther in bronze, as well as the fine group of St George and the Dragon in a courtyard of the royal palace at Berlin. The St George and his horse are of bronze; the dragon is formed of gilt plates of hammered iron. Kiss worked only in metal. The bad taste of the first half of the present century is strongly shown by many of the works of Theodor Kallide, whose Bacchanal sprawling on a Panther's Back is a marvel of awkwardness of pose and absence of any feeling for beauty. Rietschel was perhaps the best German sculptor of this period, and produced work superior to that of his contemporaries, such as Haagen, Wichmann, Fischer, and Hiedel. Some revival of a better style is shown in some sculpture, especially reliefs, by Hähnel, whose chief works are at Dresden. Schwanthaler (1802-1848), who was largely patronized by King Louis of Bavaria, studied at Rome and was at first a feeble imitator of antique classic art, but later in life he developed a more romantic and pseudo-medieval style. By him are a large number of reliefs and statues in the Glyptothek at Munich and in the Walhalla, also the colossal but feeble bronze statue of Bavaria, in point of size one of the most ambitious works of modern times.¹ Since the beginning of the second half of the century the sculpture of Germany has made visible progress, and several living artists have produced works of merit and originality, far superior to the feeble imitations of classic art which for nearly a century destroyed all possible vigour and individuality in the plastic productions of most European countries.²

Spain.—In the early mediæval period the sculpture of northern Spain was much influenced by contemporary art in France. From the 12th to the 14th century many French architects and sculptors visited and worked in Spain. The cathedral of Santiago de Compostella possesses one of the grandest existing specimens in the world of late 12th-century architectonic sculpture; this, though the work of a native artist, Mastel Mateo,³ is thoroughly French in style; as recorded by an inscription on the front, it was completed in 1188. The whole of the western portal with its three doorways is covered with statues and reliefs, all richly decorated with colour, part of which still remains. Round the central arch are figures of the twenty-four elders, and in the tympanum a very noble relief of Christ in Majesty between Saints and Angels. As at Chartres, the jamb-shafts of the doorways are decorated with standing statues of saints,—St James the elder, the patron of the church, being attached to the

¹ In size, but not in merit, this enormous statue has recently been surpassed by the figure of America made in Paris and now (1896) being erected as a beacon at the entrance to the harbour of New York City.

² On German sculpture see Foerster, *Denkmale deutscher Baukunst*, Leipzig, 1856; Wandelaar, *Adem Kraft und his School*, Nuremberg, 1898; *Reise des Gräfinde des J. von Brandenburg*, . . . von P. Fischer, Berlin, 1843; Reinold, *Fischer's Shrine of St. Sebaldo*, Nuremberg, 1856; Lübke, *Hist. of Sculpt.*, Eng. trans., London, 1872.

³ A kneeling portrait-statue of Mateo is introduced at the back of the central pier. This figure is now much revered by the Spanish peasants, and the head is partly worn away with kisses.

central pillar. These noble figures, though treated in a somewhat rigid manner, are thoroughly subordinate to the main lines of the building. Their heads, with pointed beards and a fixed mechanical smile, together with the stiff drapery arranged in long narrow folds, recall the Æginetan pediment sculpture of about 500 B.C. This appears strange at first sight, but the fact is that the works of the early Greek and the mediæval Spaniard were both produced at a somewhat similar stage in two far distant periods of artistic development. In both cases plastic art was freeing itself from the bonds of a hieratic archaism, and had reached one of the last steps in a development which in the one case culminated in the perfection of the Phidian age, and in the other led to the exquisitely beautiful yet simple and reserved art of the end of the 13th and early part of the 14th century,—the golden age of sculpture in France and England.

In the 14th century the silversmiths of Spain produced many works of sculpture of great size and technical power. One of the finest, by a Valencian called Peter Berneç, is the great silver retable at Gerona cathedral. It is divided into three tiers of statuettes and reliefs, richly framed in canopied niches, all of silver, partly cast and partly hammered.

In the 15th century an infusion of German influence was mixed with that of France, as may be seen in the very rich sculptural decorations which adorn the main door of Salamanca cathedral, the façade of S. Juan at Valladolid, and the church and cloisters of S. Juan de los Reyes at Toledo, perhaps the most gorgeous examples of architectural sculpture in the world. The carved foliage of this period is of especial beauty and spirited execution; realistic forms of plant-growth are mingled with other more conventional foliage in the most masterly manner. The very noble bronze monument of Archdeacon Pelayo (d. 1490) in Burgos cathedral was probably the work of Simon of Cologne, who was also architect of the Certosa at Miraflores, 2 miles from Burgos. The church of this monastery contains two of the most magnificently rich monuments in the world, especially the altar-tomb of King John II. and his queen by Gil de Siloe,—a perfect marvel of rich alabaster canopy-work and intricate under-cutting. The effigies have little merit.

In the early part of the 16th century a strong Italian influence superseded that of France and Germany, partly owing to the presence in Spain of the Florentine Torrigiano and other Italian artists. The magnificent tomb of Ferdinand and Isabella in Granada cathedral is a fine specimen of Italian Renaissance sculpture, somewhat similar in general form to the tomb of Sixtus IV. by Ant. Pollaiuolo in St. Peter's, but half a century later in the style of its detail. It looks as if it had been executed by Torrigiano, but the design which he made for it is said to have been rejected. Some of the work of this period, though purely Italian in style, was produced by Spanish sculptors,—for example, the choir reliefs at Toledo cathedral, and those in the Colegio Mayor at Salamanca by Alonso Berruguete, who obtained his artistic training in Rome and Florence. Esteban Jordan, Gregorio Hernandez, and other Spanish sculptors produced a large number of elaborate retables, carved in wood with subjects in relief and richly decorated in gold and colours. These sumptuous masses of polychromatic sculpture resemble the 15th-century retables of Germany more than any Italian examples, and were a sort of survival of an older mediæval style. Alonso Cano (1600-1667), the painter, was remarkable for clever realistic sculpture, very highly coloured and religious in style. Montañés, who died in 1614, was one of the ablest Spanish sculptors of his time. His finest works are the reliefs of the Madonna

and Saints on an altar in the university church of Seville, and in the cathedral, in the chapel of St. Augustine, a very nobly designed Conception, modelled with great skill. In later times Spain has produced little or no sculpture of any merit.

Italy.—Till the great revival of plastic art took place in the middle of the 13th century, the sculpture of Italy^{fourteenth century} was decidedly inferior to that of other more northern countries. Much of it was actually the work of northern sculptors,—as, for example, the very rude sculpture on the façade of S. Andrea at Pistoia, executed about 1186 by Gruamons and his brother Adeodatus.¹ Fig. 15 shows a

FIG. 15.—Relief by Benedetto Antelami for the pulpit of Parma cathedral in 1178; Byzantine style.

relief by Antelami of Parma of the year 1178. Unlike the sculpture of the Pisani and later artists, these early figures are thoroughly secondary to the architecture they are designed to decorate; they are evidently the work of men who were architects first and sculptors in a secondary degree. After the 13th century the reverse was usually the case, and, as at the west end of Orvieto cathedral, the sculptured decorations are treated as being of primary importance,—not that the Italian sculptor-architect ever allowed his statues or reliefs to weaken or damage their architectural surroundings, as is unfortunately the case with much modern sculpture. In southern Italy, during the 13th century, there existed a school of sculpture resembling that of France, owing probably to the Norman occupation. The pulpit in the cathedral of Ravello, executed by Nicolaus di Bartolomeo di Foggia in 1272, is an important work of this class; it is enriched with very noble sculpture, especially a large female head crowned with a richly foliated coronet, and combining lifelike vigour with largeness of style in a very remarkable way. The bronze doors at Monreale, Pisa, and elsewhere, which are among the chief works of plastic art in Italy during the 12th century, are described in MONREALE and METAL-WORK. The history of Italian sculpture of the best period is given to a great extent in the separate articles on the PISANI (*q.v.*) and other Italian artists. During the 13th century Rome and the central provinces of Italy produced very few sculptors of ability, almost the only men of note being the Cosmati (see ROME, vol. xx. p. 335).

During the 14th century Florence and the neighbouring Four-cities were the chief centres of Italian sculpture, and there^{fourteenth century} numerous sculptors of successively increasing artistic power lived and worked, till in the 15th century Florence had become the æsthetic capital of the world, and reached a pitch of artistic wealth and perfection which Athens

¹ The other finest examples of this early class of sculpture exist at Pisa, Parma, Modena, and Verona; in most of them the old Byzantine influence is very strong.

alone in its best days could have rivalled. The similarity between the plastic arts of Athens in the 5th or 4th century B.C. and of Florence in the 15th century is not one of analogy only. Though free from any touch of copyism, there are many points in the works of such men as Donatello, Luca della Robbia, and Vittore Pisanello which strongly recall the sculpture of ancient Greece, and suggest that, if a sculptor of the later Phidian school had been surrounded by the same types of face and costume as those among which the Italians lived, he would have produced plastic works closely resembling those of the great Florentine masters. In the 14th century, in northern Italy, various schools of sculpture existed, especially at Verona and Venice, whose art differed widely from the contemporary art of Tuscany; but Milan and Pavia, on the other hand, possessed sculptors who followed closely the style of the Pisani. The chief examples of the latter class are the magnificent shrine of St Augustine in the cathedral of Pavia, dated 1362, and the somewhat similar shrine of Peter the Martyr (1339), by Balduccio of Pisa, in the church of St Eustorgio at Milan, both of white marble, decorated in the most lavish way with statuettes and subject reliefs. Many other fine pieces of the Pisan school exist in Milan. The well-known tombs of the Scaliger family at Verona show a more native style of design, and in general form, though not in detail, suggest the influence of transalpine Gothic. In

Venice the northern and almost French character of much of the early 15th-century sculpture is more strongly marked, especially in the noble figures in high relief which decorate the lower story and angles of the doge's palace; these are mostly the work of a Venetian named Bartolomeo Bon. A magnificent marble tympanum relief by Bon has recently been added to the South Kensington Museum; it has a noble colossal figure of the Madonna, who shelters under her mantle a number of kneeling worshippers; the background is enriched with foliage and heads, forming a "Jesse tree," designed with great decorative skill. The cathedral of Como, built at the very end of the 15th century, is decorated with good sculpture of almost Gothic style, but on the whole rather dull and mechanical in detail, like much of the sculpture in the extreme north of Italy. A large quantity of rich sculpture was produced in Naples during the 14th century, but of no great merit either in design or in execution. The lofty monument of King Robert (1350), behind the high altar of S. Chiara, and other tombs in the same church

FIG. 18.—Florentine marble effigy in low relief in the church of the Certosa near Florence.

are the most conspicuous works of this period. Very beautiful sepulchral effigies in low relief were produced in many parts of Italy, especially at Florence. The tomb of Lorenzo Acciaiuoli (see fig. 16), in the Certosa near Florence, is a fine example of about the year 1400, which has absurdly been attributed to Donatello. Rome was very remarkable during the 14th century for its extraordinary poverty in the production of sculpture. The clumsy effigies at the north-east of S. Maria in Trastevere are striking examples of the degradation of the plastic art there about the year 1400; and it was not till nearly the middle of the century that the arrival of able Florentine sculptors, such as Filarete, Mino da Fiesole, and the Pollaiuoli, initiated a brilliant era of artistic activity, which, however, for about a century continued to depend on the presence of sculptors from Tuscany and other northern provinces. It was not, in fact, till the period of full decadence had begun that Rome itself produced any notable artists.

For the great sculptors of Florence during the 14th and 15th centuries we refer the reader to the separate biographical notices on the subject. The Pisani and Arnolfo del Cambio were succeeded by Orcagna and others, who carried on and developed the

Fifteenth century.

FIG. 19.—Bronze colossal statue of Colleoni at Venice, modelled by Verrocchio and cast by Leopardi.

great lessons these pioneers of the Renaissance had taught. Ghiberti, the sculptor of the world-famed *Lap-*

¹ See Ruskin, *Stones of Venice*; and Mothes, *Gesch. der Kunst u. Bildh. Venedigs*, Leipzig, 1859.

Florence. tistery gates; Donatello, the master of delicate relief and dignified realism (see fig. 17); Luca della Robbia, with his classic purity of style and sweetness of expression, came next in order. Unusual beauty elevated by religious spirit was attained in the highest degree by Mino da Fiesole, the two Rossellini, Benedetto da Maiano, and other sculptors of Florence. Two of the noblest equestrian statues the world has probably ever seen are the Gattamelata statue at Padua by Donatello and the statue of Colleoni at Venice by Verrocchio and Leopardi (see fig. 18). A third, which was probably of equal beauty, was modelled in clay by Leonardo da Vinci, but it no longer exists. Finally came Michel-

FIG. 19.—Head of the colossal statue of David by Michelangelo at Florence.

angelo, who raised the sculpture of the modern world to its highest pitch of magnificence, and at the same time sowed the seeds of its rapidly approaching decline; the head of his David (see fig. 19) is a work of unrivalled force and dignity. His rivals and imitators, Baccio Bandinelli, Giacomo della Porta, Montelupo, Ammanati, Vincenzo de' Rossi, and others, copied and exaggerated his faults without possessing a touch of his gigantic genius. In other parts of Italy, such as Pavia, the traditions of the 15th century lasted longer, though gradually fading. The statuary and reliefs which make the Certosa near Pavia one of the most gorgeous buildings in the world are free from the influence of Michelangelo, which at Florence and Rome was overwhelming. Though much of the sculpture was begun in the second half of the 15th century, the greater part was not executed till much later. The magnificent tomb of the founder, Giovanni Galeazzo Visconti, was not completed till about 1560, and is a gorgeous example of the style of the Renaissance grown weak from excess of richness and from loss of the simple purity of the art of the 15th century. Everywhere in this wonderful building the fault is the same; and the growing love of luxury and display, which was the curse of the time, is reflected in the plastic decorations of the whole church. The old religious spirit had died out and was succeeded by unbelief or by an affected revival of paganism. Monuments to ancient Romans, such as those to the two Plinys on the façade of Como cathedral, or "heroa" to unsainly mortals, such as that erected at Rimini by Sigismondo Pandolfo in honour of Isotta,¹ grew up side by side with shrines and churches dedicated to the saints. We have seen how the youthful vigour of the Christian faith vivified for a time the dry bones of expiring classic art, and now the decay of this same belief brought with it the destruction of all that was most valuable in mediæval sculpture. Sculpture like the other arts became the bond-slave of the rich and ceased to be the natural expression of a whole people. Though for a long time in Italy great technical skill continued to exist, the vivifying spirit was dead, and at last a dull scholasticism or a riotous extravagance of design became the leading characteristics.

¹ See *Yriarte, Rimini au XV^e Siècle*, Paris, 1880; also the article *Rimini*.

The 16th century was one of transition to this state of degradation, but nevertheless produced many sculptors of great ability who were not wholly crushed by the declining taste of their time. John of Douay (1524-1608), usually known as Giovanni da Bologna, one of the ablest, lived and worked almost entirely in Italy. His bronze statue of Mercury flying upwards, in the Uffizi, one of his finest

FIG. 20.—Group by Giovanni da Bologna, formerly in Brasenose College, Oxford; destroyed in 1881.

work, is a feeble copy of Ghiberti's noble production. One of Giovanni's best works, a group of two nude figures fighting, is now lost. A fine copy in lead existed till recently in the front quadrangle of Brasenose College, Oxford, of which it was the chief ornament (see fig. 20). In 1881 it was sold for old lead by the master and fellows of the college, and was immediately melted down by the plumber who bought it—a quite irreparable loss, as the only other existing copy is very inferior; the destruction was an utterly inexcusable act of vandalism. The sculpture on the western façade of the church at Loreto and the elaborate bronze gates of the Santa Casa are works of great technical merit by Girolamo Lombardo and his sons, about the middle of the 16th century. Benvenuto Cellini (1500-1569), though in the main a poor sculptor, produced one work of great beauty and dignity,—the colossal bronze Perseus at Florence (see fig. 21). His large bust of Cosimo de' Medici in the Bargello is mean and petty in style. A number of very clever statues and groups in terra-cotta were modelled by Antonio Begarelli of Modena (d. 1563), and were enthusiastically admired

FIG. 21.—Bronze statue of Perseus and Medusa by Cellini, in the Loggia de' Lanzi at Florence.

by Michelangelo; the finest are a Pietà in S. Maria Pomposo and a large Descent from the Cross in S. Francesco,

both at Modena. The colossal bronze seated statue of Julius III. at Perugia, cast in 1555 by Vincenzo Danti, is one of the best portrait-figures of the time.

Seventeenth century.

The chief sculptor and architect of the 17th century was the Neapolitan Bernini (1598-1680), who, with the aid of a large school of assistants, produced an almost incredible quantity of sculpture of the most varying degrees of merit and hideousness. His chief early group, the Apollo and Daphne in the Borgheese casino, is a work of wonderful technical skill and delicate high finish, combined with soft beauty and grace, though too pictorial in style. In later life Bernini turned out work of brutal coarseness¹ designed in a thoroughly unsculpturesque spirit. The churches of Rome, the colonnade of St Peter's, and the bridge of S. Angelo are crowded with his clumsy colossal figures, half draped in wildly fluttering garments,—perfect models of what is worst in the plastic art. And yet his works received perhaps more praise than those of any other sculptor of any age, and after his death a scaffolding was erected outside the bridge of S. Angelo in order that people might walk round and admire his rows of feeble half-naked angels. For all that, Bernini was a man of undoubted talent, and in a better period of art would have been a sculptor of the first rank; many of his portrait-busts are works of great vigour and dignity, quite free from the mannered extravagance of his larger sculpture. Stefano Maderna (1571-1636) was the ablest of his contemporaries; his clever and much admired statue, the figure of the dead S. Cecilia under the high altar of her basilica, is chiefly remarkable for its deathlike pose and the realistic treatment of the drapery. Another clever sculptor was Alessandro Algardi of Bologna (1657-1704).

Eighteenth century.

In the next century at Naples Queirolo, Corradini, and Sammartino produced a number of statues, now in the chapel of S. Maria de' Sangri, which are extraordinary examples of wasted labour and ignorance of the simplest canons of plastic art. These are marble statues enmeshed in nets or covered with thin veils, executed with almost deceptive realism, perhaps the lowest stage of tricky degradation into which the sculptor's art could possibly fall.² In the 18th century Italy was naturally the headquarters of the classical revival, which spread thence throughout most of Europe. Canova (1757-1822), a Venetian by birth, who spent most of his life in Rome, was perhaps the leading spirit of this movement, and became the most popular sculptor of his time. His work is very unequal in merit, mostly dull and uninteresting in style, and is occasionally marred by a meretricious spirit very contrary to the true classic feeling. His group of the Three Graces, the Hebe, and the very popular Dancing-Girls, copies of which in plaster disfigure the stairs of countless modern hotels and other buildings on the Continent, are typical examples of Canova's worst work. Some of his sculpture is designed with far more of the purity of antique art; his finest work is the colossal group of Theseus slaying a Centaur at Vienna (see fig. 22). Canova's attempts at Christian sculpture are singularly unsuccessful, as, for example, his pretentious monument to Pope Clement XIII. in St Peter's at Rome, that to Titian at Venice, and Alfieri's tomb in the Florentine church of S. Croce. Fiesole has in this century produced one sculptor of great talent, named Bastianini. He worked in the style of the great 15th-century Florentine sculptors, and followed especially the methods of his distinguished fellow-townsmen Mino da

¹ The *Ludovisi* group of Pluto carrying off Proserpine is a striking example, and shows Bernini's deterioration of style in later life. It has nothing in common with the Cain and Abel or the Apollo and Daphne of his earlier years.

² In the present century an Italian sculptor named Monti won much popular reputa by similar unworthy tricks; some veiled statues by him in the London Exhibition of 1851 were greatly admired.

Fiesole. Many of Bastianini's works are hardly to be distinguished from genuine sculpture of the 15th century, and in some cases enormous prices have been paid for

FIG. 22.—Colossal marble group of Theseus and a centaur, by Canova, at Vienna.

them under the supposition that they were mediæval productions. These frauds were, however, perpetrated without Bastianini's knowledge.

Scandinavia, &c.—By far the greatest sculptor of the Scandinavian revival was Bertel Thorwaldsen (1770-1844), an ^{Danish} ^{sculptor.} Icelander by race, whose boyhood was spent at Copenhagen, and who settled in Rome in 1797, when Canova's fame was at its highest point.³ He produced an immense quantity of groups, single statues, and reliefs, chiefly Greek and Roman deities, many of which show more of the true spirit of antique art than has been attained by any other modern sculptor. His group of the Three Graces is for purity of form and sculptural simplicity far superior to that of the same subject by Canova. No sculptor's works have ever been exhibited as a whole in so perfect a manner as Thorwaldsen's; they are collected in a fine building which has been specially erected to contain them at Copenhagen; he is buried in the courtyard. The Swedish sculptors Tobias Sergell and Johann Ryström belonged to the classic school; the latter followed in Thorwaldsen's footsteps. Another Swede named Fogelberg was famed chiefly for his sculptured subjects taken from Norse mythology. W. Bissen and Jerichau of Denmark have produced some able works,—the former a fine equestrian statue of Frederick VII. at Copenhagen, and the latter a very spirited and widely known group of a Man attacked by a Panther.

Within recent years Russia, Poland, and other countries have produced many sculptors, most of whom belong to the modern German or French schools. Rome is still a ^{America,} ^{Russia,} ^{&c.} favourite place of residence for the sculptors of all countries, but can hardly be said to possess a school of its own. The sculptors of America almost invariably study at one of the great European centres of plastic art, especially in Paris. Hiram Powers of Cincinnati, who produced one work of merit, a nude female figure, called the Greek Slave, exhibited in London in 1851, lived and worked in Florence. A number of living American sculptors now reside both there and in Rome.⁴

³ See Eng. Flon, *Vie de Thorwaldsen*, Paris, 1867.

TECHNICAL METHODS OF THE SCULPTOR

The production of bronze statues by the *cire perdue* process is described in the article METAL-WORK, vol xvi p 72, this is now but little practised out of Paris.

For the execution of a marble statue the sculptor first models a preliminary sketch on a small scale in clay or wax. He then, in the case of a life-sized or colossal statue, has a sort of iron skeleton set up, with stout bars for the arms and legs, fixed in the pose of the future figure. This is placed on a stand with a revolving top, so that the sculptor can easily turn the whole model round and thus work with the light on any side of it. Over this iron skeleton the artist builds up a rough model of the figure, using for the purpose the help of wood and bone tools, without the necessity of soft clay figure, if more than a few inches high, would collapse with its own weight and squeeze the lower part out of shape. While the modelling is in progress it is necessary to keep the clay moist and plastic, by squirting water on it with a sort of garden syringe capped with a finely perforated rose. When the sculptor is not at work the whole figure is kept wrapped up in damp cloths. A modern improvement is the use of modelling-clay, not with water, but with glycerine, which has the advantage of not drying and becoming brittle, and of being capable of being used over and over again. Glycerine and plastic, has the great advantage of not setting, and so the sculptor avoids the chill and consequent risk of rheumatism which follow from a constant manipulation of wet clay. When the clay model is finished, it is cast in plaster. A "piece-mould" is formed by applying patches of wet plaster of Paris all over the clay statue in such a way that they can be removed piecemeal from the model, and then be fitted together again, forming a complete hollow mould. The inside is then smoothed with plaster and water made to the consistency of cream. The skin of the plaster is then allowed to dry, and the surface of the mould is then smoothed with a fine sand. The "piece-mould" is then taken to press and the casting set free. If skillfully done by a good *fornatore* or moulder the plaster cast is a perfect facsimile of the original clay, very slightly disfigured by a series of lines showing the joints in the piece-mould, the sections of which cannot be made to fit together with absolute precision. Many sculptors have then clay moulds made of the plaster model, and use these, as they prefer to do, for the finishing touches on the plaster cast. A good plaster boy or a very experienced sculptor is then sent to work on

The next stage is to copy the plaster model into marble. The model is set up on a large block called a "scale stone," while the marble for the future statue is set upon another similar block. The plaster model is then covered with a series of marks, placed on all the most salient parts of the body, and the front of each mark is numbered. The marble block is then placed on a table, the same on both stones. An ingenious instrument called a pointing machine, which has arms ending in metal points or "needles," that move in ball-socket joints, is placed between the model and the marble block. Two of its arms are then applied to the model, one touching a point on the scale stone while the other touches a point on the marble block. The figure is then placed on the scale stone and the machine is then revolved to the marble block, and set with its lower needle touching the corresponding point on the scale stone. The upper needle, which is arranged to slide back on its own axis, cannot reach the corresponding point on the statue because the marble block is in the way. The hole is then drilled into the marble block and the figure is placed on the marble block so that the latter can slide forward so as to reach a point sunk in the marble block exactly corresponding to the point it touched on the plaster model. This process is repeated both on the model and on the marble block till the latter is drilled with a number of holes, the bottoms of which correspond in position to the number of points on the plaster model. The marble block is then removed

[illegible]

1 Moulds made in one or few pieces, from which the cast can only be extracted by destroying the mould, are called "spoils moulds". A large number of casts can be made from a "piece-mould," but only one from a "spoils mould".

skilled *scarpellino* "chisel-man" then sets to work and cuts away the marble till he has reached the bottoms of all the holes, beyond which he must not cut. The statue is thus roughly blocked out, and a more skilled *scarpellino* begins to work. Partly by eye and The scar partly with the constant help of the pointing machine, which is *pallino* used to give any required measurements, the workman almost completes the marble statue, leaving only the finishing touches to be done by the sculptor.

Among the ancient Greeks and Romans and in the medieval Polish on period it was the custom to give the nude parts of a marble statue marble to a considerable degree of polish, which really suggests the somewhat glossy surface of the human skin very much better than the dull loaf-sugar-like surface which is left on the marble by modern sculptors. This high polish still remains in parts of the pedimental figures from the Parthenon, where, at the back, they have been somewhat obscured by the weathering of the marble. The Vatican Belvedere is a remarkable instance of the preservation of this polish. Michelangelo carried the practice further still, and gave certain parts of some of his statues, such as the Moses, the highest possible polish in order to produce high lights just where he wanted them, the artistic legitimacy of this may perhaps be doubted, and in weaker hands it might degenerate into mere trickery. It is, however, much to be desired that modern sculptors should, to some extent, follow the classical practice and in a slight but uniform polish remove the disagreeable crystalline grain from all the nude parts of the marble.

A tougher method of obtaining fixed points to measure from was occasionally employed by Michelangelo and earlier sculptors. They immersed the model in a tank of water, the water being gradually allowed to run out, and thus by its sinking level it gave a series of contour lines on any required number of points. In some cases the model was supported on its sides, but in others it was suspended, previously making a model of most irregular and flat of skill.

In modelling bas-reliefs the modern sculptor usually applies the Relief clay to a slab of slate on which the design is sketched, the slate slab forms the background of the figures, and thus keeps the relief true absolutely true to one plane. This method is one of the causes of the dullness and want of spirit so conspicuous in most modern bas-reliefs. The relief is not a relief, it is a flat slab with absolutely fixed plane surface for the backgrounds. In one place, to gain an effective shadow, the Greek sculptor would cut below the average surface, in another he would leave the ground at a higher plane, either exactly as happened to each portion of his design. Other differences from the modern mechanical rules can easily be seen by a careful examination of the Parthenon frieze and the Delphi relief. The Greek sculptor was not content with the method applied to reliefs of all degrees of projection from the ground, it should, of course, only be used for those in which the projection is slight, "basso," "mezzo," and "alto-relievo" express three different degrees of salience. Very low relief is but little used by modern sculptors, mainly because it is much easier to obtain striking effects with the help of more projection. Donatello and other 15th-century Italian artists used the relief of the Greek sculptors, but their treatment of very low relief. One not altogether legitimate method of gaining effect was practised by some medieval sculptors: the relief itself was kept very low, but was "stilted" or projected from the ground, and then undercut all round the outline. A 16th-century tabernacle for the host in the Brera at Milan is a very beautiful example of this method, which as a rule is not used by modern artists. The figures look rather as if the figures were cut out in cardboard, and then stuck on.

The practice of most modern sculptors is to do very little to the Sculpt-mable with their own hands, some, in fact, have never really tors' ac-learned how to carve, and thus the finished statue is often very assistants dull and lifeless in comparison with the clay model. Most of the great sculptors of the Middle Ages left little or nothing to be done by assistants, Michelangelo, for example, being famous for carrying the carving with his own hands, and when beginning on a block of marble attacked it with such vigorous strokes of the hammer that large pieces of marble flew about in every direction. But skill as a carver, though very desirable, is not absolutely necessary for a sculptor. If he casts in bronze by the *cire perdue* process he may produce the most perfect work without ever having touched the marble harder than the modelling-wax. The sculptor in marble, however, must be able to carve a hard substance if he is to be master of his art. Unhappily some modern sculptors not only leave all manipulation of the marble to their workmen, but they also employ men to do their modelling, the supposed sculptor supplying little or nothing but his name to the work. It is not only the workmen who are neither one nor the other, but who suffer under an excess of popularity, as induced to employ aid of this kind on account of their undertaking more work than any one man could possibly accomplish,—a state of things which is necessarily very hostile to the interests of true art. As a rule, however, the sculptor's *sculpting* is what he may be said to do, and he is not only able to do it as a carver and can copy almost anything with wonderful fidelity, seldom develops into an original artist. The popular admiration

for pieces of clever trickery in sculpture, such as the carving of the open meshes of a fisherman's net, or a chain with each link free and movable, would perhaps be diminished if it were known that such work as this is invariably done, not by the sculptor, but by the *scavallino*. Unhappily at the present day there is, especially in England, little appreciation of what is valuable in plastic art, there is probably no other civilized country where the state does so little to give practical support to the advancement of monumental and decorative sculpture on a large scale—the most important branch of the art—which it is hardly in the power of private persons to further.

SCURVY, or **SCORBUTUS**, a morbid condition of the blood, manifesting itself by marked impairment of the nutritive functions and by the occurrence of hemorrhagic extravasations in the tissues of the body, and depending on the absence of certain essential ingredients in the food.

In former times this disease was extremely common among sailors, and gave rise to a frightful amount of mortality. It is now, however, of rare occurrence at sea, its cause being well understood and its prevention readily secured by simple measures. Scurvy has also frequently broken out among soldiers on campaign, in beleaguered cities, as well as among communities in times of scarcity, and in prisons, workhouses, and other public institutions. In all such instances it has been found to depend closely upon the character and amount of the food. It has been supposed that a too limited diet, either in amount or variety, might induce the disease, but an overwhelming weight of evidence goes to prove that the cause resides in the inadequate supply or the entire want of fresh vegetable matter. The manner in which this produces scurvy is not quite clear. Some high authorities have held that the insufficient supply of potash salts, in which vegetables are rich, is the procuring cause, but it has been found that the mere administration of these salts will neither prevent nor cure scurvy. Hence, while it is probable that this may be one of the factors concerned in the production of the disease, the want of other vegetable constituents, especially vegetable acids, is of still greater importance. Besides this essential defect, a diminution in the total amount of food, the large use of salted meat or fish, and all causes of a depressing kind, such as exposure, anxiety, bad hygiene, &c., will powerfully contribute to the development of the disease. See DIETETICS, vol. vii. pp. 207-208.

The symptoms of scurvy come on gradually, and its onset is not marked by any special indications beyond a certain failure of strength, most manifest on making effort. Breathlessness and exhaustion are thus easily induced, and there exists a corresponding mental depression. The countenance acquires a sallow or dusky hue, the eyes are sunken, while pains in the muscles of the body and limbs are constantly present. The appetite and digestion may be unimpaired in the earlier stages and the tongue comparatively clean, but the gums are tender and the breath offensive almost from the first. These preliminary symptoms may continue for weeks, and in isolated cases may readily escape notice, but can scarcely fail to attract attention where they affect large numbers of men. In the further stages of the disease all these phenomena are aggravated in a high degree and the physical and mental prostration soon becomes extreme. The face looks haggard, the gums are livid, spongy, ulcerating, and bleeding; the teeth are loosened and drop out; and the breath is excessively fetid. Extravasations of blood now take place in the skin and other textures. These may be small like the petechial spots of purpura (see PURPURA), but are often of large amount and cause swellings of the muscles in which they occur, having the appearance of extensive bruises and tending to become hard and brawny. These extravasations are most common in the muscles of the lower extremities, but they may be formed anywhere, and may

easily be produced by very slight pressure upon the skin or by injuries to it. In addition, there are bleedings from mucous membranes, such as those of the nose, eyes, and alimentary or respiratory tracts, while effusions of blood-stained fluid take place into the pleural, pericardial, or peritoneal cavities. Painful, extensive, and destructive ulcers are also apt to break out in the limbs. Peculiar disorders of vision have been noticed, particularly night-blindness (nyctalopia), but they are not invariably present, nor specially characteristic of the disease. The further progress of the malady is marked by profound exhaustion, with a tendency to syncope, and with various complications, such as diarrhoea and pulmonary or kidney troubles, any or all of which may bring about a fatal result. On the other hand, even in desperate cases, recovery may be hopelessly anticipated when the appropriate remedy can be obtained. The composition of the blood is materially altered in scurvy, particularly as regards its albumen and its red corpuscles, which are diminished, while the fibrine is increased.

No disease is more amenable to treatment both as regards prevention and cure than scurvy, the simple remedy of fresh vegetables or some equivalent securing both these ends. Potatoes, cabbages, onions, carrots, turnips, &c., and most fresh fruits, will be found of the greatest service for this purpose. Lime juice and lemon juice are recognized as equally efficacious, and even vinegar in the absence of these will be of some assistance. The regulated administration of lime juice in the British navy, which has been practised since 1795, has had the effect of virtually extinguishing scurvy in the service, while similar regulations introduced by the British Board of Trade in 1865 have had a like beneficial result as regards the mercantile marine. It is only when these regulations have not been fully carried out, or when the supply of lime juice has become exhausted, that scurvy among sailors has been noticed in recent times. Besides the administration of lime or lemon juice and the use of fresh meat, milk, &c., which are valuable adjuncts, the local and constitutional conditions require the attention of the physician. The ulcers of the gums and limbs can be best treated by stimulating astringent applications; the hard swellings, which are apt to continue long, may be alleviated by fomentations and frictions; while the anæmia and debility are best overcome by the continued administration of iron tonics, aided by fresh air and other measures calculated to promote the general health.

SCOUTAGE or **ESCAUGE** was one of the forms of knight-service (see KNIGHTHOOD, FEUDAL ESTATE). It was practically a composition for personal service. When levied on a knight's fee it was called scoutage uncertain, as its amount depended upon the present needs of the crown. Scoutage certain was a socage tenure, and consisted in the payment of a sum fixed in amount and payable at regular times. Scoutage appears to have been first imposed on the occasion of the Toulouse War in 1169. Magna Charta (§ 12) forbade the levy of scoutage unless *per commune consilium regni*. It appears to have fallen into disuse in the reign of Edward II., and was finally done away with by the Act abolishing feudal tenures (12 Car. II. c. 24).

SCUTARI (Turkish, *Uşakdar*), anciently *Chrysopolis*, a seaport town of Turkey in Asia, on the eastern shore of the Bosphorus, opposite Constantinople (see plan, vol vi p 305), of which it is regarded as a suburb. Climbing the slopes of several hills in the form of an amphitheatre, its houses generally painted in red, distinguished by a number of mosques adorned with numerous minarets, possessing some fine bazaars and public baths, and merging farther inland into burying-grounds, gardens, and villas, Scutari presents a very picturesque appearance, especially when viewed from the bridge of the Golden Horn or approached from the Straits of Constantinople right in front of its most prominent point. The inhabitants are largely engaged in the manufacture of saddle and silk, muslin, and cotton stuffs, the town also contains granaries and is prized as a fruit-market, more particularly for grapes, lemons, and figs. The population is estimated at 60,000 (entirely Mohammedan, with the exception of some Jews). The streets, especially the main street leading from the pier to the barracks, are in general much wider than those of Constantinople. The city includes eight mosques. Behind the landing-place is the Buyuk Jami (great mosque), surmounted by a cupola and a minaret and presenting terraces mammillated by small leaden domes. The centre of the square is adorned by a fountain of simple architecture. The mosque of Selim III, farther in the interior of the city, is likewise flanked by two minarets and surmounted by a cupola. The most elegant mosque, however, is the Valide Jami or mosque of the dowager sultana, surmounted by two minarets, built in 1547 by the daughter of Solyman. Another prominent mosque, on the right of the main street and south of Buyuk Jami, is Jemi Jami (new mosque). Other noticeable buildings are the barracks built by Selim III, forming a handsome and vast quadrangle surmounted by a tower at each angle, and whose corridors, &c., are calculated to have an aggregate length of 4 miles, an old large red building now used as a military hospital, and during the Crimean War as a hospital for the English sick and wounded, a seaglio of the sultans, a convent of howling dervishes, a simple wooden structure of two stories fronting a small cemetery. Other business quarters of the town deserving mention are Jemi Mahalle (new quarter) and the Dohanylar Mejdani (tobacco merchants' square). The most characteristic feature, however, of Scutari is its immense cemetery, the largest and most beautiful of all the cemeteries in and around Constantinople, extending over more than 3 miles of undulating plain behind the town.¹ In the centre of the ground rises the magnificent dome, supported by six marble pillars, which Sultan Mohammed erected in memory of his favourite horse. Close to the barracks, on the Bosphorus, the scene of Miss Nightingale's labours, 8000 English dead are overshadowed by a large granite obelisk. Immediately behind the town is the mountain of Bulgurlu clad in evergreen savins and red beeches, one of the plateaus of which is a favourite holiday resort. Its summit commands a very extensive view. In the plain of Haidar Pasha close by, between the cemetery and Kadikoy (judge's village, anciently Chalcedon), the English army lay encamped during the Crimean War. In front of Scutari, on a low-

¹ The cemetery is intersected with numerous paved alleys, and the tombstones are inscribed with verses of the Koran guided on a dark blue ground and bearing each simply the name of the deceased. The monuments of the men are distinguished each by a turban, those of the women each by a lotus leaf. The nature of the carved turban indicates the rank of the deceased and the fashion of the time to which it refers, so that the tombstones present the sculptured history of the Mohammedan head-dress from the date of the Turkish conquest. Each corpse is allowed a separate grave, never descended either by axe or spade. This cemetery lying in Asiatic ground is on that account the more desired as a burial-place by pious Mohammedans, and holds half the generations of Stamboul (probably some 8,000,000 persons).

lying rock almost level with the water and about a cable's length from the shore, rises a white tower 90 feet high, now used as a lighthouse, called "Leander's Tower," and by the Turks Kiz-kulesi, or the "Maiden's Tower." The first printing press in Turkey was set up at Scutari in 1723.

Its ancient name Chrysopolis most probably has reference to the fact that there the Persian tribute was collected and repaid, as at a later date the Athenians loved there too a tenth on the ships passing from the Buxine. Its more modern name of Uşakdar, signifying a courier who conveys the royal orders from station to station, commemorates the fact that formerly Scutari was the post station for Asiatic couriers, as it is still the great rendezvous and point of departure of caravans arriving from and destined for Syria, Persia, and other parts of Asia, and the spot whence all travellers and pilgrims from Constantinople to the East begin their journey.

SCÜTARİ (Turkish, *Scodra*, Slavic, *Skadar*), the capital of North Albania, at the south end of the lake of the same name, with a population of 24,500 in 1880 (mostly Mohammedans). There is only one street with any pretensions to regularity. The straggling town is built on the low flat promontory formed by the Bojana, which takes off the waters of the lake to the Adriatic, and the river which flows into the lake after crossing the plain between Scutari and the mountains of Biskassi. In winter the town is often flooded by the Bojana. The mosques and minarets are insignificant, the handsomest of the churches is the Catholic church at the north-east end. In the background is an old Venetian fortress perched on a lofty rock. The town is favourably situated for commerce, being connected by the Bojana with the Adriatic, whence its boats carry the products which descend by the Drina to the mountaineers in exchange for their wool, grain, and dyeing and building woods. There are some manufactures of arms and of cotton stuffs. In 1884 330 ships of 123,923 tons entered the port and 825 ships of 123,713 tons cleared.

Livy relates that *Scodra* was chosen as capital by the Illyrian king Gentius, who was here besieged in 168 B.C., and carried captive to Rome. In the 7th century Scutari fell into the hands of the Serbians, from whom it was wrested by the Venetians, and finally, in 1479, the Turks acquired it by treaty. Early in 1885 a beginning was made with the construction of a highway from the roadstead of San Giovanni del Medici to Scutari.

SCYLAX of Caryanda in Caria was employed by Darius I to explore the course of the Indus. He started from Afghanistan and is said by Herodotus (iv 44) to have reached the sea and then sailed to the Gulf of Suez (comp. *PERSIA*, vol xviii. p 569). Scylax wrote an account of his explorations, which is referred to by Aristotle and other ancient writers, but must have been lost pretty early, and probably also a history of the Carian hero Hecataides, who distinguished himself in the revolt against Darius.² But Scylax, who mentions the second work, confounds the old Scylax with a much later author, who wrote a refutation of the history of Polybius, and is presumably identical with Scylax of Halicarnassus, a statesman and astrologer, the friend of Panætius spoken of by Cicero (*De Div.* ii 42). Neither of these, however, can be the author of the *Periplus of the Mediterranean*, which has come down to us under the name of Scylax of Caryanda in several MSS., of which the archetype is at Paris. This work is little more than a sailor's handbook of places and distances all round the coast of the Mediterranean and its branches, and then along the outer Libyan coast as far as the Carthaginians traded, but various notices of towns and the states to which they belong enable us to fix the date with considerable precision. Niebuhr gave the date 352-348 B.C., others bring it down a year or two later, and C. Müller as late as 338-335, which is only possible if the writer's information was sometimes rather stale. See the discussion in Müller's edition (*Geog. Gr. Min.* vol. i, Paris, 1856), and against him Unger, in *Philologus*, 1874, p. 29 sq., who con-

² See A. v. Gutschmidt, in *Rhein. Mus.*, 1854, p. 141 sq.

cludes for the year 347. The latest edition is that of Fabricius (Leipzig, 1878).

SCYLLA AND CHARYBDIS. In Homer (*Od.* xii 73 sq.) Scylla is a dreadful sea-monster, daughter of Crataeus, with six heads, twelve feet, and a voice like the yelp of a puppy. She dwelt in a sea-cave looking to the west, far up the face of a huge cliff. Out of her cave she stuck her heads, fishing for marine creatures and snatching the seamen out of passing ships. Within a bowshot of this cliff was another lower cliff with a great fig-tree growing on it. Under this second rock dwelt Charybdis, who thrice a day sucked in and thrice spouted out the sea water. Between these rocks Ulysses sailed, and Scylla snatched six men out of his ship. In later classical times Scylla and Charybdis were localized in the Strait of Messina—Scylla on the Italian, Charybdis on the Sicilian side. In Ovid (*Metam.* xiv 1-74) Scylla appears as a beautiful maiden beloved by the sea-god Glaucon and changed by the jealous Circe into a sea-monster, afterwards she was transformed into a rock shunned by seamen. There are various other versions of her story. According to a late legend (Servius on Virgil, *Æn.* iii 420), Charybdis was a voracious woman who robbed Hercules of his cattle and was therefore cast into the sea by Jupiter, where she retained her old voracious nature. The well-known line

"Incaus in Scyllam cupiens vitas Charybdisum"

occurs in the *Alexandria* of Philp Gualter (a poet of the 13th century), which was printed at Lyons in 1558.

Another Scylla, confounded by Virgil (*Æc.* vi 74 sq.) with the sea-monster, was a daughter of Nisus, king of Megara. When Megara was besieged by Minos, Scylla, who was in love with him, cut off her father's purple lock, on which his life depended. But Minos drowned the unfaithful daughter (*Æschylus, Choeph.* 613 sq., Apollodorus, iii 15, 8).

SCYMNIUS of Chios, a Greek geographer of uncertain date, known to us only by a few references in later writers, but perhaps identical with the Scymnus Chius of a Delphic inscription of the beginning of the 2d century B.C.,¹ was commonly taken to be the author of an imperfect anonymous *Paraphrasis* in verse describing the northern coast of the Mediterranean, which in the first edition (Augsburg, 1600) was ascribed to Marcianus of Heraclea. Meineke showed conclusively that this piece cannot be by Scymnus. It is dedicated to a King Nicomedes, probably Nicomedes III of Bithynia, and so would date from the beginning of the 1st century B.C. See Muller, *Geog. Gr. Min.* vol. 1, where the poem is edited with sufficient prolegomena.

SCYROS, a small rocky barren island in the Ægean Sea, off the coast of Thessaly, containing a town of the same name. In 469 B.C. it was conquered by the Athenians under Cimon, and it was probably about this time that the legends arose which connect it with the Attic hero Theseus, who was said to have been treacherously slain and buried there. A mythic claim was thus formed to justify the Athenian attack, and Cimon brought back the bones of Theseus to Athens in triumph. The inhabitants of Scyros before the Athenian conquest were Dolopes (*Thuc.* i, 98); but other accounts speak of Pelasgians or Carians as the earliest inhabitants. There was a sanctuary of Achilles on the island, and numerous traditions connect Scyros with that hero. He was concealed, disguised as a woman, in the palace of Lycomedes, king of the island, when his mother wished to keep him back from the Trojan War; he was discovered there by Odysseus, and gladly accompanied him to Troy. An entirely different cycle of legends relate the conquest of Scyros by Achilles. The actual worship on the island of a hero or god named

Achilles, and the probable kinship of its inhabitants with a Thessalian people, whose hero Achilles also was, form the historical foundation of the legends. Scyros was left, along with Lemnos and Imbros, to the Athenians by the peace of Antalcidas (387 B.C.). It was taken by Philip, and continued under Macedonian rule till 196, when the Romans restored it to Athens, in whose possession it remained throughout the Roman period. It was sacked by an army of Goths, Heruli, and Peucini, in 269 A.D. The ancient city was situated on a lofty rocky peak, on the north-eastern coast, where the modern town of St George now stands. A temple of Athena, the chief goddess of Scyros, was on the shore near the town. The island has a small stream, called in ancient times Cephissus. Strabo mentions as its sole products its excellent goats and a species of variegated marble—the latter in great favour at Rome.

SCYTHE AND SICKLE. Till the invention of the reaping machine, which came into practical use only about the middle of the 19th century, scythes and sickles were the sole reaping implements. The scythe is worked with two hands with a swinging motion, while the sickle or reaping hook is held in one hand and the reaper bends and cuts the crop with a shearing or hitting motion. Of the two the sickle is the more ancient, and indeed there is some reason to conclude that its use is coeval with the cultivation of grain crops. Among the remains of the later Stone period in Great Britain and on the European continent curved flint knives have occasionally been found the form of which has led to the suggestion that they were used as sickles. Sickles of bronze occur quite commonly among remains of the early inhabitants of Europe. Some of these are deeply curved hooks, flat on the under-side, and with a strengthening ridge or back on the upper surface, while others are small curved knives, in form like the ordinary hedge-bill. Among the ancient Egyptians toothed or serrated sickles of both bronze and iron were used. Ancient Roman drawings show that both the scythe and the sickle were known to that people, and Pliny makes the distinction plain.² Although both implements have lost much of their importance since the general introduction of mowing and reaping machinery, they are still used very extensively, especially in those countries where small agricultural holdings prevail. The principal modern forms are the toothed hook, the scythe hook, the Hainault scythe, and the common scythe. The toothed hook, which was in general use till towards the middle of the 19th century, consists of a narrow-bladed curved hook, having on its cutting edge a series of fine close-set serratures cut like file-teeth, with their edges inclined towards the left or handle. Such sickles were formerly made of iron edged with steel; but in recent times they came to be made of cast steel entirely. Towards the middle of the century the toothed hook was gradually supplanted by the scythe hook or smooth-edged sickle, a somewhat heavier and broader-bladed implement, having an ordinary knife edge. Both these implements were intended for "shearing" handful by handful, the crop being held in the left hand and cut with the tool held in the right. A heavy smooth-edged sickle is used for "bagging" or "clouting"—an operation in which the hook is struck against the straw, the left hand being used to gather and carry along the cut swath. The Hainault scythe is an implement intermediate between the scythe and

¹ "Of the sickle there are two varieties, the Italian, which is the shorter and can be handled among brushwood, and the two-handed Gallic sickle, which makes quicker work of it when employed on their [the Gauls'] extensive domains; for there they cut their grass only in the middle, and pass over the shorter blades. The Italian mowers cut with the right hand only" (*H. N.*, xviii. 87).

² See Rhodæ, in *Rheum. Mus.*, 1879, p. 158 sq.

the sickle, being worked with one hand, and the motion is entirely a swinging or bagging one. The implement consists of a short scythe blade mounted on a vertical handle, and in using it the reaper collects the grain with a crook, which holds the straw together till it receives the cutting stroke of the instrument. The Hanault scythe is extensively used in Belgium. The common hay scythe consists of a slightly curved broad blade varying in length from 28 to 46 inches, mounted on a bent, or sometimes straight, wooden sned or snathe, to which two handles are attached at such distances as enable the workman, with an easy stoop, to swing the scythe blade along the ground, the cutting edge being slightly elevated to keep it clear of the inequalities of the surface. The grain-reaping scythe is similar, but provided with a cradle or short gathering rake attached to the heel and following the direction of the blade for about 12 inches. The object of this attachment is to gather the stalks as they are cut and lay them in regular swaths against the line of still-standing corn. The reaping scythe, instead of a long sned, has frequently two helves, the right hand branching from the left or main helve and the two handles placed about 2 feet apart. The best scythe blades are made from rolled sheets of steel, riveted to a back frame of iron, which gives strength and rigidity to the blade. On the Continent it is still common to mould and hammer the whole blade out of a single piece of steel, but such scythes are difficult to keep keen of edge. There is a great demand for scythes in Russia, chiefly supplied from the German empire and Austria. The principal manufacturing centre of scythes and sickles in the United Kingdom is Sheffield.

SCYTHIA, SCYTHIANS When the Greeks began to settle the north coast of the Black Sea, about the middle of the 7th century B.C., they found the south Russian steppe in the hands of a nomadic race, whom they called Scythians. An exacter form of the name was *Scythoi*. The inhabitants of the steppe must always have been nomads; but the life of all nomads is so much alike that we cannot tell whether the Scythians are the race alluded to in *Il.* xiii. 8 sq.

The name is first found in Hesiod (*Strabo*, vii. p. 300) about 800 B.C., and about 689 (Herod., iv. 15) Aristeas of Proconnesus knew a good deal about them in connexion with the ancient trade route leading from their country to Central Asia. From the passage of the Tanais (Don) for fifteen marches north-east through the steppe the country belonged to the nomad Sarmatians, whose speech and way of life resembled those of the Scythians. Then came the wooded region of the Budini, who spread far inland and were probably a Finnish race of hunters with filthy habits.¹ In this region lay Gelonus, the Greek emporium of the fur trade, round which lived the half-Grecian Geloni, probably on the Volga and hardly farther south than Simbirsk. Seven more marches in the same line ran through desert, and then in the country of the Thyssagete the road turned south-east, and led first through the country of the Iyrææ, whose way of hunting (Herod., iv. 22) indicates that they dwelt between the steppe and the forest, but belonged more to the former, the road perhaps crossed the river Ural near Orenburg, and ascending its tributary the Ilek crossed the Muggor Mountains. Beyond this in the steppe as far as the Sir-Darya and Amu-Darya the traveller was again among Scythians, who were regarded as a branch of the European Scythians. Next came a long tract of rocky soil, till the bald-headed Argippæi were reached, a race esteemed holy and seemingly Mongolian, who dwelt on the slopes of impassable mountains, probably the Belur-tagh,

and served as intermediaries in trade with the remoter peoples of Central Asia. The description of the fruit on which they subsisted (Herod., iv. 23) suits the *Elaeagnus hortensis*, indigenous on the upper Zersiflian. Many notices of ancient writers about Scythia (e.g., as to the eight months winter and the rainy summer) suit only the lands on the first part of this trade road; moreover, the Greeks soon began to extend the name of Scythians to all the nations beyond in a northerly or north-easterly direction. But such inaccuracy is not common till the fall of the Scythian race, when their name became a favourite designation of more remote and less known nations. Our best and chief informants, Herodotus and Hippocrates, clearly distinguish the Scoloti or true Scythians from all their neighbours, and on them alone this article is based.

The boundaries of Scythia are, broadly speaking, those of the steppe, which had as wide a range in antiquity as at the present day, cultivable land having always been confined to the immediate neighbourhood of the rivers. But to the west the Scythians went beyond the steppe, and held Great Wallachia between the Ainta and the Danube (Atlas and Ister). Here their northern neighbours were the Agathyrsians of Transylvania, who were perhaps Aiyans, though in manners they resembled the Thracians. The Dniester was Scythian as far up the stream as the Greeks knew it. On the Bug were found first the mixed Græco-Scythian Callipææ and Alazones as far as Exampeus (an eastern feeder of the Bug), then agricultural Scythians (*Aporthipæi*), who grew corn for export, and therefore were not confined to the steppe. This points to south-east Podolia as their dwelling-place. Beyond them on the upper Bug and above the Dniester were the Neuri, who passed for were-wolves, a superstition still current in Volhynia and about Kieff. On the left bank of the Dniester the "forest-land" (*Yalaia*) reached as far as the modern Bereslaw, then came the Scythians of the Dniester (the Borysthenians), who tilled the soil (of course only close to the river), and extended inland to the Panticæus (Inguletz?)² and up the stream to the district of Gerrhi (near Alexandrovsk). Herodotus does not know the falls of the Dniester, beyond Gerrhi he places a desert which seems to occupy the rest of the steppe. Still farther north were the wandering Androphagi (Cannibals), presumably hunters and of Mordvinian race.³ The nomadic Scythians proper succeeded their agricultural brethren to the east as far as the Gerrhus (Konskaya), and their land was watered by the Hypacyrus (Molotchynaya).⁴ The royal horde was east of the Gerrhus and extended into the Chimeæ as far as the fosse which cut off Chersonesus Trachæa from the rest of the peninsula, and remains of which can still be traced east of Theodosia. The southern neighbours of the royal Scythians were the savage Taurian mountaineers. Along the coast of the Sea of Azoff the royal horde stretched eastward as far as Cremni (Taganrog); farther inland their eastern border was the Don. They extended inland for twenty marches, as far probably as the steppe itself, and here their neighbours were the Melanchlæni (Black-cloaks).

The true Scythians led the usual life of nomads, moving

¹ Herodotus (iv. 54) makes it an eastern instead of a western feeder of the Dniester.

² The eastern Mordvins (Ersians) still passed for cannibals in the time of the Arabian travellers.

³ Herodotus (iv. 56) represents the Gerrhus as a branch of the Dniester flowing into the Hypacyrus, which is not impossible (Von Baer, *Histor. Ztg.* p. 66). But Herodotus himself never travelled beyond Olbia, and what he there learned about the rivers was necessarily vague, except for the parts which the Eastern trade route from Olbia touched. He filled up this imperfect information on analogy, supposing that all these rivers came from lakes, as the Bug did, with which he knew a lake was connected called "mother" of that river (iv. 51, 52, 54, 55, 57).

¹ In Herod., iv. 109, *φθιτοργαίονες* is to be taken literally. Plin. de Carpin relates the same thing of the Mongols.

through the steppe from exhausted to fresh pastures, their women in waggons roofed with felt and drawn by oxen, the men on horseback, the droves of sheep, cattle, and horses following. They lived on boiled flesh, mare's milk, and cheese, they never washed, but enjoyed a narcotic intoxication in combination with a vapour bath by shutting themselves up within curtains of felt and strewing hemp seed on heated stones. The women, in place of washing, daubed themselves with a paste containing dust of fragrant woods and removed it on the second day. Like many other barbarians, the Scythians, at least in Hippocrates's time (ed. Latré, ii 72), were not a specially hardy race, they had stout, fleshy, flabby bodies, the joints concealed by fat, their countenances somewhat ruddy. The observation of Hippocrates that they all looked alike is one that has often been made by travellers among lower races. They were liable to dysentery and rheumatism, which they treated by the actual cautery, impotence and sterility were common, and, though the accounts vary, it is probable that the race was not very numerous (Herod., iv 81).

Hippocrates's description has led many writers to view the Scythians as Mongolian, but the life of the steppe impresses a certain common stamp on all its nomad inhabitants, and the features described are not sufficiently characteristic to justify the assumption of so distant a Mongol migration. What remains of the Scythian language, on the other hand, furnished Zeus with clear proofs that they were Aryans and nearly akin to the settled Iranians. The most decisive evidence is found in Herodotus (iv. 117), viz., that Scythians and SARMATIANS (*g.e.*) were of cognate speech, for the latter were certainly Aryans, as even the ancients observed, supposing them to be a Median colony (Diod., ii 43, Pliny, vi 19). The whole steppe lands from the Oxus and the Jaxartes to the Hungarian pusztes seem to have been held at an early date by a chain of Aryan nomad races.

The Scythian deities have also an Aryan complexion. The highest deity was Tabiti, goddess of the heath, next came the heaven-god Papanus, with his wife the earth-goddess Apia, a sun-god, Citosyrus, a goddess of fecundity, Arpessus, who is compared with the Queen of Heaven at Ascalon, and two gods to whom Herodotus (iv 58) gives the Greek names of Heracles and Ares. These deities were common to all Scythians. The royal horde had also a sea-god, Thammasadas. In true Iranian fashion the gods were adored without images, altars, or temples, save only that Ares had as his symbol a sabre (Herod., iv 62), which was set up on a huge altar piled up of faggots of brushwood. He received yearly sacrifices of sheep and oxen, as well as every hundredth captive. Ordinarily victims were strangled. Diviners were common, and one species of them, who came only from certain families, the Enarians or Anarians, were held in high honour. These supposed their race to have offended the goddess of heaven, who in revenge smote them with impotence; they assumed the dress and avocations of women and spoke with a woman's voice.¹ Divination was practised with willow withes as among the Old Germans; the Enarians, however, used lime-tree bark. False prophets were tied on a wagon with burning brushwood, and the frightened team was driven forth. Oaths were sealed by drinking of a mixture of wine with the blood of the parties into which they had dipped their weapons. When the king was sick it was thought that some one had sworn falsely by the deities of his hearth,² and the man

was beheaded whom the diviners, or a majority of them, pronounced to be the culprit. When the king commanded the death of a man all his male offspring perished with him (for fear of blood-revenge). He who gained a suit before the king had the right to make a drinking-cup of his adversary's skull. Actions at law thus stood on the same footing with war, for this is what one did after slaying a foe. The Scythians fought always on horseback with bow and arrow, and the warrior drank the blood of the first man he slew in battle, probably deeming that his adversary's prowess thus passed into him. No one shared in booty who had not brought the king a foeman's head, the scalp was then tanned and hung on the bride. Captive slaves were blinded on the absurd pretext that this kept them from stealing the mare's-milk butter they were employed to churn.

The government was strictly despotic, as appears most plainly in the hideous customs at the burial of kings. The corpse of an ordinary Scythian was carried about among all the neighbours for forty days, and a funeral feast was given by every friend so visited. But the royal corpse was embalmed and passed in like manner from tribe to tribe, and the people of each tribe joined the procession with their whole bodies disfigured by bloody wounds, till at length the royal tombs at Geruhi were reached. Then the king was buried along with one of his concubines, his cupbearer, cook, groom, chamberlain, and messenger, all of whom were slain. Horses, too, and golden utensils were buried under the vast barrow that was raised over the grave. Many such tumuli (called in Tatar *kurgan*) have been found between the Dnieper and the sources of the Tokmak, a tributary of the Molotchaya. Then, on the first anniversary, yet fifty horses and fifty free-born Scythian servants of the king were slain, and the latter were pinned upright on the stuffed horses as watchmen over the dead.

The Scythians deemed themselves autochthonous; then patriarch was Tagitans, a son of the god of heaven by a daughter of the river Dnieper. This legend, with the site of the royal graves, points to the lower Dnieper as the cradle of their kingdom. The further legend (Herod., iv. 5) of the golden plough, yoke, battle-axe, and cup (tokens of sovereignty over husbandmen and warriors) that fell from heaven, and burned when the two eldest sons of Tagitans approached them, but allowed the youngest son to take them and become king, has been well compared by Dnieker with the Iranian conception of *hwerenô*, the halo of majesty, which refused to be grasped by the Turanian Fraînagê, but attached itself to pious kings like Thraétônâ. The eldest brother, Lipoxas, was ancestor of the Achaetæ; the second, Arjoxas, of the Catiani and Traspians; the youngest, Colaxas (whose name seems to be mutilated), was father of the royal tribe of Paralatae, and from him, too, the whole nation had the name of Scolots. Pliny (*II. IV.*, iv. 88) places the Achaetæ on the upper Bug, so this seems to be the proper name of the agricultural Scythians; if so, the Catiani and Traspians will be the Borysthenian and nomad Scythians who dwelt between the husbandmen and the royal horde. Colaxas divided his kingdom among his three sons, the chief kingdom being that in which the golden relics were kept, and these three sons correspond to the three kings of the Scythians in the time of Darius's invasion, viz., Scopas, whose realm bordered on the Sarmatians, Idanthyrsus, sovereign of the chief kingdom; and Taxacis,—the last two being neighbours of the Budini and the Geloni. According to the Scythians, Tagitans lived just a thousand years before the year 513 B.C.,—a legend which, taken with the tradition of autochthonism, indicates a much earlier date for the immigration of the Scythians than we should deduce from other narratives.

¹ Remegius in 1776 observed the same symptoms, with the same consequences of relegation among the women, in certain Nogai Tartars on the Kuban.

² The plural (Herod., iv 69) reminds us of the *Fravashi* of the king in the *Avesta*.

Aristeas of Proconnesus (Herod., iv 13) had heard of a migration of the Scythians into their later settlement. The one-eyed Arimaspians, who, as neighbours of the gold-guarding griffins, may be sought near the gold-fields of the Tibetan plateau, had attacked the Issedones (whom later authors are probably right in placing in the region of Kashgar and Khotan), and the latter in turn fell on the Scythians and drove them from their seats, whereupon these occupied the lands held till then by the Cimmerians. It is a probable conjecture that the branch of the royal Scythians spoken of as dwelling north of the Oxus and Jaxartes was really a part of the nation that remained in their ancient home. Aristeas's story has much internal probability, but it is impossible to hold that the Scythian migration immediately preceded the first appearance of the expelled Cimmerians in Asia Minor, in Aristeas's own days (695 B.C.). The Scythians must have seized the steppe as far as the Dnieper centuries before, but the older inhabitants, who were probably of one race with the Thracians, remained their neighbours in the Crimea and the extreme west till the beginning of the 7th century.

Concerning the complete expulsion of the Cimmerians and the Scythian invasion of Asia that followed, Herodotus (iv 11 sq., i 103-106, iv 1, 3 sq.) gives an account, taken from several sources, which is intelligible only when we put aside the historian's attempts to combine these. A barbarian (*sc.* Median) account was that the Scythian nomads of Asia, pressed by the Massagetae, crossed the Araxes (by which Herodotus here and in other places means the Amu-Darya) and fell on Media. Taking these Scythians for Scolots and assuming, therefore, that the reference was to their first migration, Herodotus had to place the expulsion of the Cimmerians between the crossing of the Araxes and the invasion of Media, and he had heard from Greeks (of Pontus) that on the Dniester was the grave of the Cimmerian kings, who had slain each other in single combat rather than share the migration of their people. This local tradition implies that the Cimmerians reached Asia Minor through Thrace, which, indeed, is the only possible route, except by sea, Herodotus, however, is led by his false presuppositions to conduct them eastwards from the Dniester by the Crimea (where many local names preserved their memory), and so along the Black Sea coast, and then westwards from the Caucasus to Asia Minor. The Scythians, he thinks, followed them, but, losing the trail, went east from the Caucasus, and so reached Media. This he gives only as his own inference from two things—(1) that the Cimmerians settled on the peninsula of Sinope, from which their forays into Asia Minor seem to have been conducted, and (2) that the Scythians invaded Media. The Median source spoke further of a great victory of the Scythians, after which they overran all Asia, and held it for twenty-eight years (634-606), levying tribute and plundering at will, till at length the Medes, under Cyaxares, destroyed most of them after making them drunk at a banquet.¹ Here a third, Egyptian, account comes in, viz. that King Psammetichus (d. 611) bought off certain northern invaders who had advanced as far as Philistaea, there is no reason to doubt that these are the Scythians of the Median account. Still more important is the evidence of certain prophecies of Jeremiah (comp. in 6) in the reign of Josiah (628-609), describing the approach from the north of an all-devouring nation of riders and bowmen (Jer. iv. 6 sq., v. 15 sq., vi 1 sq., 22 sq.).² Herodotus's twenty-eight years are simply the period between the accession of Cyaxares

and the taking of Nineveh, which followed close on the overthrow of the Scythians, Justin, on the other hand, gives the Scythians eight years of sovereignty, which fits well with the interval between the first and the second siege of Nineveh (619-609).³

A fourth account in Herodotus, which connects the *θῆλεια νόσος* of the Enarians with the plundering of the temple of Astarte at Ascalon, is entirely apocryphal, and must come from the Greek identification of this Astarte with the Scythian Arpipsa. Yet it seems to have been chiefly this story that led Herodotus to take the Scythians of his Median source for Scolots. He is refuted by another account of Iranian origin. Ctesias (in Diod., ii 34) tells of a long war between the Medes and the Sace, occasioned by the defection of Parthian subjects of Media to the latter nation in the time of Astibaras (Cyaxares), so that the Scythian conquerors actually came from the east, not from the north. Herodotus's Median source closed with Cyaxares recovering his power, the story which follows about the resistance of the slaves of the Scythians to their returning lords, who cowed them by using whips instead of arms, must have come from the Pontic Greeks, and is certainly a local legend,⁴ which has nothing to do with the wars in Asia, and indeed is connected by Callistratus (Steph. Byz., s.v. Τάφρου) with a war between Scythians and Thracians.

From the expedition of Darius upwards Herodotus names five generations of Scythian kings, Idanthyrus, Saulius, Gnturus, Lycus, Spargapethes, the last may be contemporary with the foundation of Olbia (646 B.C.).⁵ Under Idanthyrus fell the invasion of Darius (513 B.C.). The motive for this invasion cannot possibly have been revenge for the Scythian invasion of Media. It is possible that a popular war against the chief nation of the nomads, who are so hated by the Iranian peasants, seemed to Darius a good way of stimulating common feeling among his scattered subjects, and it is certain that he had quite false ideas of the wealth of Scythia, due perhaps to export of grain from the Grecian cities of the Scythian coast. Herodotus's account of the campaign is made up in a puzzling way of several distinct narratives, retouched to smooth away contradictions. Here it must suffice to refer to the article PERSIA (vol. xviii p. 570), and to add that the geographical confusion in Herodotus and his exaggerated idea of the distance to which the Persians advanced seem to be due partly to a false combination between a Scythian account of the campaign and certain notices about the burning of Gelonus by enemies and about fortresses on the river Oarus which had come to him from the inland trade route, and had nothing to do with Darius, partly to a confusion between the desert reached by the Persians and that which lay between the Budni and Thyssagetae.

While the Persian rule in the newly conquered districts of Europe was shaken by the Ionic revolt, the Scythians made plundering expeditions in Thrace, and in 495 penetrated into the Chersonesus, whose tyrant Miltades fled, but was restored after their retreat by the Dolonci (Herod., vi 40). Darius had Abydus and the other cities of the Propontis burned lest they should furnish a base for a projected Scythian expedition against Asia (Strabo, xii p. 591), this agrees with the fact known from Herodotus (v 117),

¹ Eusebius's date (634) for the Scythians in Palestine is deduced from Herodotus.

² It is meant to explain the origin of the fosse (Herod., iv 3), which the slaves were said to have dug, and of a subject-ace in the same district (Pliny, *H.N.*, iv 80), the Sindians (Amm. Mar., xxi 8, 41; Val. Flac., vi 86), or rather perhaps the Satharche.

³ That the wise ANACHARSIS (*sc.* v) was brother of King Saulius (Ctesias of Diog. Laert., i 101) seems to be a mere guess of Herodotus's Scythian informant Tunes. The story of Anacharsis's fate is coloured by that of the later king Scyles.

¹ This story may be influenced by the myth about the feast of the Saces (Strabo, xi p. 512). Ctesias has it that peace was made.

² This is Hitzig's discovery and must be sound. Before the fall of Nineveh the Chaldeans could not be a source of danger.

that Abydus had been retaken by Daurises a little before. In this connexion the Scythian embassy to King Cleomenes at Sparta (Herod., vi 84) to arrange a combined attack on Asia becomes credible, for, barbarians though they were, the Scythians had a political organization and many connexions with the Ionians of the Pontic colonies, so that their envoys may well have reached Sparta at the same time with Aristagoras (499) and served as decoys for his fantastic schemes.¹

Our accounts of the Scythians begin to fail after the time of King Scyles, who affected Grecian habits and was deposed and finally slain for sharing in Bæotic orgies (Herod., iv 78-80), his death fell a little before Herodotus's visit to Olbia (c 456). We read in an unclear context (Diod., ii 43) of a division of the Scythians into two great tribes, the Falli and the Napæ, the former of whom crossed the Don from the east and destroyed the latter and also the Tanaites.² These events seem to point to a change of dynasty in the royal horde.

The *Perplus* ascribed to Scylax (346 B.C.) knows the Scythians as still occupying almost exactly the same limits as in Herodotus's time, only in the east there is a small but significant change: the Sarmatians have already crossed the Don (§ 68). King Ateas still ruled Scythia in its old extent (Strabo, vii 307), but all that we know of the events of his reign took place south of the Danube, wars with the Triballi in Servia, with Byzantium, with the king of the Greek city of Istrus, and finally with his old ally Philip of Macedon. Philip defeated and slew Ateas near the Danube in 339 B.C. He was then over ninety years old.³

The Scythians appear once more in the region of the Dobruja in 313, when they helped the citizens of Callatis against Lysimachus and were defeated by him (Diod., xix 73). All this points to a considerable advance of their frontier southwards, and in fact Pseudo-Scymnus (Ephorus) gives Dionysopolis (a little to the west of the modern Balchik) as the place where the Crobzyan and the Scythian territories met in his time (334 B.C.).⁴ This apparent advance of the realm contrasts singularly with the distress to which Ateas was reduced by the king of the insignificant town of Istrus, an evidence that the Scythian power was really much decayed. Ateas indeed is sometimes painted as a rude barbarian lord of a poor but valiant and hardy race, and Ephorus, who mainly follows Herodotus about Scythia, yet speaks of the Scythians in contrast with the fierce Sarmatians as corresponding to Homer's description of a just and poor people feeding on milk (Strabo, vii 302). But Aristotle, on the contrary (*Eth. Nic.*, vii 8), speaks of the effeminacy of the Scythian monarchs as notorious, and indeed there can be little doubt that the Scythians crossed the Danube and settled in the Dobruja under pressure of the Sarmatians behind them, and that the idyllic picture drawn by Ephorus presupposes the fall of their political system. Diodorus (ii 43) tells us that the Sarmatians exterminated the inhabitants of most part of Scythia, and this must have taken place in the later years of Ateas, between 346 and 339.

At a later but uncertain date the great inferiority of the Scythians to the Sarmatians is illustrated by the story of Amage, the warlike consort of a debauched Sarmatian king, who with only 120 chosen horsemen delivered Chersonesus

in Tauris from the neighbouring Scythian king, slew him with all his followers, and gave the kingdom to his son (Polyæn., viii 56). It is, however, not quite certain whether these were a remnant of the old Scythians; and it is still more doubtful whether the powerful Scythian kingdom of Seilurus, who brought the Greek cities of the Crimea to the verge of ruin, but was destroyed by Mithradates Eupator (106), was really a kingdom of Scythians.⁵ The last certain trace of true Scythians occurs about 100 B.C. in the Olbian *pasphisma* in honour of Protagenes.⁶ Here they appear as a small nation west of Olbia between the Thissamæ and Saudaræ, who are anxious to take refuge in Olbia from the (Scordiscian) Galatians.

Sources—Herodotus (iv 1-82, 97-142) and Hippocrates (*De Aëre*, &c., c 17-22, in Lattès's ed., ii 68-82) are alone trustworthy, because they carefully distinguish the Scythians from the other northern nations. Ephorus (in Strabo, vii p 302 sq.) and Scymnus, *Perplus*, 773-778), Diodorus (ii 43 sq.) and Theophrastus (in Justin, i 1-8, 5, 1-11, and Jordan, *Öst.*, v-ri, x) do not do so, and must be used with great caution.

Helps—Ukert, *Geog. d. Gr. und Röm.*, ii 2 (complete collection of materials from original sources), Niebuhr, *Kleine Schriften*, vol. 1 (1828), Zeuss, *Die Deutschen und die Nachbarn stämme* (1837)—an admirable discussion, which established the Aryan origin of the Scythians, Böckh, in *C. I. Græc.*, v p 81 sq., K. Neumann, *Hellenen im Skythenlande* (1865)—the best book, in spite of certain fundamental errors, on the ideas that great part of the steppe was once wooded and that the Scythians were Mongols, Müllenhoff, "Origin and Speech of the Pontic Scythians and Sarmatians," in *Monatsb. d. Berl. Ak.* (1866). The best account of the trade route which in the 6th century B.C. passed through a great part of what is now Russian territory is by K. E. v. Baer, *Historische Reisen*, &c. (1873), comp. also Grote, *Hist. of Greece*, iii 314 sq. (1869), and Danneberg, ii 430 sq. (5th ed.). There is a class of more amateurs, especially in east Germany, who absurdly take the Scythians to have been Slavs (A. v. G.).

SEA. Any part of the ocean marked off from the general mass of water may be called a sea. In geography the name is loosely applied: for instance, the Arabian Sea is an open bay, Hudson's Bay is an enclosed sea. Seas proper lie within the transitional area which divides the permanent continental masses from the permanent ocean basins, and their boundaries are consequently subject to geological change, and to alteration by subsidence and elevation occurring in historic times.

Inland Seas are seas entirely surrounded by land (see CASPIAN SEA, DEAD SEA, and, for general discussion, LAKE).

Enclosed Seas have communication with the ocean restricted to one opening, which may take the form of one, two, or more straits close to each other. The best known are the White Sea of the Arctic Ocean; the Baltic, Zuyder Zee, Hudson's Bay, Gulf of Mexico, and Mediterranean, with the Adriatic and Black Sea, of the Atlantic; the Red Sea and Persian Gulf of the Indian Ocean; and the Yellow Sea and Sea of Okhotsk of the Pacific.⁷ They are all cut off from general oceanic circulation and very largely from tides, but the result is not stagnation. The Baltic and Black Sea are but slightly saline on account of the number of large rivers falling into them, and the fresh surface-water flows out as a regular current, liable indeed to be checked, and even reversed for a time, but in the main persistent, while the salt water flows in uniformly as an undercurrent. A state of equilibrium is arrived at, so that periodical fluctuations of salinity do not affect the average of a number of years. The water of the Mediterranean and Red Sea is much saltier than that of the ocean, which therefore flows in as a surface-current, while the dense very salt water escapes below. In the case of the Baltic and Black Sea dilution by rivers, in that of the Mediterranean and Red Sea concentration by evaporation maintains a circu-

¹ King Arxantas, whose primitive census is mentioned in Herodotus (iv 81), seems to have flourished at this time.

² Pliny, *H. N.*, vi 60, comp. vi 22, where we must read "Asampatas, Palos, ab his Tanaites et Napeæ" and, below, "Satachænes, Palmoë."

⁴ Comp. Pliny, *H. N.*, iv 44, who calls the Scythians Arrotæres.

⁵ C. I. Gr., ii. No. 2058; comp. Zippel, *Röm. Herrschaft in Illyrien*, p. 155.

⁶ The prevalence of colour names for these seas is noteworthy.

lation. Winds and differences of barometric pressure are, as in inland seas, great factors in producing variable currents (See BALTIC SEA, BLACK SEA, MEDITERRANEAN SEA, RED SEA, &c.)

Partially Enclosed Seas may be (a) comparatively shallow irregular channels through which strong tides sweep, or (b) ocean basins cut off by barriers barely rising to the surface, or remaining permanently submerged, in which case there may be no break of continuity in the ocean surface to indicate the sea. Seas of the first description are related to shallow enclosed seas, but are most affected by tides and ocean currents; the principal are the Kara Sea of the Arctic Ocean, Baffin Bay and North Sea of the Atlantic, Behring Sea and Japan Sea of the Pacific. They are subject to considerable temperature changes owing to their proximity to land. Seas coming under the second category combine the peculiarities of the open ocean and of deep inland seas. The Caribbean Sea of the Atlantic, the China Sea, Java Sea, and numerous small seas of the eastern archipelago of the Pacific are the best examples. Their chief peculiarity is that the temperature of the water instead of falling uniformly to the bottom becomes stationary at some intermediate position corresponding to the top of the barrier. They are usually very deep (See NORTH SEA, NORWEGIAN SEA, and PACIFIC OCEAN).

Other Seas—Coral Sea, Arabian Sea, Sea of Bengal, are names, now dropping out of use, to designate parts of the ocean. "Sargasso Sea" is an expression devoid of geographical meaning (see ATLANTIC OCEAN, vol. iii. p. 20).

Firths and Estuaries—A river entering the sea by a short estuary flows over the surface, freshening it to a considerable extent, and, if the force of its current is not too great, the rising tide slowly forces a wedge of sea water up between river and river bed, withdrawing it rapidly when ebb sets in. In a firth that is large compared with the river falling into it, judging from results recently obtained in the Firth of Forth,¹ a state of equilibrium is arrived at, the water increasing in salinity more and more gradually as it proceeds seawards, the disturbing influence of the tide becoming less and less, and the vertical distribution of salinity more and more uniform until the river water meets the sea, diffused through a nearly homogeneous mass with a density little inferior to that of the ocean. Between the extreme cases there are numerous gradations of estuary depending on the ratio of river to sea inlet.

Deposits—All seas within about 300 miles of continental land, whatever may be their depth, are paved with terrigenous debris, and all at a greater distance from shore are carpeted with true pelagic deposits (see PACIFIC OCEAN).

Marine Fauna and Flora—The mixing of river with sea water produces a marked difference in the fauna and flora of seas. Where low salinity prevails diatoms abound, probably on account of the greater amount of silica dissolved in river water, and they form food for minute pelagic animals and larvae, which are in turn preyed upon by larger creatures. In some seas, such as the North Sea, there are many celebrated fishing beds on the shallow banks of which innumerable invertebrate animals live and form an inexhaustible food-supply for edible fishes. Naturalists have remarked that in temperate seas enormous shoals of relatively few species are met with, while in tropical seas species are very numerous and individuals comparatively few. Organisms, such as the corals, which secrete carbonate of lime appear to flourish more luxuriantly in warmer and saltier seas than in those which are colder and fresher.

The geological and dynamic aspects of seas are treated of in GEOLOGY (vol. x. p. 284 *sq.*) and GEOGRAPHY (PHYSICAL); and in ATLANTIC OCEAN, BALTIC SEA, BLACK SEA, INDIAN

OCEAN, MEDITERRANEAN SEA, NORTH SEA, NORWEGIAN SEA, PACIFIC OCEAN, POLAR REGIONS, and RED SEA the general geographical and physical characters of oceans and seas are described. In METEOROLOGY some account is given of the influence of the sea on climate, and chemical problems connected with the ocean are discussed in SEA WATER.

SEA-CAT See SEA-WOLF, *infra*.

SEA-DEVIL See FISHING-FROG, vol. ix p. 269.

SEA-HORSE Sea-horses (*Hippocampus*) are small marine fishes which, together with pipe-fishes (*Syn-gnathina*), form the order of Lophobranchiate fishes, as already noticed in ICHTHOLOGY, vol. xii p. 694. The gills of the members of this order are not arranged in leaf-like series as in other fishes, but form a convex mass composed of small rounded lobes attached to the branchial arches, as shown in the accompanying figure (fig. 1) of the head of a sea-horse, in which the gill-cover has been pushed aside to show the interior of the gill-cavity. Sea-

FIG. 1.—Gills of *Hippocampus abdominalis*.

horses differ from pipe-fishes by having a prehensile and invariably finless tail, it is long, slender, tapering, quad-rangular in a transverse section, and, like the rest of the body, encased in a dermal skeleton, which consists of horny segments, allowing of ventral, and in a less degree of lateral, but not of dorsal, flexion. The typical sea-horse (*Hippocampus*) can coil up a great portion of its tail, and firmly attach itself by it to the stems of sea-weeds or other similar objects. The body is compressed and more or less elevated, and the head terminates in a long tubiform snout, at the end of which the small mouth is situated. The whole configuration of the fore part of the body, as well as the peculiar manner in which the head is joined to the neck-like part of the trunk, bears a striking resemblance to a horse's head; hence the name by which these fishes are generally known. Sea-horses are bad swimmers and are unable to resist currents. With the aid of their

FIG. 2.—*Phyllopteryx eques*.

single dorsal fin, which is placed about the middle of the fish's body and can be put into a rapid undulatory motion, they shift from time to time to some other object near them, remaining stationary among vegetation or coral where they find the requisite amount of food and sufficient

¹ Mill, *Proc. Roy. Soc. Ed.*, xii. 29, 137, and 347.

cover. Their coloration and the tubercles or spines on the head and body, sometimes with the addition of skinny flaps and filaments, closely resemble their surroundings, and constitute the means by which these defenceless creatures escape detection by their enemies. These protective structures are most developed in the Australian genus *Phyllorhynchus*, one of the most singular types of littoral fishes.

Sea-horses belong to the tropics and do not extend so far north as pipe-fishes. They are abundant at suitable localities, chiefly on the coral-banks of the Indo-Pacific Ocean. Some thirty species are known, of which the majority belong to the genus *Hippocampus* proper. Their size varies from 2 to 12 inches in length; but in China and Australia a genus (*Solenognathus*) occurs the species of which attain to a length of nearly 2 feet; they, however, in form resemble pipe-fishes rather than sea-horses. The species which may be sometimes seen in aquaria in Great Britain is *Hippocampus antiquorum*, from the Mediterranean and the coasts of Portugal and France. The food of the sea-horses consists probably of very small invertebrates and the fry of other fishes. Like the other Lophobranchiates, they take great care of their progeny. The male *Hippocampus* carries the ova in a sac on the lower side of the tail, in which they are hatched; in the other genera no closed pouch is developed, and the ova are embedded in the soft and thickened integument of either the abdomen or the tail.

SEAL. In the article MAMMALIA (vol. xv. p. 442) will be found a general account of the distinguishing characteristics of the animals constituting the sub-order *Pinnipedia* of the order *Carnivora*, and their divisions into families and genera. It only remains to give some further details respecting those members of the group to which the term "seal" is properly restricted (the sub-family *Phocine*), especially those which inhabit the British coasts.

Although seals swim and dive with the greatest ease, often remaining as much as a quarter of an hour or more below the surface, and are dependent for their sustenance entirely on living prey captured in the water, all the species frequently resort to sandy beaches, rocks, or ice-floes, either to sleep or to bask in the sun, and especially for the purpose of bringing forth their young. The latter appears to be the universal habit, and, strange as it may seem, the young seals—of some species at least—take to the water at first very reluctantly, and have actually to be taught to swim by their parents. The number of young produced is usually one annually, though occasionally two. They are at first covered with a coat of very thick, soft, nearly white fur, and until it falls off they do not usually enter the water. This occurs in the Greenland and grey seal when from two to three weeks old, but in the common seal apparently much earlier. One of this species born in the London Zoological Gardens had shed its infantile woolly coat and was swimming and diving about in its pond within three hours after its birth. The movements of the true seals upon the ground or ice are very different from those of the *Otaries* or eared seals, which walk and run upon all four feet, the body being raised as in the case of ordinary quadrupeds. The hinder limbs (by which mainly they propel themselves though the water) are on land always perfectly passive, stretched backwards, with the soles of the feet applied to each other, and often raised to avoid contact with the ground. Sometimes the fore limbs are equally passive, being placed close to the sides of the body, and motion is then effected by a shuffling or wriggling action produced by the muscles of the trunk. When, however, there is any necessity for a more rapid mode of progression, the animals use the fore paws, either alternately or simultaneously, pressing the palmar surface on the ground and lifting and dragging the body forwards

in a succession of short jumps. In this way they manage to move so fast that a man has to step out beyond a walk to keep up with them; but such rapid action costs considerable effort, and they very soon become heated and exhausted. These various modes of progression appear to be common to all species as far as has been observed.

Most kinds of seals are gregarious and congregate, especially at the breeding season, in immense herds. Such is the habit of the Greenland seal (*Phoca grandlandica*), which resorts in the spring to the ice-floes of the North Sea, around Jan Mayen Island, where about 200,000 are killed annually by the crews of the Scotch, Dutch, and Norwegian sealing vessels. Others, like the common seal of the British islands (*Phoca vitulina*), though having a

FIG. 1.—Common seal (*Phoca vitulina*).

wide geographical range, are never met with in such large numbers or far away from land. This species is stationary all the year round, but some have a regular season of migration, moving south in winter and north in summer. They are usually harmless, timid, inoffensive animals, though, being polygamous, the old males often fight desperately with each other, their skins being frequently found covered with wounds and scars. They are greatly attached to their young, and remarkably docile and easily trained when in captivity; indeed, although there would seem little in the structure or habits of the seal to fit it by nature to be a companion of man, there is perhaps no wild animal which attaches itself so readily to the person who takes care of and feeds it. They appear to have much curiosity, and it is a very old and apparently well-attested observation that they are strongly attracted by musical sounds. Their sense of smell is very acute, and their voice varies from a harsh bark or grunt to a plaintive bleat. Seals feed chiefly on fish, of which they consume enormous quantities; some, however, subsist largely on crustaceans, especially species of *Gammarus*, which swarm in the northern seas, also on molluscs, echinoderms, and even occasionally sea-birds, which they seize when swimming or floating on the water.

Although the true seals do not possess the beautiful under-fur ("seal-skin" of the furriers) which makes the skin of the sea-bears or *Otaries* so precious, their hides are still sufficiently valuable as articles of commerce, together with the oil yielded by their fat, to subject them to a devastating persecution, by which their numbers are being continually diminished (see below, p. 581 *sq.*).

Two species of seals only are met with regularly on the British coasts, the common seal and the grey seal. The

common seal (*Phoca vitulina*) is a constant resident in all suitable localities round the Scottish, Irish, and English coasts, from which it has not been driven away by the molestations of man. Although, naturally, the most secluded and out-of-the-way spots are selected as their habitual dwelling-places, there are few localities where they

Fig 2.—Skull of common seal, showing form of teeth

may not be occasionally met with. Within the writer's knowledge, one was seen not many years ago lying on the shingly beach at so populous a place as Brighton, and another was lately caught in the river Welland, near Stamford, 30 miles from the sea. They frequent bays, inlets, and estuaries, and are often seen on sandbanks or mud-flats left dry at low tide, and, unlike some of their congeners, are not found on the ice-floes of the open sea, nor, though gregarious, are very large numbers ever seen in one spot. The young are produced at the end of May or beginning of June. They feed chiefly on fish, and the destruction they occasion among salmon is well known to Scottish fishermen. The common seal is widely distributed, being found not only on the European and American coasts bordering the Atlantic Ocean but also in the North Pacific. It is from 4 to 5 feet in length, and variable in colour, though usually yellowish grey, with irregular spots of dark brown or black above and yellowish white beneath. The grey seal (*Halicturus grypus*) is of considerably larger size, the males attaining when fully adult a length of 8 feet from nose to end of hind feet. The form of the skull and the simple characters of the molar teeth distinguish it generally from the common seal. It is of a yellowish grey colour, lighter beneath, and with dark grey spots or blotches, but, like most other seals, is liable to great variations of colour according to age. The grey seal appears to be restricted to the North Atlantic, having been rarely seen on the American coasts, but not farther south than Nova Scotia, it is chiefly met with on the coasts of Ireland, England, Scotland, Norway and Sweden, including the Baltic and Gulf of Bothnia, and Iceland, though it does not appear to range farther north. It is apparently not migratory, and its favourite breeding places are rocky islands, the young being born in the end of September or beginning of October.

Other species of seals inhabiting the northern seas, of which stragglers have occasionally visited the British coasts, are the small ringed seal or "flee-rat" of the sealers (*Phoca hispida*), the Greenland or harp seal (*Phoca granatiana*), the hooded or bladder-nosed seal (*Cystophora cristata*), and possibly the Bearded seal (*Phoca barbata*), though of the last there is no certain evidence. The general characters and geographical distribution of the remaining species of the group are indicated in the article MAMMALIA, vol. xv p. 442. (W. H. F.)

SEAL FISHERIES

From a commercial point of view seals may be divided into two groups,—hair seals and fur seals. The former are valued for the oil they yield and for their skins, which are converted into leather, and the latter for their skins alone. The fur seals are provided

with a dense soft under-fur like velvet and a quantity of long loose exterior hair, which has to be removed in dressing the hides. Hair seals are either entirely without under-fur or possess it in too small a quantity to render the skins of much commercial value as furs. The two groups correspond to the two divisions of eared seals and earless seals described above (see also vol. xv pp. 442-449).

Harp Seals.—The principal harp seal fisheries are those of Newfoundland and Labrador (area about 200 miles), the Gulf of St. Lawrence, Jan Mayen and the adjacent seas, Nova Zembla, the White Sea and Arctic Ocean, the Caspian, and the North and South Pacific. The first-named is by far the most important. To the immense icefields borne past these shores during the spring months great herds of seals resort for the purposes of bunting forth and sucking their young. These are usually produced in the last week of February and increase rapidly in size. When born they weigh about 5 lb., in four weeks the fat beneath the skin has increased to a depth of 3 to 4 inches, and with the adhering skin weighs from 40 to 50 lb. At this age the animals are in the best condition for being taken, as the oil then yielded is of the best quality. They remain on the ice attended by their dams for about six weeks, when they begin to take to the water, and it becomes much more difficult to capture them. When a floe containing young seals is reached, the hunters take to the ice armed with a pole or "gaff," having a hook at one end and shod with iron at the other. A blow on the nose from this quickly despatches the animal, by means of the "scalping-knife" the skin with the fat adhering is then rapidly detached. The fat and skins are rolled into bundles and dragged to the ship. When the ship reaches port the skins are separated from the fat and salted for export to Great Britain, where they are converted into leather. Of late years furriers have succeeded in converting a few of the finer skins into ladies' trappets. The fat was formerly thrown into huge vats, where its own weight and the heat of the sun extracted the oil, but in the improved modern process the fat is ground into minute pieces by machinery and then steamed, the oil, after being exposed for a time in glass-covered tanks to the action of the sun's rays, is bottled for exportation. The greater part of it goes to England, where it is largely employed both as an illuminant and as a lubricant. It is also used for tanning purposes and in the manufacture of the finer kinds of soap.

From 8000 to 10,000 men embark annually from Newfoundland on this pursuit. The steamers, which are rapidly superseding sailing vessels, are stowily numbered, sheathed with non and wood, and provided with iron-plated stems, they carry from 300 to 800 men each, and make two, and sometimes when very successful even three, trips in the season. From 20 to 25 steamships in all are engaged in this industry, 6 of these being from Dundee, Scotland. The Dundee vessels arrive in Newfoundland in February and there ship their crews, at the close of the sealing season they proceed to the northern whale fishery and return home in October. A "close time" for seals is now established by law. Sailing vessels cannot clear for this fishery before 1st March, nor can steamers before 10th March. After the young seals have taken to the water, the steamers then second trips engage in the pursuit of the old breeding seals till the middle or end of May. These are taken either by shooting them or clubbing them when congregated in herds on the ice. This practice, which is most injurious to the fishery, has of late been partially abandoned, by an agreement among the owners of vessels not to continue operations beyond 30th April. The failure and disappointments of the voyage are numerous, many vessels returning to port with few seals or even with none. The prizes, however, are so enormous that there is no hesitation in embarking capital in the enterprise. It is no uncommon event for a steamer to return two or three weeks after leaving port laden to the gunwale with seals. As many as 42,000 have been brought in by a single steamer, the value at two and a half dollars per seal being \$105,000 (£21,875). The men on board the steamers share one-third of the proceeds of the voyage among them, the remainder goes to the owners who equip and provision the vessels. In sailing vessels the men get one-half the proceeds. The number of seals taken annually ranges from 350,000 to 500,000. In the three years 1877, 1878, and 1881 the average take was 436,413, valued at £213,937. Between 1881 and 1886 the returns fell below this average owing to the heavy ice, which comparatively few vessels succeeded in penetrating. The large number of young seals which escaped during these years will improve the fishery in the future.

In the seas around Newfoundland and Labrador there are four species of seals,—the bay seal, the harp, the hood, and the aquino flapper. The first of these frequents the mouths of rivers and harbours and is never found on the ice. The harp, so called from a curved line of dark spots on its back making a figure somewhat resembling an ancient harp, is by far the most numerous, and is far pre-eminence the seal of commerce. The hood, which owes their

¹ Some naturalists have proposed the name *Trichechus* for the hair seals and *Oulophocæna* for the fur seals, in allusion to the different character of the skin in the two groups.

name to a bag or head on the nose of the males, which they can inflate at pleasure for protection, are much larger than the harps, but their oil is not of such good quality. But few square flippers are taken, they are large seals from 12 to 16 feet in length, and are believed to be identical with the great Greenland seals. The seals frequenting these seas are migratory. In May, attended by their young, they commence their northerly movements to the Greenland seas, where they spend two or three months, and in September begin their southerly migration, moving along the coast of Labrador, feeding in its fords and bays. One division passes through the Straits of Belle Isle into the Gulf of St. Lawrence, the other along the east coast of Newfoundland. By the close of the year they reach the Great Banks, their southern headquarters, and early in February commence their northerly movement to meet the ice on which their young are to be brought forth.

The Newfoundland fishery was of slight importance till the beginning of the 19th century. At first the seals were taken in nets, the next method was shooting them from large boats, which left shore about the middle of April. Afterwards small schooners were employed, and a rapid expansion of the fishery followed. Over 100 of these small vessels used to leave the port of St. John's, and as many more the ports of Conception Bay. In 1795 the whole catch of seals was but 5000. In 1805 it reached 31,000, in 1815, 126,000, in 1822, 306,383. The largest catches on record were in 1830, when 556,942 seals were taken, in 1831, 686,836, 1843, 651,370, and in 1844, 685,580. The following table shows the number of seals taken in some recent years:—

Years	No of Seals	Years	No of Seals
1850	200,000	1851	447,003
1861	375,282	1852	200,500
1869	320,621	1853	350,250
1870	200,000	1854	286,527
1880	221,793		

Of late years an increasing number of steamers from St. John's have resorted to the Gulf of St. Lawrence as well as small sailing vessels from the southern ports of Newfoundland. A few residents of the Magdalen Islands also pursue the seals on the Gulf coast, and the Canadians carry on the fishery along the shore by means of nets both in spring and autumn. The nets are made of strong hempen cord, some of them very large and costing with the anchors and gear as much as £1500 each. This fishery is carried on from Blanc Sablon Bay to Cape Whittle. The number taken averages about 70,000 to 80,000.

Next in importance is the seal fishery carried on between Greenland, Spitzbergen, and the coast of Jan Mayen, between 68° and 74° N lat and 8° E and 17° W long. In most years, however, the seals are taken mainly in the vicinity of Jan Mayen. The fishery is carried on by the British, Norwegians, Swedes, Danes, and Germans. The number taken by the British vessels about equals that taken by all the others together. The species taken are the same as on the Newfoundland coast, the harp or saddleback and the hood or bladder-nose. The breeding season is about three weeks later than in the case of the Newfoundland seals, the young being brought forth between the 16th and the 22d of March. The method of capture is almost the same as that of the Newfoundland hunters. Steamers are now almost exclusively employed. The only British ports now engaged in the enterprise are Dundee and Peterhead. During the twelve years 1873 to 1885 the number of British vessels taking part in it was from 14 to 21, the number of men varying from 500 to 1200, and the number of seals taken from 55,000 to 75,000. The total number of seals taken by these vessels during the ten years ending 1884 was 452,013. Formerly, from 1500 to 2700 men were employed, and the number of seals taken ranged from 50,000 to 125,000. The decline has been largely caused by the reckless and barbarous way in which the fishery has been conducted, the practice of seal-hunters of all nations having been to reach the seals soon after the young were born, and then to wash on for the mothers as they came to suckle them and shoot them without mercy, leaving the young to die in thousands of starvation on the ice. The consequence is that the herds are not now a twentieth part of their former size. Newfoundland hunters, on the other hand, do not disturb the seals till they are grown and about to leave their mothers, the old seals are never killed till a later date.

By an international treaty between England and Norway—the two nations most interested—the young seals have been placed under the Jan Mayen fishery. The Dundee and Peterhead steamers are chiefly manned by Shetlanders, who are taken on board at Lerwick. The vessels make the ice from the 15th to the 20th March and commence the chase in the destructive way already described. They follow up the capture of the young seals in April, when they are better worth taking. Then they proceed to separate the skins from the fat. The former are salted on board, and the fat is stowed in tanks. In May the pursuit of the old seals on the ice commences and continues till the 15th, when it is time to proceed to the whale fishery. The oil is not manufactured till the vessels reach home late in the autumn. As the blubber undergoes decay in the tanks, the oil is not so good in quality as that made in Newfoundland from the fresh fat.

The Jan Mayen fishery commenced in 1840. In that year 13 British vessels and 650 men engaged in it, and 17,300 seals were taken. The Norwegians and other nationalities also took part in it. Steamers were introduced in 1855. The following table shows the growth and decline of the fishery:—

Year	No of British Vessels	No of Men	Seals taken	Year	No of British Vessels	No of Men	Seals taken
1840	13	650	17,300	1875	22	1200	71,400
1845	30	1550	94,850	1882	14	840	41,668
1850	32	1400	14,058	1881	14	840	23,064
1856	54	2700	81,000	1882	15	900	21,062
1861	46	2200	10,450	1883	16	960	21,062
1865	36	800	112,000	1884	20	1200	49,130
1870	22	1220	128,000				

The Norwegian vessels are all steamers, sheathed with wood and iron, the crews averaging forty-six men. They belong principally to Tromsø, but Tromsø also sends out a number of small vessels to hunt adult seals. The total annual product has reached \$300,000. Over twenty Norwegian and Swedish steamers are engaged in this fishery. Since about the year 1873 or 1874 the Norwegians and Swedes have discovered a new fishing-ground for adult seals off the coast of Greenland between Iceland and Cape Farewell. It is carried on in the months of June and July. The seals taken are all of the hood kind. At one time the Jan Mayen fishery averaged 200,000 seals annually among all the nationalities engaged. It does not now exceed 120,000 to 130,000.

The Danes, the Eskimo, and the half-breeds carry on a seal fishery off the western coast of Greenland between Cape Farewell and 79° N lat. The seals taken are chiefly the flea or spotted seal and the square flipper. Rink, in his *Greenland*, estimates the annual number taken at 89,000, but at present it does not exceed 50,000, as the seals are becoming scarcer. The oil is made at the Danish settlements on the coast, and the skins are dried, not salted, and both are shipped to Denmark.

The fisheries of Nova Zembla, once productive, have declined in value, and are now carried on by only five vessels, which reach the island about the end of June. The fishermen commence with hunting the seal and the walrus and afterwards fish for the common trout. Five kinds of seals are found here, the most common being the *Phoca caspica* and the *Phoca groenlandica*. The number taken is small.

The Russians carry on a seal fishery on the eastern and western coasts of the White Sea, in the bays of the Dwina and the Mezen and on the coast of Kamui. The species is the *Phoca groenlandica*. These seals live in the high regions of the polar seas from May till September, and appear later in the gulfs and bays of the Arctic Ocean, whence the young are born. The fishery is carried on in February. Soon after the hunt commences and lasts till the end of March. On the eastern coast of the White Sea the chase is pursued over a space of 230 miles. Two thousand hunters assemble at Kedy, near Cape Vornoff. High wooden towers are erected along the shore, whence observers watch the movements of the seals. Hunting shods for the men are also erected. When a herd of seals is observed, the men go out on the ice, throwing small boats after them, and kill the young and old with clubs and guns. They approach the seals without being discovered, the hunters make themselves in long white shirts and advance slowly and noiselessly over the snow. They are often exposed to the greatest dangers, owing to the sudden movements of the ice. In following up the chase in April they use sailing boats 22 feet long, with an iron-plated bottom, which they draw up on the ice, where a vast encampment is formed, and shooting-parties search for the seals. On the western shore of the White Sea the seals hunt less readily than on the eastern. The hunters meet at Doryatso, a few miles north of the river Poni. About 500 men engage in the chase. The Russians take each year in the Arctic Ocean and the White Sea from 2,600,000 to 3,000,000 lb of seal blubber. Allowing an average of 40 lb per seal, this would imply the capture of 65,000 to 75,000 seals. The skins are made into leather.

The most extensive and valuable seal fishery of the Russians is the Caspian Sea, where the seals (*Phoca caspica*) are plentiful. They pass the summer in deep water, and in the autumn resort to the eastern basin, where the ice forms earliest and breaks up latest. Here the young takes place on the ice in December and January. The seals are also hunted at the mouths of the Volga and the Ural, and in the southern part of the sea, on the islands of the Gulf of Apsheron. There are three methods of hunting the seals,—killing them with clubs (the commonest and most successful way), shooting them on the ice, and taking them in nets. From 130,000 to 140,000 are taken annually.

A few seals are taken off the coast of California and Washington Territory. In the South Pacific, off the coast of Chili, only a few are now taken where formerly they were captured by the thousand.

The elephant seal or sea elephant (*Macrorhinus leonina*) was formerly taken in great numbers at various places for the sake of

its oil. This fishery is now almost a thing of the past, since about 1875 it has been carried on solely from New London in Connecticut, the fleet numbering only four or five vessels. The yield in 1880 was 42,000 gallons of oil, worth \$21,420.

The average number of hair seals taken annually may be estimated as follows:

	Seals
Newfoundland, including Labrador and the Gulf of St. Lawrence	400,000
Canadian net fishery, Gulf of St. Lawrence	75,000
Jan Mayen and the adjacent seas	120,000
Western Greenland	50,000
Nova Zembla, White Sea, and Arctic Ocean	75,000
Caspian Sea	140,000
North and South Pacific	5,000
Total number of hair seals	875,000
Value at \$2.50 per seal	\$2,187,500

Fur Seals.—The fur seals occupy two distinct areas. None exist on the shores of the North Atlantic. South of the equator they extend from near the tropics to the region of antarctic ice. By far the most important and valuable fur seal fisheries are those carried on at St. Paul's and St. George's Islands, belonging to the Pribiloff group, off the coast of Alaska, at the Commander Islands in the Behring Sea, and that in the same sea 700 miles west of the Alaskan seal islets. The species found here is the northern fur seal (*Callorhinus ursinus*). The males attain mature size about the eighth year, when their length is from 7 to 8 feet, their girth from 7 to 8 feet, and their weight, when in full flesh, from 500 to 700 lb. The females are full grown at four years old, when they measure 4 feet in length, 2½ in girth, and weigh from 80 to 100 lb. The yearlings weigh from 30 to 40 lb. The seals resort to these islands late in spring chiefly for reproductive purposes, making their appearance from the southwest. The number annually visiting St. Paul's and St. George's is estimated at five millions. About the middle of April the males begin to arrive and take their places along the shore in "the rookeries," as the breeding-grounds are called. The younger males are prevented from landing by the older, and are compelled either to stay in the water or to go to the uplands. By the middle of June all the males have assembled, and then the females begin to appear. Each old male seal collects from ten to fifteen or more females, when the males most jealously. The males fight furiously, "so that night and day the aggregated sound is like that of an approaching railway train." By the middle of July the family circle is complete. Soon after landing the female gives birth to one pup, weighing about 6 lb, which she nurses at wide intervals without any affection. Pairing takes place soon afterwards. No food is taken by the breeding seals while on the rocks, a period of three to four months. When the males leave after this long fast, they are reduced to half their former weight. In the end of October and middle of November all leave the island, the young males going last and by themselves.

The killing of the seals is carefully regulated. No females are killed, and only a certain number of young "bachelor" seals whose skins are of superior quality. These younger male seals are spread out on the slopes above the rookeries to rest. A party of men armed with clubs of hard wood quietly creep between them and the shore, and at a given signal start up with a shout and drive the seals inland. When they reach the killing-grounds near the villages, they select those that are two or three years old and seem likely to yield the most valuable fur. These they despatch with a club. The skins are carefully salted for exportation. Besides the skin each seal yields about a gallon and a half of oil. But it is not used, as its rank odour renders it selling very costly. The value of the skins in the fur trade varies from five to twenty-five dollars each, at times when furs are especially fashionable, a higher price is obtained. The quality of the Alaska furs is superior, but those obtained in the South Shetland and antarctic regions are rated best. A cloak of the richest fur seal, a yard deep or more, will cost from \$25 to \$40. The roots of the loose exterior hairs penetrate deeper into the skin than those of the fur or short hair, and can readily be cut by paring on the fleshy side, without touching the roots of the fur, the long hairs then drop off, leaving the valuable fur below in a sheet like pure velvet. The number of seals killed on the Pribiloff Islands is limited to 100,000 annually, and with the precautions taken they increase as fast as if left to themselves, "for when the number of males is in excess, the continual fighting on the rookeries destroys many of both females and young, which get trampled to death."

Alaska was purchased from Russia by the United States in 1867. The Pribiloff Islands were leased to the Alaska Commercial Com-

pany of San Francisco for twenty years, from 1st May 1870, under Act of Congress approved 1st July 1870. The annual rental is \$55,000 with a tax of \$2.62 on each skin taken,—making the total rental \$317,000 per annum. The Alaska Commercial Company have leased the Commander Islands from the Russian Government. About 30,000 fur seals are annually taken there.

The fishery at the mouth of the Straits of Juan de Fuca and its vicinity is carried on by Americans and Canadians. The seals are captured in the waters, the largest number being secured at and about Cape Flattery, to the extent of 15,000 annually. The Lobos Islands, at the mouth of the Rio de la Plata, are under the protection of the Government of Uruguay, the number of seals annually taken being limited to about 12,000. Some of the numerous islands about Cape Horn are the breeding-places of fur seals, as are also the South Shetland Islands farther south. This Cape Horn region is visited by a fleet of seven to ten vessels belonging to New London and Stonington, Connecticut, and also by a few Chilean and other South American vessels. Only occasionally does a vessel visit the South Shetlands, though the quality of skins to be secured there is very superior. The headquarters for the fleet between seasons is at Punta Arenas, or Sandy Point, in the Straits of Magellan. The American fleet in 1880 numbered nine vessels of 1192 tons. The result of the fishery was 9275 furs, worth \$90,481. Early in the 19th century the Falkland Islands abounded in fur seals, but they have been exterminated. The number now (1880) annually secured there does not average more than 500, in some years only 50 skins are taken.

These are annually received at London from the Cape of Good Hope about 10,000 sealskins taken at various islands in the Southern Indian Ocean and along the south-west coast of Africa. A few fur seals are taken in the Okhotsk Sea.

Nearly all the fur-seal skins find their way to London, where they are plucked, dressed, and dyed. A few, however, are prepared in New York. At the seal islands they are salted and baled with the fur inside, and in this manner shipped to London. The annual yield of the fur-seal fisheries of the world is about 185,000.

	Seals
Pribiloff Islands, Alaska	100,000
Commander Islands	120,000
Straits of Juan de Fuca and vicinity	15,000
Lobos Islands, mouth of Rio de la Plata	12,000
Magellan, including South Shetland Islands and Straits of	15,000
Falkland Islands	500
Cape of Good Hope, including south-west coast of Africa and islands in Southern Indian Ocean	10,000
Islands belonging to Japan	2,500
Total	185,000
At an average of \$7 per skin the annual value would be	\$1,295,000
Value of hair seals annually	\$1,875,000
Total value of hair and fur seals	\$3,482,500

SEA LAWS, a title which came into use amongst writers on maritime law in the 16th century, and was applied by them to certain medieval collections of usages of the sea which had been recognized as having the force of customary law, either by the judgments of a maritime court or by the resolutions of a congress of merchants and shipmasters. To the former class belong the sea laws of Oléron, which embody the usages of the mariners of the Atlantic, under the latter come the sea laws of Wisby, which reflect the customs of the mariners of the North Sea and of the Baltic.

The earliest collection of such usages which was received in England is described in the *Black Book of the Admiralty* as the "Laws of Oléron," whilst the earliest known text is contained in the *Liber Memorandum* of the corporation of the City of London, preserved in the archives of their Guildhall. These laws are in an early handwriting of the 14th century, and the title prefixed to them is *La Charte d'Oleroun des Juggements de la Mer*. How and in what manner these "Judgments of the Sea" came to be collected is not altogether certain. Cleirac, a learned advocate in the parliament of Bordeaux, in the introduction to his work on *Les Us et Coutumes de la Mer*, first printed at Bordeaux in 1647, states that Eleanor, duchess of Guienne (the consort of Louis VII. of France, but subsequently divorced from him and married to Henry II. of England), having observed during her visit to the

¹ The sea-lion (*Eumetopias stellens*) is a characteristic pinniped of the Pribiloff Islands and other parts of Alaska. It has very little commercial value; but by the natives along the Behring Sea coast of Alaska, Kamchatka, and the Kuriles it is highly prized. From the hide they make coverings for their boats, the intestines are made into garments, the stomach walls are used as poultices for oil; the flesh is dried and eaten; and the whiskers are sold to the Chinese, who use them as pickers to their opium pipes, and in several ceremonies in their joss houses.

Holy Land, in company with Lous, that the collection of customs of the sea contained in *The Book of the Consulate of the Sea* (see vol. vi p. 317) was held in high repute in the Levant, directed on her return that a record should be made of the judgments of the maritime court of the island of Oléron (at that time a peculiar court of the duchy of Guenne), in order that they might serve as law amongst the mariners of the Western Sea. He states further that Richard I of England, on his return from the Holy Land, brought back with him a roll of those judgments, which he published in England and ordained to be observed as law. It is probable that the general outline of Cleirac's account is correct, as it accords with a memorandum on the famous roll of 12 Edw. III., "De Superioritate Maris Anglie," which, having been for many years carefully preserved in the archives of the Tower of London, is now deposited in the Public Record Office. According to this memorandum, the king's justices were instructed to declare and uphold the laws and statutes made by the kings of England, in order to maintain peace and justice amongst the people of every nation passing through the sea of England. "Quæ quidem leges et statuta per dominum Ricardum, quondam regem Anglie, in reditu suo a Terra Sancta correctæ fuerunt, interpretata, declarata, et in Insula Oleron publicata, et nominata in Gallica lingua La Leyes Olyroun."

The earliest version of these Oléron sea laws, which, according to the memorandum above mentioned, were received in England in the latter part of the 12th century, comprised certain customs of the sea which were observed in the wine and the oil trade, as carried on between the ports of Guenne and those of Brittany, Normandy, England, and Flanders. No English translation seems to have been made before the *Rutter of the Sea*, printed in London by Thomas Petyt in 1536, in which they are styled "the Lawes of ye Yle of Auleron and ye Judgements of ye See." French was, in fact, a tongue familiar to the English High Court of Admiralty down to the reign of Henry VI. A Flemish text, however, appears to have been made in the latter part of the 14th century, the *Purple Book of Bruges*, preserved in the archives of Bruges, in a handwriting somewhat later than that of the *Liber Memorandum*. Prefixed to this Flemish version is the title, "Dit es de Coppie van den Rollen van Oleron van den Vonnisse van der Zee." Certain changes, however, have been made in the *Purple Book of Bruges* in the names of the ports mentioned in the original Gascon text. For instance, Sluys is in several places substituted for Bordeaux, just as in the *Rutter of the Sea* London replaces Bordeaux. That these sea laws were administered in the Flemish maritime courts may be inferred from two facts. First, a Flemish translation of them was made for the use of the maritime tribunal of Damme, which was the chief Flemish entrepôt of the wine trade in the 13th century. The text of this translation has been published by Adriaen Verwer under the title of the *Judgments of Damme*. In the second place, there is preserved in the archives of the senate of Dantzic, where there was a maritime court of old, famous for the equity of its judgments, an early manuscript of the 15th century, which contains a Flemish reproduction of the judgments of Oléron headed "Dit is Twater Recht in Vlaenderen." So far there can be no doubt that the judgments of Oléron were received as sea laws in Flanders as well as in England in the 14th century. Further inquiry enables us to trace them as they followed the course of the wine trade in the North Sea and the Baltic Sea. Boxhorn, in his *Chronyk van Zeelande*, has published a Dutch version of them, which Van Leeuwen has reproduced in his *Batavia Illustrata*, under the title of the *Lawes of West-Capell* in Zealand. Verwer has also pub-

lished a Dutch text of them in his *Nederlant's See-Rechten*, accompanied by certain customs of Amsterdam, of which other MSS exist, in which those customs are described as usages of Stavoren, or as usages of Enkhuizen, both ports of active commerce in the 15th century. Of these customs of Amsterdam, or, as they were more generally styled, "Ordnances of Amsterdam," further mention is made below.

A new and enlarged collection of sea laws, purporting to be an extract of the ancient laws of Oléron, made its appearance in the latter part of the 15th century in *Le Grant Routier de la Mer*, printed at Poutiers in France by Jan de Marnet, at the sign of the Pelican. The title-page is without a date, but the dedication, which purports to be addressed by its author Pierre Garcie alias Feriande to his godson, is dated from St Gilles on the last day of May 1483. It contains forty-seven articles, of which the first twenty-two are identical with articles of the "Judgments of the Sea," in the *Liber Memorandum*, the remaining articles being evidently of more recent origin. A black-letter edition of this work in French, without a date, is preserved in the Bodleian Library at Oxford, and to the last article this colophon is appended: "Ces choses précédentes sont extractes du tres utile et profitable Roolle Doleyron par le dict Pierre Garcie alias Feriande." An English translation is printed in the appendix to *A View of the Admiralty Jurisdiction*, published in 1661 by Dr John Godolphin, in which the laws are described as "an Extract of the Ancient Laws of Oléron rendered into English out of Gascon alias Feriand." Although this new text had the recommendation of an advocate who had filled the office of judge of the Admiralty Court during the Commonwealth and been appointed king's advocate-general by Charles II, it seems to have been superseded in a short time by Cleirac's *Us et Costumes de la Mer*, to which was appended the following clause of authentication: "Tesmoin le Seel de l'Isle d'Oléron, estably aux contractz de la dite Isle, le jour du Mardy apres la Feste Sainct André l'an mille deux cens soixant-six." Cleirac does not inform us from what source or under what circumstances he procured his text, nor on what authority he has adopted in certain articles readings at variance with those of Garcie, whilst he retains the same number of articles, to wit, forty-seven. The clause of authentication cannot be accepted as a warranty above suspicion, as the identical clause of authentication with the same date is appended to the early Norman and Breton versions of the rolls, which contain only twenty-six articles. Cleirac's version, however, owing probably to the superior style in which it was edited, and to the importance of the other treatises on maritime matters which Cleirac had brought together for the first time in a single volume, seems to have obtained a preference in England over Garcie's text, as it was received in the High Court of Admiralty during the judgeship of Sir Leoline Jenkyns, and an English translation of it was introduced into the English translation of the *Black Book of the Admiralty* made by John Bedford, the deputy registrar of the High Court, and dedicated to Sir Leoline Jenkyns. It seems to have been Bedford's intention to print this translation under the title of "Sea Laws", but the manuscript passed into the hands of Sir Leoline Jenkyns, who gave it to the College of Advocates in 1685. The *Black Book* itself, which was missing for a long time from the Admiralty registry, has recently been discovered and has been replaced in the archives of the Admiralty Court. Of these two versions of the sea laws of Oléron the earliest obtained a wide-world reception, for it was translated into Castilian (*Puerto de Layron*) by order of King Alphonso X., and a Gascon text of it is still preserved in the archives of Leghorn, apparently in a handwriting of the 15th cen-

tury, entitled "Asso es la copia deus Rolles de Leron de jugemens de mar"

The parent stock of the Wisby sea laws would appear to have been a code preserved in the chancery of Lubeck, drawn up in the Old Saxon tongue, and dated 1240. This code contains amongst many others certain articles on maritime law which are identical with articles in the Gothland sea laws, Gothland being the island of which Wisby was the chief port. This collection comprises sixty-six articles, and it is now placed beyond a doubt by recent researches, especially of Professor Schlyter of Lund, that these Gothland sea laws are a compilation derived from three distinct sources,—a Lubeck, an Oléron, and an Amsteidan source. A Saxon or Low German text of this collection was printed for the first time in 1505 at Copenhagen by Godfrey de Gemen, a native of Gouda in Holland, who is reputed to have set up the earliest printing-press in Copenhagen. This print has no title-page, and in this respect resembles the earliest known print of *The Consulate of the Sea*, but upon a blank leaf, which occupies the place of a frontispiece in one of two copies of Godfrey de Gemen's text, both preserved in the royal library at Copenhagen, there has been inserted with a pen in alternate lines of black and red ink the title "Dat hoghste Gotlansche Water-Recht gedruket to Kopenhagen Anno Domini m d v," and there has also been inserted on the first page of the text the introductory title "Her beghynt dat hoghste Water-Recht?" (here begins the supreme sea law). Professor Schlyter has discovered a MS (No 3123) in the royal library at Copenhagen, which is written on parchment in a hand of the 15th century, and from which it seems probable that Godfrey de Gemen mainly derived his text, as it comprises the same number of articles, containing the same matter arranged in the same order, with this minor difference, that, whilst both the MS and the print have the simple title "Water-Recht" prefixed to the first article, the MS has also a similar title prefixed to the fifteenth. Further, as this article together with those that follow it in the MS, appears to be in a handwriting different from that of the articles that precede, the fifteenth article may justly be considered as the first of a distinct series, more particularly as they are numbered in Roman characters, beginning with § 1, and such characters are continued with a single interruption down to the end of the MS. Although, however, the numeration of the articles of this second series is continuous and the handwriting of the MS from the fifteenth to the sixty-sixth article is unchanged, the text of the series is not continuous, as the fortieth article commences with an introductory clause—"This is the ordinance which the skippers and merchants have resolved amongst themselves as ship law." There is no difficulty in recognizing the first division of this second series of sea laws as a Low German version of the Judgments of Oléron, transmitted most probably through a Flemish text. This hypothesis would account for the substitution in several articles of Sluys for Bourdeaux. On the other hand, the introductory clause which ushers in the fortieth article is identical with the title that is generally prefixed to MSS of the maritime Ordinances of Amsterdam, and the text of this and of the following articles down to the sixty-fifth inclusive is evidently of Dutch origin and more or less identical with Verwer's text of the usages of Amsterdam. M Pardessus, in his valuable *Collection de Lois Maritimes*, published in Paris before Professor Schlyter made known the result of his researches, has justly remarked that the provisions of several articles of this last division of the sea laws are inconsistent with the theory that they originated at Wisby. It may be observed that the sixty-sixth article of the MS. is a Lubeck law identical with the first article of the first

series, which is of Lubeck origin. No colophon is appended to this final article in the MS. Nevertheless, Godfrey de Gemen's edition of 1505, which breaks off in the middle of the sixty-sixth article of the MS, has the following colophon—"Here end the Gothland sea laws, which the community of merchants and skippers have ordained and made at Wisby, that all men may regulate themselves by them. Printed at Copenhagen, a d m d v." The question naturally suggests itself, To what MS was Godfrey de Gemen indebted for this colophon, or is the alternative more probable that he devised it? There is no known MS. of this collection of an earlier date to which an appeal can be made as an authority for this colophon, on the contrary, the only known MSS of which the date is earlier than Godfrey de Gemen's print, both of which are in the library of the university of Copenhagen, are without this colophon, and one of them, which purports to have been completed at Nyköping on the Eve of the Visitation of the Virgin in 1494, concludes with a colophon which precludes all idea that anything has been omitted by the scribe, viz., "Here ends this book, and may God send us his grace, Amen." We are disposed to think that Gemen himself devised this colophon. He was engaged in printing for the first time other collections of laws for the Danish Government, and, as Gothland was at that time a possession of Denmark, he may have thus distinguished the sea laws from another collection, namely, of land laws. Professor Schlyter, however, believes Gemen may have borrowed it from a MS which is lost, or at all events is not known. There is some support to this view in the fact that in the archives of the guildhall of Lubeck there is preserved a MS of 1533 which contains a Low German version of the same collection of sea laws, with a rubric prefixed to the first article announcing them to be "the water law or sea law, which is the oldest and highest law of Wisby," and there are good reasons for supposing that the scribe of this MS. copied his text from a MS other than the Copenhagen MS. The same observation will apply to a second MS. of a similar character preserved in the library of the gymnasium of Lubeck, which purports to have been written in 1537. But as regards the Wisby sea laws little reliance can be placed on such rubrics or colophons as proofs of the facts recited in them, though they may be valuable as evidence of the reputed origin of the sea laws at the time when the scribe completed the MS. In illustration of this view it may be stated that in the same year in which the more recent of these two MSS purports to have been completed—namely, 1537—there was printed at Lubeck an enlarged edition of the sea laws consisting of seventy-two articles, being a Low German translation of a Dutch text, in which six additional Dutch laws had been inserted which are not found in the Copenhagen MS, nor have a place in Gemen's text, yet to this edition is prefixed the title, "This is the highest and oldest sea law, which the community of merchants and shipmasters have ordained and made at Wisby, that all persons who would be secure may regulate themselves by it." Further, it has an introductory clause to its thirty-seventh article—"This is the ordinance which the community of skippers and merchants have resolved upon amongst themselves as ship law, which the men of Zealand, Holland, Flanders hold, and with the law of Wisby, which is the oldest ship law." At the end of the seventy-second article there follows this colophon: "Here ends the Gothland sea law, which the community of merchants and mariners have ordained and made at Wisby, that each may regulate himself by it. All honour be to God, m d x x x v i i." Each article of this edition has prefixed to it after its particular number the word "belevinge" (judgment). It would thus appear that the Wisby sea laws

have fared like the Oléron sea laws they have gathered bulk with increasing years.

The question remains to be answered, How did this collection of sea laws acquire the title of the "Wisby sea laws" outside the Baltic? for under such title they were received in Scotland in the 16th century, as may be inferred from extracts from them cited in Sir James Balfour's *System of the more Ancient Laws of Scotland*, which, although not printed till 1754, was completed before his death in 1583. The text of the Wisby sea laws generally current in England is an English translation of a French text which Clerac published in 1641 in his *Us et Costumes de la Mer*, and is an abbreviated, and in many respects mutilated, version of the original sea laws. This inquiry, however, would open a new chapter on the subject of the northern sea laws, and the civilizing influence which the merchants of Wisby exercised in the 13th century through their factories at Novgorod, linking thereby the trade of the Baltic to that of the Black Sea.

(T T)

SEALING WAX. In mediæval times, when the principal use of sealing wax was for attaching the impression of seals to official documents, the composition used consisted of a mixture of Venice turpentine, beeswax, and colouring matter, usually vermilion. The preparation now employed contains no wax. Fine red stationary sealing wax is composed of about seven parts by weight of shellac, four of Venice turpentine, and three to four of vermilion. The resins are melted together in an earthenware pot over a moderate fire, and the colouring matter is added slowly with careful stirring. The mass when taken from the fire is poured into oiled tin moulds the form of the sticks required, and when hard the sticks are polished by passing them rapidly over a charcoal fire, or through a spurt flame, which melts the superficial film. For the brightest qualities of sealing wax bleached lac is employed, and a proportion of perfuming matter—storax or balsam of Peru—is added. In the commoner qualities considerable admixtures of chalk, carbonate of magnesia, baryta white, or other earthy matters are employed, and for the various colours appropriate mineral pigments. In inferior waxes ordinary resin takes the place of lac, and the dragon gum of Australia (from *Xanthorrhoea hastilis*) and other resins are similarly substituted. Such waxes, used for bottling, parcelling, and other coarser applications, run thin when heated, and are comparatively brittle, whereas fine wax should soften slowly and is tenacious and adhesive.

SEALKOTE. See **STALKOT**.

SEALS (Gr. *σφραγίς*, Lat. *sigillum*). During the mediæval period the importance of seals was very great, as they were considered the main proofs of the authenticity of all sorts of documents, both public and private.¹ That is much less the case now, the written signature being thought a safer guarantee of genuineness. In order to make illicit use or imitation of a seal difficult, the seal itself was usually locked up and guarded with special care, and in the case of royal personages or corporate bodies was often made a very complicated work of art, which it would have been almost impossible to copy exactly. One very curious precaution that was adopted is still in use with the corporate seal of the monasteries of Mount Athos. The circular matrix² is divided into four quarters, each

of which is kept by one of the four *epistates* or ruling monks, the four pieces are joined by a key-handle, which remains in the custody of the secretary. Thus it is only when all five guardians of the various parts of the matrix meet together that the complete seal can be stamped on any document. The device on the Mount Athos seal is a half-length figure of the Madonna and Child, and the imprint is made by blackening the matrix in the flame of a lamp and then pressing it on the paper or vellum itself. Mediæval seals were applied in two different ways: in one the stamp was impressed in wax run on the surface of the document (Fr. *plagué* or *en placard*), in the other the wax impression was suspended by cord or strips of parchment (Fr. *pendant*). The latter method was necessarily used with metal seals or *bulles* (see below).

For the sake of greater security in the case of *plagué* seals, it was a common practice from the 12th century onwards, or even earlier, to make a cross cut in the vellum of the document, the corners of which were then turned back, thus forming a square opening, over which the wax seal was stamped, the turned-up corners helped to hold the wax in its place, and the aperture allowed a second matrix to be applied at the back. This was usually a smaller private seal called a *secretum*. Thus, for example, an abbot would use on the front of a document the large corporate seal of his community, and on the back would stamp his personal seal as a *secretum*.

Till the 12th century pure white beeswax was generally used, after that wax coloured green or red. The use of shellac or other harder materials, such as modern sealing-wax, is of recent date. Thus it was usual to protect the soft wax seals by some sort of "fender," often a wreath of rushes or plaited strips of paper twisted round it, another method much employed in the 15th century was to cover the seal with leaves of oak, bay, or beech. *Pendant* seals were often encased in boxes of wood or *cuir bouilli*, which in some cases are very richly decorated. From the 13th to the 15th century original royal documents are usually on fine vellum and have green seals hung by many-coloured silk and gold threads, while office copies are on coarser vellum and have white seals hung by parchment strips. In England an important official, called the clerk of the chafe-wax, an office which still exists, was entrusted with the duty of softening the wax for state seals over a chafing-brazier. Two different methods of sealing documents, either closed or open for inspection, are recorded in the legal terms "letters secret" and "letters patent."

Owing to the enormous number of mediæval seals which still exist, and their frequently great historical and artistic importance, it is necessary to adopt some method of classification, especially for large collections, such as that of the British Museum, which contains about 25,000 specimens, and the very important one of the Society of Antiquaries.⁴ The chief classes are these:—(1) *Ecclesiastical*.—(a) Seals belonging to offices, such as those of popes, bishops, abbots, deans, &c.; (b) common seals of corporate bodies, such as chapters, religious colleges, monasteries, and the like; (c) official seals without the name of the officer; (d) personal seals, with or without a name. (2) *Lay*.—(a) Royal seals, including those of queens and royal princes; (b) official seals in the name of the sovereign or a state official; (c) common seals of corporate bodies, such as towns, universities, guilds, schools, hospitals, &c.; (d) personal seals (not being royal) with offices, heraldry, merchants' marks, or other devices, with or without a name, or with name only, or with legend only

¹ For antique seals, see GIBBS, JEWELLERY, and RING.

² In some cases, in the presence of witnesses, a seal which did not belong to the signer of a document was used when the right matrix was not at hand. This has naturally caused many archaeological puzzles.

³ The word "seal" is often used to denote both the impression made

and the object that makes the impress. More correctly the latter is called the "matrix," and only the impression is called the "seal."

⁴ This valuable collection has been arranged and catalogued by Dr C. S. Percival, the best modern authority on English seals.

*French Royal Seals*¹—The earliest and most complete series of seals is that of the French kings. The Carolingian and Merovingian monarchs mostly used antique gems or pastes,—portrait heads being selected and a legend added in the metal setting of the matrix. Charlemagne used a head of Jupiter Serapis,² Pippin the Short that of the Indian Dionysus. The British Museum possesses a seal of Odo or Eudes, king of France (888-898), impressed from a fine Greek gem of the 3d century B.C., with a portrait of Seleucus IV. The oldest existing matrix is that of Lothaire I (c. 817), now preserved at Aix-la-Chapelle, attached to an altar-cross. It is an oval intaglio in rock crystal, with a laureated portrait and the legend *† XPE ADIVVA HLOTHARIUM REG*, it is not an antique, but is of contemporary Byzantine-Rhenish work. Till the time of Louis VI (1108-1137) these seals were *plaqués*, but he introduced *pendants* seals about 1108, and counter-seals at the back were first used by Louis VII (1137-60). The grand series of round seals with an enthroned figure of the king begins with the Capet Henry I (1031-60). The king holds a sceptre in one hand and a flower in the other. Those of the queens are frequently of a pointed oval form, with a standing portrait figure holding a flower in each hand. In the 13th and 14th centuries the French royal seals were elaborate works of art, with a finely draped figure of the king seated under a rich canopy on a throne, decorated with lions' or eagles' heads, the king holds a sceptre in each hand. The queens' seals, of a round or pointed oval form, are also very beautiful, with a graceful figure standing between two shields under a rich canopy. After the 15th century there was a rapid decadence in the royal seals, and in the 17th and 18th centuries they were of the most tasteless style, far worse than those used in England at the same date.

English Royal Seals—This, which is on the whole the most beautiful of all royal series, begins with the seal of Edward the Confessor (see fig. 1).³ The great seal of William the Norman and his successors was not *plaqué*, like the earlier ones, but pendant, it has on one side an enthroned figure of a king copied from contemporary French seals, and on the reverse the king on horseback armed with spear and shield. These two ways of representing the sovereign have been used on all the royal seals of England down to the present day. By degrees greater elaboration of ornament was introduced into the throne and its canopy. In Edward III's time niches with minute statuettes of saints were added at the sides of the obverse. The climax of magnificence was reached in the reign of Henry V. On the obverse of his seal the king

FIG. 1—Seal of Edward the Confessor.

¹ See Wailly, *Éléments de Paléographie*, vol. II, pl. A, by various authors, *Traité de Num. et de Glyptique*, vol. I, Paris, 1834 (which contains also plates of English royal seals); Douet-d'Arno, *Coll. de Sceaux de l'Empire*, Paris, 1863-66; *Bulletin de la Société de Spéculative*, Paris, v, y, D'Anisy, *Recueil de Sceaux Normands*, Caen, 1835.

² The monks of Durham also used a gem with a head of Jupiter Serapis, round which was added the legend—*CAPIVVS SANCTI OSWALDI*.

³ The English kings before the Conquest signed usually with a cross only, but a few, such as Offa, Ethelwulf, and Ethelred, occasionally used seals, especially on documents containing grants to St. Denis and other French abbeys, on which they followed the French custom of affixing *plaqués* seals.

suits holding the orb and sceptre, the gorgeous canopy contains statuettes of the Virgin and two saints, and at each side are three rows of statuettes in minute canopied niches, each low two tiers high, about fifteen minute figures of saints and angels are introduced into the design. On the reverse is the king on horseback, bearing a sword and shield, the horse, going at full speed, is clothed with richly embroidered heraldic drapery, and on its head and on the king's is a lion crest. After Henry V the seals began to decrease in magnificence, and in the reign of Henry VII the new taste of the Renaissance began to supplant the pure Gothic of the earlier seals. In the time of Philip and Mary both sovereigns appear together, seated under canopies, or riding side by side.⁴ The great seal of the Commonwealth is a marvel of ugliness. On the obverse is a perspective view of the interior of the House of Commons, and on the reverse a map of Great Britain and Ireland. Cromwell's seal has an equestrian portrait of himself, and its reverse the arms of the Commonwealth between a lion and a dragon as supporters. Little is noticeable about the seals of succeeding sovereigns, that of Victoria is minutely cut, but is very poor as a work of art.

Other English Seals—Gilt bronze was the commonest material for large seals, but other metals were used, such as gold, silver, and lead, also jet and ivory, especially before the Norman Conquest. Rock crystal, carnelian, and sard were the favourites among the hard stones cut for matrices. Large seals were usually either round or of a pointed oval form (as in figs. 2 and 3), the small *secretæ* were sometimes square, triangular, or hexagonal, as well as round or oval.⁵ The most elaborate and beautiful of all were those of religious corporations, such as the chapter seals of monasteries.⁶ These are among the most exquisite works of art that the Middle Ages produced, especially during the 14th century, and exceed in delicacy of workmanship and elaboration of design the finest seals of all other classes, not excepting those of the sovereigns. Fig. 2 shows the common seal of Boxgrove priory (Sussex), the matrix of which is now in the British Museum. On one side is a figure of the Virgin enthroned, and on the reverse a representation of the west front of the priory church, with open tracery and niches containing minute statuettes. This elaborate matrix is made up of four distinct pieces of gilt bronze, and to form the perfect seal must have been a work requiring considerable skill and patience. The reverse was formed by two stamps used on two separate plaques of softened wax: one of these formed the background with the various statuettes, and the second was used to stamp the open tracery work of the front of the church, the latter when hard was fitted on to the

FIG. 2—Fourteenth-century seal of Boxgrove priory, reverse.

⁴ A variety of design is introduced on the reverse of one of Queen Elizabeth's seals: she is represented standing, holding the orb and sceptre, and wears a dress with enormous hoops. Her other seal has the usual equestrian portrait on the reverse.

⁵ As a rule, from the 12th to the 15th century, ecclesiastical seals and those of females were of the pointed oval form, most others being circular, there are, however, many exceptions to this rule.

⁶ A special English office for the blessing of seals is printed by Maskell, *Mon. Rituaire*, 1832, vol. II.

impression of the background, and thus a sort of miniature model of the church was made, with its statues and the inner planes of the façade seen through the open tracery work,—the effect being extremely rich and delicate. When the finished obverse and reverse had been fitted together, the legend was added on their edges by means of the fourth piece of the matrix,—a strip of bronze with letters cut

into it on both its edges; first one side and then the other of this strip was pressed against the rim of the wax seal, which thus received the impression of the complete legend all round its edge. The seal of Southwark priory, also of the 14th century, is even more elaborate, as both sides have open tracery separately applied, and thus the matrix consists of five distinct pieces. Many of the bishops' seals, though less complicated in design, are of equal beauty to those of the chapters. The common design has a standing figure under a richly decorated canopy. Fig. 3 shows a very beautiful example, the seal of Richard, bishop of Durham. The standing figure of the bishop in mass vestments is modelled with wonderful skill and shows extreme taste in the treatment of the drapery; the legend is

[sigillum] RICARDI. DEI. GRA. DVNHELMENSIS. EPI. A great variety of sacred subjects occur on ecclesiastical seals

FIG. 3.—Seal of Richard de Bury, late 14th century.

FIG. 4.—Seal of King's College, Cambridge.

in addition to single figures of patron saints; the most frequent were perhaps the Crucifixion, the Annunciation, the Coronation of the Virgin, and the Virgin enthroned in Heaven; small figures of kneeling worshippers were

often added. Fig. 4 shows one of the most magnificent of this class, with, in the centre, a figure of the Virgin in glory, between St Nicholas and Henry VI., each under a very rich canopy; at the sides are shields charged with England and France, and France (modern) alone, held by two monks.¹ This very beautiful work of art dates about the year 1443. In the 15th century the ecclesiastical seals began to fall off in richness and beauty, and after the Reformation were of little artistic value. Very handsome seals were used by lay corporations, especially the municipalities of towns. These last frequently have a careful representation of the town itself, with its circuit of walls or that of its chief castle or cathedral, and thus often afford valuable evidence as to the form of its de-

fences and principal buildings. Fig. 5 shows a fine example, 3 inches in diameter,—the corporate seal of Rochester, made in the 13th century; it has a minute representation of the keep of Rochester Castle, surrounded by an outer circuit wall and a moat. On one of the turrets of the gateway is a sentinel blowing a signal horn; legend,

FIG. 5.—Corporate seal of Rochester.

SIGILLVM . CIVITVM . ROFENSIS. The reverse has the same legend repeated round the scene of the Crucifixion of St Andrew. Other corporation seals are covered with small figures under elaborate canopy work, much like those of the ecclesiastical foundations.

Seals of hospitals are often designed in a similar way, with a representation of the hospital building very minutely treated. In the 15th century seals began to be designed in a rather pictorial style, which, though very graceful, is inferior to the earlier and more architectonic class. Very magnificent seals were used by state officials: those of the lord high admiral of England are especially fine, from the beautiful form of the ship on the obverse. Fig. 6 shows that of the earl of Huntingdon, who was lord high admiral in the reign of Henry VIII. In design it resembles

FIG. 6.—Seal of Lord High Admiral Huntingdon.

those of the admirals of the previous century. On the sails are embroidered the royal arms of England.

Among private seals those of powerful barons are often large and very beautifully cut. Fig. 7 shows a silver matrix, now in the British Museum, which is remarkable for the great beauty of its workmanship. Its legend is SIGILLVM . ROBERTI . FILII . WALTERI. On it an armed knight, of the time of Henry III., is riding over a dragon, whose tail ends in a scroll of very beautiful conventional foliage, modelled with the greatest spirit and delicacy.

¹ This class of seal is often a sort of miniature reproduction of some magnificent altar retable, as in fig. 4.

A common and graceful form of private seal in the 13th and 14th centuries has simply a shield with the owner's

FIG 7.—Seal of Robert Fitzwalter, c. 1270

arms on a diapered background, the whole enclosed within many-cusped tracery. Fig 8 shows an example of a fine Greco-Roman gem, —a carnelian engraved with a female head, full face. The 14th-century owner of this has added a metal setting with the words CAPT MARIE MAGDALENE, to give it a sacred meaning. The legends of private seals or *secreta* were often chosen in allusion to their use, common phrases are "clausa secreta tego," or "lecta lege, tecta tego." Many ingenious devices were practised to enable the same matrix to give two or more different varieties of impression. In some cases the border with the legend was so contrived as to slide up the handle, so that the seal could be made either with or without an inscription. Others had the border made to revolve on a swivel, so as to supply two different legends, and the magnificent monastic seals (as that shown in fig 2) were arranged so as to give a perfect seal without the use of the elaborate open tracery. In the 15th and 16th centuries merchants and handicraftsmen frequently employed devices connected with their trade—either some tool or badge or an arbitrary sign used as a trade-mark, or a rebus of the owner's name was used, such as a bolt and a tun (cask) for the name Bolton. The use of seals by the humbler classes was more common in England than abroad, even bondsmen sometimes had seals, both before and after the Norman Conquest. Seals of other countries mostly followed

FIG 8.—Antique gem used as a private seal

the same fashions as those of England, though of course varying in design and workmanship with each country. On the whole, the English seals were superior during their best period (the 14th century) to those of any other country, though matrices of great beauty were produced in both Germany and France. In Italy less care and skill were usually spent on seals, partly owing to the greater use of metal bullae for important charters.

Metal Bulla—These are necessarily not *plaque* but *pendant*, and are held usually by cords passed through a hole in the seal. Lead was the metal most commonly used, but some sovereigns had bullae struck in silver or gold, either as a mark of their own dignity or to confer special honour on the recipient of a charter. An extant letter from Petrarch to Charles IV thanks that emperor for a diploma of the rank of count, and especially for the honour shown to him by the attachment of gold bullae to the document. Lead bullae were also used by various ecclesiastical dignitaries, from patriarchs to bishops, but were rarely used by ecclesiastics of lower rank. In some cases, however, especially in Sicily and Byzantium, bullae were used by laymen of very moderate rank. A large number of fine papal bullae exist dating from the 7th century onwards.² Since the time of Pope Paschal II they have borne heads of St Peter and St Paul, previously they had such simple devices as crosses or stars, with the name of the pontiff. Another early series of bullae begins in the 8th century with the bullae of the patriarchs of Byzantium. Those of the doges of Venice exist in large numbers, bearing figures of St Mark and the reigning doge kneeling before him. Existing bullae of Charlemagne have a rude profile portrait crowned with a diadem, and on the reverse the monogram of KAROLVS arranged in the form of a cross.

SEAMANSHIP

SEAMANSHIP is the art of sailing, manœuvring, and preserving a ship or a boat in all positions and under all reasonable circumstances, and thus involves a sound practical knowledge of all the forces by which she may be actuated and the means at command to assist or counteract them; it is a branch of applied mechanics acquired by experience and study. The former can only be obtained thoroughly in many years spent at sea, in personal connexion with the work of the ship and her boats, that such training should commence at an early age is very desirable, if not even imperative. The practical knowledge so gained should be supplemented and improved by reading, conversation, and discussion, as the casualties which befall ships are so varied that a man may pass forty years in seagoing vessels without experiencing one-half of those which might occur. Many of the old maxims are still applicable to every class of vessel and must always remain so.

The terms "ship" and "vessel" are here intended to embrace all classes, though "ship" is generally applied to the larger without reference to form or description unless such is specified. Though the use of sails has been greatly superseded by the introduction of steam-power both in the navies of all nations and in the mercantile marine, it is still generally admitted that seamanship is best acquired

on board a vessel which is dependent upon her sails. The construction and equipment of sailing ships had reached a high point of perfection at the time steam came into general use. The power derived from the steam-engine does not change any of the former conditions, but simply adds another element, confined to propulsion directly ahead or astern (except with reversible wheels or twin screws), which when combined with sails renders a ship much more manageable and safe,—that is to say, assuming all the forces at command to be properly applied. Hence it is very desirable that all ocean-going steam vessels should have sufficient sail-power to turn them round (wear) or to enable them to sail with the wind abeam without steam, especially when fitted with single screws or with paddle wheels which do not work separately. Twin screws, of course, give a double chance as far as the engine is concerned, but even with that advantage the loss of the rudder would leave the ship in a helpless condition if she had not efficient head and after sails to balance her on the desired course.

At present the excessive desire to make quick passages has greatly augmented the danger unavoidably attending a sea voyage, the risk as well as the violence of a collision

¹ The term "bull" for a paper charter comes from its lead bulla.

² See Ficoroni, *Promiss. Antichit.*, Rome, 1745.

at high speed in thick weather being thereby much increased. Through the want of masts and sails there is a probability of total loss by drifting helplessly on a lee shore during a gale, or by foundering "in the trough of the sea." In spite of her monstrous size (22,000 tons), the "Great Eastern," in 1863 or 1864, with her six comparatively small masts and weak sails was, after the loss of her rudder, very roughly used by the waves striking her full on the side. She was in the position which is expressed by the common sea-phrase "wallowing in the trough of the sea," from which her crew had no power to extricate her. A smaller vessel deeply laden in such a position would most probably have foundered, leaving no one to tell the tale. Too much stress is laid upon the retardation caused by masts and rigging when steaming head to wind, it is the pitching and plunging motion of the ship into a succession of waves that principally retards her speed. If the waves are approaching at the rate of 10 miles an hour and the ship is steaming against them at a similar rate, they will strike the bows with a force equal to 20 miles an hour. When a ship is steaming through comparatively smooth water (sheltered by land) against a gale of wind, her speed is but little reduced by the force of the wind alone, when other circumstances admit of her working full power. Storm-sails only require short masts, but these and the canvas they support should be strong, which is not the case in the merchant service generally.

Duties of a seaman. Every seaman is expected to be thoroughly acquainted with the rigging of the vessel in which he serves, and when in charge he should frequently examine every part, to see that it is efficiently performing the duty assigned to it, being neither too taut nor too slack, nor suffering from chafing, wet, or other injury. He should be capable of repairing or replacing any part with his own hand if necessary and of teaching others how to do so. He need not necessarily be a navigator, though a good navigator must be a seaman, nor is it necessary that a seaman should be a shipbuilder, a mast-maker, a rope-maker, or a sail-maker, but he should possess a general knowledge of each art, especially the last, every able seaman should be able to sew a seam and assist the ship's sail-maker in repairing sails. It is greatly to be regretted that various circumstances have brought about such a change in the system of rigging ships, in both the British navy and the mercantile marine, that those who sail in them seldom see it done. Young officers were in former times frequently entrusted with the charge of day watches, during which they would give the necessary orders for making, shortening, or trimming sails, perhaps even tacking and wearing. That practice gave confidence and quickened the desire to learn more, it was more frequently done in small than in large ships. The general adoption of the steam-engines in ships has not only diminished the value of sail-power but of seamanship also, and has produced such a change in the rig that instead of masts and yards we find only two or three poles. In the British navy so many new sciences have been introduced that seamanship takes but a low place among them at the examination of a midshipman, who has had but little boat duty and probably found the discussion of seamanship in his mess-place contrary to rule. The rapidity with which all sail and mast drill is executed, combined with the perfection of the "station bill," renders it worse than useless as a means of teaching, as it gives a false confidence which fails in the hour of necessity, when the accustomed routine is thrown out by a sail actually splitting to pieces or a spar snapping. The fact that the same men perpetually do the same thing must tend greatly to render each evolution quick so long as every one is in his accustomed place, but sickness or the absence of a party from duty will disorganize the ship for

some time, as the general usefulness of the men has been cramped. Sail drill in harbour is open to grave objections, unless in a tide-way, the ship must be invariably head to wind, for reefing and furling the yards are laid square, consequently flat aback, both earnings are hauled out at once, and as it is only for exercise they are only half secured. Even when reefing top-sails at sea either for exercise or of necessity in company with other ships, the yards are laid square to enable the men to get readily on the weather-side, therefore, if on a wind, the sail must remain aback or the ship must be kept away till the wind is on the beam in order to shake the sail.

The foundation of all teaching of seamanship must be a Knots, knowledge of the knots, bends, and splices, and their use in the various parts of the rigging and equipment of a ship.¹ Some knots, bends, and hitches are intended to afford security as long as desired, and then to be easily disengaged. Other knots, splices, and seizings are of a more permanent character, generally continuing as long as the rope will last.

¹ A person wishing to make sailor's knots need not be deterred by the want of material, as nearly all that are here represented were made, for the purpose of sketching them, with the lashing of a packing case.

² For an explanation of this and other technical terms, see the glossary on p. 603 below.

This hitch by itself round a large object would not hold and round a small one would jam excessively. See KNOT, 1, c, fig. 13.

Two Half-Hitches (fig. 9)—The half-hitch repeated, this is commonly used, and is capable of resisting to the full strength of the rope. A stop from *a* to the standing part will prevent it jamming.

Clove Hitch—Pass the end *a* round a spar or rope and cross it over *b*, its standing part, then sit round again and put the end *a* through the second bight. This hitch is generally used at right angles to the object and is improved by adding a half-hitch with the end *a* round *b*. When pulled in a line with the spar it becomes simply two half-hitches. An illustration is given in KNOT, 1, c, fig. 15.

Double Blackwell Hitch (fig. 9)—Pass the end *a* twice round the hook and under the standing part *a* at the last cross. The ordinary Blackwell hitch only extends to the first cross at *b*, and is quickly formed by passing the hook of a jagger through the bight of *a* rope so that the end may be jammed between it and the standing part, as from *a* to *b*. Used for setting up top gallant rigging and similar light work when a ship is of little consequence.

Cat's paw (fig. 7)—Twist up two parts of a lanyard in opposite directions and hook the ends in the eyes, *s*. A piece of wood should be placed between the parts at *a*. A large lanyard should be clove-hitched round a large toggle and a strap passed round it below the toggle.

Martins-Sail Hitch (fig. 9)—Lay the end *a* over *c*, fold the loop over on the standing part *b*, then pass the mauling-spike through, over both parts *b* of the bight and under the part *b*. Used for tightening each turn of a seizing.

Fig 9—Fisherman's Bend

Fig 10—Studding-Sail Haym Bend

Fig 11—Timber Hitch

Fisherman's Bend (fig. 9)—Take two turns round a spar, then a half-hitch round the standing part and between the spar and the turns, lay a half-hitch round the standing part.

Studding-Sail Haym Bend (fig. 10)—Similar to the above, except that the end is tucked under the first round turn, this is more snug. A *magnus hitch* has two round turns and one on the other side of the standing part with the end through the bight.

Timber Hitch (fig. 11)—Take the end *a* of a rope round a spar, then lay the standing part *b*, then several turns round *a* of its own part *s*, against the lay of the rope.

Fig 12—Snaking

Fig 13—Carnek Bend

Fig 14—Inside Clinch

Fig 15—Midshipman's Hitch

Snaking (fig. 12)—This consists of turns and crossings, the latter taken diagonally with a mauling hitch each time. Used to keep woodings and seizings in place. The same term is applied to luses between the backstays to keep a broken part from falling.

Carnek Bend (fig. 13)—Lay the end of one hawser over its own part to form a bight as *c*, *b*, pass the end of another hawser up through that bight near *b*, going out over the first end at *c*, crossing under the first long part and over its end at *d*, then under both long parts, forming the loops, and above the first short part at *b*, terminating the end in the opposite direction vertically and horizontally to the other end. The ends should be securely stopped to their respective standing parts, and also a stop on the becket or extreme end to prevent it catching a rope or clew, in that form this is the best quick means of uniting two large hawsers, since they cannot jam. When large hawsers have to work through small pipes, good security may be obtained either by passing ten or twelve taut racking turns with a suitable strand and securing each end to a standing part of the hawser, or by taking half as many round turns taut, crossing the ends between the hawsers over the seizing and reef-knotting the ends. This should be repeated in three places and the extreme ends well stopped. Connecting hawsers by bowline knots is very objectionable, as the bend is large and the knots jam.

Sheet Bend—Pass the end of one rope through the bight of another, round both parts of the other, and under its own standing part. Used for bending small sheets to the clews of sails, which present bights ready for the hitch. An ordinary reef is composed of a series of sheet bends. See KNOT, 1, c, fig. 30. A *cowser's knot* is made like a sheet bend.

Single Wall Knot—Unlay the end of a rope, and with the stand *a* from

bight, take the next strand *b* round the end of *a*, take the last strand *c* round the end of *b* and through the bight made by *a*, haul the ends taut. A *double wall* against the lay (not crowned) makes a good stopper. A *double knot* is similar, but made with the lay. Fig. 21 of at KNOT, 1, c, represents a single wall knot.

Double Wall Crowned—Form a single wall, and lay one of the ends, *a*, over the knot, lay *b* over *a*, and *c* pass it *b* and through the bight of *a*, haul the ends taut. See KNOT, 1, c, fig. 22.

Double Wall Crowned—Form a single wall crowned, then lay the ends follow their own parts round until all the parts appear double, pull the ends down through the knot. A very excellent and generally used abseiling stopper. See KNOT, 1, c, fig. 23.

Matthew Walker—Unlay the end of a rope. Take the first strand round the rope and through its own bight, the second strand round the rope, through the bight of the first, and through its own bight, the third strand through all three bights. Haul all taut. An easily made and useful knot. Illustrations are given in KNOT, 1, c, figs. 24 and 25.

Inside Clinch (fig. 14)—The end *a* is bent close round the standing part *b* till it forms a circle and a half, when it is securely seized at *a*, *b*, and *c*, this making a running eye, when taut round anything it jams the end. It is used for securing hemp cables to anchors, the standing parts of sprawl sheets, and for many other purposes. If the eye were formed outside the bight an *outside clinch* would be made, depending entirely on the seizings, but more ready for slipping. **Midshipman's Hitch** (fig. 15)—Take two round turns inside the bight, the same as a half-hitch repeated, stop up the end, or let another half-hitch be taken or held by hand. Used for hooking a tackle for a temporary purpose.

Fig 16—Turk's Head

Fig 17—Spanish Windlass

Fig 18—Slings

Turk's Head (fig. 16)—With fine line (very dry) make a clove hitch round the rope, cross the bights twice, passing *a* end the crossway (up or down) each time, then keeping the whole spread flat, let each end follow its own part round and round till it is too tight to remove any more. Use as an ornament variously on side-ropes and foot-ropes of jubbons. It may also be made with three ends, two formed by the same piece of line secured through the rope and one single piece. Form with three, a diamond knot, then each end crossed over its neighbor follows its own part as above.

Spanish Windlass (fig. 17)—An iron bar and two marling spikes are taken, two parts *a* and *b* are twisted lying at right angles (fig. 17), passed round the bar, and round till sufficiently taut. In leaving *a* and *b* together to form an eye two round turns are taken with a stand and the two ends have up.

Slings (fig. 18)—This is simply the bight of a rope turned up over its own part, it is frequently made of chain, when a shackle (bow up) takes the place of the bight, *a* and another stop connecting the two ends with the part which goes round the mast-head. Used to sling lozen yards. For boats' yards it should be a grummet with a thumb nail set in *y*. As the bendancy of all yards is to cut forward with the weight of the sail, the part marked by an arrow should be the fore side, easily illustrated by a round rule and a piece of twine.

Fig 19—Sprit Sheet Sheet Knot

Fig 20—Turning in a Dead-Eye Cutter

Fig 21—Turning in a Dead Eye end up

Sprit Sheet Sheet Knot (fig. 19)—This knot consists of a double wall and double crown made by the two ends, consequently with six strands—with the ends turned down. Used formally in the clews of sails, now as an excellent stopper, a lashing or shackle being placed at *a*, and a lanyard round the head at *b*.

Turning in a Dead-Eye Cutter Stay Fashion (fig. 20)—A bend is made in the stay or shroud round its own part and have together with a bar and stand, two or three seizings diminishing in size (one round and one of either round or flat) up have on taut and snug, the end being at the side of the follow part. The dead-eye is put in and the eye driven down with a commodore.

Turning in a Dead-Eye end up (fig. 21)—The shroud is measured round the dead-eye and marked where a shroud-roping is heavy on, the dead-eye is then forced into its place, on it may be put in first. The end beyond *a* is taken up taut and secured with a round seizing, higher still the end is secured by another seizing. As it is important that the eye should always be kept in the rope as much as possible, these eyes should be formed conformably either right-handed or left-handed. It is easily seen how a rope would naturally knick by putting a little extra twist into it. A shroud whose dead-eye is turned in end up will bear a great strain, but is more dependent on the seizings, the under turns of the throat are the first to break and the others the first to slip. With the enter-stay fashion the standing part of the shroud gives way under the strain of the eye. A rope will afford the greatest resistance to strain when secured round large thimbles with a straight end and a sufficient number of flat or macking seizings. To splice shrouds round dead eyes is objectionable on account of opening the stunsils and admitting water, thus hastening decay. In small vessels, especially yachts, it is inadmissible on the score of neatness, in

that case a round seizing is placed between the dead-eye and the splice. The dead eye should be in diameter 1½ times the circumference of a hemp shroud and three times that of a rope. The circumference of the shroud should be of the same size as wire, thus, hemp shroud 12 inches, wire 6 inches, dead-eye 18, layard 6 inches.

Short Splice—The most common description of splice is when a rope is lengthened by another of the same size, or nearly so. Fig 22 represents a splice of this kind. The strands have been unlaid, marked, and passed through with the assistance of a marling-spike, over one strand and under the other, twice each way. The ends are then cut off close. To make a splice nearer the stands should have been halved before turning them in a second time, the upper half of each strand only being turned in, then all are cut smooth.

Splice—Unlay the strands and place them upon the same rope *eye*. As such a distance as to give the size of the eye, enter the centre strand (unlaid) under a strand of the rope (as above) and the other two in a similar manner on their respective sides of the first, taper each end and pass them through again. If neatness is desired, reduce the ends and pass them through once more, cut off smooth and save the part disturbed tightly with suitable hand line. Uses too numerous to mention. *Cat Splice*—Made in a similar manner to an eye-splice, but of two pieces of rope, therefore with two splices. Used for mast-head pendant, pig yoke, breast back-eyes, and even odd shrouds, to keep the eyes of the rigging level by one part. It is not so strong as two separate eyes. *Horse-Shoe Splice*—Made similar to the above, but one part twice much stronger than the other, or another piece of rope is spliced across an eye, forming a horse-shoe with two long legs. Used for dolphin on dories, jacksays (one on each side), and cutter's tummy pendant. *Long Splice*—The strands must be unlaid about three times as much as for a short splice and marled,—one being taken to make a lay or shingle of each. Unlay one of the strands still further and follow up the vacant space with the corresponding strand of the other part, fitting it firmly into the rope till only a few inches remain. Treat the other side in a similar manner. There will then appear two long stands in the centre and a long and a short one on each side. The splice is neatly divided into three distinct parts, at each the strands are divided and the corresponding halves knotted (as shown on the top of fig 24) and turned in twice. The half strand may, if desired, be still further reduced before the halves are turned up for the second time. This and all other splices should be well stretched and tanned in due shape before the ends are cut off. The long splice alone is adapted to running ropes.

Shroud Knot (fig 24)—Pass a stop at each distance from each end of the broken shroud at about six times the length of a strand, when it is unlaid, to form a single wall knot on each side after the parts have been marled; it will then appear as represented in the figure, the strands having been well tapered and have tail separated. The part *a* provides the knot on the opposite side and the ends *b*, *c*, the part *c* provides the knot on the same side.

After the knot has been well stretched the ends are tapered, laid smoothly between the strands of the shroud, and finally saved over. This knot is used when one or two French Shrouds are used. Mar the parts with a similar amount of eye as before, stop one set of stands turn up on the shroud (to keep the parts together), and turn the ends back on their own part, forming a knot between the strands of the shroud. The strands round the sail bugits and shroud, haul the knot tight and stretch the whole, then leave down the bugits close. It will look like the ordinary shroud knot. It is very liable to break if the ends by which the wall knot is made after being here were passed through the bugits, it would make the knot stronger. The ends would be tapered and served.

Flemish Eye (fig 24)—Secure a spar or toggle twice the circumference of the rope intended to be rove through the eye, unlay the rope which is to form the eye about three times its circumference, at which part place a strong whipping. Point the rope vertically under the eye, and haul it taut up by the eye if it is four stranded rope, otherwise by a few yards. While doing so arrange six or twelve pieces of spun-yarn at equal distances on the wood and exactly half the number of yards that have been unlayed. If it is a small eye select two or three yards from each side near the centre, cross them over the top at *a*, and half knot them tightly. So continue until the eye is completed and drawn down tightly on the opposite side to that from which they came, being the equally interrupted. By the pieces of spun-yarn which were placed under the eye tightly round various parts to keep the eye in shape when taken out of the water. The eyes are replaced by turns of mainline hove on as taut as possible, the hitches forming a row like the eye. Hence on a good seizing of spun-yarn close below the eye and another between six and twelve inches below the first, it may then be parcelled and saved, the eye is saved over twice, and well tapered each time. As large ropes are composed of so many yards, a greater number must be knotted over the toggle each time, 4 inches rope has 132 yards, which would require 22 knottings of six each time, a 10-inch rope has 881 yards, therefore, if ton are taken from each side every time, about twice that number of knottings will be required. It is almost impossible if the yards are hitched, the others being merely passed over. The chief use of these eyes has been to form the collars of stays, the whole stay in each case having to be rove in the eye. It is very convenient device. It is almost superseded for that purpose by a big spread in the stay and lashings eye shafts the eye mast, for which it is commonly used at present. This eye is not always called by the same name, but the weight of evidence is in favour of calling it a Flemish eye. *Zepemander's Eye*, which also has a decorative name, is formed by taking out of a rope one strand longer by 6 inches or a foot than the required eye, then placing the ends of the two strands a similar distance below the disturbance of the one strand that is at the end of the eye; the single strand is laid back through the vacant space it left till it arrives at the neck of the eye, with a similar length of space and to the other two strands. They are all secured together, secured, layard, marled, and served. The principle of such eyes is justness.

Howe's Eye—Formed by turns of coarse spun-yarn hove taut round the stay, over parceling at the eye, and then over the collar. The collar and the assistance is given by a padding of short yards distributed equally round the

rope, which, after being firmly secured, especially at what is to be the under part, are turned back over the first layer and seized down again, thus making a shoulder. The shoulder is sometimes it is formed with parceling only. In neither case it is finished by marling, followed by saving or grafting. The use is to prevent the Flemish eye in the end of the stay from slipping up any further.

Rolling Hitch (fig 25)—Two round turns as taken round a spar or large rope in the direction in which it is to be hauled and one in the opposite direction. The size of the seizing line is about one-eighth (nominal) that of the ropes to be secured, but varies according to the number of turns to be taken. The eye is spliced in the line and the end is run through it, embracing both parts. If either part is to be spun-yarn, cut the eye as close as possible, pass the line round as many times (with much slack) as it is intended to have under-turns, and pass the end back through them all and through the eye. Secure the eye from rendering round by the ends of its splice, leave the turns on with a marling spike (see fig 5), perhaps seven or nine, haul the end through taut, and commence again the riding turns in the hollows of the first. If the end is not taken back through the eye but pushed up between the two turns (as sometimes happens) the eye will be turned the opposite way in order to follow the direction of the under turns, which are always one more in number than the rides. When the rides are complete, the end is forced between the last two under turns, and the eye is taken, the end being put up where it went down, when a wall knot is made with the strands and the ends cut close, or the end may be taken once round the shroud. *Throat Seizing*—Two ropes of equal turns are laid on each other parallel and secure a seizing similar to that shown in fig. 21,—that is, with upper and riding, but no cross turns. As the two parts of rope are intended to turn up at right angles to the direction in which they were secured, the *seizing* should be of stoutest line and short, not exceeding seven lower and six riding turns. The end is better secured with a turn round the standing part. Used for turning in dead-eyes and variously. *Flat Seizing*—formed similarly to the above, but it has neither riding nor cross turns.

Tracking-Seizing (fig 27)—A turning eye having been spliced round one part of a rope, the line is passed mainly round the other part, crossed back round the first part, and so on for ten to twenty turns according to the expected strain, every turn being hove as tight as possible, after which round turns are passed to fill the spaces at the neck of each rope, by taking the end *c* over the other and putting into the hollow at *b*, returning at *d*, and going to *e*. When it reaches *e*, a turn may be taken round that rope only, the end rove under it, and a half-hitch taken, which will form a knot between the end and the knot at the end and will close the shrouds as were (which is half the size of hemp) and the end turned up round a dead-eye of small wire-seizings are preferable. It appears very undesirable to have wire rigging, but the plates of wire are so acting up, as in case of accident the ends of that the mast going over the side, a shot or collision breaking the ironwork—the scannens are powerless.

Diamond Knot (figs 28, 29)—The rope must be marled as far as the centre if the knot is required there, and the strands handled with great care to keep the lay in them. These bugits are turned up as in fig 28, and the end of *a* is taken over *a* and up the bugit *c*. The end of *b* is taken over *c* and up through *a*. The end *c* is taken over *a* and through *b*. When hauled taut and the strands are laid in again it will appear as in fig 29. Any number of knots may be made on the same rope, the ropes used may be of different foot ropes, on the yibboom, and similar places, where it was necessary to give a good look for the heads or feet. The heads are now generally used. *Double Diamond*—Made by the ends of a single strand following the same order as the knot is repeated. Used at the upper end of a side rope as an ornamental stopper.

Strapping Blocks—There are various modes of securing blocks to ropes, the most simple is to splice an eye at the end of the rope a little longer than the block, and then to pass the rope through the eye of the block. The eye of the rope is kept in place, such is the case with yib-booms. As a general rule, the parts of a stop combined should possess greater strength than the rope to which they are applied. The steel of an ordinary block is about three times the circumference of the rope which is to rove through it, as in such block *a* is 3-inch rope, but small rope requiring larger blocks in proportion to the size of the eye; the single strand block for a 1-inch rope. When the work to be done is of an important nature, the blocks are much larger, and the blocks are more than twice the size of the line. Leading-blocks and sheaves in blocks are generally smaller than the blocks through which the ropes pass farther

Fig 26—Round Seizing

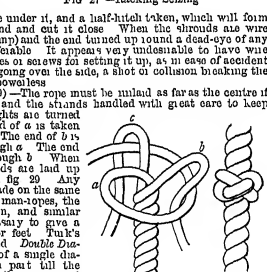

Fig 27—Tracking Seizing

Figs 28, 29—Diamond Knot

Fig. 30 Grummet-Stop.

away, which appears to be a mistake, as more power is lost by friction. A clamp block may be double the nominal size of the rope. A single stop may be made by joining the end of a rope of sufficient length to go round the block and thimble by a common short splice, which rests on the crown of the block (the opposite end to the thimble) and is stretched into place by a jigger, a strand is then passed from the thimble to the stop, and the rope is then thimble and how taut by a Spanish windlass to clamp the parts together ready for the reception of a small round seizing. The clamping or pinching into shape is sometimes done by machinery operated by a screw in a portable derrick. The stop may be made the required length by a long splice, but it would not possess any advantage.

Grained Stop (fig. 30).—Made by unlaying a piece of rope of the desired size about a foot more than ten times the length required for the stop. Place the centre of the rope round the block and thimble, and with chalk where the parts cross, take one third of the rope, bring the two chalk marks together, and cross the strand in the lay on both sides, continuing round and round all the two ends until the third turn, they are then halved, and the upper halves half-rolled and put under and under the next strands, exactly as one part of a long splice. A piece of worn or well-stretched rope will better retain its shape, upon which success entirely depends. The object is neatness, and if three or multiples of three stops are to be made it is economical.

Double Stop (fig. 31).—Made with one piece of rope, the splice being brought as usual to the crown of the block, the big ends fitting into spaces some inches apart, converging to the upper part, above which the thimble receives the big ends *a*, *b*, and the four parts of the stop are secured side by side round seizing doubly crossed. If the block be not then on the right side (the well horizontal or vertical) a union thimble is used with another stop, which produces the desired effect, thus the fore and main bridle blocks need very large stops, as they are, required (for appearance) to be horizontally, a single stop would the yard vertically has a union thimble between it and the double stop, and the main bridle stop is a double stop to the shell than the single stop and admits of smaller rope being used. The same principle applies to the block-stops, the lashing is similar. Metal blocks are also used in fixed points, durability is their chief recommendation. Great care must be taken to be sure that the rope does not close the ropes which pass by them as well as those which receive them.

Sealings Stop.—Twine, rope, yarn, or rope is warped round two or more ropes placed at the desired distance apart, till it assumes the requisite size and strength, the two ends are then knotted to the ropes for any purpose. The sealings are applied in several places to bind the pulleys together before the rope is warped. The sealings are then applied to the rope, after which it is made up with suitable material. A large stop should be warped round four or six ropes in the fore to give it the shape in which it is to be used. The description of stop is much stronger and more supple than rope of similar size. Twine stops (covered with duck) are used for blocks and in similar places requiring neatness. Rope-yarn and spun-yarn stops are used for attaching the blocks to the ropes for any purpose. To bring a strand on to the crown of the centre of the stop is passed under the rope and each part is crossed three or four times round the rope, a spun-yarn stop above the centre will prevent slippage and is very necessary with wire rope. As an instance of a large sealings block stop being used, when the "Melville" was hove down at Chusan (China), the main-gin-block was double stopped with sealings containing 28 parts of 8-inch rope. The weight was 112 lbs. in the 20-inch cable in a block of 280 tons, which more than four pairs of a 20-inch cable. The estimated strain it bore was 80 tons.

Stoppers for ordinary running ropes are made by splicing a piece of rope to a loaf or a block and thimble, unlaying 3 or 4 feet, tapering it by cutting away some of the yarn, and making it down square with a good whipping all on the end. It is used by taking a half-catch round the rope which is to be lashed upon, dogging the end up in the lay, and holding it by hand. The rope can come through it when hauled, but cannot go back.

Whipping and Pointing.—The end of every working rope should at least be whipped to prevent it fraying out, in stages of war and yachts they are invariably pointed. Whipping is done by placing the end of a piece of twine or knitted stuff on a rope about an inch from the end, taking three or four turns (and five if working towards the end), the twine is then laid on the rope again lengthways, and on to the live, leaving a short length of twine, and then four are repeatedly passed under the rope over the first end and over the right, till there are all six to ten turns, then haul the right end through between the turns and out to the side. To point a rope is to give it a good whipping a few inches from the end according to size, open out the end entirely, select all the outer yarns and twist them into knittles either singly or two or three together, scrape down, and tape the knittles to the rope. Then every alternate knittle knittles and secure the remainder down by a turn of twine or a smooth yarn lashed close up, which acts as the wick in weaving. The knittles are then reversed and another set of knittles are woven, and the rope is then enough to look well. At the last turn the ends of the knittles which are laid back are laid forward over and under the web and hauled through lightly, making it present a circle of and a slight level with which the core is cut off smoothly. However and large ropes have a knot formed in their ends during the process of pointing. A piece of 1 or 1½-inch rope about 1½ to 2 feet long is spliced into the core of the rope, and the rope is then made up in the usual manner (all strands) are taken at a time and twisted up, open the ends of the becket only sufficient to marry them close down, in turn the twisted yarns between the strands (as splicing) three turns, and are taken off separately. Both ends are treated alike, when the pointing is completed a loop a few inches in length will protrude from the end of the rope, which is very useful for reoving it. A hauling line or reoving line is made by twisting the rope into a hard lead. **Gravelling** is very similar to pointing and frequently done the whole length of a rope, as a side rope. Pieces of white hair more than double the length of the rope, sufficient to cover the rope, are made up in the hair called flocks; the centre of each is made flat by twine and the weaving process continued as in pointing. Block-stops are sometimes so covered, but, as it causes decay, a small wire is used instead.

Sheep-Shank (fig. 32).—Formed by making a long hitch in a top-gallant back-

stay, or any rope which it is desirable to shorten, and taking a half-hitch near each bend, as at *a*, *b*. Rope-yarn stops at *b*, *d* are desirable to keep it in place

till the strain is brought on it. Wire rope cannot be so treated, and it is in-
convenient to hemp rope that is large and stiff.

Knitting Yarns (fig. 33).—This operation becomes necessary when a com-
paratively short piece of
junk is to be made into
each yarn is divided into
small, which is called
twice laid. The end of
each yarn is divided
rubbed smooth, and mar-
ked (as for splicing)

Two of the divided yarns
as *c*, *e*, and *d*, are passed in
opposite directions round all the other parts and knitted.
The figure is drawn open, but the knot *A* and *B* should
be passed close together, the knot hauled taut, and the ends cut off
flat Shaps (fig. 34).—Made of 4-inch rope, each yarn being 36 feet in length,
with an eye placed in one end, through which the other is rove before being
placed over one end of the cask, the rope is then
hauled round the opposite side of the cask and two
half inches made with the end, forming another run-
ning eye, both of which are taken down taut as the
tackle requires the weight. Slings for smaller casks
requiring close should be of the description, though
of smaller rope, as the cask cannot possibly slip out.
Bale slings are made by splitting the ends of about 3
fathoms of 8-inch rope together, which then looks
like a long stop, similar to the double stop (repre-
sented in fig. 35), the higher 1 being placed under the
cask and 2 over one of the legs *c*, *d*, and other and attached to
the whip or back.

The marks on the lead-line are leather at 2, 3, and 10 fathoms, white at 5
and 15, red at 7 and 17, and blue at 13. The length of the line is not usually
included. The deep-sea line commences with 2 knots at 20, another knot being
added for every 10 fathoms, and a single knot at each intermediate 5. Log-
lines should have ample strain (the distance between the log staves the
mark). The distance of 47 feet and a 28-second glass were adopted to assimilate
the scale to the shore fathoms, which was about 15 feet to half a
minute would be more correct and more convenient.

Since spaces will not allow of a full description of masting and Mast-
ing, only a few of the more important points will be noticed.
The masts must be stepped before they are rigged, accordingly
it will first describe the manner in which they are put on board
in cases where the assistance of shears or bulk or jerry is not
available, at an out port a seaman is still left to his own resources,
just as he was in former times. Fixing the masts in a large frigate,
such as that shown in fig. 35 below, is a serious consideration, as
the mainmast weighs about twenty tons.

Two suitable spars must be procured about three-fourths the
length of the main mast and about two-thirds its diameter, the
gaster the housing the higher the better. The spars are fowed along
side or under the stem with the thicker ends forward, and pre-
buckled over the side or hoisted in through the stern-pulley by means
of a derrick, whichever is most convenient. The smaller ends are
rested upon a spar across the gunnel or the heel of the poop,
crossed, and lashed with strong well-stretched rope (about 4½ or 5
inches) passed figure-of-eight fashion, commencing at the centre,
returning with riding turns as a rule, and then being secured to the
turns at the extreme ends should not be so taut as the others.
Care must be taken to place the securing equivalent from each heel
after they have been trimmed to fit flat upon shoes of strong oak
planing, they will remain within them full spread by about 2
feet each side till after the head seizing has been secured. Lash
a threefold purchase-block to the horns above the lashings, to haul
down clear under the coes, so as to correspond with a twofold
block to be lashed to the mast. If such blocks cannot be procured
two top-blocks may be substituted for the upper block and one on
the mast, reserving the fourth top-block as a lead secured to one
of the shea legs or near it. Two purchases may be used at the
same time with advantage, one block hanging on the fore, the
other on the after side. A grid-line is also placed on the highest
part of the horns as far as the mast, and the purchase is used for
the purpose of hoisting up a man should anything require atten-
tion. The lashing at the shear-head must be well protected with
old canvas and all the decks must be shored up in the vicinity of
the places where the shea-legs stand for each mast. The legs
must be lashed together at the desired spread and heel tackles led
forward and aft from each. To form the low head-gyres the central
part of the horns are shored above the mast, and are provided
as far as is convenient in four directions and set up by tackles.
When all is ready and the purchase rove, the lower block should
be secured forward as high as can be, and, while the purchase is
being hove over, a light derrick or small shears lifting the shear-
head will greatly assist, of course the after heel tackles must be
well secured. After the shears are erect and the heels cleared and
the purchase is hove over, the shea-legs are scuffed about by the heel tackles
and gyres to any desired position, the hole for the mizen-mast
is first plumbed.

The mizen-mast should be brought alongside with its head aft
and a sufficiently strong salvageage stop lashed on the fore side if it

is. Top blocks in large ships are 26 inches, carrying 4½ inch rope, the block-
ing strain of which is 26 tons, by taking the standing part down to the mast
there are three parts lifting, equal to 78 tons, sufficient to haul down the mast.
Twenty-two inch blocks and an 8-inch rope would break at 54 tons. Large
ships have one 26-inch and an 8-inch double block for yards, which would
raise an 8-inch rope. The size of a block must be in proportion to the
size of the rope it is intended to haul, and of a chain cable the diameter of the rope.

is to be lifted by one purchase, and one on each side if two are used, and as high up as the shears will allow, the limit being from heel to lashing 6 or 8 feet less than from the lower side of the purchase-

block to the deck. Old spars having been hung over the side for the mast to rub against and the purchase fall taken round the capstan, the mast is hove up till the heel comes above the gunnel, then two single blocks with long-tailed strops are secured round it with the gird lines of about 4 inches and twice the length of the mast ready rope. The trundle-tees

are now usually bolted on in the mast-house. The gird-line from the shear-head must be bent to the head of the mast at a suitable height to act as a topping-lift. As the mast is hove up by the

captain a stout rope from outboard must be timber-hitched round the heel so as to ease it in as it clears the gunnel, and to haul it towards the partners (mast-hole), when it has been lowered to within 2 feet of the step, a slow rope is passed three times round the mast and a "cat's paw" is made on each side, through the eyes of which a capstan bar is passed ready to have either way as

FIG. 54.—The spars and rigging of a frigate: 1, the bowsprit, 2, bobstays, three pairs, 3, sprit sail-guffs, projecting on each side of the bowsprit,—the ropes at the cadentias are jib guys, 4, jibboom, 5, maintriangle stay, and below it the flying jib mast-angles, 6, back-ropes, 7, flying-boom, 8, fore-royal stay, through jib stay, and halysia, 9, fore-top-gallant-stay, jib stay, and halysia, 10, two fore-top-mast-stays and fore-top-mast-stay-sail halysia, 11, the fore-top-boomies, stopped into the top and two fore stays, 12, two fore-reeches, 13, fore-top-mast, 14, fore-royal mast, yard, and lift, 15, top-gallant-mast, yard, and lift; 16, fore-top-mast, top-sail-yard, lift, and reef tackle, 17, fore-top, fore-lift, and top-sail-sheet, 18, fore-mast and fore-reeches, nine pairs, 19, fore shears, 20, fore-gaff, 21, fore-top-mast back-stays and top sail-tees, 22, royal and top-gallant back-stays, 23, fore-royal-boomies and main-top-gallant-stay, 24, fore-top-gallant-boomies and main-top-gallant-stay, 25, standing pairs or fore-top-sail-boomies and main top mast stays, 26, hauling parts of fore top-sail-boomies and main top boomies, 27, four parts of fore boomies, 28, main-top-boomies, 29, main-top-boomies, 30, main-trick, 31, main-royal truss, 32, mizen-royal-deck and mizen-royal truss, 33, main-top-gallant-boomies and mizen-top-gallant-boomies, 34, standing pairs of main-top-sail-boomies and main-top-mast stays, 35, mizen-top-sail-boomies, 36, hauling parts of main-top-sail-boomies, 37, mizen-top-boomies, and cross-jib-boomies, 38, main-top-boomies and mizen stay, 39, vangs, similar on each gaff, 40, ensign staff, 41, spanker boom, 42, quarter-deck's davits, 43, one of the direct topping-lifts and wind sail, 44, main-yard-tackle, 45, a bell-rope

required, in the meantime both the heel of the mast and the step should be well coated with white lead or coal-tar. Lower and slow according to directions from below, when the mast is stopped and brought to the desired position, place four temporary wedges, viz a triangle, twice it up by the gird-lines, unlash the purchase or strops, overhaul down, turning the triangle, and haul the gird-lines taut on each side.

The shears can be transported forward in nearly an upright position by first pulling the heel-tackles and then the guys, shifting the guys forward one at a time as necessary. The main-mast and the fore-mast are taken in the same way as the mizen-mast, described above,—all three abaft the shears, but, being much longer, they require greater lift and greater gear generally.

To take in the bowsprit the shears are again moved forward, all the heel-tackles being led forward and again lashed on the heels. A purchase nearly as strong as that to be used in lifting the bowsprit should be secured between the fore-mast-head and the shear-head, or two parts of a stout hawser may be used, the middle being clove-hitched over the horns and the ends taken round beams well aft on either side, ready for veering as the shears are dropped (to an angle of about 45°), then to act as the principal support; the fore-guys are also taken aft to assist. The fore-mast must be veiled on both decks and one or more tackles used to keep the heel aft. The bowsprit cap is invariably bolted on in the mast-house; the bowsprit is then brought under the bows with the cap end forward and slung for the main purchase a little

outside the housing, which is generally about two-fifths of the whole length. The main purchase should plumb nearly the length of the housing outside the bows, and the higher the shear-head the greater the freedom of motion. The other purchases attached to a strop through the hole in the cap and the guys from the cap to each cat-head alike tend to force in the bowsprit when it is high enough, besides this a heel rope is put round it before it leaves the water, and a strop with a tackle to the luffs is used to bowse it into the hole and moorise. It is hoisted to about an angle of 45° before the heel is entered. A rough sketch made to scale will greatly facilitate such operations and ensure success. When a bowsprit is put in by shears on a bulk or jetty, it is hoisted up ahead of the ship nearly horizontal, or at the angle (steve) which it is intended to assume, and the ship is moved ahead towards it, till the bowsprit takes in the desired position.

The directions for masting a large ship are more than sufficient for masting a small one, which is so much easier.

Gammoning the bowsprit is the most important point in rigging a ship, as the stays of the fore-mast and main-top-mast sprit depend for security on the bowsprit. In large ships there are two distinct lashings (of either new stretched rope or chain) to keep the bowsprit down, they are passed in a similar manner over a long saddle-shaped piece of wood called a gammoning fish and through the holes in the head keene, the outer one first. One end is cinched or shackled round the bowsprit over the fore-part of the hole; the

FIG. 57.—Cutter rigging: 1, bowsprit and gaff-ropes, 2, jib-boom, 3, as the fore sail, 4, cross-reeches and top-mast-ropes, 5, pennant, designating the shunt to which she belongs, 6, gaff-top sail, 7, end of boom and topping-lift bow.

Bow-sprit.

² References are not repeated for each mast where the names and functions are identical.

other, being loose through the after-part of the hole, comes up on the aft side of the first turn on the bowsprit and down inside that part and before the turns in the hole, thus forming a double cross with the first turns outside. Every turn is set up as passed by means of a pendant brought the hawse-pipe or bow-pipe, and a block is secured to the hole for the bobsstay, which are attached to the gammoning by a salvage or toggle, and held while the next turn is being passed by a tacking screw set up and by nails driven through the links into the fish if chain. When the hole is full of turns—eight or ten—the whole is flapped together as tightly as possible, commencing at the lower part.

The clothing of a pendant is the large strap consists of five straps for its own security and the fore-stay. A bobsstay collar is hoisted on at one-third the distance between the night-heads and the outer extremity, and close outside it two bobsstay should collars and a fore-stay collar, then the second bobsstay collar, two bobsstay should collars, another fore-stay collar, and the third bobsstay collar, in addition to these there is a cap bobsstay, which sets up to a bolt close inside the bowsprit cap. The bobsstay and bowsprit should collars are hoisted at right angles to the spar, and usually cleated in that position. But this cleating is a mistake, as the strain comes upon each of them very obliquely, it is necessary that they should yield in that direction before the cleats are nailed, or they will give way and slacken the rope when it is most required to be taut. Bobsstays are cut to the required length, wormed and parcelled from the centre towards the ends, and served, they are served through their respective holes in the ewinot before being spliced, which splice is tapered, parcelled, and served over, and lasts on the head of the heart when it is seized in. The bobsstays and bowsprit should collars are set up by laurays half the nominal size of rope and the same size of wire, the standing parts are secured by running eyes round the necks of the collars confining the hearts, and are set up by two luffs, one acting upon the other.

The cross-trees are swayed up one at a time by the two gud-lines, whose standing ends and a guy on deck conduct them to their places, where they drop into tresses and are bolted to the trestle-trees. When a whole top is to be got up it is placed abait the mast (except the mizzen) with the lower side forward and the fore part uppermost; the gud-lines are passed under it, that is, before it, each being rove up through the second hole from aft for the futtock-plates and hitched tightly to its own part as it passes the lubber's hole, which part is also stopped to the hole at the fore part of the top. If it be a cross-tree, the trestle-trees may be taken down the fore (under) side (as before), rove up through the after-hole for the futtock-plate, down through the lubber's hole, taut up through the foremost, and lashed to the hosting part, which is stopped firmly to the fore part, where a gud-line leading from the mast abait is also stopped after the end has been made fast to the centre hole for the top-luff, that gud-line is to keep the top clear of the trestle-trees as it goes up and to assist in placing it. There are several slightly different ways of slinging a whole top, but in all cases the gud-line (before the stop is cut) hoist the fore part higher than themselves, till it falls over them and hangs as nearly horizontal as could be judged in slinging it. The final adjustment of it in its place is done by hand, and then it is bolted to the cross-trees. The mizzen-top is put over either in a similar manner with a guy to the tuffail or sent up before the mast with the after part uppermost, a gud-line from the mast-mast-head keeping it clear of the trestle-trees, which project much farther on the fore side. Tops are taken off by the reverse process, but it is more difficult to get the hole back over the mast-head.

Tops are now very seldom made in one part, but in two halves, which is more convenient and equally serviceable. Each half is sent up in a similar manner to the whole top, the gud-lines are bent on precisely the same way, but one half at a time, which falls square at the side of the mast when the stop is cut instead of going over the top of the mast. After the top is hoisted, it is advisable to hoist up the lower cap into the top while the whole space of the lubber's hole is still free, but not to put it on till after the lower rigging is fixed. The cap being placed near the mast with the bolts downwards and the hole for the top-mast forward, both gud-lines are brought down through the lubber's hole on the same side, that which crossed before the mast is bent on to the fore part of the cap, and that which belongs to the side on which the cap is being made to sling the after part fairly and is then stopped to the fore part, so that this last is hoisted up by both gud-lines and on till in the top, when the stop at the fore end being cut, the cap hangs in front of the mast and the round hole can be placed exactly over the space between the trestle-trees where the top-mast will come up. A soft piece of wood called a "bolster" is made to fit into the angle formed by the trestle-tree and the mast on each side, and is bolted in place so as to present a smooth rounded surface along the whole distance required for the rigging to rest upon, and is covered by a padding of tarred canvas or six parts thick, secured by a row of flat-headed nails along the upper edge. Each mast is similarly provided.

Preparatory to sending up the lower rigging on the masts it is

necessary to rearrange the gud-lines, as it is obviously inconvenient Lower to hoist the eye of a shroud over the mast and allow it to fall down rigging over both parts of a heavy rope which would require to be hauled up from the deck or reeve every time, therefore they are lashed to the leads in the trestle-trees for the truss falls, and a small gud-line is lashed high up abait the mast to be worked in they and for both sets of rigging. The starboard tackle-pendant is put over first, then the port part, next the starboard foremost part of shrouds followed by the port part, and so on alternately till all the shrouds are in place, ending with an odd one called a swifter on each side. Large ships have four pairs of shrouds and a swifter on each side. They are all sent up in a similar manner. The large gud-line from the trestle-tree is secured to the pendant at the extremity and for the shrouds more than the length of the mast-head below the sear by means of a stop with a ship-rope, toggle, and down-haul; the eye is opened to the shape of the mast-head and the after-part is stopped to the gud-line, which sways it up to the lubber's hole, when the men in the top bend the eye in the direction it is to go over the mast and make fast then small gud-line a fathom or two below the sear, with a stop on the after part of the eye, which is cut when the pendant or shroud is far for going over the mast-head. When the shroud is over, each eye is hauled down by a large mallet called a "commander." Ropes should be rove through the thimbles of the pendants and hauled tant when they are being driven down, then the "up and down" tackles should be hooked to the short legs (which are forward), while the long legs are being lashed abait the mast and the runner blocks lashed to them for stopping the mast by the runner. As the masts are being taken down, they should be temporarily set up by the dead-eyes and laurays, or by a luff-tackle on each, to prevent them springing up before another part passes upon them. It is of very great importance to keep each eye taut before others pass on it both for preservation and appearance, many an eye has been strapped of its service and parcelled through slipping out from under the weight. A piece of rounding made fast to a bolt in the hounds of the mast (as an eye in the collar end is very useful for keeping the eye of the eye down while it is being made taut, by roving the short eye end up through the eye of the shroud and hooking a button from the deck to it, which is pulled upon at the same time that the shroud is set up on the other side of the ship, when finished, that piece of rope will be jammed. The lower stays, after they have been completely fitted and the hearts have been turned in, are secured to the mast over the other side of the fork of the mast, the sides, and at the eyes. The gud-lines, having been put back to the mast-head, are sent down through the lubber's hole, one crossing the fore side of the mast, and are bent to both stays below the fork of collars and stopped to the eyes, they are thus swayed up near their places, the respective eyes being lashed together by rope-lashings low down over the eyes of all the shrouds. The hearts are then carried forward, the fore to the hearts in collars around the bowsprit and the main to the hearts provided for the fore-part near the fore-partners, while the collars of the stays are suspended from the fore-part of the top, the collars being saved down as required to preserve a straight line between the lashing-eyes and the point where the stay is set up.

The following is the method employed to set up the rigging on Setting the masts. It is first drawn forward by the runners and tackles up stays. (Askin to the long legs of mast-head pulleys, which are lashed together abait the mast, will not hurt before the position it is intended to stand in, as the strain of the shrouds will draw it aft. Many seamen recommend, with reason, that a stann should be brought on the after-swifters while it is being stayed, to keep it more firm. The propriety of wedging the mast before the rigging is set up may be considered an open question; it was considered lubberly forty years ago, but is now the common practice. The laurays of the stays are in proportion. When the stays are hoisted, since many more turns can be passed through hearts than through dead-eyes. The standing parts are made fast round the collar or stop of the lower heart by a running eye, the end is rove up through the heart in the stay and down through the lower one twice and the slack hauled through by the sail-tackle, which must be previously secured for that purpose round the lower mast-head and hung over the fore-part of the top, on the two top-burtons may be used, one for each stay. When the stays are hoisted through and secured, the double block of a luff-tackle is attached by turning the luff back over a toggle on girt, as slings are represented in fig 18. Then a salvage stop is passed twice round both parts below the bight *s* (when the figure is turned up), brought up on the side of the arrow, and hooked to the luff. A cat's-paw, as shown in fig 7, may be used with a girt placed at *g* to keep the parts open, otherwise a large rope would be injured. The single block of the luff is secured to the stay as high up as it will reach by a long double-tailed salvage, which is dogged softly at first, but terminates with close-tant turns and a spinn-yarn seizing. Care must be taken to prevent kinking the rope, especially if it is wire; if hemp, it should be parcelled to protect the outer yarns. The fall of the luff is connected with the

Getting
up tops.

sail-tackle (by one of the means described) and the sail-tackle fall led in the direction of the stay, it is pulled up steadily, the mps of the layards having been well taken to make them slip through the hearts, while they are also shaked up by levers. When tant enough the layard is suddenly seized to the mast part, another turn is set up, and secured, till the scores in the hearts are full, then riding turns are taken. Whilst the first riding turn still bears the strain, all the seizings on the layards should be cut off, and others put on when each part has taken over an equal strain. After the riding turns are completed, the end of the layard is secured by a clove hitch and a seizing. Where there is not a sail-tackle a long luff may be used in a similar manner, the double block being secured above the single block of the other luff. It is desirable that both stays on the mast should be set up at the same time, but it is not imperative, care should be taken that they are equally taut.

Lan- yards. A layard for rigging with dead-eyes is half the nominal size of rope shrouds and the same size as wire rigging. The knot is inside under the end of the shroud, or is first spliced to a bolt in the chains and then rove through that hole; it is rove full before commencing to set up. The mast having been stayed, luffs are placed on the shrouds with the double block down and brought to the layard as above described, the up-and-down tackle from the mast-head pendant is secured to the fall of the luff by a cat's-paw and strop and pulled up till taut enough, the foremost shroud on the starboard side first, then that on the port side, and so on alternately till they are all nearly taut alike (the after-vertices not quite so taut as the others), which is best ascertained by the eye as perceived from the mast-head, if the dead-eyes are not secure (even) when finished, it is far better to turn them in afresh than to have an unequal strain on the shrouds. If a pair of shrouds were set up at the same time it would be better for the eye and the seizing. Tails should be used freely on the layards as they enter the dead-eyes, whether they are of iron or wood, it causes them to slip quite as well as grease and preserves the tops, while grease causes them to decay. The layards are seized to the mast part till a clove hitch is taken above the dead-eye and the end seized down, the parts of the layard should then be made to bear an equal strain, and afterwards seized together lest any part should be injured. The runnins should be kept taut till everything is secured, then eased up gently, to avoid straining the mast. Lower masts generally have an inclination to belly,—i.e., bend aft. Space must be allowed for this, by the use of the various parts of the rigging, the main principles follow the lines of that which has been already rather fully described above. The top mast stays and rigging are set up by means of top-buttons and jiggers, the top-gallant-rigging and that of all small vessels by jiggers and light appliances.

Lower cap and top mast. The lower caps were supposed to have been swayed up by the gird-lines and placed in position to receive the top-masts before the lower rigging was set up. To fix one of them in its place, let the top-block be hoisted up lashed to the mast-head close below the square on which the cap is to rest, on the side suitable to the sheave in the top-mast, through the block rove a suitable hawser (9 inches for a large ship), send the fore end down through the square hole between the trestle-trees, lay it along the top-mast (the spare one if allowed two), rove it through the live sheave in the heel, and hitch it round the head of the top-mast and hawser, leaving considerable end, also place a good lashing round the mast-head and the hoisting part of the hawser and send the two parts of the hawser together about half-way up, strong enough to bear the weight of the mast. If the top-mast be much longer than the space between the deck and the trestle-tree, the lashing must be placed low enough from the head of the mast to allow it, while suspended, to project above the top outboard, while the heel is guided down the main hatchway or lower-mast. The cap is then used to hoist the mast up, when it is pointed between the trestle-trees, remove the lashing round the head, and if landed,—i.e., resting its weight on the deck,—make the end of the hawser fast round the mast-head, the hitch being on the side opposite to the block, and cast off the lashing lashing, leaving the mast ready to be hoive up by the two parts of the hawser. If not landed, hoive up 8 or 4 feet before securing the end of the hawser, so that, when that has been done and well secured, the capstan may be moved back till both parts bear an equal strain, the lashing can then be taken off without fear of a jerk. After the head of the top-mast has been hoive 3 or 4 feet through the hole in the cap, it is securely lashed, commencing with a clove-hitch round the mast, the ends being passed through the bolts under the cap on one side and repeated on the other, so that it will be sure to hang horizontally. Hoive round the capstan till the cap is above the lower mast-head, then steer it by means of a hand-pike or capstan bar in the fish-hole, while men in the top direct the head of the top-mast by handpikes, till the hole in the cap is exactly over the square of the mast, when by moving back the capstan and beating the cap down with a commander it will fit firmly in its place.

If the heel of the top-mast rests on the deck before the head

is free from the trestle-trees, it is as well to lower it down to that position, but, if it is too short to rest there, the up-and-down tackle must be used to suspend it by straps through the fish-hole, while the top-block is being unlashd and hooked to the after-bolt fixed for that purpose in the cap and the end of the hawser secured to the foremost bolt on the opposite side. In large ships a shone is placed under the fore-part of the cap to support the weight and to assist a possible blow from the top-sail-yard. The top-mast may now (unless it is blowing hard) be swayed right up and fitted to prove that it will fit when required (an allowance being made for the wood swelling with wet), and sent on deck in exchange for the other mast, which when swayed above the lower cap will have a gird-line lashed round the head and then be raised 15 or 20 feet more. One part of the gird-line should be sent down abaft all and bent on to the fore-part of the top-mast cross-trees, by this, assisted by a gny, they can be swayed up till above the lower cap, upon which the after-part will rest, securely lashed to the bolts to prevent it slipping, while the fore-part will lean against the top mast at such a distance as to ensure it falling in the right position when the top-mast is lowered and to receive the head of the mast between the trestle-trees as it is swayed up again to a convenient position for receiving the rigging. The rigging is swayed up by gird-lines on the cross-trees, and put over in a similar manner to the lower rigging, the top-button pendants first, then the shrouds and backstays in succession, and the stays are lashed.

There is usually a chain necklask round each top mast-head, sunk in the bolsters, one leg of each is for the top-sail-tye hanging-block to shakele to, and forward there are two others, one for the top-sail-yards and fore-top-mast stay-sail-halyards. After the rigging has been placed over, the top mast-head, the cap is sent up by two gird-lines lashed as high as possible and bent to the foremost part of the cap, with stops to the after-bolts, by which means it goes up before all, with the under-side towards the mast, when it is high enough the after-steps are cut and it slides up on the top of the mast, assisted by men at the mast-head, who get it over the square and rest it down. Directly the top-mast is in position to receive the rigging the top-ope pendants are rove and the tackles secured, first one to relieve the hawser of the weight and then the other in its place. Copper funnels are sometimes used to receive the top-mast rigging, similar to those for top-gallant-masts.

Top-gallant and lower rigging is sometimes stripped of the service Top-gallant and covered with canvas, which is afterwards painted, for the sake lent and of the durability of the canvas, the top-gallant is usually coped or lessened. Another bad practice is that of taking off one of the top-gallant backstays, thereby directly diminishing the support. But worse still is the trick of forming the eyes of rigging and backstays by two seizings, the ends of each rope going to different sides of the ship, this gives two eyes over the mast instead of four, and makes everything depend on the strength of the seizings. It is now a very common practice to cross the top-gallant rigging and set it up on opposite sides of the top, instead of rove it through the necklask on the top-mast and setting it up on the same side. This is done entirely for the sake of saving seconds in shifting the spars, either the top-gallant-mast or the top-mast. Shrouds so treated give no support to the mast whatever, probably they act in the reverse way, as may be easily shown by drawing a straight line to represent the masts when standing upright and lines in equal proportion at right angles for the top and cross-trees. Draw the top-gallant rigging on one side from mast to cross-tree, and thence to the opposite side of the top. The top-mast, having a little play in the cap and at the heel, is bound to go over some inches at the head, taking the cross-tree with it; it will then be seen that the weather side of the cross-tree has approached the lee side of the top, slackening the weather and tightening the lee top-gallant rigging.

Getting the yard on board requires great care to avoid injury. Lower the hammock netting and other things. Spars should be slung yards over the side for it to rub against and slip-ropes through the ports to ease it over the gunnel. If it is to be hoisted in on the port-side, the starboard yard-arm is forced foremost. A hawser may be rove through the port top-block down through the lubber's hole and bent round the centre of the yard. The hatch of the lubber's hole must be open and a strong mat provided. Instead of the hawser the jacks may be taken round the shore running all difficulty, and a bit towards the side at which the yard is coming in is desirable. Lower yards are usually rigged while resting across the gunnel; they are swayed up by the jacks, and slung with strong chains—the part round the yard being connected with that round the lower mast head by a tongue and slip. The yards must be

prevented from sailing forward with the weight and drag of the sail, accordingly the clings, either chain or rope, should be put on with the light coming up the fore side (see fig. 18, where the arrow indicates the fore side and the direction the sail pulls), they are generally put on the wrong way. Merchant ships are invariably fitted with iron clings which are fixtures on the mast, holding the yard at the requisite distance and acting as a universal joint. They are of great advantage where there is not a large crew.

Trim and
stowage

While the rigging is progressing the disposition of all heavy weights is worthy of serious attention, for not only ought the vessel to be brought to the draught and trim designed by the builder, or that which has by experience been found the best, but there must not be too much strain at any one part, especially at the extremities.

In ships intended for sailing or steaming rapidly this is of vital importance, the bows and stuns of cutter or schooner yachts should be empty. Placing the weights in the wings of the hold will steady the rolling motion and make the intervals longer, but this may be carried too far for stability,—especially if the vessel has a low free-board. Weights low down close to the keel will increase stability at the expense of a quick uneasy rolling motion. A yacht which carries much weight low down will be very stiff under canvas and may sail well in the Solent, but would be unfit to go outside the Isle of Wight. When heavy weights are carried in merchant ships as part cargo, they should never be placed as a solid mass, railway bars, for instance, may be stowed against fashion a foot apart, by which means they will occupy as much space and act upon the ship in the same way as an equal weight.

Bending
sails

Before bending sails all the ropes are to be ready for use. A yacht's sails if new should be scumbled, to take the stiffness out of them. In all cases they should be set when bent and the yards braced each way (unless it is blowing too hard), or there is a risk of something going wrong when they are required for use. In setting them care should be taken that no part is stretched or gut unduly.

Cable.

The turn and of a chain cable is usually secured by a tongue-sail and by a short piece of cable which passes round the mast and is shackled to the keelson, it still retains the name of "clinch." The tongue should not have scope enough to reach the compressor, as it has been known to snap back the ring and ship the cable. It is a good thing to tie up the ship before the cable is stowed, so that it will be accessible at all times, either for slipping, slackening another cable, or bending a hawser. It may be thought that a chain cable would not be so liable to foul, but that is a mistake, if care is not taken to spread it evenly, it will form a pyramid with turns round the base, upon which the upper part will fall as soon as the ship leans over, it will then be necessary to haul up several small lights before the cable will run clear.

Single
anchor.

A ship should never be long at single anchor in a tide-way or during variable winds, for fear of fouling her anchor and thereby destroying its holding power. Frequently space is wanted, as ship and cable range over the lee cable, with liability to foul other ships or their anchors. A long scope of cable will only keep a ship clear of her anchor during very light winds, unless assisted by close attention and correct judgment on the part of the seaman. The direction of the two streams of tide should be considered in connexion with the wind in order to keep the ship to leeward of her anchor each time she passes it. A strong wind blowing across the direction of the tide and acting on the hull of the ship will secure that effect, but when the directions of wind and tide are the same, or nearly so, precaution is necessary at each turn of the tide, it is then that a buoy watching over the anchor is of great service. When the wind and tide are in the same direction the helm should be kept over to that side which will cause the ship's head to point in the direction on which she has previously passed the anchor, as the light of the cable will be dragging that way. The force of the tide alone will cause the ship to shoot over cautiously, but when she is assisted by the fore-top-mast stay-sail (or stay-fore-sail in small vessels) the sheer will be much greater. The sheet in either case is better to windward and the fore-top-sail braced sharp aback if the wind is light, but, when the tide commences to change, the sail should be allowed to fill, or it should be taken in and the helm placed in midships. If sufficient effect has not been produced by helm and head-sails before the tide ends, the mizen-top-sail should be set as soon as the ship falls back to shoot over cautiously, but when she is assisted by the fore-top-mast stay-sail, first braced aback to turn her stern in the desired direction and then flak aback so as to drag the cable straight. Cutters and schooners have not that advantage; they must depend on the helm and head-sails. At the end of a weather tide the helm and stay-sail will guide the vessel past the anchor. If a ship should break her sheer (pass the wrong way), or during calms and variable winds should approach her anchor, the cable should be hove in, and if there is reason to suspect the cleanness of the anchor, it should be heaved, since it will be of no use as an anchor if a turn of cable is round the fluke. When anchoring, the state of the tide must be considered in connexion with the depth of water, a vessel was once left high-and-dry by the ebb-tide near Dungeness, and a large iron ship drove her own anchor through her bottom in the Solent, off Lymington.

The avoidance of the anchors in shallow water is another reason for mooring.

When a ship is in an exposed position, where it may become necessary to let go two or three anchors through stress of weather, in any part of the northern hemisphere, the bow or the port side should be used first, next the foremast one on the starboard side, and as a third the after one on the starboard side, since the ordinary wind veers with the sun, and at the end of the gale the cables will be clear of each other. In the southern hemisphere the reverse order holds good.

When a ship is likely to remain many days at an anchorage Mooring.

where there is a tide or variable winds it is better to moor: at once on a spar, with a scope of cable each way as eight times greater than the depth of water, and an open hawse towards the fore wind. The two cables combined should always be much in excess of the distance between the anchors, otherwise they will possess but little strength to resist a rectangular strain,—an error frequently committed. The amount of support which cables will render under such circumstances will be in proportion to the sine of the angle contained between the anchor and the ship's bow and a line from one anchor to the other. Suppose, for example, a ship moored with anchors east and west of each other, 100 fathoms apart and having 55 fathoms on each cable, in 10 fathoms of water. With chain cables the hawse pipes would not be more than 55 fathoms from each anchor, consequently with a south wind the support given to the ship by each cable will only be 35 per cent. of the strain on the cable,—that is, say, 66 tons combined when the cables are strained up 100 fathoms each. The support to the ship will only be 10 tons, i.e., an addition of 5 fathoms each way will (under the above circumstances) give 101 tons, and a scope of 80 fathoms each way will give 153 tons. In practice the cables by dragging over the ground, especially soft mud, assume a direction more ahead, particularly when each cable has a long scope. The anchors should be placed sufficiently far apart to prevent fouling with the slack chain, but not farther, unless the water is too shallow to allow the ship to pass over her anchor at low tide. Such an anchorage is not suitable for very long ships unless special moorings are provided, for which purpose Parks's mooring-blocks are very suitable and inexpensive, they are commonly used in Portsmouth harbour. These blocks are recommended as moorings for the use of yachts and small craft, as being trustworthy and less likely to be stolen than anchors of any kind. Should a ship that is moored with a good scope on each cable have the unfortunate misfortune of being in an exposed position will be preferable to what it would be if put on a single anchor, as the light of cable dragging over the ground will retard her progress, giving more time for another anchor to be let go. In all cases of veering cable either it should be done so freely that the ship will fall off broadside to the wind, when it may be secured while drifting, or it should be done very slowly, a few fathoms, or even a few feet at a time, the ship not being allowed to get any strain away. Young during a gale should be avoided, if possible, it should be done in turns, before the violence of the squall is felt, but if it is intended to pay out freely all broadside on, the head-yards should be braced over to assist and another anchor should be ready. A cable should never be secured entirely by the bits or windlass, but the compressor and duck stoppers should participate in the strain. When unmooring, the riding cable should be veered freely to allow the ship to get directly over the lee anchor, if it is embedded, strain the cable while vertical and heave on the other, which must break it out.

The laborious operation of clearing hawse was suggested, or Clewing avoided by the introduction of chain cables and the invention of hawse the mooring swivel. As the cables unsuitable at every 124 or 16 fathoms, the end to be dipped round the other cable need not be long.

There are two general methods of holding the weight of the lee cable when the turns are taken for hauling the cable up to a light tongue ship to take the flat link, but only about one-fourth the strength of the cable, in a large ship it should have a roller at the top, so that the end of a hawse may be rove and form a standing part. The ship being fixed on the lee cable close above the turns and the hawse taut, the nearest shackle aboard is taken out, and the short end thus formed is hauled out of the hawse-pipe by the fore-bowline, or else by a rope from the bow of the bowsprit, a hook-rope being also attached for hauling the cable up to a boat. A boat should be in attendance from which to detach the loop-rope from the end of the cable, pass it round the riding-cable, and make it fast again to the end of the cable (hanging by the bowline) for hauling it back through the hawse-pipe, thus an elbow is formed taut round the riding-cable in the reverse direction to the elbows and turns below the ship. That operation must be repeated till the same number of turns is formed above as below the ship,—observing that a cross cannot be removed, but the lee cable can be brought under the other. When the cable is taut in and shackled, the ship is knocked off, which allows the turns to drop clear. The cables will then be as they were when moored, with the addition of one or two fathoms on the lee cable. If the short end of the cable is lowered into a boat and lifted by the bowline only for each turn,

the operation can be performed much quicker. The second method is to lash the two cables together above the turns with a piece of old rope, which acts as the slip and is cut when done with. In rough weather when a boat cannot lie under the bows the lashing must be passed by a man on the cable (if it is not high enough, leave it up), after which both cables are hove into the same hawse-pipe, whence they are easily cleared inboard, if there are many turns a small lashing will suffice in moderately deep water.

One of the objections made to slack mooring is that turns are formed below water where they are not visible. To meet this objection a piece of paper representing a slip stuck to the glass cover of a compass, with two differently colored threads attached around to be regarded is that which it would be the least convenient to say sail from. At the time of unmooring the direction of the tide is very important in the case of sailing ships, and should not be disregarded by steamers. The hauling part of the cat-fall is always owing to the ship's motion through the water. The cable on the second anchor should always be hove short before making sail. Should there be plenty of room and the wind moderate, there is no caution necessary beyond placing hands in the chains with newly marked lines, and putting the helm hand over each way to ensure its being clear. The after-yards should be braced up on one tack and the head-yards on the other, to pay her head off, in cutters and schooners the stay-fay-sail is used for that purpose. If another vessel is at anchor too close astern to ensure getting away while aback of lee, it should not be attempted, but, by squaring the after-yards as soon as the anchor is weighed, the vessel should pay till it becomes safe to fill all the sails and pass under the stern of the other vessel. The anchor should have *cat* and *cat* and *fish* also during the interval, much way should never be on the ship till the anchor is secured, for fear of it slipping or of a man falling overboard. Should locks or shallow water be inconveniently close astern different means must be adopted. If the wind blows directly on shore, offering no chance of direction, and a current runs parallel to the shore, the ship's head should be cast against the stream. The yards should be braced about ship up, with as much sail set over them as the force of the wind will allow, every means being taken to heave the anchor up quickly, and, in a well-manned ship, as soon as it is out of the ground, haul on board the main-tack and aft with the sheet, set jib and spankin. The helm being aback, keep it so as long as is required, and hance round the head-yards quickly, the wind will soon blowing astern. Then, by pulling close to the wind, the least movement will be retarded till the anchor is secured; then set the fore-sail.

The above is applicable in moderate weather when all or nearly all plain sail could be set. But, should there be a strong wind cable and a rough sea, it might not be possible to weigh the anchor or to prevent it starting the bows if it were hove up, in that case it must be sacrificed for the safety of the ship by passing the strongest hawser from the after-port (padded with the cable) and hauling it fast by a rolling-hitch, and hauling it taut, an ax and block should be in readiness, also guys, to prevent the spring of the hawser breaking men's legs. The compass should be reefed and all ready for setting, the top-sails (double or treble reefed) should be set or sheeted home ready for setting, and all the yards should be braced up on the tack it is intended to go off on. The first opportunity should be taken when the ship is commencing a yaw in the desired direction to slip the cable, set the after-sail and fore-top-mast stay-sail; as soon as the top-sails fill, out the spring, set the reefed courses, and the main- and mizzen-try-sails. To wear the cable previous to shipping would be more likely to break the hawser. The expenditure of losing an anchor should only be resorted to when there is too much wind and sea to admit of weighing it and not too much to prevent the ship, of whatever description, from gaining something to windward under a press of sail. Otherwise her condition is made more by the loss of the anchor, it would be better to decide upon riding the gale out, letting go other anchors, veering all the cable available, striking the top-masts, and lacing the yards nearly fore-and-aft. The cutting away of the lower-masts, when necessary, must always be done with great care to avoid killing people or bulging the ship with the wreckage. The layards of the lower rigging on one side should be cut as the ship heels in that direction, and a few patches made in the mast on both sides 3 or 4 feet above the deck, the men running aft out of the way when it is likely to fall, for which operations they would have from eight to fourteen seconds. As soon as the mast has fallen the layards of the stays should be cut and the most strenuous efforts made to cut and clear every rope which would still hold the mast to the ship.

When weighing in rough weather with sufficient room to drift, it is better to have the anchor fully secured before making any sail, or, if it were intended to run before the wind, the sail may be set on her course by the jib only till the anchor is stowed. Steaming up to an anchor against strong wind or tide is objectionable, as it requires great attention and judgment to avoid jerks, the same applies to steaming in a gale to ease the strain on the cable; a con-

under the tautest part, this second boat, by containing in a circle round the anchor and returning to the side of the stationary one, will cause a turn to be formed round the fluke, as represented in the figure. Both crews should again pull hard to tighten the turn round the fluke, after which, both parts being held in one boat and made equally taut, an anchor shackle (bushed) is placed round them and shaken down by a vessel-and-haul pul on both parts by the crew of one boat, while the other tows ahead to keep a strain on the hawser till it is nearly vertical, when the anchor is secured. The ship can then take in the two parts of the hawser and weigh it.

In getting a ship under way there are a few precautions which Getting should necessarily be observed. If the ship is moored, the first under command to be weighed is that which it would be the least convenient to say sail from. At the time of unmooring the direction of the tide is very important in the case of sailing ships, and should not be disregarded by steamers. The hauling part of the cat-fall is always owing to the ship's motion through the water. The cable on the second anchor should always be hove short before making sail. Should there be plenty of room and the wind moderate, there is no caution necessary beyond placing hands in the chains with newly marked lines, and putting the helm hand over each way to ensure its being clear. The after-yards should be braced up on one tack and the head-yards on the other, to pay her head off, in cutters and schooners the stay-fay-sail is used for that purpose. If another vessel is at anchor too close astern to ensure getting away while aback of lee, it should not be attempted, but, by squaring the after-yards as soon as the anchor is weighed, the vessel should pay till it becomes safe to fill all the sails and pass under the stern of the other vessel. The anchor should have *cat* and *cat* and *fish* also during the interval, much way should never be on the ship till the anchor is secured, for fear of it slipping or of a man falling overboard. Should locks or shallow water be inconveniently close astern different means must be adopted. If the wind blows directly on shore, offering no chance of direction, and a current runs parallel to the shore, the ship's head should be cast against the stream. The yards should be braced about ship up, with as much sail set over them as the force of the wind will allow, every means being taken to heave the anchor up quickly, and, in a well-manned ship, as soon as it is out of the ground, haul on board the main-tack and aft with the sheet, set jib and spankin. The helm being aback, keep it so as long as is required, and hance round the head-yards quickly, the wind will soon blowing astern. Then, by pulling close to the wind, the least movement will be retarded till the anchor is secured; then set the fore-sail.

The above is applicable in moderate weather when all or nearly all plain sail could be set. Anchor

Lost anchor

Fig. 38

strut when it parted, so as to catch the fluke as a hook. Towing a hawser against the tide is generally wear of time, and a chain forms too narrow a bite, unless the anchor is buoyed. When the anchor is felt both boats should close together and their crews pull with all their strength for a minute or two. Then, while one boat remains stationary, keeping her part of the hawser steady, the other should cross her bows with a slack hawser, which thus passes

stant watch should be kept to prevent the cable over becoming slack. Fore-and-aft rigged vessels have much less difficulty in getting under way when close to a lee shore, as then main-sails can be fully set without holding wind, and directly she pays off all the sails draw.

Running on shore If the anchors drag and the ship strikes the bottom, especially on rocks, and it is apprehended that she may go to pieces or founder in comparatively deep water, it would be right to select the best place on shore (if there be a choice), and endeavour to thrust her into it by slipping or breaking all the cables and making sail, if there is still the means of doing so, with the view of driving her up as high as possible and so saving life. Let it also be at the top of high water, if that can be waited for. When there is a heavy strain on a chain cable it is easily broken by scratching a notch with a common saw on a link that rests firmly on the bits and then striking it with a maul or sledge-hammer.

The usual way of testing whether the anchors are holding or not is by dropping the lead over the side and leaving the line slack, but the ship is liable to swing over it, causing it to be disturbed. A grapnel over the bow or from the bowsprit is preferable. Also by sitting on a cable before the bits a tremulous motion is felt if the anchor is dragging.

If instead of a dead lee shore we have the wind oblique with the line of coast, and the ship from some cause too close to admit of a stem-bow towards it, the head-yards should be braced abox to cast her head inshore, while the after-yards are kept square, this will cause the ship to make a long steeple-board from the shoal, which will not so much retard the wind, but will save the vessel. The helm up to that time may be kept in midships, as there is no reason to diminish the curve. As the steeple-way is lost the helm should be put hard up, the head-yards squared, and the mizzen-top-sail kept shivering till braced up on the desired tack. The main-top-sail should be kept full. If it is necessary to get the ship round as quickly and as shortly as possible, the fore-yard, instead of being squared when about to shake, may be lowered entirely round quickly so as to continue paying her bow off till the wind comes aft, then squared to allow her to come to. The jib or the fore-top-mast stay-sail (according to the weather) may be hoisted when the anchor is tripped or not, until the wind is before the beam on the desired tack; if at the former time the sheets should be hauled to windward and kept so till the ship is before the wind, then eased off till the wind comes before the beam. The spanker or mizen-top-sail should be set as soon as it will draw the right way.

Wearing ship What has been said of tumbling the sails as the ship is turned round after casting with her head inshore is equally applicable to a case of ordinary wearing when it is desirable to turn the ship with as little loss of ground as possible. As a general guide to the position in which the yards should be placed, it may be remembered that the pressure on the sails always acts at right angles to the yards. The wind may be accomplished by drawing the sheets sharp up when the wind is two or three points abaft the beam. As it will then blow directly into the sails they will certainly receive greater strain, but the speed of the ship will be less than when the yards were square, and it may be observed that considerable leeway will be caused by the lateral pressure. In wearing ship all the fore-and-aft sails should be taken in except the head-sails, and when the helm is put up the main-sail should be taken in and the mizzen-top-sail hoisted, the latter continued till it is sharp up for the new tack. A fashion has been adopted of leaving the mizzen-top-sail square till after the head-yards have been squared; hence everything depends for a time upon the action of the rudder, and the ship sails a considerable distance before the wind and loses so much ground. The operation of wearing a cutter requires much more care than with a square-rigged vessel on account of the heavy boom. A schooner is treated similarly, but the spinnaker sails are lighter in proportion to the size of the vessel. Before putting the helm up, the tack of the main-sail is treed up (the top-sail closed up), and the peak dropped till it is nearly in a line with the boom topping-lifts, which is called scandalizing the main-sail. Both peak and boom are secured firmly in midships by means of the downhaul and shoote. Not only is the diminution of after-sail necessary to allow the vessel to pay off quickly, but the change of wind from one quarter to the other may only cause a gybe which is perfectly under control. The jib and stay-fore-sail are gybed by hauling the sheets fast just before the wind is aft so as to diminish the jerk as much as possible. The peak of the main-sail is easily rehoisted while the tack is up and the vessel luffed up to the wind. The runners and weather-boom topping-lift should be pulled up while the ship is before the wind and the top-sail-sheet hauled out as soon as the peak is up, the tack-tackle being shifted to windward and pulled down. In wearing during fine weather, especially in yachts when racing, some rake may be preferable to the loss of time and the main-sail may be kept set. As the main-sheet is usually rove through a treble block on the boom, a double block to move along the horse, and a single block on each quarter, a strong crew can man each part at the same time and haul the boom in

midships quickly, belaying the part which was at the lee side and is about to become the weather side directly the boom is over the leading block, while the other part is kept in hand till the gybe has been effected to lessen the jerk.

The sails of all vessels are most effective when set as nearly flat set as practicable, and also each sail as well as each part of a sail, sails should be spread at the same angle from the keel. If under that condition too much or too little weather-helm is required, the balance should be established by changing the quantity of canvas at either end or by altering the trim, not by permanently easing off a sheet, for that is as detrimental as dragging the inside at a large angle. By altering the stand of the masts materially the angle and consequent set of all gaff-sails are thrown out.

To tack a fore-and-aft-rigged vessel is very simple, by easing off Tacking the jib and fore-sheets at the time the helm is eased down and hauling over the main-sheet, the vessel will soon run up to the wind, then if the fore-sheet is hauled flat over as for the former tack it will assist to pay her bow off the right way. The jib-sheet would be hauled aft while shaking, but not too soon to cause it to take the wrong way. The fore-sheet is shifted over as the other sails are about to fall, according to the speed with which the vessel is paying off. In a smart vessel, such as a cutter-yacht in smooth water and with a good breeze, there will be no occasion to retain the fore sheet, but allow it to shake itself over similarly to the jib. Returning to the idea of tacking with difficulty, the helm should be put hard over as the speed decreases and reversed directly steeple-way commences; this remark applies to vessels of all shapes and sizes, and will also the advantage not to pull the helm over too large an angle while the vessel is going at great speed. At an angle of 10 degrees, more than 98 per cent of the force on the rudder is applied to turning the vessel and 17½ per cent to retard her, while at 80 degrees one-half the force would retard and 86½ per cent tend to turn. Hence we see the reasons for recommending close fitting, broad, tapering rudders.

While the vessel is in stays the weather-boom topping-lift should be pulled to take the weight of the boom, the tack to the tackle on the weather side set up, and the lee one slackened as soon as the ship is round, also shift the main tack-tackle over to windward and set it up; get a pull of the gaff-top-sail tack if necessary.

The jib of a cutter, yawl, or schooner with a running bowsprit is a difficult sail to handle when the vessel is under way. If there is lee-room it is better to keep the yacht away before the wind and let the outhaul, when the traveller will run in, or pull at the same time as the inhaul, which should be kept in, or pulled up, to keep it square. Haul the stay-fore-sail sheet over to make room to haul in the jib to leeward of it. Gather in the slack canvas smartly to keep it from getting overboard, get hold of the luff of the sail by the stay-ropes, while some hands pull on the downhaul. When the sail is perfectly under control let go the halyards and continue hauling on the stay-ropes and downhaul. When there is no room to run before the wind, it is best to have the weather-fore-sheet to windward while tacking, or shifting a jib, by letting go the outhaul the traveller will run in and the sail can be handled as before, a good hold being always kept of the weather side, that is, the luff of the sail. If another jib is to be bent it should be laid along the weather side of the deck in readiness, with the tack forward and the head aft. The sheets are then untoggled from the former sail, hauled across outside (to windward) of the fore-sheet, and tacked to the second jib, also the tack to the tackle on the hook it, and run it out. Hook the halyards and hoist the jib up by them, then tauten the luff by the purchase while the sheet is flowing.

A jib headed gaff-top-sail is preferable for use on a wind and Gaff-top commanding breeze, though for light winds a long yard spreads a sail fine sheet of canvas. Such a yard should be slung at one-third from the fore-end (as a boat's dipping lug), the clew-line block secured at the length of the leech from the upper eye, and the standing part of the clew-line made fast to the lower end, this last to keep it clear of the cross tree when being hauled down, which must always be done on the side it has been set, a tack being made if necessary to bring it to windward. On the approach of a squall the fore-sail should be hauled down by means of the downhaul and the vessel luffed up, it is dangerous to attempt bearing up at such a time until the main-sail has been somewhat relieved of the effect of the water in the rudder side greatly in tripping a vessel over.

As bad weather comes on the main-sail must be reefed (a smaller Reefing jib having been already set) by topping up the boom, easing down sails, the peak and throat, and hauling down the reef cringle to the boom by the reef-tackle; lash the tack and tie the points without rolling the slack canvas. The second and third reefs are taken in as the wind increases and the fore-sail reefed again or stowed, during which time the jib-sheet should be hauled flat, the peak-tack tied up, and the vessel kept close to the wind to avoid plunging the sea over the bow. To reef the bowsprit, hoist the top-mast, let the jib run in, slack the bobsays and bowsprit shoats, take out the fid, and let the bowsprit run in one or two reefs, then reef it, set taut the gear, and set a small jib. It is at all times much more

difficult to steer a short vessel than a long one, but especially in a heavy sea, when the mode of treatment must be entirely different. A small vessel should be luffed up to meet every large wave in order to bow it as much as possible. She will have but little way on at the time of meeting it, and will drop into it easily, the bow will then fall off the sea fill, and a run be made parallel to the waves till she is luffed up again. A four-cored gaff has been taken through a heavy sea under eas by pulling up to meet every dangerous crest which could not be dodged, and just before it broke over the bow backing away from it. The smallest amount of sail which can be shown by a main-sail is when it is balance-reefed, this is accomplished by close-reefing it and lowering the jaws of the gaff close down to the boom, and the peak stratches up that part of the leech above the close-reef angle. The plan is more frequently adopted by fishing smacks than by yachts or other well-found vessels, they have a try-sail which, being laced on a smaller gaff, is hoisted by the same peak and throat halyards as the larger sail, and has its sheet secured to a bolt near the stem, while the boom is crutched and secured with the main-sail and the large gaff lashed to it. The try-sail admits of being reefed, it is a safe sail either on or off the wind in rough weather. The greatest care is necessary when running before the wind to keep the vessel on her course and to avoid gybing. A vessel should never get under way without a small boat, and a cutter should never be without her legs for fear of taking the ground unexpectedly. In tacking to windward, if the wind is variable, keep nearly dead to leeward of the mark vessel, as every change in the direction of the wind will then be an advantage, unless the vessel has a preference for one direction over the other, that will of course decide it.

Tacking

If taken aback by a change of wind, and wishing to remain on the same tack, put the helm up and haul over the fore-sheet. In a ship haul over the head-sheets and braces the head-yards aback. The way to tack a ship under favourable circumstances may here be assumed as well known, and only a few hints relative to doubtful cases given. In a few minutes put to the attempt set all suitable sail, keep steady till "with a small helm, so as to get as much way as possible." If the crew is large enough to list the ship, send them over to leeward, ease down the helm slowly, haul the boom in midships, haul down the head-sails, ease off the fore-sheet, let go the head-bowlines, and check the head-braces. Directly the wind is out of the fore-top-sail, brace the head-yards sharp up again and haul the bowlines. When the wind is entirely out of the sheet-top-sail, let the fore-top-gallant brails and sheets come up, and raise tacks and sheets except the fore-tack, which should be raised after the main-yard has been swung. As soon as the vessel loses her way, shift the helm hard over, and send the men to their stations. If she brings the wind across her bow, hoist the head-sails with the sheets on the same side as before, if the wind takes them well and the ship is still going round, give the order "main-sail haul," haul over the main-tack, aft the sheet, shift over the head-sails, haul the head-bowlines. As the main-top-sail fills, or, before, according to the rapidity with which she pays off, swing the head-yards to the order of "haul off all."

Misad-
stays.

If when near head to wind it is found that the bow is falling back and stern-way commencing, it is evident that she has "misad stays." The helm in that case should not be shifted, as with stern-way it will help her to pay her bow off in the direction it was before. The head-sails should be hoisted, the main-sail and spanker taken up, the fore-sheet hauled aft, the after-yards squared. As the wind comes aback the beam the mizen-top-sail should be kept shivering and the main-top-sail just full, shift the helm as she gathers headway. When before the wind square the head-yards, shift over the head-sheets, and keep them flowing. Set the spanker when it will take the right way, complete wearing as before described. This is similar to "box-hauling," it is not necessary to brace the bow to the beam, as in sailing ship without an auxiliary screw-propeller. It may be done when the ship is found edging down on a lee shoal, too close to west, and having a depth of water not exceeding 20 fathoms. It will take two or three minutes to open the hawse-pipe, get the cable clear, and procure hammer and punches for unslacking, and mauls for breaking the cable if necessary. Put the helm down and act as in ordinary tacking till she ceases to turn and goes to the wind, then let go the anchor, whether she has entirely lost her way or not, as raising the anchor a little will give a greater swing back when the strain comes and allow more time for slipping the cable, which should be done directly the wind has crossed the bow, at the same time swing the after-yards. If the cable has been shipped successfully, the head-yards may be hauled as soon as the after-yards have been braced up, as

Jib-
hauling

"Jib hauling" may occasionally save a ship even in these days of steam, as a paddle-steamer will not turn with her head against a strong tide and a heavy sea, or if not, as raising the anchor a little will give a greater swing back when the strain comes and allow more time for slipping the cable, which should be done directly the wind has crossed the bow, at the same time swing the after-yards. If the cable has been shipped successfully, the head-yards may be hauled as soon as the after-yards have been braced up, as

she will soon be broadside on. It has been proposed to run a spring from the after-lee-port to the anchor, but that would take too much time.

"Backing and filling" is practised in a tidal channel which is backing too narrow to allow a ship to gather way for tacking. One top-sail and with the jib and spanker occasionally, is generally sufficient to give filling slight head or stern way, to avoid either back or another vessel, while the tide carries her broadside against the wind, the less sail exposed the less the lee-way. Fore-and-aft vessels having less power to get stern-way should have a boat in attendance with a line and a small anchor.

"Kedging" was a frequent performance before steam-tugs were introduced, it consisted of a series of small anchors, from one small anchor to another, previously laid out by boats. For a similar purpose harbours that were much frequented were formerly furnished with a succession of warning buoys. The large ropes used for transporting ships are called hawsens, and by a strange anomaly were formerly cable-laid nine-stranded. Such ropes are hard and stiff to handle, it absorbs more wet and retains it longer, therefore is less durable, when new the strength is far inferior to hawsen-laid ropes of same size. Manila and cork hawsens float on the water and are therefore very useful.

Drugging through a narrow tidal channel by means of an anchor dredge just touching the bottom is called "dredging" or "clubbing," it can be practised in a passage which is too narrow for backing and filling, such as the upper part of the Thames, where it is done every day. The vessel swings to her anchor and points her stern up (or down the stream, by heaving in the cable, and when fairly pointed, the capstans and windlasses afford great facility) the tide takes the ship on as fast as it is running so long as the course remains clear. When it is desirable to approach either side, a few fathoms of cable paid out will cause it to hold, the helm and the action of the tide will then steer the ship as desired, and by heaving in cable she will go on again, so that a sailing-ship should go up at half the rate of the tide at least. With a screw-steamer it is far easier, as the screw will straighten her as well as the tide, and when fairly pointed through an open space she can make a stern-board at five knots an hour while perfectly under control.

A few words may be said about making and shortening sail in Making bad weather. One point holds good in all cases the sails should and never be allowed to flap, as that exposes them to the danger of shortening. The tack or luff is invariably secured first, while the mg sail sheet is hoisted, the steady stann comes up to keep the sail from flapping. Before hoisting fore-and-aft sails the sheets are steadied aft, and, should a sheet carry away, the sail is hauled down or bailed up instantly. Spankers and try-sails should be taken in entirely by the lee-brails, the stack only of the weather-brails being at first taken down. A practice has become general in the British navy of securing the top-sail clew-line blocks to the lower cap instead of round the yard, for the sake of saving time when shifting top-sail-yard, the use of the clew-line for hauling the yard down and readying it is thus lost, this is one of many objectionable practices.

There has been a difference of opinion as to the mode of setting Top-sails and taking in top-sails and courses, but the same rules should apply and to all square sails alike that which is safest for one will be safest courses for the others. Experience and the balance of opinion favour the hauling home of the weather top-gallant-sheet, top-sheet, and tack of the fore-stay or main-stay first, with a good stann on the clew-lines, clew-garnets, and bunt-lines, and a broad happily pointing. The lee sheet may then be hauled and eased down by clew-line and bunt-line. Each bowline should also be steadied taut in succession to prevent the leech from flapping. There appears to be no advantage in first hauling the lee-sheet partially down. The taking in of these sails has been equally a matter of dispute, and many advocates tacking in a top-sail in a different manner from that which they would adopt in taking in a course. A French rule was often quoted and followed in former times. It runs thus—

"And he who steers the tempest to disarm,
Will never first embalm the lee yard arm."

It must be remembered that the decision there supported by the sea-poet was then a novelty, and opposed to the opinion of the practical seaman. A man-sail had been split by "letting fly" the sheet, but that proves nothing, as all sails will split if the clew fly loose in a gale. The lee clew of an Eighty gun ship's main-top-sail was blown over the yard-arm in consequence of the weather-sheet having carried away, that clew was hauled up first. It might not have happened had the bunt-line been well manned and hauled there been a small stann on the lee bowline. Either plan will answer if the bunt-lines are well manned and the sheets eased steadily, but that the weather clew should be set first and taken in last is preferable.

In taking in top-gallant-sails before the wind both sheets should be kept fast till the yard is down. When a top-sail is to be eased the yard should be pointed to the wind, and for the first reef the top-gallant-sheets, bunt-line, and bowlines should be hauled taut, for the second reef the top-gallant-sail should be clewed up, to keep the sheets from knocking the men at the yard-arms. In rough

weather a preventer parcel and rolling-tackle should be put on before the men go on the yards. For a fourth reef the top-sail should be clewed up during the operation, it will then be performed with less difficulty. The long reef-earls in top-sails and courses have generally given place to the lighter and more expeditious method of having reef-lines on the sails, with buckets and toggles on the jacksay. The whole strain of the sail is thus thrown on the jacksay and small eyebolts, instead of the points being firmly tied round the yard itself. Also the slab of each reef is usually allowed to hang down and chafe at the fold, but this can be prevented by fastening three or four small slab-lines on each side of each reef. Cunningham's invention for reefing top-sails is very valuable in all weakly manned ships, but it requires to be kept square upon the yard while rolling up. If it becomes necessary to shift a top-sail during a gale, it should be made up on deck in the shape it would assume if fuiled on the yard, and stopp'd with spun-yarn, with the reef-earings and bowline huddles showing near the ends and the clews and bunt-line toggles near the centre, where it would be slung by a ship stop. When the two ears are taken into the centre it will form four parts, and the weather top-mast studding-sail halyards bent round it will cause it to look like a large bale. In that state it is hoisted into the top by the ship tackle, at the same time being steadied by the studding-sail halyards. These all the ropes are bent, clew-lines and bunt-lines hauled up, reef-tackles hauled out, and the sail bent to the yard before the courses are shipped, and the sail is reefed as desired before the weather sheet is hauled home. A fore-sail or main sail is bent in a similar manner, except that the various ropes employed on a course are bent on deck, by which ropes and the burtous it is swayed up. Studding sails are very useful in long voyages, then dense on the main-mast it is to be regretted, especially in long ships. A top-mast or top-gallant top-sail will be shipped before all, by a man on the yard gathering in the sail as it is lowered to him and holding the other leech till it cuts the right way.

Coasting. During a coasting voyage the vessel must be within a moderate distance of the shore, therefore the person in charge should constantly be ready to run for shelter when necessary, and have the moral courage to do so in time. In yachting voyages, however distant, there is a natural desire to see the land and all that is worth seeing, and being so well supplied with charts, such vessels can enter any harbor, when perhaps a pilot is not able to get out. A ship sailing on a foreign voyage should seek "blue water" as soon as possible, and keep a safe distance from all land which is liable to become a lee shore, and not be tempted to edge in because a certain tack is much nearer to the desired course than the other. For the choice of tack and for mile water, see NAVIGATION.

Heaving to. To have to go to anchor is a stoppage of business done in a cutter by easing off the jib-sheet, hauling over the weather fore-sheet, and turning up the tack of the main-sail. A schooner is tacked similarly the top-sail (if she has one) is backed and the gaff-fore-sail is taken in. A ship has her courses hauled up, head-sheets eased off, and either the main or fore yard squared. Upon the latter point opinions differ. If two ships are close together, the one to windward had better haul the main-top-sail and the ship to leeward the fore-top-sail, they should always pass on a little headway. Boats invariably board ships on the lee side, small vessels, when drifting fast, on the weather side. A ship at anchor in a tide-way will always present a lee side during some period, but a "weather tide" causes a dangerous sea for boats. A boat's cans should never be tossed up or forward when there is danger of then fouling, for fear of starting the boat or running some one in the after wake.

When in the vicinity of a lee beach and landing by means of a boat is determined on, the cans should be named to the utmost and the waves watched (as they always vary), and the boat forced in on the top of the third large wave, care being taken to keep her exactly end on to the sea. At the instant of touching the ground every man should jump out and begin to haul up the boat, if she is of reasonable weight. The next wave will probably put her all out of danger. By holding on to the boat they give and receive mutual support, and avoid being sucked back by the receding water or crushed by the boat.

The term "heave to" as applied to a vessel in a gale of wind is derived from the desire to turn her bow up towards the wind and sea; this under all circumstances of sail should be the point aimed at, since then the seas strike the sails obliquely as also the bow, which is the strongest part. The best sail to keep on a ship during a violent gale are the close-reefed main-top-sail, main- and mizzen-top-sails, and fore stay-sail. The fore-top-sail also may do good, and is far preferable to a main-stay-sail. The pressure of the main-top-sail tends greatly to mitigate the violent motion, also by heeling the ship she presents a higher side to keep the sea out and a sloping deck to sail the water in running off. The helm should be about one turn "a lee," and the sails should be kept down. In the northern hemisphere ships should heave to on the starboard tack, and the reverse in southern latitudes. More sail should be made as soon as the gale moderates, to steady the ship. The violent rolling motion may sometimes be diminished by altering course, so that the period be-

tween the waves reaching the vessel may be made to disagree with her own period of oscillation, or when tanning before the wind by bearing the yards up in opposite directions. Steamers at a reduced speed can scarcely be considered as heave to, then masts and sails are too weak to be of any use in a gale and too small in moderate winds, they make the tudden do all the work. The best sail to send under is close-reefed main-top-sail, reefed fore-sail, and fore-top-mast stay-sail.

These contingencies should always be anticipated by the captain and officer of the watch, and in some degree by every man in the crew, so that the alarm should lose its effect, and the vessel be able to meet any emergency. A main falling overboard, fire, and collision. A boat's crew should be appointed in each watch, who on going on deck should see the boat ready and the plug in. If the ship be on a wind and capable of tacking, on the cry "A man overboard!" the Main helm should be put down and the ship steered round on the other tack, with either the fore or main yards left square and the courses board up, she will then drift down towards the man, while the boat, which was first on the weather side, is being lowered to pick him up. If the ship is running free the case is worse, she must be brought to the wind instantly with the head-yards square. Various plans have been devised for lowering boats, many of them very good when executed by trustworthy men, the same may be said of the old system with pump blocks and tackles, practices and coolness will render either successful.

With regard to fire, prevention is better than cure, lights in the Fire hold should never be without a protecting lantern, and passengers' sleeping-cabins should be lighted by lamps fixed in the bulkhead, inaccessible from the inside. Pumps and engines for extinguishing fire should be on the upper deck, for fear of being cut off by the first outbreak. Fire stations and ex-cases should be frequent even with the smallest crew. On the first alarm all ports and ventilators should be closed, wind-sails hauled up, hatchways closed as much as practicable, awnings and all lower sails taken in, and the ship kept before the wind, unless the fire is in the after-part, in which case the boats should be lowered at once. Many other things will present themselves to a cool head, perhaps the first order should be "Silence."

Collisions may be reckoned among those dangers against which Collisions.

no man should himself, be he ever so wise and experienced, it avails not that one ship should do what is right, unless they both do so. The laws upon the subject appear to be all that can be desired (see "Rules of the Road," under NAVIGATION, vol. xvi p. 277), but the mode of enforcing obedience is very lax and ineffectual. A purely nautical tribunal is greatly needed, and every unjustifiable deviation should be severely punished, whether followed by an accident or not. There is admitted to be a great deal of ground for the charge is so conflicting that a judge must be puzzled where to find the truth. The great increase of speed diminishes the time of approach, the increased length of vessels demands a larger circle to turn in, the want of sail at the extremities diminishes the power of turning, throwing all the work on the middle, which is proportionately much smaller than it was. The perpendicular stem gives a deadly blow at the star end, instead of first cutting down the upper works by the sloping cut-water, and probably coming to a state of rest before reaching the water's edge. Sufficient care is not taken to keep all lights from the upper deck and all places where they may disable the eyes of the officer in charge or the lookout men. Even holes have been made at the back of the bow-light box to enable the officer of the watch to see them burning, of course his eyes are thereby rendered unable to see the dangerous objects. Officers in the merchant service are invariably in two watches, which does not allow them sufficient time for sleep, especially in windy weather. If immediate action is not taken the instant a sail or a light is reported, the officer in charge should take bearings by the compass, by which he will soon know if the other vessel is inclined to pass ahead or astern. If it remains stationary by the compass, they must both be converging on the same spot.

If a ship should spring a leak at sea which may be attributable to Leaks, to straining and is sufficiently serious, she should be run before the wind and sea under small sail. If the pumps then clear out the water, she may run for a port or resume her voyage when the gale ceases. If the leak does not abate, though the motion of the ship is easy, it will be evident that a butt (end of a plank) has started if it is a wooden ship, or that a plate has given way if an iron ship. In that case, the butt or plate must be secured by being carried aft and kept square by the marks, while the ropes on the head of the sail are veered, the sail is placed like a large patch over the place leaved. Should the position of the leak not be discovered, it might be well to place the sail under the main-mast,

if this has no effect, place another sail under the fore-mast and the fore-foot. This simple device is no doubt very ancient and was probably the process called in the book of Acts "undeginding the ship."

Sails have usually been thimble, but that requires much time, and the utility is questionable. If a large hole has been made by calmar a spread sail would be burst by the pressure, but, such a hole being usually at the side and partially visible, a large sail neatly in the form in which it was stowed, having the steps cut, should be thrown over before the hole and downwards, and, when sunk below the supposed depth of the fissure, brought towards it till the light of the sail enters the vortex, when it will be sucked in violently and either disappear within the ship or block the pumps, as taken to the cabin, by this means the ship may be steered with the assistance of her sails. If there be no hemp cable on board, the largest lawful must be used with a spate top-mast or the largest spate available.

A leak can be stopped from onboard when accessible by placing over it pads of oiled or tarred canvas, tared coal-sacks, bags of white lead, tallow, paint, clay, or any material which fits close when pressed by boards and shored down firmly,—that on something similar could be done when a ship is on shore. If a ship is on shore with a large hole in one part of her bottom, she might be recovered, especially if rib-side recedes many feet, by building a double partition with a space of about 2 feet between on each side of the injured part, filling the space with clay, and showing it well,—in other words, by improving two water-tight bulkheads, the water having been pumped out of the sound parts the using tide mauls to float her. Then a ship is on shore with a small crack in her bottom, but not a larger hole, she may be floated by constant pumping, even though at first the expedient should fail to prevent the tide from ebbing and flowing in the hold. By maintaining as much as possible an inward flow the small fissures will gradually choke with weed and sand, till the inflow is so reduced as to be within the power of the pumps, hay, oakum, or dirt of any kind should be thrown over where it can be sucked into the leak. The ordinary pumps of a ship may be supplemented by nailing together four common deal boards and fitting two square valves weighted with lead, hinged and lined with leather, to rest on seats 2 feet from one end, which must be weighted on the outside as the bottom. A large hole near the top should be provided with a leather lip to shoot the water over the combings. When slung in the lights of two ropes four men jerk it up and down, the force with which it descends through the water will send a stream up the tube with less labour than being used on shore.

Ship on shore

Ships on shore should be secured from driving into a worse position before being freed from any weight. Haul substances such as guns and shot should not be thrown on the lee side or where the ship in hauling off might strike on them. Keep sufficient fresh water for immediate use. An anchor is usually carried out between two boats, the flukes being hung to a spar across the boats checked up from the thwart, the stock is suspended across the sterns of the boats. The boats should be hauled out to a kedg anchor, while other boats support short heights of lamp cable. Good axes should be used for letting go the anchor.

Rudders.

A wooden rudder when immersed is very little heavier than water and can be shipped and unshipped by seamen with ordinary appliances, but on ships have metal rudders sometimes weighing as much as 20 tons. The following remarks apply to wooden rudders only. To incline a rudder requires the woodcock, a check recessed and nailed to the stern-post close above the upper pintle,—the use of which is to prevent it being unhinged by accident. From a beam or check above the rudder-head suspend two luff-tackles, single blocks, and two leads up, and the double blocks down to strops through the tiller hole. A few men on each luff-fall will easily lift the rudder the length of the pintles, and as they are drawn from the guddens it will swing free and may be lowered between two boats suspended by spars across their gunwales, the height of a rope will bring the head up to a position similar to that of the head,—nearly horizontal. It can then be taken under the main-yard and hoisted in, or be carried for repair to a wharf or suitable beach at high water. Before a rudder is taken off to be hung, two long guys are rove through holes for the purpose at the fore-part of the head, one of each being hitched to the band for the rudder-chains, while the other is as readiness to hand into the ship half-way forward and low down. On the rudder-head being suspended by the luff-tackles a little higher than its position when shipped, the guys will haul it to the exact line with the stern-post, it is then lowered into the guddens, the guys unrove by means of the short coils, and the woodcock replaced. Smooth water is desirable for that operation, a little tide in a line with the keel will assist. The tiller should be firmly wedged or secured in the rudder-head so as to prevent any jerking motion, for the same reason, the wheel ropes should be kept moderately taut; they should also be rove in two parts, lashed together on top of the wheel, for convenience in shifting them one part at a time. The rudder-chains are shackled to a band, which embraces the rudder a little above the water, and is attached to a stout rope, usually stopped up round the counter ready

to receive tackles, by which the ship may be steered imperfectly after the rudder-head is dislashed.

The construction of a temporary rudder has always been considered an interesting and highly useful piece of seamanship. One easy plan is to pass the end of a large hemp cable out of the rudder-head or central post, haul it up to the ship's side, lash to it one or more large spars, sling the whole bundle about the centre of the spars with stout hawsers as guys, throw it overboard, and leave in a part of the cable, leaving the part with the spars lashed to the side of it far enough away not to be lifted out of the water with the pitch of the ship. The guys when rove through blocks on the spare top-sail yard-arms, which are lashed across the gunnel for the pumps, are taken to the cabin, by this means the ship may be steered with the assistance of her sails. If there be no hemp cable on board, the largest lawful must be used with a spate top-mast or the largest spate available.

Early in the 19th century Captain Edward Pakenham contrived an efficient rudder with the material in his ship. Part of a top-mast heel up formed the rudder head and main-piece, the fid-hole becoming the tiller-hole. The main-piece passed through the round hole of the lower cable which was made of elm and lined with leather, and which, being secured by a collar near the lower part, acted for pintles and guddens, and was drawn into place by two hawsers *h, h*, till it embraced the stern-post by the square intended for the mast-head (fig 39). These should be ropes to the bolts *b, b* to keep it horizontal. Another top-mast was cut, which with the remainder of the first made four parts in all, flattened and fitted together, woodlashed and bolted, and so forming the required width. Three pieces of ballast were let into the lower part, and the whole planked over and secured with spike nails. Fine weather was necessary for shipping it and a collar was built above the rudder-hole to confine the motion and to support the weight. The materials carried in modern ships may differ, but a feasible mind will generally find substitutes. The "Pogue" frigate, commanded by the Hon H J Ross, steered across the Atlantic during sixteen days of almost continuous gales, a distance of 1500 miles, by means of a cable over the stern and a Pakenham rudder during part of the time. She had been on shore in the Gulf of St Lawrence, during the voyage she was washed 20 inches of water on her side, she had also six masts sprung, she reached St Helens in the Isle of Wight on the 13th of October 1855.

It is a difficult thing to get a lower yard from the deck into its Raising place without letting go other stays or rigging, and this the following instance will illustrate. The "Thunderer," an eighty-four yard gun ship, broke her main-yard, which was 112 feet long, completely in two, 5 feet to leeward of the slings. The broken parts were sent down, and a main-top sail-yard crossed instead, while a reefed top-sail did duty as a course and a mizen-top-sail over it as a main-top-sail. The parts of the main-yard were placed together on deck, the two halves of a spare anchor stock were let in on the fore and aft sides and an oak mast fish on top, with some studding-sail-booms to round it off. All parts were bolted, hooped, and woodlashed together, making it as strong as ever it was, entirely from the material carried in the ship.

To represent the time of dipping the port yard-arm under the main stay *y* represents the jacks, which bear the principal weight (total, 64 tons), the two fore-tackles lashed to the masts-head, *p, p* the masts-head pendants, *f, f* a top-button, *s, s* a sail-tackle to the top-mast-head, *m, m* main-tackles from the mast-head pendants, *l* the main-fall, *y* a yard-tackle secured to an upper-deck beam. The main-yard was entirely rigged before being crossed; the blocks are not shown. In a long ship the operation would be easier. When a fore-yard has to be got across from the deck, time and trouble can be saved by letting go, half at a time, all the fore-rigging and back-stays which are on that side.

When feeling the way into harbour during a thick fog, let a boat pretend to tow the ship with the deep-sea lead-line, by this means a margin of 100 fathoms of safety will be secured. Care should be taken that every running rope in the ship be slackened previous to rain or heavy dew.

For further information and variety of opinions see Captain Francis Lister, R.N., *Points of Seamanship and Discipline*, Robert Kipping, *Masting, Mast-making, and Rigging Ships*, Vanderkroon, *The Trench*, Lord R. H. Nassau, *Seaman's Manual* (18th ed., 1857), Captain Abner S. Searns, *Seamanship*, Charles Bushell, *Rigger's Guide*, Captain Sir George S. Nares, *Seamanship* (18th ed.)

A B, "able-bodied," signifies a trained seaman. *Aboard* (prep and adv.), relatively nearer the stern. *Abeam*, in a direction abreast the ship. *Above ship*, towards the bow. *Accommodation-ladder*, a flight of steps, over the side, leading to the deck, suitable for ladies. *Afloat*, severed from all security. *Aft*, towards the stern. *Armning the lead*, placing tallow in the cavity at the end to bung up openings from the bottom. *Astern*, behind, to pass astern is to go behind. *thence*, across, as across the bows. *Avast* (as in the expressions, "Avast here," "Avast heaving"), stop.

[illegible][illegible][illegible]

keep under the heel the jibboom. *Critch*, an iron rest for a boom, a metal swivel for an oar to work in. *Cut and run*, to cut the cable and go in haste. *Dart*, a jerk of wood or iron to lift a weight. *Deaden her way*, to retard progress. *Dead eye*, a clump of wood with three holes, without sheaves, an iron frame for setting up rigging. *Derrick*, a single spar held by guys to lift a weight. *Dog*, *Dog*, *Dog*, a cry of the crew. *Dog*, a small boat. *Dog*, the leech of the sail between the reefs when allowed to stick up. *Dog* *van*, a small set of fasteners for the use of the quartermaster. *Dog-watch*, 4 to 6 and 6 to 8 P.M., figuratively, a short time. *Downs*, to lower a sail, put out a light.

[illegible][illegible][illegible][illegible]

Inboard, any place within the ship. In irons, when the sails are so badly arranged that the vessel will not obey the helm. In the wind, too close, the sails flapping.

each seaman, or otherwise to ascertain that each seaman understands the same before he signs it, and is to attest each signature, (3) the agreement is to be in duplicate, one part to be retained by the superintendent, the other by the master, (4) in the case of substitutes, they are where possible to be engaged before a superintendent, in other cases the agreement is to be sent over and explained to the seaman by the master and signed by the seaman in the presence of a witness (s 150). The only cases where no agreement in writing is necessary is where the hiring is for a coaster of less than eighty tons register or for a foreign vessel. In the case of union apprentices the indentures must be executed in the presence of and attested by two justices. No stamp duty is chargeable on indentures for the sea service. In the case of foreign-going ships making voyages averaging less than six months in duration, running agreements with the crew may be made (s 151). No person unlicensed by the Board of Trade, other than a master or mate or agent of the owner, may engage or supply seamen. The discharge of a seaman, like his engagement, must take place before a superintendent or an officer of equivalent authority. The seaman is entitled to receive a certificate of service and discharge. His wages must be paid within a limited time from his discharge, varying according to circumstances, and are not now dependent, as they were at common law, upon the earning of freight. If he is discharged before a month's wages are earned, he is entitled to a month's wages. As far as possible, payment is to be made in money and not by bill. In the absence of special stipulations, wages are not generally due until the contract of service is complete. By 4 Geo. IV. c. 7, s. 7, no seaman may advance a seaman more than half his wages while aboard. Sums recoverable as wages are, in addition to wages properly so called, the expenses of subsistence and of the voyage home when a ship is sold or transferred abroad, and the master does not deposit with a consular officer a sufficient sum for the seaman's expenses pursuant to s 205, the expenses of a seaman left behind or discharged from a British ship, or a British subject from a foreign ship, out of the United Kingdom, allowance for shore and land provisions, the moneys and effects of a deceased seaman who has been employed on a British ship, expenses caused by illness from want of proper food and accommodation and medicines, and double pay for every day, not exceeding ten, during which payment of wages is delayed without proper cause. Wages cannot be attached. They may be forfeited or reduced by desertion, wilful disobedience, smuggling, want of assistance, or any offence committed by neglect or default of the seaman, and misconduct of other kinds. Advance notes—that is, documents promising the future payment of money on account of a seaman's wages conditionally on his going to sea and made before the wages have been earned—are void, and no money paid in respect of an advance note can be deducted from the wages earned. Merchant Seamen (Payment of Wages and Rating) Act, 1850 (43 & 44 Vict. c. 13, s. 2). Allotment notes may be made in the form prescribed by the Board of Trade, and may stipulate for the allotment of not more than half the seaman's wages in favour of a wife, parent, grandparent, child, grandchild, brother or sister (s 169), or of a savings bank (43 & 44 Vict. c. 16, s. 3). Seamen's savings banks have been established and are administered by the Board of Trade, chiefly under the powers given by the Seamen's Savings Banks Act, 1856. If during the absence of a seaman on a voyage his wife and family become chargeable to the parish, two-thirds of his wages at the last rate at which he can be recovered by the parish. Careful provision is made for the custody of a deceased seaman's effects and wages, and then delivery to his representatives. The possibility of a seaman's being left destitute abroad is provided against by ss 206, 207. Consular officers abroad are bound to send home any distressed or shipwrecked seaman, the expenses being chargeable upon the mercantile marine fund. Compensation is to be made in such cases for loss of property, provisions or water on board. If a complaint of the quality or sufficiency be frivolous, the persons complaining are liable to forfeit a week's wages. All foreign-going ships are to carry proper medicines and medical stores. Lime and lemon juice and other antiscorbutics are to be provided on ships bound to foreign ports other than ports in Europe and the north of North America. An ounce of a pint of lemon juice is to be served to each member of the crew after the ship has been used for ten days (Act of 1837, 30 & 31 Vict. c. 124, s. 4). A foreign-going ship having one hundred persons or upwards on board must carry a qualified medical man (s 130). Each seaman or apprentice is entitled to a space of not less than 72 cubic feet, the place to be securely constructed, properly lighted and ventilated, and properly protected from weather and sea, and as far as possible from effluvia caused by cargo or bilge-water. The place is to be inspected and certified by a surveyor of the Board of Trade, and to be kept free from goods and stores. The local marine board (or the Board of Trade where there is no local marine board) may appoint a medical inspector of seamen, who may on application by the master or owner report to the superintendent of the mercantile marine office as to whether any seaman is fit for duty (30 and 31 Vict. c. 124, ss 9, 10).

Bye-laws and regulations relating to seamen's lodging-houses may be made by the sanitary authority of any seaport town with the sanction of the president of the Board of Trade. Such bye-laws and regulations are to provide for the licensing of seamen's lodging-houses, the inspection of the same, the sanitary conditions of the same, the publication of the fact of a house being licensed, the due execution of the bye-laws and regulations and the non-obstruction of persons engaged in securing such execution, the preventing of persons not duly licensed holding themselves out as keepers or purporting to keep licensed houses, and the exclusion from licensed houses of persons of improper character (46 and 47 Vict. c. 41, s. 48). Provision is made for the protection of seamen from imposition by cruises and lodging-house keepers. This protection may in certain cases be extended by order in council to foreign ships (s 237, and 43 and 44 Vict. c. 16, ss 5, 6). At the time of discharge of the crew in the United Kingdom a list in the form sanctioned by the Board of Trade is to be made out and delivered to a superintendent of a mercantile marine office containing, *inter alia*, the following particulars—(1) the number and date of the ship's register and her registered tonnage, (2) the length and general nature of the voyage or employment, (3) the Christian names, surnames, ages, and places of birth of all the crew, including the master and apprentices, their qualities on board, their last ships or other employments, and the dates and places of their joining the ship, (4) the names of any members of the crew who have been married or hurt, with the times, places, causes, and circumstances thereof, (5) the wages due at the time of their respective discharges to any of the crew who have died, (6) the clothing and effects of any other effects belonging to any crew who have died, with a statement of the manner in which they have been dealt with, and the money for which any of them have been sold (s 273). Every birth or death occurring at sea is to be recorded in the log-book and reported on arrival at any port in the United Kingdom to the registrar-general of shipping and seamen, who forwards a certified copy to the registrar-general of births and deaths (37 and 38 Vict. c. 88, s. 37). An official log-book is a form sanctioned by the Board of Trade is to be kept by the master of every ship except a coaster. It must contain, *inter alia*, (1) every legal conviction of any member of his crew and the punishment inflicted, (2) every offence committed by any member of his crew for which it is intended to prosecute, or to enforce a forfeiture, or to exact a fine, together with a statement concerning the reading over of such entry and concerning the reply (if any) made to the charges, (3) every offence for which offence for which the punishment inflicted, (4) a statement of the conduct, character, and qualifications of each of his crew, or a statement that he declines to give an opinion on such particulars, (5) every case of illness or injury happening to any member of the crew, with the nature thereof and the medical treatment adopted (if any), (6) the name of every seaman or apprentice who ceases to be a member of the crew, otherwise than by death, with the time, place, manner, and cause thereof, (7) the amount of wages due to any seaman who enters Her Majesty's service during the voyage, (8) the wages due to any seaman or apprentice who dies during the voyage, and the gross amount of all deductions to be made therefrom, (9) the sale of the effects of any seaman or apprentice who dies during the voyage, including a statement of each article sold and of the sum received for it (s 282). At common law there was no obligation of the owner to provide a seaworthy ship, but by the Act of 1876 every person who sends or attempts to send, or to party to assist or attempting to send, a British ship to sea in such unseaworthy state that the life of any person is likely to be thereby endangered is guilty of a misdemeanour, unless he proves that he used all reasonable means to insure her being sent to sea in a seaworthy state, or that he going to sea in such unseaworthy state was under the circumstances reasonable and justifiable. A master knowingly taking a British ship to sea in such unseaworthy state, or party to the life of any person is likely to be thereby endangered is guilty of a misdemeanour. In every contract of service between the owner and the master or any seaman and in every indenture of sea apprenticeship, an obligation is implied that the owner, master, and agent shall use all reasonable means to insure the seaworthiness of the ship (39 and 40 Vict. c. 80, s. 4). A return of certain particulars, such as lists of crews and of distressed seamen sent home from abroad, a list of deaths, births, and discharges at sea, must be sent to the registrar-general of shipping and seamen, an officer of the Board of Trade. The seaman is privileged in the matter of wills (see WILLS), and is exempt from serving in the militia (42 Geo. III. c. 90, s. 43). Assaults upon seamen with intent to prevent them working at their occupation are punishable summarily by 24 and 25 Vict. c. 100, s. 40. There are special enactments in favour of Lascars and foreign seamen on British ships (see 4 Geo. IV. c. 80; 17 and 18 Vict. c. 104, s. 544; 17 and 18 Vict. c. 120, s. 18; and 19 Vict. c. 91, s. 10). In addition to this legislation directly in his interest, the seaman is indirectly protected by the provisions of the Merchant Shipping Acts requiring the possession of certificates of competency by ships' officers, the periodical survey of ships by the Board of Trade, and the enactments against deck cargoes and overloading, as well as by

other Acts, such as the Chain Cables and Anchors Acts, enforcing a minimum strength of cables and anchors, and the Passenger Acts, under which a proper supply of life-boats and life-buoys must be provided.

The duties of the seamen appear to be to obey the master in all lawful matters relating to the navigation of the ship and to assist him, to encourage him in what he may become entitled to prize money under 22 and 23 Car II c 11 (see Prize). Any services beyond these would fall under the head of salvage service and be recompensed accordingly. There are certain offences for which the seaman is liable to be summarily punished under the Act of 1854. They comprise desertion, neglect or refusal to join his ship or abscond with her, quitting the ship without leave before she is placed in security, wilful disobedience to lawful command, either on one occasion or continued, assault upon a master or mate, combining to disobey lawful commands or to neglect duty or to impede the navigation of the ship or the progress of the voyage, wilful damage to the ship, or embezzlement of or wilful damage to her stores or cargo, and smuggling. The punishment varies from forfeiture of all or part of his wages to twelve weeks' imprisonment (s 243), as amended by the Merchant Seamen Act, 1880.

A master, seaman, or apprentice who by wilful breach of duty, or by neglect of duty, or by reason of drunkenness, does any act tending to the immediate loss, destruction, or serious damage of the ship or to immediately endanger the life or limb of any person belonging to or on board of the ship, or who by wilful breach of duty, or by neglect of duty, or by reason of drunkenness or omits to do any lawful or proper act and requests to be done by him for preserving the ship from immediate destruction, or serious damage, or for preserving any person belonging to or on board of the ship from immediate danger to life or limb, is guilty of a misdemeanour (s 259). A seaman is also punishable at common law for piracy and by statute for piracy and offences against the Slave Trade Acts. A riotous assembly of seamen to prevent the loading or unloading of any ship or to prevent others from working is an offence under 33 Geo III c 67 (see Riot). Desertion between emigrant ships is punishable by 12 and 13 Vict c 25, and from any foreign ship by 15 and 16 Vict c 26, of course by virtue of conventions with Portugal and other foreign powers. The rating of seamen is now regulated by the Merchant Seamen Act, 1880. By that Act a seaman is not entitled to the rating of "A B" unless he has served four years before the mast, or three years or more in a registered decked fishing vessel and one year at sea in a sailing vessel (43 and 44 Vict c 61, s 184). Desertion from a fishing vessel contributes to seamen's refuges and hospitals to be charged upon the mercantile marine fund. As a matter of fact, however, there appears to be no grant in support of seamen's hospitals out of any public funds. The principal seamen's hospital is that at Greenwich, established in 1821 and incorporated by 3 and 4 Will IV c 9 under the name of "The Seamen's Hospital Society." Up to 1870 this hospital occupied the old "Deadweight" at Greenwich, but in that year it obtained the use of a new and commodious hospital from the admiralty at a nominal rent, in return for which a certain number of beds are to be at the disposal of the admiralty. The hospital is supported by voluntary contributions, including those of many foreign Governments, and has been its foundation and the end of 1884 relieved no less than 253,829 seamen of all nations. There is also a dispensary for seamen at the London Docks, and a floating hospital at Cardiff, equally supported by voluntary contributions. At one time there was an excellent contribution of sixpence a month from the pay of masters and seamen towards the funds of Greenwich Hospital, levied under the powers of some of the Greenwich Hospital Acts. The payment of these contributions enabled them to receive annuities from the funds of the hospital. These "Greenwich Hospital sixpences," however, became the source of very considerable irritation and have now been discontinued. In their place a purely voluntary seamen's provident fund has been established, its object being to persuade seamen to subscribe sixpence a month towards the seamen's hospital.

The remedies of the seaman for wages are an ordinary action in the Queen's Bench Division or plaint in a county court, an action *in rem* or *in personam* in the Admiralty Division of the High Court (in Scotland in the Court of Session), a Vice-Admiralty Court, or a county court having admiralty jurisdiction, or summary proceedings before justices, or before a superintendent of a mercantile marine office. The master has the same remedies as the seaman for his wages, under which are included all disbursements made on account of the ship. At common law he had only a personal action against the owner. He has the additional advantage of being able to insure his wages, which a seaman cannot do. A common law action for wages is seldom brought, the statutory remedies being more convenient. By the Admiralty Court Act, 1861, the High Court of Justice (Admiralty Division) has jurisdiction over any claim by a seaman of any ship for wages earned by him on board the ship, whether the same be due under a special contract or otherwise (24 Vict. c 10, s 10). This section has been liberally construed and held to apply to such persons as a surgeon, purser, pilot, carpenter, and steward. The court can entertain

claims by foreign seamen against a foreign ship, on notice being given to the consul of the foreign country. If he protest, the court has a discretion to determine whether the action shall proceed or not. A claim for wages in the High Court must be brought within six years (4 and 5 Anne, c 3, s 17). The Vice-Admiralty Court Act, 1863, gives jurisdiction in claims for wages in respect of amount to vice-admiralty courts. A county court having admiralty jurisdiction may entertain claims for wages where the amount claimed does not exceed £150 (31 and 32 Vict c 71, s 8). The jurisdiction of the inferior court is protected by the proviso that, if the action be brought in the High Court for a claim not exceeding £150, the plaintiff may be condemned in costs, and will not be entitled to costs if he recovers less than this sum, unless the judge certifies that it was a proper case to be heard in the High Court (s 9). In actions in all courts of admiralty jurisdiction the seaman has a maritime lien on the ship and freight, ranking next after claims for salvage and damage. The amount recoverable summarily before justices is limited to £50. Orders may be enforced by distress of the ship and her tackle. Proceedings must be taken within six months. A naval court on a foreign station may determine questions as to wages without limit of amount. As a rule a seaman cannot sue abroad for wages due for a voyage to terminate in the United Kingdom. The superintendent of a mercantile marine office has power to decide any question whatever between a master and owner and any of his crew which both parties in writing agree to submit to him. These summary remedies are all given by the Act of 1854. The Merchant Seamen Act, 1880, extends the jurisdiction of the superintendent of a mercantile marine office to questions as to wages in cases where a superintendent, if the amount in question is not less than £25, the superintendent may adjudge finally, unless he is of opinion that a court of law ought to decide it. The same Act extends the provisions of the Employers and Workmen Act, 1875, to seamen. The Act of 1875 itself specially excluded them. A county court or court of summary jurisdiction (the latter limited to claims not exceeding £10) may under the Act of 1875 determine all disputes between an employer and workman arising out of their relation as such. The jurisdiction of courts of summary jurisdiction is protected by the enactment of the Act of 1854 that no proceeding for the recovery of wages under £50 is to be instituted in a superior court unless either the owner of the ship is bankrupt, or the ship is under arrest or sold by the authority of such court, or the justices refuse the case to such court, or neither owner nor master is or resides within the limits of the place where the seaman is put ashore (s 159). It should be noticed that claims for wages in respect of amount may be brought in all county courts and before justices without any limit as to amount (s 169). In Scotland the sheriff court has concurrent jurisdiction with justices in claims for wages and upon allotment notes.

Fishermen.—The regulations respecting fishermen are contained chiefly in the Sea Fisheries Acts, 1868 and 1883, and in the Merchant Shipping (Fishing-Boats) Act, 1880. The Sea Fisheries Act of 1868 constituted a registry of fishing-boats, and that of 1883 gave powers of enforcing the provisions of the Acts to sea-fishery officers. The Merchant Shipping (Fishing-Boats) Act was passed in consequence of the occurrence of some cases of barbarous treatment of boys by the skippers of North Sea trawlers. The Act provides, *inter alia*, that indentures of apprenticeship are to be in a certain form and entered into before a superintendent of a mercantile marine office, and that no boy under 16 years of age is to be employed in sea-fishery, that agreements with seamen on a fishing-boat are to contain the same particulars as those with merchant seamen, that running agreements may be made in the case of short voyages, that reports of the names of the crew are to be sent to a superintendent of a mercantile marine office, and that accounts of wages and certificates of discharge are to be given to seamen. No fishing-boat is to go to sea without a duly certified skipper. Provision is also made for securing reports of cases of neglect, injury, ill-treatment, or punishment of any of the crew, and for inquiry into the cause of such death, &c. Disputes between skippers or owners and seamen are to be determined at request of any of the parties concerned by a superintendent. For special privileges of fishermen in the use of the seashore, see RIPARIAN LAWS. They are also exempt from Trinity House dues. There are numerous police provisions contained in various Acts of Parliament dealing with the breach of fishery regulations. These provisions act as an indirect restriction to honest fishermen in their employment. The rights of British fishermen in foreign waters and foreign fishermen in British waters are in many cases regulated by treaty, generally confirmed in the United Kingdom by Act of Parliament. A royal fund for widows and orphans of fishermen has recently been formed, the nucleus of the fund being part of the profits of the Fisheries Exhibition held in London in 1883.

United States.—The law of the United States is in general accord-

¹ See the works on merchant shipping, such as those of Abbott, Maclean, Maule and Pollock, Rose, Admiralty Law and Practice, Williams and Bruce, Admiralty Practice, also Rose, Modern Legislation for Seamen and for Safety at Sea, 1885.

ance with that of England. The law relating to seamen in the navy will be found in the articles for the government of the navy (*Revised Statutes*, a 1624) Legislation in the interests of merchant seamen dates from 1790 A list of the crew must be delivered to a collector of customs The shipping articles are the same as those in use in the United Kingdom For vessels in the coasting trade they are, with certain exceptions, to be in writing or in print They must in the case of foreign-bound ships be signed before a shipping commissioner appointed by the circuit court or a collector of customs, or (if entered into abroad) a consular officer, where practicable, and must be acknowledged by his signature in a prescribed form One third of a seaman's wages earned up to that time is due at every port where the ship unloads and delivers her cargo before the voyage is ended They must be fully paid in gold or silver equivalent within twenty days of the discharge of the cargo Advance notes can be made only in favour of the seaman himself or his wife or mother There is a summary remedy for wages before a district court, a justice of the peace, or a commissioner of a district court A shipping commissioner may act as arbitrator by written consent of the parties Seaworthiness is an implied condition of the hiring There may be an examination of the ship on the complaint of the mate and a majority of the crew The expenses of an unnecessary investigation are charged upon the wages of those who complain A seaman may not leave his ship without the consent of the master For foreign-bound voyages a medicine-chest and antiscorbutics must be carried, also 60 gallons of water, 100 lb of salted meat, and 100 lb of wholesome bread for every person on board, and for every seaman at least one suit of woollen clothing, and fuel for the fire of the seaman's room An assessment of forty cents per month per seaman is levied on every vessel arriving from a foreign port and on every registered coasting vessel in aid of the fund for the relief of sick and disabled seamen In the navy a deduction of twenty cents per month from each man's pay is made for the same purpose The offences and punishments are similar to those in the United Kingdom There is also the additional offence of visiting a hostile ship on board¹ (J. Wt.)

SEARCH, RIGHT OF. "The right of visiting and searching ships on the high seas," says Lord Stowell, "whatever be the ships, whatever be the cargoes, whatever be the destinations, is an incontestible right of the lawfully commissioned ship of a belligerent nation, because till they are visited and searched it does not appear what the ships or the cargoes or the destinations are; and it is for the purpose of ascertaining these points that the necessity of this right of visitation and search exists This right is so clear in principle that no man can deny it who admits the right of maritime capture, because if you are not at liberty to ascertain by sufficient enquiry whether there is property which can be legally captured, it is impossible to capture" ("The Maria," 1 C Robinson's Reports, 36). This right of search or visitation and search has not been at all times recognized The second armed neutrality of the Baltic powers in 1800 attempted to withdraw their vessels from the right The bombardment of Copenhagen in 1801 was one of the results of this policy Since the convention which followed that event the right has been regarded as established within proper limits, and is often regulated by treaty, especially as to the search of vessels suspected of being engaged in the slave trade Apart from treaty, the main rules which govern the right are these (1) It is a belligerent right, and can be exercised only in time of war, unless in the case of a vessel reasonably suspected of piracy or breach of revenue regulations (2) It can be exercised only by a ship of war duly commissioned by the sovereign of the belligerent power and only in the case of a merchant vessel, whether of an enemy or neutral power (3) It cannot be exercised in neutral waters, and an attempt to exercise it in such waters is a gross violation of neutrality (4) It can be exercised only for certain purposes, such as to examine the ship's papers and to see whether she carries any contraband goods (5) After the ship of war has raised her flag an affirming gun (*coup d'assurance*) loaded with blank cartridge must be fired to bring the merchant vessel to (6) In case of reasonable suspicion it is the duty of the ship of war to detain the

merchant vessel for the decision of a prize court Resistance by a neutral vessel, whether alone or in convoy, renders her liable to capture according to the English and United States doctrine But most Continental authorities lay down that the declaration of the officer in charge of the convoy is to be accepted, and that a refusal to accept such declaration may justify the convoy in resisting search There is also a conflict of opinion as to whether a neutral loses his neutral rights by loading his goods on board an armed ship of the enemy It has been held in England that such a proceeding is a violation of neutrality, as affording a presumption of resistance to search

The right of search is historically interesting, as on two occasions it has brought Great Britain into collision with the United States One of the causes of the war of 1812 was the right then claimed (but since abandoned) by Great Britain of searching vessels of the United States for British subjects serving in them as seamen, with a view to impressing them for the royal navy In 1861 the British mail steamer "Trent" was stopped on the high seas by a United States ship of war, and Messrs Shidell and Mason, two commissioners of the Confederate States proceeding to Europe, were taken out of her and afterwards imprisoned in the United States On diplomatic representations being made at Washington by the ambassadors of Great Britain and other powers the commissioners were released, and a war was avoided

SEA-SERPENT. The belief in enormous serpents, both terrestrial and marine, dates from very early times Pliny (*H N*, viii 14), following Livy (*Ept*, xviii), tells us of a land-serpent 120 feet long, which Regulus and his army besieged with laurels, as though it had been a city, and this story is repeated by several other writers (Plorus, ii 2, Val Max, i 8, Gellius, vi 3) The most prolific in accounts of the sea-serpent, however, are the early Norse writers, to whom the "So-Orm" was a subject both for prose and verse Olaus Magnus (*Hist Gent Sept*, xxi 24) describes it as 200 feet long and 20 feet round, and states that it not only ate calves, sheep, and swine, but also "disturbs ships, rising up like a mast, and sometimes snaps some of the men from the deck," illustrating his account with a vivid representation of the animal in the very act Pontoppidan, in his *Natural History* (Eng tr, 1755, p 195 *sq*), says that its existence was generally believed in by the sailors and fishermen of his time, and recounts the means they adopted to escape it, as well as many details regarding the habits of the creature The more circumstantial records of comparatively modern times may be most conveniently grouped according to the causes which presumably gave rise to the phenomena described (1) A number of porpoises swimming one behind another may, by their characteristic mode of half emerging from and then re-entering the water during respiration, produce the appearance of a single animal showing a succession of snake-like undulations The figure given by Pontoppidan was very likely suggested by such an appearance, and a sketch of an animal seen off Llandudno by several observers² looks as though it might have had a similar origin, notwithstanding that this hypothesis was rejected by them (2) A flight of sea-fowl on one occasion recorded by Professor Aldis³ produced the appearance of a snake swimming at the surface of the water (3) A large mass of seaweed has on more than one occasion been cautiously approached and even harpooned under the impression that it was such a monster⁴ (4) A pair of basking sharks (*Selache maxima*) furnish an explanation of some of the recorded observations, as was first pointed out by Frank Buckland These fish have a habit of swimming

in pairs, one following the other with the dorsal fin and the upper lobe of the tail just appearing above the water, and, as each animal is fully 30 feet long, the effect of a body of 60 or more feet long moving through the water is readily produced. To this category belongs the famous serpent cast up on Stronsay, one of the Orkneys, of which an account was read to the Wernerian Society of Edinburgh¹, some of its vertebrae were preserved in the Royal College of Surgeons of London, and identified as those of *Selache maxima* by both Home and Owen². There is also evidence to show that specimens of *Carcharodon* must have existed more than 100 feet long³. (5) Ribbon-fish (*Regalecus*), from their snake-like form and great length (sometimes as much as 20 feet), have been suggested as the origin of so-called "sea-serpents" amongst others by Dr Andrew Wilson⁴, but Dr Gunther⁵, from what is known regarding the habits of these fish, does not regard the theory as tenable. (6) A gigantic squid (*Architeuthis*) was most likely the foundation of the old Norse accounts,⁶ and also of those which in the early part of the 19th century came so frequently from the United States as to gain for the animal the sobriquet of "American sea-serpent"⁷. These stories were so circumstantial and on the whole so consistent, and vouched for by persons of such eminence, that no doubt was possible (notwithstanding the cavilling of Mitchell)⁸ as to the existence of a strange marine monster of very definite character in those regions. The description commonly given of it has been summed up by Gosse⁹ somewhat thus—(i) general form that of a serpent, (ii) length averaging 60 feet, (iii) head flattened, eye generally not mentioned, some distinctly stating that it was not seen, (iv) neck 12 to 16 inches in diameter, (v) appendages on the head, neck, or back (accounts here variable), (vi) colour dark, lighter below, (vii) swims at the surface, head thrown forward and slightly elevated, (viii) progression steady and uniform, body straight but capable of being bent, (ix) water spouting from it, (x) in shape like a "nun buoy". The annexed figure (fig 1) represents one which was seen from H.M.S. "Daedalus"¹⁰. To show the reasonableness of this hypothesis, it may be added

FIG. 1.—Sea-serpent, as seen from H.M.S. "Daedalus."

that gigantic Cephalopods are not unfrequent on the shores of Newfoundland,¹¹ and are occasionally met with on the coasts of Scandinavia,¹² Denmark, and the British Isles,¹³ that their extreme size seems to be above 60 feet, and, furthermore, that their mode of progression is by means of a jet of water forcibly expelled from the siphon, which would impart that equable motion to which several

observers allude as being evidently not produced by any serpentine bending of the body. A very interesting account of a monster almost certainly originating in one of these squids is that of Hans Egede,¹⁴ the well-known missionary to Greenland, the drawing by Bing, given in his work, is reproduced here (fig 2), along with a sketch of a squid in the act of rearing itself out from the water (fig 3), an action which they have been observed in aquaria habitually to perform. Numerous other accounts seem to be explicable by this hypothesis.¹⁵ (7) A sea-lion, or "Anson's seal" (*Morunga elephantina*), was suggested by Owen¹⁶ as a possible explanation of the serpent seen from H.M.S. "Daedalus", but a thus was afterwards rejected by Captain M'Quahae,¹⁷ who stated that it could not have been any animal of the seal kind, it seems better to refer the appearance to a squid as above stated. (8) A plesiosaurus, or some other of the huge marine reptiles usually believed to be extinct, might certainly have produced the phenomena described, granting the possibility of one having survived to the present time. Newman¹⁸ and Gosse¹⁹ have both supported this theory, the former citing as evidence in its favour the report of a creature with the body of an alligator, a long neck, and four paddles having been seen by Captain Hope of H.M.S. "Fly" in the Gulf of California.²⁰ (9) No satisfactory explanation has yet been given of certain descriptions of the sea-serpent, among others of this class may be mentioned the huge snake seen by certain of the crew²¹ of the "Pauline" in the South Atlantic Ocean, which was coiled twice round a large sperm whale, and then towered up many feet into the air, and finally dragged the whale to the bottom. Perhaps the most remarkable, however, is Lieutenant Hayne's²² account of a creature seen from H.M. yacht "Osborne" where two different aspects were recorded,—the first being a ridge, 30 feet in length, of tri-

angular fins, each rising 5 to 6 feet above the water, while the second wing showed a large round head 6 feet in diameter, with huge flappers, which moved like those of a turtle! It would thus appear that, while, with very few exceptions, all the so-called "sea-serpents" can be explained by reference to some well-known animal or other natural object, there is still a residuum sufficient to prevent modern zoologists from denying the possibility that some such creature may after all exist.

Quite distinct in origin from the stories already touched on is the legend of the sea-serpent or *tunnin* among the Arabs (Mas'udi, i 266 sq., Kazwini, i 132 sq., Damiri, i 186 sq.), which is described in such a way as to leave no doubt that the waterspout is the phenomenon on which the fable rests. The *tunnin* is the Hebrew *tannin* (E V "whale," "dragon"), which in Ps cxlvi 7 might in the context be appropriately rendered "waterspout."

SEA-SICKNESS, a peculiar set of symptoms experienced by many persons when subjected to the pitching and rolling motion of a vessel at sea, of which depression, giddiness, nausea, and vomiting are the most prominent.

Although the vast majority of persons appear to be liable to this ailment on exposure to its exciting cause (the instances of complete and constant immunity being rare), they do not all suffer alike. Many endure distress of a most acute and even alarming kind, while others are simply conscious of transient feelings of nausea and discomfort. In long voyages, while many are affected with sea-sickness for the first few days only, others are tormented with it during the entire period, especially on the occurrence of rough weather. In short voyages, such as across the English Channel, not a few even of those susceptible escape, while others suffer in an extreme degree, the sickness persisting long after arrival on shore.

The symptoms generally show themselves soon after the vessel has begun to roll by the onset of giddiness and discomfort in the head, together with a sense of nausea and sinking at the stomach, which soon develops into intense sickness and vomiting. At first the contents of the stomach only are ejected; but thereafter bilious matter, and occasionally even blood, are brought up by the violence of the retching. The vomiting is liable to exacerbations according to the amount of oscillation of the ship, but seasons of rest, sometimes admitting of sleep, occasionally intervene. Along with the sickness there is great physical prostration, as shown in the pallor of the skin, cold sweats, and feeble pulse, accompanied with mental depression and wretchedness. In almost all instances the attack has a favourable termination, and it is extremely rare that serious results arise, except in the case of persons weakened by other diseases, although occasionally the symptoms are for a time sufficiently alarming.

The causes giving rise to sea-sickness have long been discussed, and a vast number of theories have been proposed. The conditions concerned in the production of the malady are apparently of complex character, embracing more than one set of causes. In the first place, the rolling or heaving of the vessel disturbs that feeling of the relation of the body to surrounding objects upon which our sense of security rests. The nervous system being thus subjected to a succession of shocks or surprises fails to effect the necessary adjustments for equilibrium. Giddiness and with it nausea and vomiting follow, added probably by the profound vaso-motor disturbance which produces such

manifest depression of the circulation. Much has been made by some of the effects of the displacement of the abdominal viscera, especially the stomach, by the rolling of the vessel, but, while this may possibly operate to some extent, it can only be as an accessory cause. The same may be said of the influence of the changing impressions made upon the vision, which has been regarded by some as so powerful in the matter, since attacks of sea-sickness occur also in the dark, and in the case of blind persons. Other contributory causes may be mentioned, such as the feeling that sickness is certain to come, which may bring on the attack in some persons even before the vessel has begun to move, the sense of the body being in a liquid or yielding medium as it descends with the vessel into the trough of the sea, the varied odours to be met with on board ship, and circumstances of a like nature tend also to precipitate or aggravate an attack. Dr Chapman's view is that the essential cause is an undue afflux of blood to the spinal cord. But, in the few rare instances where sea-sickness has proved fatal, *post-mortem* appearances have been almost entirely negative, and only such as are met with in death from syncope.

Innumerable preventives and remedies have been proposed; but most of them fall far short of the success claimed for them. No means has yet been discovered which can altogether prevent the occurrence of sea-sickness, nor is it likely any will be found, since it is largely due to the pitching movements of the vessel, which cannot be avoided. Swinging couches or chambers have not proved of any practical utility. No doubt there is less risk of sickness in a large and well-ballasted vessel than in a small one, but, even though the rolling may be considerably modified, the ascending and descending movements which so readily produce nausea continue. None of the medicinal agents proposed possess infallible properties, a remedy which suits one person will often wholly fail with another. There appears to be a wide confluence of opinion that the remedies are among the most potent drugs which can be employed, and full medicinal doses of bromide of potassium, chloral, or opium (the last two only under strict medical direction) taken before sailing appear to act usefully in the case of many persons. On the other hand, some high authorities have recommended the employment of nerve stimulants, such as a small cupful of very strong coffee to be taken about two hours before sailing, which will frequently prevent or mitigate the sickness. When the vessel is in motion, or even before starting, the recumbent position with the head low and the eyes closed should be assumed by those at all likely to suffer, and, should the weather admit, on deck rather than below,—the body, especially the extremities, being well covered. Many persons, however, find comfort and relief from lying down in their bath with a hot bottle to the feet, by which means sleep may be obtained, and with it a temporary abatement of the distressing giddiness and nausea. Should sickness ensue very small quantities of some light food, such as thin arrowroot, gruel, or soup, ought to be swallowed if possible, in order to lessen the sense of exhaustion, which is often extreme. The vomiting may be mitigated by saline effluvia such as drunks, ice, chloroform, hydrocyanic acid, or opium. Alcohol, although occasionally useful in great prostration, is not generally found to be of much service, but tends rather to aggravate the sickness. Dr Chapman, in accordance with his view of the cause of the sickness, introduced a spinal ice-bag, which has been extensively employed and recommended, but, like every other plan of treatment, it has only occasional success. The more recently proposed remedies, such as nitrate of amyl and creosote, do not seem to yield any better results than the agents already mentioned.

SEATTLE, county seat of King county, Washington Territory, United States, on Seattle Bay, east side of Puget Sound, with Lake Union, 3 miles long, on the north, and Lake Washington, 25 miles long, on the east, is the largest city of the Territory. A ship canal to connect these lakes with Puget Sound is now (1886) in course of construction. Seattle has shipyards, foundries, machine-shops, sawmills, lumber-yards, breweries, and manufactures of furniture, carriages, cigars, crackers, patent medicines, boxes, and barrels. It possesses the Territorial university. The Columbia and Puget Sound and the Puget Sound Shore Railroads have their terminus here, whence large shipments of coal take place. The population in 1880 was 3533, and in 1885 it was estimated at 12,000.

¹ Dr Andrew Wilson has claimed this monster as a ribbon-fish, *Times*, 16th June 1877.

SEA WATER¹ The ocean covers very nearly eight-elevenths of the total area of the globe, its average depth may be estimated as 2000 fathoms, and its total mass at 1.322×10^{18} (i.e., 1.3 million million millions) tons. Its general configuration must be assumed to have been substantially the same as it is now for thousands of years, hence we may safely conclude that the absolute composition of the ocean as a whole is constant in the sense of being only subject to very slow progressive millennial variation, and that, taking one part of the ocean with another, the percentage composition of the fixed part of the *solutum* can oscillate only within narrow limits. The composition of this *solutum* is very complex. According to Forchhammer, ocean salt in addition to the chlorides and sulphates of sodium, magnesium, potassium, and calcium—which had long been known to be its principal components—includes silica, boric acid, bromine, iodine, fluorine as acid, and the oxides of nickel, cobalt, manganese, aluminium, zinc, silver, lead, copper, barium, and strontium as basic components. Arsenic, gold, lithium, rubidium, cesium have been discovered since Forchhammer wrote. But all these subsidiary components, as that investigator found, amount to very little,—so little that in his numerous quantitative analyses of waters which he had procured from all quarters of the globe he confined himself to the determination of the chlorine, sulphuric acid, magnesia, lime, potash, and soda. The soda, however, he determined only by difference, assuming that the muriatic and sulphuric acids are united with the bases into perfectly neutral salts. As a general result he found that, in the open ocean, the ratio to one another of the several acids and bases named is subject to only slight variations. But his samples had all been collected at the surface; the potash had been determined by an insufficiently exact method, and the assumed neutrality of the total salt had not been proved. With the view primarily of supplementing Forchhammer's work, Dittmar made complete analyses of 77 of the samples brought home by the "Challenger," so selected that 34 out of the 77 represented depths of 1000 fathoms or more. His analyses brought out a small surplus of base, proving the presence of carbonate in all the waters, but the numerical values thus found for the "alkalinity," being charged with the observational errors of the whole series of determinations, could not be relied on. Dittmar therefore subsequently availed himself of a very easy and yet exact method for the direct determination of this quantity, which meanwhile had been discovered by Tormøe, and applied it to over 130 "Challenger" samples. He besides made a special inquiry into the relation between the quantity of lime and the depth at which the water had been collected, and a similar inquiry in regard to the bromine. As a general summary he gives the following three tables. The total salts contained in ocean water amount on an average to about 3.5 per cent, thus leaving 96.5 per cent for the water proper.

¹ All our knowledge of the subject of chemical oceanography—a branch of physical geography which has only lately come to be extensively cultivated—is derived from a series of investigations chiefly embodied in the following publications:—(1) Forchhammer, "On the Composition of Sea Water," &c., in *Phil. Trans.*, v. 155, pp. 203-262 (1865); (2) Oscar Jacobson, *Ann. d. Chem.*, vol. cxxiv, p. 1, 97 (1878); (3) *Den Norske Nordhavs Expedition, 1878-79. Chem.*, by Tormøe; (4) the *Jahresberichte* of the Kiel committee for the scientific investigation of the German Ocean, 1873-82; (5) *Physico and Chemistry of the Voyages of II. M. S. "Challenger"*—I "Report on Researches into the Composition of Ocean Water," &c., by Prof. W. Dittmar, January 1884, II "Report on the Specific Gravity of samples of Ocean Water," &c., by J. S. Bachman, January 1884, III "Report on Deep-sea Temperature," &c., by the officers of the expedition. A shorter and more popular exposition of the whole is found in:—(6) *Narrative of the Cruise of II. M. S. "Challenger"* (1885). The excellent *Handbuch der Oceanographie* (Stuttgart), by Prof. G. von Boguslawski, may be referred to as being almost up to date.

TABLE I—Average Composition of Ocean-Water Salts

	Per 100 parts of Total Salts		Per 100 of Halogen calculated as Chlorine	
	Dittmar	Forchhammer	Forchhammer	
Chlorine	55.292	59.848	99.848	Not determined
Bromine	0.188	0.340	0.340	Not determined
Sulphuric acid, SO ₄	6.410	11.576	11.576	11.88
Carbonic acid, CO ₂	0.152	0.274	0.274	Not determined
Lime, CaO	1.572	2.928	2.928	2.93
Magnesia, MgO	6.209	11.212	11.212	11.03
Potash, K ₂ O	1.332	2.405	2.405	1.93
Soda, Na ₂ O	41.234	74.462	74.462	Not determined
(Basic oxygen, equivalent to the halogens)	(-12.493)	(-22.559)		
Total salts	100.000	180.584	181.1	

TABLE II—Results from combining Acids and Bases (Dittmar)

Chloride of sodium	77.753	Sulphate of potash	2.485
Chloride of magnesium	10.878	Biomide of magnesium	0.217
Sulphate of magnesium	4.737	Carbonate of lime	0.345
Sulphate of lime	3.600	Total salts	100.000

Reducing to the absolute mass of the ocean as given above, we arrive at the following numbers—

TABLE III—Absolute Composition of the Salts of the Ocean.

Unit=1 million million=10 ¹² tons			
Chloride of sodium	35990	Sulphate of potash	1141
Chloride of magnesium	5034	Biomide of magnesium	100
Sulphate of magnesium	2192	Carbonate of lime	160
Sulphate of lime	1666		49593
Total bromine	87.2	(Dittmar)	
Total iodine	0.08	(Kottstorf)	
Total chloride of rubidium	25.0	(C. Schmitt)	

Of the several quantities recorded in columns 2 or 3 of Table I "carbonic acid" is proved to be subject to variation, all the rest, including even the bromine, are practically constant. This shows that Forchhammer's proposition holds for ocean water from all depths, with one important qualification—special research on the lime showed that its quantity increases slightly but appreciably with the depth. Taking s, m, d as representing the lime per 100 of chlorine in shallow, medium-depth, and deep-sea water respectively, Dittmar found as mean results of analyses which agreed very well together—

$$s = 3.0175 \quad m = 3.0300 \quad d = 3.0303$$

$$\text{Probable error, } \pm 0.0012 \quad \pm 0.0014 \quad \pm 0.0011$$

But $m - s = 0.0124$ and $d - s = 0.0132$. One explanation of this result is that the crustaceans, foraminifera, and molluscs which form carbonate of lime shells live chiefly in surface waters, but after their death sink to the bottom, where—especially in great depths—their carbonate of lime is partially redissolved.

Oceanic Carbonic Acid—It is well known that not only in the neighbourhood of actual volcanoes but in thousands of other places on the dry land carbonic acid gas is constantly streaming forth into the atmosphere, and it is generally admitted now that this supply of telluric carbonic acid amounts to more than all that is furnished by processes of combustion and respiration. This carbonic acid and springs should be absent from the bottom of the ocean is too absurd an assumption to be entertained, hence, supposing even the water of the ocean was perfectly neutral, it could not but contain dissolved carbonic acid. But such carbonic acid, at the ocean surface at least, would constantly tend to assume, and in general probably actually would come down to, the small limit value prescribed to it by the given proportion by volume of the carbonic acid in the atmosphere and the laws of gas-absorption. This proportion, according to the best modern researches, is almost constant, everywhere amounting to very nearly 0.0005 volume per unit volume of air. The coefficient of absorption by pure water is 1.8 at 0° and 1.0 at 15° C. Hence, even in the polar regions, the surface water could not hold in permanent solution more than about 0.54 c.c., or say one milligramme per litre of water. Jacobson, in his

² Equal conjointly to 35.376 parts of chlorine, which accordingly is the percentage of "halogen reckoned as chlorine" in the real total solids.

³ Calculating the surplus base as normal carbonate. In Table II, this carbonate is represented as so much CaCO₃.

numerous analyses of North Sea water, found from 90 to 100 milligrammes per litre, but he also observed that only a small portion of the carbonic acid is eliminated on boiling the rest comes out only when the water is distilled to dryness. He presumed that the gas was retained chemically by the chloride of magnesium. Buchanan, who inquired into the subject synthetically, arrived at the conclusion that it was the sulphates in sea water (*qua* sulphates) which retained the carbonic acid. Accordingly in his numerous carbonic acid determinations he heated the gas by distilling the water down with an excess of chloride of barium. Tornøe was the first to prove that the carbonic acid in sea water is present as carbonate, and that, in the northern part of the North Atlantic at least, the total carbonate is high, while considerably below the quantity which would convert the surplus lime into normal, falls short of that which would be required to produce fully saturated acid carbonate.

Even without Tornøe's discovery it would have been necessary to find the true interpretation of the results of the numerous carbonic acid determinations made during the voyage of the "Challenger" by Buchanan. Dittmar had no difficulty in proving the non-existence of the alleged affinity of sulphates for carbonic acid, and naturally concluded that the chloride of barium used in the processes liberates the loose part of the carbonic acid by converting the normal carbonate into a precipitate of carbonate of barium, thus— $\text{R}^{\circ}\text{CO}_3 + \text{CaCl}_2 = \text{R}^{\circ}\text{Cl}_2 + \text{CaCO}_3 + 2\text{CaO}$. A series of synthetical experiments showed that this is substantially, though not exactly, correct. If Buchanan's *modus operandi* were rigorously followed, the carbonic acid, dissolved in lime, falls somewhat short of the actual amount of loose carbonic acid present, while on resuming the distillation after addition of fresh water, an appreciable part of fixed carbonic acid passes away as gas. Yet, Buchanan's results being of great value, Dittmar discussed them (conjointly with his own alkali-determinations) on the basis of the assumption that they afforded a fair approximation to the proportions of loose carbonic acid in the respective waters. His general conclusions are as follows. Taking "alkaline" as meaning the "weight" of the carbonic acid, CO_2 in the normal carbonate part of the carbonate present per 100 parts of total solids, the alkalinity in the water samples analysed (omitting a few obviously abnormal cases) was found to be as follows (Table IV) —

Alkalinity ranges from	Number of Cases	Alkalinity ranges from	Number of Cases
0.1400 to 0.1420	9	0.1640 to 0.1710	6
0.1440 " 0.1470	84	Alk. = 0.1721	1
0.1480 " 0.1510	40	" = 0.1888	1
0.1520 " 0.1550	19	" = 0.2079	1
0.1560 " 0.1590	12	" 0.1400 to 0.2079	127
0.1600 " 0.1630	4		

Values above 0.18 are obviously exceptional, hence the normal range may be said to be from 0.14 to 0.16. The most frequently occurring values were found to be about 0.146 in the case of surface or shallow sea water, and in the case of bottom water about 0.152. In regard to the loose carbonic acid a full discussion of Buchanan's results led to the following conclusions — (1) carbonic acid rarely occurs in the free state, as a rule it falls short of the quantity which would produce bicarbonate, (2) in surface waters it is relatively high where the natural temperature is relatively low, and *vice versa*, (3) within equal ranges of temperature it seems to be less in the surface water of the Pacific than it is in that of the Atlantic Ocean. Of the 195 samples of sea water which Buchanan analysed for carbonic acid only 22 contained fully saturated bicarbonate, and only 2 out of these are proved by the analyses to have contained free carbonic acid in addition to bicarbonate. In all the remaining 173 samples the "carbonic deficit" (meaning the proportion of carbonic acid which was wanted to completely transform the carbonate into bicarbonate) assumed tangible and often considerable values. We are probably safe in concluding that the ocean as a whole will have to continue taking in carbonic acid for thousands of years before its carbonic acid deficit has been reduced to nothing. But it is as well to observe that at its surface in the warmer latitudes the attainment of this condition is a physical impossibility as long as the percentage of carbonic acid in the air retains its present low value.

A solution of a bicarbonate when shaken, say in a bottle, with pure air (free of carbonic acid) at summer heat gives up its combined carbonic acid to the air space in the bottle until the partial tension of the acid gas there has come up to a limit value p , which is called the dissociation tension of the bicarbonate at the prevailing temperature t . General experience concerning such phenomena warrants the presumption that, up to a certain (low) temperature t_0 , $p = 0$, and thence onwards, p increases with t . It does not follow that the bicarbonate in a solution when shaken again and again with even pure air tends to become normal carbonate, for, as we know, the elimination of carbonic acid may stop as soon as the residual carbonate has come down to some composition

$\text{R}^{\circ}\text{O}(1+x)\text{CO}_2$ (where x is less than 1), and x may be a function of temperature. Dittmar has attempted to determine the course of the function $1+x=f(t)$ in inference to natural sea water on the one hand and to pure air (an feed of its carbonic acid) and ordinary air on the other. One sample of sea water containing its surplus base as practically bicarbonate served for all the experiments. It was shaken again and again at a fixed temperature t with one of the other kind of air, until (after "N" shakings, always with renewed air) the stage of saturation appeared to have become constant. The investigation is not completed yet, the following table (V) gives the results which have come out so far. The final carbonate was $\text{Li}_2\text{O} \cdot \text{Na}_2\text{O}$.

t	N	Pure air n_0	Ordinary air n_1	t	N	Pure air n_0	Ordinary air n_1
2° C	300	1.90		15°	200	1.50	
2°	260	2.04		20°	200	1.42 (7)	
2°	62		2.06	25°	59	1.53	
10°	200	1.70		32°	62	1.68	
15°	50		1.841	32°	62		1.89
15°	100	1.68		32°	150		1.82

Hence we see that even at the highest temperature, and with air free from carbonic acid, the carbonate never came down below the state of sesquicarbonate, while with ordinary air, at 32° C., it never fell below $n=1.8$. At 2° n_0 as well as n_1 was $n=2$, the value characteristic of bicarbonate. Now Buchanan reports a good number of cases, when, even at lower temperatures, n was considerably less than 1.8 at any rate. Hence, if his numbers are correct, unless the atmosphere acts more powerfully than the air in Dittmar's bottle, it would appear that deep-sea water is in general below even the stage of carbonic acid saturation which it could attain at the surface at high temperatures.

In any mixed solution of salts every base is combined with every acid, hence the "carbonate" of sea water is strictly speaking a complex plural. But as a matter of probability the carbonic acid has very little chance of uniting with any of the potash or soda, and the overwhelmingly large quantity of alkaline chloride would no doubt convert any carbonate of magnesia that was introduced into double chloride of magnesium and alkali metal, hence it is fair to assume that oceanic carbonate is chiefly carbonate of lime. Now immense quantities of this compound are being constantly introduced into the ocean by rivers. Dumas once gave it as his opinion that the suspended carbonic acid remains dissolved in the ocean as long as and wherever the carbonate there is at the bicarbonate stage, but, as soon as part of the loose carbonic acid goes off into the air, the corresponding weight of normal carbonate separates out as an addition, ultimately, to the solids on the bottom. Dittmar has tried to test this notion synthetically, but without arriving at very definite results. According to his experiments sea water which contains free carbonic acid dissolves allied solid carbonate of lime, and more largely carbonate of magnesia, sea water which contains fully, or almost fully, saturated bicarbonate dissolves carbonate of magnesia very appreciably, but would not appear to act on carbonate of lime at all. But, when carbonate of lime was produced in the water by successive additions of potential calcium carbonate in the form of dissolved sodium carbonate and its equivalent of calcium chloride, the original carbonate of lime could be increased very largely, with formation of solutions which remained clear during a long-continued period of observation. As a set-off against this a few of the many hundred samples of sea water which he recovered from the "Challenger" deposited in the course of a number of years crystalline crusts of carbonate of lime on the sides of the bottles, and the mother-liquor never contained more than the normal quantity of lime per 100 parts of chlorine. In discussing this question Dittmar gives an estimate, based on data furnished by Bogdanow's work, of the total carbonate of lime introduced into the ocean annually by the thirteen principal rivers, and by doubling the quantity he estimates the carbonate of lime introduced by all rivers as equal to about 1.34×10^{12} tons. Now the sum total of carbonate of lime, CaCO_3 , in the ocean amounts to about 160×10^{12} tons, hence it would take 1190 years to increase the present stock of carbonate of lime in the ocean by one per cent. of its value.

Absorbed Oxygen and Nitrogen in Ocean Water.—As a matter of physical necessity these two gases must be present in the water of the ocean—and they may be presumed in general to pervade it to its greatest depth—because the whole of the surface of the sea is in constant contact with the atmosphere. Our knowledge regarding their distribution in the ocean may be said to date from 1872, when Jacobson inquired into the matter in a most masterly manner in connexion with the German North Sea expedition. The work of his predecessors possesses no scientific value, because they employed inadequate methods. Unlike them, Jacobson did not attempt to analyse a sample of sea water on board ship, he extracted the air from measured samples (in an excellent method of his own) and then sealed them up in glass tubes, to measure and analyse them after his return home. Buchanan, during the

¹ See GEOLOGY, vol. x, p. 222.

"Challenger" cruise adopted Jacobsen's method. Of the 164 samples which he sealed up successfully 69 came from the surface and 95 from depths varying from 6 to 4575 fathoms. A good number of these he analysed himself after his return, the majority, however, were analysed and all were measured by Dittman. The latter, in order to be able to interpret the results, also investigated the absorption of oxygen and nitrogen gas from air by sea water. The following table (VI) gives the result of his investigations. One litre (1000 volumes) of ocean water when saturated with constantly renewed air at t° , and a pressure of 760 millimetres, plus tension of steam at t° C., takes up the following volumes, measured dry at 0° C. and 760 millimetres pressure, of the pure gases

Tempera- ture t ^o	Dissolved Nitrogen and Oxygen in Cubic Centimetres (volumes)		Percentage of Oxygen in Dissolved Gas
C	Nitrogen	Oxygen	
0°	15.40	8.18	34.40
5°	15.26	8.22	34.21
10°	12.47	6.45	34.09
15°	11.34	5.83	33.93
20°	10.41	5.31	33.78
25°	9.62	4.87	33.65
30°	8.94	4.50	33.47
35°	8.56	4.17	33.31

The method used for obtaining these numbers adapted itself closely to the one which Buchanan had employed for extracting the gas samples. In the calculations it was assumed that atmospheric air contains 21.0 volumes of oxygen for 79.0 volumes of nitrogen, the slight variation in this ratio, which is known to occasionally present itself, being neglected. From the table we can calculate approximately the limits between which the proportions of dissolved oxygen and nitrogen in the water of the ocean must be presumed to oscillate in nature. The pressure of the atmosphere at the sea-level, though by no means constant, is never far removed from that of 760 mm. of mercury. The temperature of the surface water (with rare exceptions) may be said to vary from -2° C. (in the liquid part of the ocean in the arctic and antarctic regions) to about 30° C. (in the tropics). The ocean receives all its dissolved oxygen and nitrogen from the surface, neither gas comes in from below, except perhaps a relatively insignificant quantity of nitrogen derived from the decay of dead organisms, which may safely be neglected. Hence the ocean can contain nowhere more than 15.6 c.c. of nitrogen or more than 8.18 c.c. of oxygen per litre, and the nitrogen will never fall below 8.55 c.c. We cannot make a similar assertion in regard to the oxygen, because its theoretical minimum of 4.30 c.c. per litre is liable to further diminution by processes of life and putrefaction and by oxidation generally.²

At any point in the surface of the ocean the water constantly tends to assume the composition demanded for the prevailing temperature by the laws of gas absorption. But it is rarely possible for it to assume this composition, owing to the water being in a continual state of motion, and, supposing a certain area of the ocean surface were in a state of stagnation, the temperature would vary in diurnal cycles, and even the calculated volume of nitrogen per litre would be a periodic function of time, exhibiting its maximum at the hour of minimum temperature, and *vice versa*. The process of absoptometric exchange, however, even at the constantly oscillating surface of the ocean, is slow, it could not keep pace with the change of temperature, and the actual nitrogen curve would never go as high up or as low down as the theoretical one. In addition to this, the lower strata of the water constantly add to, or take away from, the surface nitrogen by diffusion and occasional intermixture. All this holds for the oxygen likewise, except that it is liable to constant diminution by oxidation. On the whole we may assume that all the disturbing influences will only modify, not efface, the course of events as prescribed by the laws of gas-absorption.

In regard to non-surface water we have to confront a greater complexity of phenomena. The gas-contents of deep-sea water, of course, have nothing to do with the low temperature and the high pressure which in general prevail there. For the purpose of a preliminary survey, let us imagine a deep-sea water formed from one kind of surface water, which took up its air at a constant temperature (t_1), and then sank down unmixed with other waters. The volumes of the oxygen and nitrogen per litre have at first the values assigned to them by the laws of gas absorption. But, while the nitrogen (as long as the water remains unmixed with other liquids) remains constant, the oxygen will become less and less through the processes of oxidation which go on in the deep without compensation. Hence if there were absolute stagnation in the ocean anywhere the proportion of oxygen there might be reduced ultimately to nothing. Among the many "Challenger" deep-sea specimens which were analysed for their gas-contents none was

found quite free from absorbed oxygen, and this confirms the conclusion that absolute stagnation exists nowhere in the ocean, not even at its greatest depth. Occasionally, however, the oxygen was found to have sunk down to very little, as shown by the following two examples —

Sample	O ₂ per Litre of Nitrogen	O ₂ per Litre of Oxygen	O ₂ of Oxygen calculated from Nitrogen	Depth in Fathoms
1001	15.08	0.6	8.21	2875
1645	13.38	2.04	6.95	1500

These must have been an approximation to absolute rest at these two places at any rate. On the whole, the results of the gas analyses, as interpreted on the basis of Dittman's absoptometric determinations, agreed fairly well with the inferences which we have just been deducing from physical laws. There was no lack of anomalous results, but it was not found possible to trace them to natural causes. The equilibrium in regard to the absorbed nitrogen and oxygen in the ocean is maintained by the atmosphere, and, from the fact that the air contained in surface water is always richer in oxygen than is atmospheric air, one naturally concludes that the ocean should constantly add to the percentage of oxygen in the air in the tropics and constantly diminish it in the colder latitudes. But Regnault's numerous air-analyses do not confirm this. Nor need this be wondered at, since, as we have seen, even the corresponding influence on the atmospheric carbonic acid has so far defied the powers of chemical analysis.

Salinity of Ocean Water — Even in the open ocean the "salinity" — meaning in a given quantity of water the weight of dissolved salt and the weight or volume of the whole — is subject to considerable variation, and it obviously is one of the foremost duties of observing oceanographers to collect the data by means of which it may be possible one day to represent that quantity mathematically as a function of geographic position, depth, and time. For the quantitative determination of the salinity an obvious, easy, and sufficient method is to determine the specific gravity S_t at a convenient temperature t ; this in fact is the method which has so far been employed by all observers almost to the exclusion of every other. Buchanan used it during the "Challenger" cruise perhaps more extensively than any of his predecessors had done. Of the arithmetical relation between salinity on the one hand and S and t on the other the successive researches of Ekman (as supplemented by Tonne), Thorpe and Ruckel, Dittman, and others have given us a practically satisfactory knowledge. According to Dittman the function (within the limits of Buchanan's values) coincides practically with the formula

$$S_t - S_0 = \chi(a + bt + ct^2),$$

where S_t means the specific gravity at t° C. referred to that of pure water of $+4^\circ$ C. as equal to 1000, S_0 has a similar meaning in reference to pure water, χ stands for the weight of total halogen calculated as chlorine per 1000 parts, by weight, of sea water, and $a=1.45993$, $b=-0.005592$, $c=+0.000064$. For oceanographic purposes, however, it is not necessary to go back to χ , it suffices from series of values S_t to deduce the corresponding values S_0 for a convenient standard temperature, and to reason on these reduced numbers as if they measured the salinity, just as we take the readings of a thermometer as in themselves representing "temperatures". Thus, in fact, is always done, only unfortunately different standard temperatures have been chosen by different observers; Buchanan adopted 15.56° C. $= 60^\circ$ Fahr. Before going further, let us observe that the specific gravity of sea water, taking it as it is *in situ*, has an important oceanographic significance, even in such cases. But the quantity in the case of deep-sea waters is influenced very largely by the presence of the pressure-increment layer of water—which in itself is a complex function of the successive temperatures and salinities—and unfortunately we still lack the constants and formulae for making the necessary reductions with adequate exactitude. Meanwhile all our statistics of sea water specific gravities, valuable as they are, constitute statistics of only salinities and nothing else.

At the surface of the ocean the salinity is liable chiefly to three influences:—(1) concentration by formation of ice or by the action of dry winds, (2) dilution through the melting of ice or the falling of rain; (3) concentration or dilution through the virtual addition of salt or water by inflowing currents of saltier or fresher water respectively. The effect of the formation or melting of ice, though great within the arctic circles, does not tell much on the non-polar seas. More important in regard to these is the effect of the south-east and the north-east trade winds, which in the Pacific blow between about 3° and 21° S. lat. and between about 2° and 50° N. lat. respectively, leaving between the two a belt of 5° of a region of calms (see more exactly, METEOROLOGY, vol. xvi. p. 144). In the Atlantic the limiting lines of both trades oscillate annually, so that the equatorial boundary of the north-east trade shifts from 3° to 11° N. lat. and that of the south-east trade from about 1° to 8° N. lat.

¹ Theoretically any number may be substituted for 760, for calculating purposes need not be multiplied.

² In calculating these limit values the tension of the vapour of water is taken into account, hence the apparent non-agreement with the entries in the table.

³ According to Grassi's experiments, if sea water under the pressure of one atmosphere has the specific gravity 1026, it assumes at depths of 1000, 500, 2000 fathoms a density of 1029 + 1, 2, 3 times 7.8×10^{-6} ; 1026.9, 1026.8, 1026.7 respectively.

Both trades blowing from colder into warmer regions absorb water largely and thus raise the salinity within their areas of action. The western anti-trades which blow on the polar sides of the two trades, passing from hotter to colder regions, should dilute the ocean there, but they do not seem to act so powerfully in this direction as might be expected. In the belt of equatorial calms between the two trades abundant rains fall frequently and dilute the water very perceptibly.

What has been said thus far about the distribution of surface salinity applies chiefly to the Atlantic, which in fact is far more completely known in this respect than any other ocean. The ac-

Curves showing variation of surface salinity of ocean with latitude

companying diagram shows how on the average the surface salinity varies there with the latitude. The bolder curve is drawn after a table given by Buchanan in his part of the *Narrative of the Cruise of the "Challenger"*, the other after a more extensive table given by Boguslawski as embodying the mean results of many observations by different authorities with reference to standard temperatures varying from 15° to 17° C.,—coast waters affected by the influx of large rivers having been omitted. In the North Atlantic there is an area of maximum (surface) salinity ($S=1028.5$) between 25° and 35° N. lat. and 80° and 20° W. long. The zone of minimum salinity lies between 15° N. lat. and the equator. In the South Atlantic (surface) there are two concentration centres,—an eastern one about St. Helena and between that island and Ascension, and a western one north of San Trinidad,—both nearer the equator than that of the North Atlantic. As pointed out by Buchanan, a relatively high salinity (not merely on the surface) is quite a characteristic feature of the Atlantic, and in its northern part prevails up to the high latitudes of the Norwegian Sea, which was so thoroughly investigated by Swenson (1876) and Tornøe (1877 and 1878) during the Norwegian expeditions. The salt (and heat) conveying influence of the Gulf Stream makes itself felt up to Spitzbergen (76° N. lat.). On both sides of the Faeroe Islands the specific gravity σ_{20}^{20} comes up to 1027.0, at the Bear Islands it sinks to 1026.7, and thence farther northwards to 1026.1. While the Gulf Stream pushes northwards, a current of relatively fresh polar water travels southwards and, creeping along the eastern coast of the United States, forms what is known as the "cold wall." In passing from the surface to the depth of the ocean the general rule (Buchanan) is that the actual specific gravity σ_{θ} increases with the depth, but this does not hold for the surface for specific gravity referred to standard temperature. In places where there is active dilution at the surface (σ_{θ} in the belt of equatorial calms) the salinity as a rule increases down to some 50 or 100 fathoms, but thence downwards it follows the general rule, that is, it decreases down to 800 or 1000 fathoms, and thence increases steadily to the bottom. In the South Atlantic the salinity of the bottom water has an almost constant value ($\sigma_{\theta}=1025.7$ to 1025.9); but northwards it increases from 1026.16 to 1026.92 at 2000 to 4000 fathoms (Buchanan).

In regard to the Pacific our knowledge is far less complete. A glance at the curve shows that the (surface) salinity at a given latitude is less there than it is in the Atlantic. In the whole of the Pacific there is only one concentration centre, which lies about the Society Islands, with a maximum salinity corresponding to $S_{20}=1027.18$ (W. D.).

SEA-WOLF, also **SEA-CAT** and **WOLF-FISH** (*Anarrhichas lupus*), a marine fish, the largest kind of the family

Blennius or *Blennies*. In spite of its large size, it has retained the bodily form and general external characteristics of the small blennies, which are so abundant on every rocky part of the coast. Its body is long, subcylindrical in front, compressed in the caudal portion, smooth and slippery, the rudimentary scales being embedded and almost hidden in the skin. An even dorsal fin extends along the whole length of the back, and a similar fin from the vent to the caudal fin, as in blennies. But its formidable

dentition distinguishes the sea-wolf from all the other members of the family. Both jaws are armed in front with strong conical teeth, and on the sides with two series of large tubercular molars, a biserial band of similar molars occupying the middle of the palate. By these teeth the sea-wolf is able to crush the hard carapaces or shells of the crustaceans and molluscs on which it feeds, but whether it uses the teeth as a weapon of defence and deserves the character of ferocity generally attrib-

uted to it would appear to be rather questionable from observations made on specimens in the aquarium at Hamburg, which allowed themselves to be handled without in any way resenting the loss of their liberty. It must, however, be added that the small blennies bite.

Teeth of the lower and upper jaws of the sea-wolf readily when caught. Sea-wolves are inhabitants of the northern seas of both hemispheres, one (*A. lupus*) being common on the coasts of Scandinavia and North Britain, and two in the seas round Iceland and Greenland. Two others occur in the corresponding latitudes of the North Pacific. They attain to a length exceeding 6 feet, and in the north are esteemed as food, both fresh and preserved. The oil extracted from the liver is said to be in quality equal to the best cod-liver oil. Of late years small numbers have reached the English markets, where, however, the prejudice which attaches to all scaleless fishes, particularly such as possess a varied pattern of coloration, hinders their use as food.

SEBASTE. See **SYRAS**.

SEBASTIAN, DOM. See **PORTUGAL**, vol. xix pp. 546-547.

SEBASTIAN, ST., the patron saint against plague and pestilence, was by birth a Narbonne. According to the Roman breviary his nobility and bravery had endeared him to the emperor Diocletian, who made him captain of the first cohort. Having secretly become a Christian, he was wont to encourage those of his brethren who in the hour of trial seemed wavering in their profession. This was conspicuously the case when the brothers Marcus and Marcellinus were being led forth to death; by his exhortations he prevailed on them to resist the entreaties and tears of their wives and children. The emperor having been informed of this conduct sent for him and earnestly remon-

² For the sake of comparison there is shown on the lower part of the diagram the surface salinity curve for the Pacific drawn after Buchanan's summary tabulation of his results.

strated with him, but, finding him inflexible, ordered that he should be bound to a stake and shot to death. After the archers had left him for dead a devout woman, Irene, came by night to take his body away for burial, but, finding him still alive, carried him to her house, where his wounds were dressed. No sooner had he wholly recovered than he hastened to confront the emperor, reproaching him with his impiety, Diocletian, filled with astonishment, which soon changed into fury, ordered him to be instantly carried off and beaten to death with rods (288). The sentence was forthwith executed, his body being thrown into the cloaca, where, however, it was found by another pious matron, Lucina, whom Sebastian visited in a dream, directing her to bury him in the Catacombs under the site of the church now called by his name. He is celebrated by the Roman Church on 20th January (duplex). His cult is chiefly diffused along the eastern coast of Italy and in other districts liable to visitations of plague. As a young and beautiful soldier, he is a favourite subject of sacred art, being most generally represented as undraped and severely, though not mortally, wounded with arrows.

SEBASTIANO DEL PIOMBO (1485-1547), painter, was born at Venice in 1485, and belongs to the Venetian school, exceptionally modified by the Florentine or Roman. His family name was *Luciani*. He was at first a musician, chiefly a solo-player on the lute, and was in great request among the Venetian nobility. He soon showed a turn for painting, and became a pupil of Giovanni Bellini and afterwards of Giorgione. His first painting of note was done for the church of St John Chrysostom in Venice, and is so closely modelled on the style of Giorgione that in its author's time it often passed for the work of that master. It represents Chrysostom reading aloud at a desk, a grand Magdalene in front, and two other female and three male saints. Towards 1512 Sebastiano was invited to Rome by the wealthy Siennese merchant Agostino Chigi, who occupied a villa by the Tiber, since named the *Fauresina*, he executed some frescos here, other leading artists being employed at the same time. The Venetian mode of colour was then a startling novelty in Rome. Michelangelo saw and approved the work of Luciani, became his personal friend, and entered into a peculiar arrangement with him. At this period the pictorial ability of Michelangelo (apart from his general power as an artist, regarding which there arose no question) was somewhat decayed in Rome, the rival faculty of Raphael being jealously exalted in comparison, in especial it was contended that Buonarroti fell short as a colourist. He therefore thought that he might try whether, by furnishing designs for pictures and leaving to Sebastiano the execution of them in colour, he could not maintain at its highest level his own general supremacy in the art, leaving Raphael to sustain the competition as he best might. In this there seems to have been nothing particularly unfair, always assuming that the compact was not fraudulently concealed; and the facts are so openly stated by Michelangelo's friend Vasari (not to speak of other writers) that there appears to have been little or no disguise in the matter. Besides, the pictures are there to speak for themselves, and connoisseurs have always acknowledged that the quality of Michelangelo's unmatched design is patent on the face of them. Of late years, however, some writers, unnecessarily jealous for Buonarroti's personal rectitude, have denied that his handwork is to be traced in the pictures bearing the name of Sebastiano. Four leading pictures which Sebastiano painted in pursuance of his league with Buonarroti are the *Pietà* (earliest of the four), in the church of the Conventual, Viterbo, the *Transfiguration* and the *Flagellation*, in the church of S. Pietro in Montorio, Rome, and, most celebrated of

all, the *Raising of Lazarus*, now in the London National Gallery. This grand work—more remarkable for general strength of pictorial perception than for qualities of detailed intellectual or emotional expression—is more than 12 by 9 feet in dimensions, with the principal figures of the natural size, it is inscribed "*Sebastianus Venetus faciebat*," and was transferred from wood to canvas in 1771. It was painted in 1517-19 for Giulio de' Medici, then bishop of Narbonne, afterwards Pope Clement VII., and it remained in Narbonne cathedral until purchased by the duke of Orleans early in the 18th century,—coming to England with the Orleans gallery in 1792. It is generally admitted that the design of Michelangelo appears in the figure of Lazarus and of those who are busied about him (the British Museum contains two sketches of the Lazarus regarded as Michelangelo's handwork), but whether he actually touched the panel, as has often been said, appears more than doubtful, as he left Rome about the time when the picture was commenced. Raphael's *Transfiguration* was painted for the same patron and the same destination. The two works were exhibited together, and some admirers did not scruple to give the preference to Sebastiano's. The third of the four pictures above mentioned, the *Flagellation of Christ*, though ordinarily termed a fresco, is, according to Vasari, painted in oil upon the wall. This was a method first practised by Domenico Veneziano, and afterwards by some other artists, but Sebastiano alone succeeded in preventing the blackening of the colours. The contour of the figure of Christ in this picture is supposed by many to have been supplied by Buonarroti's own hand. Sebastiano, always a tardy worker, was occupied about six years upon this work, along with its companion the *Transfiguration*, and the allied figures of saints.

After the elevation of Giulio de' Medici to the pontificate, the office of the "*piombo*" or leaden seal—that is, the office of sealer of briefs of the apostolic chamber—became vacant, two painters competed for it, Sebastiano Luciani, hitherto a comparatively poor man, and Giovanni da Udine. Finally Sebastiano, assuming the habit of a friar, secured the very lucrative appointment,—with the proviso, however, that he should pay out of his emoluments 300 scudi per annum to Giovanni. If he had heretofore been slow in painting, he became now supine and indifferent in a marked degree. He lived on the fat of the land, cultivated sprightly literary and other society, to which he contributed his own full quota of amusement, and would scarcely handle a brush, saying jealously that he benefited the profession by leaving all the more work for other artists to do. Berni, one of his intimates, addressed a *capitolo* to him, and Sebastiano responded in like versified form. One of the few subject-pictures which he executed after taking office was Christ carrying the Cross for the patriarch of Aquileia, also a Madonna with the body of Christ. The former painting is done on stone, a method invented by Sebastiano himself. He likewise painted at times on slate,—as in the instance of Christ on the Cross, now in the Berlin gallery, where the slate constitutes the background. In the same method, and also in the same gallery, is the *Dead Christ* supported by Joseph of Arimathea, with a weeping Magdalene,—colossal half-length figures. Late in life Sebastiano had a serious disagreement with Michelangelo with reference to the Florentine's great picture of the Last Judgment. Sebastiano encouraged the pope to insist that this picture should be executed in oil. Michelangelo, determined from the first upon nothing but fresco, tartly replied to his holiness that oil was only fit for women and for sluggards like Friar Sebastian, and the coolness between the two painters lasted almost up to the friar's death. This event, consequent upon a violent fever acting rapidly upon a

very sanguine temperament, took place at Rome in 1547 Sebastiano directed that his burial, in the church of S Maria del Popolo, should be conducted without ceremony of priests, friars, or lights, and that the cost thus saved should go to the poor, in this he was obeyed.

Numerous pupils sought training from Sebastiano del Piombo but, owing to his dilatory and self-indulgent habits, they learned little from him, with the exception of Tommaso Laureti. Sebastiano, conscious of his deficiency in the higher sphere of invention, made himself especially celebrated as a portrait painter. The likeness of Andrea Doria, in the Doria Palace, Rome, is one of the most renowned. In the London National Gallery are two fine specimens: one canvas represents the friar himself, along with Cardinal Ippolito de' Medici, the other, a portrait of a lady in the character of St. Agatha, used to be identified with one of Sebastiano's prime works, the likeness of Juha Gonzaga (painted for her lover, the aforementioned cardinal), but this assumption is now discredited. There were also portraits of Marcantonio Colonna, Vittoria Colonna, Ferdinand maquis of Pescara, Popes Adrian VI, Clement VII (Stuyj Gallery, Naples), and Pao III, Sanmichele, Anton Francesco degli Albizzi, and Pietro Aretino. One likeness of the last-named siter is in Arezzo and another in the Berlin gallery.

SEBASTOPOL, or SEVASTOPOL, the chief naval station of Russia on the Black Sea, is situated in the south-west of the Crimea, in 44° 37' N lat. and 33° 31' E long, 935 miles from Moscow, with which it is connected by rail *via* Kharkoff. The estuary, which is one of the best roadsteads in Europe and could shelter the combined fleets of Europe, is a deep and thoroughly sheltered indentation among chalky cliffs, running east and west for nearly 3½ miles, with a width of three-quarters of a mile, narrowing to 930 yards at the entrance, where it is protected by two small promontories. It has a depth of from 6 to 10 fathoms, with a good bottom, and large ships can anchor at a cable's length from the shore. The main inlet has also four smaller indentations.—Quarantine Bay at its entrance, Yuzhnaya (Southern) Bay, which penetrates more than a mile to the south, with a depth of from 4 to 9 fathoms, Dockyard Bay, and Artillery Bay. A small river, the Tchohnaya, enters the head of the inlet. The main part of the town, with an elevation ranging from 30 to 190 feet, stands on the southern shore of the chief inlet, between Yuzhnaya and Artillery Bays. To the east are situated the barracks, hospitals, and storehouses, a few buildings on the other shore of the chief bay constitute the "northern side." Before the Crimean War of 1853-56 Sebastopol was a well-built city, beautified by gardens, and had 43,000 inhabitants, but at the end of the siege it had not more than fourteen buildings which had not been badly injured. After the war many privileges were granted by the Government in order to attract population and trade to the town, but both increased slowly, and at the end of seven years its population numbered only 6750. The railway line connecting Sebastopol with Moscow gave some animation to trade, and it was thought at the time that Sebastopol, although precluded by the treaty of Paris from reacquiring its military importance, might yet become a commercial city. In November 1870, during the Franco-German War, the Russian Government publicly threw off the obligation of those clauses of the treaty of Paris which related to the Black Sea fleet and fortresses, and it was decided again to make Sebastopol a naval arsenal. In 1882 Sebastopol had a population of 26,150 inhabitants, largely military. The town has been rebuilt on a new plan, and a fine church occupies a prominent site. There are now two lycæums and a zoological marine station. Although belonging to the government of Taurida, Sebastopol and its environs are under a separate military governor.

The peninsula between the Bay of Sebastopol and the Black Sea became known in the 7th century as the Heralcolote Cheisonese (see vol. vi p. 587). In the 5th century a c Greek colony was founded here and remained independent for three centuries, when it became part of the kingdom of the Bosphorus, and subsequently

tributary to Rome. Under the Byzantine emperors Cheisonesus was an administrative centre to their possessions in Taurida. According to the Russian annals, Vladimir, prince of Kieff, conquered Cheisonesus (Kosun) before being baptized there, and restored it to the Greeks on marrying the princess Anna. Subsequently the Slavonians were cut off from relations with Taurida by the Mongols, and only made occasional raids, such as that of the Lithuanian prince Olged. In the 16th century a new influx of colonizers, the Tatars, occupied Cheisonesus and founded a settlement named Akhtai. This village, after the Russian conquest in 1738, was selected for the chief naval station of the empire in the Black Sea and received its present name ("The August City"). In 1820 strong fortifications were begun, and in 1833 it was a formidable fortress. In September 1854, after having defeated the Russians in the battle of the Alma, the Anglo-French laid siege to the southern portion of the town, and on 17th October began a heavy bombardment. Sebastopol, which was nearly quite open from the land, was strengthened by earthworks thrown up under the fire of the besiegers, and sustained a memorable eleven months' siege. On 8th September 1855 it was evacuated by the Russians, who retired to the north side. The fortifications were blown up by the allies, and by the Paris treaty the Russians were bound not to restore them.

SEBENICO (*Sibenik*), a town of Austrian Dalmatia, on the coast of the Adriatic, about half-way between Zadar and Spalato, is situated on an irregular basin at the mouth of the Kerka, connected with the sea by a winding channel 3 miles long. The channel is defended by a fort designed by Sanmichele, and the town itself, picturesquely situated on the abrupt slope of a rocky hill, is guarded by three old castles, now dismantled. There is also a wall on the landward side. Sebenico is the seat of a bishop, and its Italian Gothic cathedral, dating from the 15th and 16th centuries, is considered the finest church in Dalmatia. Its excellent harbour and its situation at the entrance of the Kerka valley combine to make Sebenico the entrepôt of a considerable trade. Fishing is carried on extensively. The population of the commune in 1880 was 18,104, of the town proper about 8000.

SECCHI, ANTONIO (1818-1878), Italian astronomer, was born on 29th June 1818 at Reggio in Lombardy, and entered the Society of Jesus at an early age. In 1849 he was appointed director of the observatory of the Collegio Romano, which was rebuilt in 1853, there he devoted himself with great perseverance to researches in physical astronomy and meteorology till his death at Rome on 26th February 1878.

The results of Secchi's observations are contained in a great number of papers and memoirs. From about 1864 he occupied himself almost exclusively with spectrum analysis, both of stars (*Catalogo delle Stelle di cui si è determinato lo Spettro Luminoso*, Paris, 1867, 8vo. "Singli Spettro Prismatici delle Stelle Fisse," two parts, 1868, in the *Atti della Soc. Ital.*) and of the sun (*Le Solei*, Paris, 1870, 8vo., 2d ed. 1877). Though his publications always bear witness of his indefatigable zeal and energy, they are often uncritical and wanting in accuracy.

SECKENDORF, VEIT LUDWIG VON (1626-1692), a German statesman and scholar of the 17th century, was the most distinguished member of an ancient and widespread German noble family, which took its name from the village Seckendorf between Nuremberg and Langenzenn, and is said to have been ennobled by the emperor Otto I in 950, though it traces its own genealogy no further back than 1262. The family was divided into eleven distinct lines, but at present only three are preserved, widely distributed throughout Prussia, Württemberg, and Bavaria.¹ Veit Ludwig von Seckendorf, son of Joachim Ludwig, of the Gudentine line, was born at Herzogenaurach (near Erlangen) in Upper Franconia, 20th December 1626. His youth fell in the midst of the Thirty Years' War, in which his father was actively

¹ Amongst the Seckendorfs less known to fame than Veit Ludwig are his nephews, Friedrich Herrlich (1673-1763), soldier and diplomatist; Leo (1773-1809), poet, literary man, and soldier; the brothers Christian Adolf (1767-1833) and Gustav Anton ("Patrik Peale") (1775-1823), both literary men of some note.

engaged. But his talented and noble mother carefully watched over his education. In Coburg, Mühlhausen, and finally in Erfurt, whither his mother removed in 1636, he acquired the Latin, Greek, and French languages. In 1639 he returned to Coburg, and the reigning duke, Ernest the Pious, made him his *protégé*. Entering the university of Strasburg in 1642, he devoted himself to history and jurisprudence. After he finished his university course his patron gave him an appointment in his court at Gotha, with the charge of his valuable library. He there laid the foundation of his great collection of historical materials and mastered the principal modern languages. In 1652 he was appointed to important judicial positions and sent on weighty embassages. In 1656 he was made judge in the ducal court at Jena, a position which he held many years and in which he took the leading part in the numerous beneficent reforms of the duke. In 1664 he resigned office under Duke Ernest, who had just made him chancellor and with whom he continued on excellent terms, and entered the service of Duke Maurice of Zeitz (Altenburg), with the view of lightening his official duties. After the death of Maurice in 1681 he retired to his estate, Meuselwitz in Altenburg, from nearly all public offices, and devoted himself to his intellectual labours. Although living in retirement, he kept up a correspondence with the principal learned men of the day. He was especially interested in the endeavours of the pietist Spener to effect a practical reform of the German church, although he was hardly himself a pietist. In 1692 he was appointed chancellor of the new university of Halle, but died a few weeks afterwards, on the 18th of December.

Seckendorf's principal works were the following:—*Deutscher Fürstentum* (1656 and often afterwards), a handbook of German public law; *Der Christenstaat* (1685), partly an apology for Christianity and partly suggestions for the reformation of the church, founded on Pascal's *Pensées* and embodying the fundamental ideas of Spener; *Commentaries historiques et politiques de Lutheranisme sine de Reformatione* (3 vols., Leipzig, 1692) occasioned by the Jesuit Maimbourg's *Histoire du Lutheranisme* (Paris, 1680), his most important work, and still indispensable to the historian of the Reformation as a rich storehouse of authentic materials.

See D. G. Schreiber's *Historia vitæ ac meritum Plii Ludolphi a Seckendorf* (Leipzig, 1798); Schöpsch, *Lebensbeschreibungen berühmter Männer* (Leipzig, 1798); Nassmann, "Velt Ludwig von Seckendorf," in *Preussische Jahrbücher* (vol. xii., 1808, p. 257 sq.); W. Roscher, "Zwei sächsische Staatswirthe im 16ten und 17ten Jahrhundert," in *Witten's Archiv für die sächsische Geschichte* (vol. i., 1802); and Theodor Kolbe, "Seckendorf," in Herzog-Plitt's *Realencyclopädie* (1886).

SECRETARY-BIRD, a very singular African animal first accurately made known, from an example living in the menagerie of the prince of Orange, in 1769 by Vosmaer,¹ in a treatise published simultaneously in Dutch and French, and afterwards included in his collected works issued, under the title of *Regnum Animale*, in 1804. He was told that at the Cape of Good Hope this bird was known as the "Sagittarius" or Archer, from its striding gait being thought to resemble that of a bowman advancing to shoot, but that this name had been corrupted into that of "Secretarius." In August 1770 Edwards saw an example (apparently alive, and the survivor of a pair which had been brought to England) in the possession of Mr

Raymond near Ilford in Essex; and, being unacquainted with Vosmaer's work, he figured and described it as "of a new genus" in the *Philosophical Transactions* for the following year (xi. pp. 55, 56, pl. ii.). In 1776 Sonnerat (*Voy. Nouv. Guinée*, p. 87, pl. 50) again described and

Secretary-Bird.

figured, but not at all correctly, the species, saying (but no doubt wrongly) that he found it in 1771 in the Philippines Islands. A better representation was given by D'Aubenton in the *Planches Enluminées* (721); in 1780 Buffon (*Oiseaux*, vii. p. 330) published some additional information derived from Querehoent, saying also that it was to be seen in some English menageries; and the following year Latham (*Synopsis*, i. p. 20, pl. 2) described and figured it from three examples which he had seen alive in England. None of these authors, however, gave the bird a scientific name, and the first conferred upon it seems to have been that of *Falco serpentarius*, inscribed on a plate bearing date 1779, by John Frederick Miller (*III. Nat. History*, xxviii.), which plate appears also in Shaw's *Cimelia Physica* (No. 28) and is a misleading caricature. In 1786 Scopoli called it *Otis secretarius*—thus referring it to the Bustards;² and Cuvier in 1798 designated the genus to which it belonged, and of which it still remains the sole representative,³ *Serpentarius*. Succeeding systematists have, however, encumbered it with many other names, among which the generic terms *Gypogeryanus* and *Ophiotheres*, and the specific epithets *reptilivorus* and *cristatus*, require mention here.⁴ The Secretary-bird is of remarkable appearance, standing nearly 4 feet in height, the great length of its legs giving it a resemblance to a Crane or a Heron; but the expert will at once notice that, unlike those birds, its tibiae are feathered all the way down. From the back of the head and the nape hangs, loosely and in pairs, a series of black elongated feathers, capable of erection and dilation in periods of excitement.⁵

¹ Curiously enough, Boddaert in 1783 omitted to give it a scientific name.

² Ogilby's attempt to distinguish three species (*Proc. Zool. Society*, 1835, pp. 104, 105) has met with no encouragement; but examples from the north of the equator are somewhat smaller than those from the south.

³ The scientific synonymy of the species is given at great length by Drs Finsch and Hartlaub (*Vögel Ost-Afrikas*, p. 93) and by Mr Sharpe (*Cat. B. Brit. Museum*, i. p. 45); but each list has some errors in common.

⁴ It is from the fancied resemblance of these feathers to the pens which a clerk is supposed to stick above his ear that the bird's name of Secretary is really derived.

⁵ Le Vaillant (*See. Voy. Afrique*, ii. p. 273) truly states that Kolben in 1719 (*Copie Bonæ Spei hodiernum*, p. 182, French version, ii. p. 198) had mentioned this bird under its local name of "Snake-eater" (*Slangen-vreter*, Dutch translation, i. p. 214); but that author, who was a bad naturalist, thought it was a Pelican and also confounded it with the Spoonbill, which is figured to illustrate his account of it. Though he doubtless had seen, and perhaps tried to describe, the Secretary-bird, he certainly failed to convey any correct idea of it. Latham's suggestion (*loc. infra cit.*) that the figure of the "Grus Capensis codae cristatus" in Petiver's *Geophylacanthum* (tab. xii. fig. 12) was meant for this bird is negatived by his description of it (p. 20). The figure was probably copied from one of Smeaton's paintings and more likely to have had its origin in a Grus of some species. Vosmaer's plate is lettered "Amerikanischen Roof-Vogel," of course by mistake for "Afrikaanischen."

The skin round the eyes is bare and of an orange colour. The head, neck, and upper parts of the body and wing-coverts are bluish-grey, but the carpal feathers, including the primaries, are black, as also are the feathers of the vent and tibiae,—the last being in some examples tipped with white. The tail-quills are grey for the greater part of their length, then barred with black and tipped with white, but the two middle feathers are more than twice as long as those next to them, and drooping downwards present a very unique appearance.

The habits of the Secretary-bird have been very frequently described, one of the best accounts of them being by Vieilleux in the Zoological Society's *Proceedings* for 1856 (pp. 348-352). Its chief prey consists of insects and reptiles, and as a rule makes it held in high esteem. Making every allowance for exaggeration, it seems to possess a strange partiality for the destruction of the latter, and successfully attacks the most venomous species, striking them with its knobbed wings and kicking forwards at them with its feet, until they are rendered incapable of offence, when it swallows them. The nest is a huge structure, placed in a bush or tree, and in it two white eggs, spotted with rust-colour, are laid. The young remain in the nest for a long while, and even when four months old are unable to stand upright. They are very frequently brought up tame, and become agreeable not to say useful pets about a house, the chief drawbacks to them being that when hungry they will help themselves to a small poultry, and the fragility of their legs, which follows on any sudden alarm, and ends in their death. The Secretary-bird is found, but not very abundantly and only in some localities, over the greater part of Africa, especially in the south, extending northwards to the west to the Gambia and in the interior to Khartoum, where Von Henglin observed it breeding.

The systematic position of the genus *Secretary-bird* has long been a matter of discussion, and is still one of much interest, though of late classifiers have been pretty well agreed in placing it in the order *Accipitres*. Most of them, however, have shown great want of perception in placing it in the Family *Falconidae*. No anatomist can doubt its forming a peculiar Family, *Secretary-birdidae*, differing more from the *Falconidae* than do the *Vulturidae*, and the fact of Prof. A. Milne-Edwards having recognized in the Miocene of the Allier the fossil bone of a species of this genus, *S. robustus* (*Os foss. France*, p. 465-466, pl. 186, figs. 1-6), proves that it is an ancient form, one possibly existing on a direct and not much modified line from a generalized form, whence may have sprung not only the *Falconidae* but perhaps the progenitors of the *Ardeidae* and *Columbidae*, as well as the puzzling *Cariacidae* (SEIZIEM, q v). (A. N.)

SECULAR GAMES were celebrated at Rome for three days and nights with great ceremony to mark the commencement of a new *saeculum* or generation. Originally they were a propitiatory festival, imported from Etruria under the name of Ludi Terentini, and held at irregular intervals, in view of extraordinary prodigies, but in 249 B.C. it was decreed that they should be celebrated in every hundredth year after that date. This decree was frequently disregarded, partly for political reasons and partly because in Augustus's time and with his approval the quinquagennarii, acting under Greek influence, sanctioned the longer period of 110 years.

The dates of the actual celebrations are as follows:—the first in 509 B.C., the second in 348, the third in 249, the fourth in 146, the fifth by Augustus in 17 (for this occasion Horace wrote his *Carmen Saeculare*), the sixth by Claudius in 47 A.D. = 800 A.V.C., the seventh by Domitian in 88, the eighth by Antoninus Pius in 147 = 900 A.V.C., the ninth by Severus in 204 (320 years after the Augustan celebration), the tenth by Philip in 243, the eleventh and last by Gallienus c. 262. The projected celebration of Maximian in 304 did not take place.

Censorinus, *De Die Natali*, c. 17, Zosimus, l. 1 § 9; Val. Max., l. c. 5. The dates of the first two celebrations appear to rest only on the authority of Valerius Antias, the others are certain. The quinquagennarii books assigned fictitious dates for the pre-Augustan celebrations. Comp. Marquardt, *Die römische Staatsverwaltung*, in p. 360 sq.

SECUNDERĀBĀD, one of the chief British military cantonments in India, is situated in the native state of Haidarābād (Hyderabad) or the Nizam's Dominions, in 17° 26' 30" N. lat. and 78° 33' E. long., 1830 feet above the level of the sea, and 6 miles north-east of Haidarābād city. Secunderābād is the largest military station in India and forms the headquarters of the Haidarābād subsidiary

force, which constitutes a division of the Madras army. The strength of the military force stationed at Secunderābād in 1883 was 5632, European troops numbering 2276 and native troops 3356. To the south-west of the cantonment there is a large reservoir or tank, known as the Husan Sāgar, about 3 miles in circumference. Secunderābād town, which forms the cantonment bazaar, contains a population of over 30,000. Adjoining this cantonment to the north is the Bolāram cantonment, one of the stations of the Haidarābād contingent, under the immediate command of the nizam, and 2 miles to the south of Secunderābād cantonment are the lines of the Haidarābād reformed troops, also belonging to the nizam. During the mutiny (1857-58) both the subsidiary force and the Haidarābād contingent rendered good service.

SECUNDUS, JOHANNES, or JOHANN EVERTS (1511-1536), Latin poet, was born at The Hague on 10th November 1511. He was descended from an ancient and honourable family in the Netherlands; his father, Nicholas Everts, or Everard, seems to have been high in the favour of the emperor Charles V. On what account the son was called Secundus is not known. His father intended him for the law; but though he took his degree at Bourges it does not appear that he devoted much time to legal pursuits. Poetry and the sister arts of painting and sculpture engaged his mind at a very early period. In 1533 he went to Spain, and soon afterwards became secretary to the cardinal-archbishop of Toledo, in a department of business which required no other qualification than that which he possessed in a very eminent degree,—a facility in writing with elegance the Latin language. It was during this period that he composed his most famous work, the *Besais*, a series of amatory poems, of which the fifth, seventh, and ninth *Canzona* of Catullus seem to have given the hint. In 1534 he accompanied Charles V. to the siege of Tunis, but gained few laurels as a soldier. After quitting the service of the archbishop, Secundus was employed as secretary by the bishop of Utrecht, and so much did he distinguish himself by the classical elegance of his compositions that he was called upon to fill the important post of private Latin secretary to the emperor, who was then in Italy. But, having arrived at St. Amand, near Tonnay, he was cut off by a violent fever on 8th October 1536.

SEDAINE, MICHEL JEAN (1719-1797), dramatist, was born at Paris on 4th July 1719. Few men of letters have risen from a lower station. Although his father was an architect, he died when Sedaine was quite young, leaving no fortune, and the boy began life as a mason's labourer. He worked himself up in his trade and was at last taken as pupil and partner by the builder who employed him. Meanwhile he had done his best to repair his deficiencies of education, and in 1753 he published a volume of poems of some merit. He then took to the theatre and after composing various *vandevilles* and *opérettes* attracted the attention of Diderot, and had two remarkable plays accepted and performed at the Théâtre Français. The first and longest, *Le Philosophe sans le Savoir*, was acted in 1765; the second, a lively one-act piece, *La Gageure Impromise*, in 1768. These two at once took their place as stock pieces and are still ranked among the best French plays, each of its class. Sedaine inclined somewhat to the school of *drame* or *tragedie bourgeoise*, but he was free from the excessive sentimentality which in the hands of Diderot and others marred the style, and he had a vein of singularly natural and original comedy. Indeed his originality is one of his chief points, though except the two pieces mentioned little or nothing of his has kept the stage or the shelves. Sedaine, who became a member of the Academy, secretary for architecture of the fine arts division, and a prosperous man generally, was personally

both popular and respected. He lived to a considerable age, dying at Paris on 17th May 1797.

SEDALIA, a city of the United States, county town of Pettis county, Missouri, lies 189 miles west of St Louis, on the highest swell of a rolling prairie, which drains by small streams north-east to the Missouri. It is a railroad centre, and, besides the machine-shops and carriage-factories of two railway companies (the Missouri, Kansas, and Texas, and the Missouri Pacific, Middle Division), it contains foundries, flour-mills, and establishments for the manufacture of furniture, woollen goods, soap, beer, &c. Among the public buildings are two opera-houses, a public library, a high school, and a gymnasium. Founded in 1860 by General George R. Smith, Sedalia had 4560 inhabitants in 1870, and 9561 in 1880.

SEDAN, a town of France, the chef-lieu of an arrondissement in the département of Ardennes, lies on the right bank of the Meuse, 13 miles east-south-east of Mézières by the railway to Thionville (Lorraine), and is surrounded by heights of about 1000 feet. Since its fortifications were *déclassées*, a process of embellishment has been going on. Place Tuenné takes its name from the statue of the illustrious marshal, who was born in the town in 1611. The public buildings include a Protestant church, a synagogue, a museum, and a college. The manufacture of fine black cloth has long been, and still continues to be, the staple industry, employing in the town and neighbourhood more than 10,000 workmen, and producing to the value of 40,000,000 francs annually. Several spinning-mills have been erected by Alsatian refugees since 1871. Considerable activity is also displayed in various departments of metal-working, especially in the surrounding villages. The population was 13,807 in 1872, and 19,240 in 1881 (19,556 in the commune).

Sedan was in the 13th century a dependency of the abbey of Mouzon, the possession of which was disputed by the bishops of Liège and Rheims. United to the crown of France by Charles V. it was ceded by Charles VI. to Guillaume de Baugement, who sold it to the La Maëks. For two centuries this powerful family managed to continue masters of the place in spite of the bishops of Liège and the dukes of Burgundy and Lorraine, and in the person of Henri Robert they adopted the title "prince of Sedan." In the 16th century the town was an asylum for many Protestant refugees, who laid the basis of its industrial prosperity, and it became the seat of a Protestant seminary. The last heroes of the La Marek family brought Sedan and the duchy of Bouillon to Henri de la Tour d'Auvergne, viscount of Turenne. When the new duke attempted to maintain his independence, Henry IV. captured Sedan in three days, and the second duke (eldest brother of the great marshal), who had several times revolted against Louis XIII., was at last, after his share in the conspiracy of Cinq-Mars, obliged to surrender his principality. Sedan thus became part of the royal domain in 1641. On 1st September 1870 the fortress was the centre of the most disastrous conflict of the Franco-German War. Shut in by the Germans, who had occupied the surrounding heights, the whole French army, after a terrific contest, was obliged to capitulate—the emperor, 39 generals, 280 staff-officers, 2600 officers, and 83,000 men becoming prisoners of war. The village of Bazilly was the scene of the heroic stand made by the marines under Martin des Pallières. It now contains the great osuary, and a monument to the memory of the marines; and the house which has been rendered famous by Neville's painting, "Les Dernières Caresses," is a museum of objects found on the battlefield.

SEDDON, THOMAS (1821-1856), landscape painter, was born in London on 28th August 1821. His father was a cabinetmaker, and the son for some time followed the same occupation; but in 1842 he was sent to Paris to study ornamental art. On his return he executed designs for furniture for his father, and in 1848 gained a silver medal from the Society of Arts. In the following year he made sketching expeditions in Wales and France, and in 1852 began to exhibit in the Royal Academy, sending a figure-piece, Penelope, and afterwards landscapes, deriving their subjects from Brittany. In the end of 1853 he started for the East and joined Mr Holman Hunt at Cairo. He worked

for a year in Egypt and Palestine, executing views which Mr Ruskin has pronounced to be "the first landscapes uniting perfect artistic skill with topographical accuracy, being directed, with stern self-restraint, to no other purpose than that of giving to persons who cannot travel trustworthy knowledge of the scenes which ought to be most interesting to them." Seddon's Eastern subjects were exhibited in Berners Street, London, in 1855, and in Conduit Street in 1856. In October 1856 Seddon again visited Cairo, where, after a very brief illness, he died on 23d November. In 1857 his works were collected and exhibited in the rooms of the Society of Arts, and his important and elaborately finished picture, Jerusalem and the Valley of Jehoshaphat, was purchased by subscription and presented to the National Gallery. A memoir of Seddon, by his brother, was published in 1859.

SEDGWICK, ADAM (1785-1873), geologist, was born in 1785 at Dent, Yorkshire, where his father was vicar of the parish. He was educated at Sedburgh school and at Trinity College, Cambridge, where he graduated as fifth wrangler in 1808, and was elected a fellow in 1809. For some years he devoted himself chiefly to the studies and duties of academic life, but gradually he acquired an absorbing interest in geology and natural science, which was fostered by long excursions into the country, rendered necessary by the state of his health. In 1818 he succeeded Professor Hailstone in the Woodwardian chair of geology. Among his principal discoveries, which appeared for the most part in the *Cambridge Transactions* and the *Transactions of the Geological Society*, were those of the true position and succession of the Paleozoic strata of Devonshire and Cornwall, of the geological relation of the beds afterwards named Permian in the north and north-west of England, and of the general structure of North Wales,—a subject which led him into controversy with Murchison. In 1834 he published a *Discourse on the Studies of the University of Cambridge*, which reached a fifth edition. By his generosity and energy he succeeded in rendering the geological collection of the Woodwardian Museum one of the most complete in the kingdom. He was one of the original secretaries of the Cambridge Philosophical Society established in 1819, and was president of the Geological Society of London from 1829 to 1831. Having taken holy orders, he was advanced to the dignity of canon of Norwich cathedral, and for some time also he was vice-master of Trinity College. Sedgwick died at Cambridge on 25th January 1873.

SEDITION in Roman law was considered as *maiestas* or treason. In English law it is a very elastic term, including offences ranging from libel to TREASON (*q.v.*) It is rarely used except in its adjectival form, *e.g.* seditious libel, seditious meeting, or seditious conspiracy. "As to sedition itself," says Mr Justice Stephen, "I do not think that any such offence is known to English law" (*Inst. Crim. Law*, vol. i. chap. xxiv.).¹ The same high authority lays down the law in the following terms, which were substantially adopted by the Draft Criminal Code Commissioners:

"Every one commits a misdemeanour who publishes verbally or otherwise any words or any document with a seditious intention. If the matter so published consists of words spoken, the offence is called the speaking of seditious words. If the matter so published is contained in anything capable of being a libel, the offence is called the publication of a seditious libel. Every one commits a misdemeanour who agrees with any other person or persons to do any act for the furtherance of any seditious intention common to both or all of them. Such an offence is called a seditious conspiracy. A seditious intention is an intention to bring into hatred or contempt or to excite disaffection against the person of Her Majesty, her heirs and successors, or the Government and constitution of the

¹ The word "sedition" occurs, however, in 40 and 41 Vict. c. 21, s. 40.

United Kingdom, as by law established, or either House of Parliament, or the administration of justice, or to excite Her Majesty's subjects to attempt otherwise than by lawful means the alteration of any matter in church or state by law established, or to raise discontent or disaffection amongst Her Majesty's subjects, or to procure feelings of ill-will and hostility between different classes of Her Majesty's subjects. An intention to show that Her Majesty has been misled or mistaken in her measures, or to point out errors or defects in the Government or constitution as by law established, with a view to their reformation, or to excite Her Majesty's subjects to attempt by lawful means the alteration of any matter in church or state by law established, or to point out, in order to their removal, any hostility between different classes of Her Majesty's subjects, is not a seditious intention. In determining whether the intention with which any words were spoken, any document was published, or any agreement was made, was or was not seditious, every person must be deemed to intend the consequences which would naturally follow from his conduct at the time and under the circumstances in which he so conducted himself" (*Digest of the Criminal Law*, §§ 91-94).

The principal enactments now in force dealing with seditious offences were all passed during the last twenty-five years of the reign of George III. They are 37 Geo. III c. 123, prohibiting the administering or taking of unlawful oaths (see OATH); or the belonging to an unlawful confederacy, 60 Geo. III and 1 Geo. IV c. 1, prohibiting unlawful drilling and military exercises; and the Acts for the suppression of corresponding societies, 39 Geo. III c. 79 and 57 Geo. III c. 19. No proceedings can be instituted under these last two Acts without the authority of the law officers of the crown (9 and 10 Vict. c. 33). Under the head of statutes aimed at seditious offences may also be classed 2 Ric. II st. 1, c. 5 and 12 Ric. II c. 11, against *scandalum magnatum* or slander of great men, such as peers, judges, or great officers of state, whereby discord may arise within the realm, and 13 Car. II c. 5, against tumultuous petitioning (see PETERITION). There has been no prosecution in recent times for seditious words as distinguished from seditious libel, but such words have been admitted as evidence in proceedings for seditious CONSPIRACY (*qv*), as in the prosecution of O'Connell in 1844 and of Mr. Parnell and others in 1880 (see Reg. v. Parnell, Cox's *Criminal Cases*, vol. xiv. 508). By the Prison Act, 1877, any prisoner under sentence for seditious or seditious libel is to be treated as a misdemeanant of the first division (40 and 41 Vict. c. 21, s. 40).

Scotland.—"All acts by which the minds of the people may be incited to defeat the Government or control legislation by violent or unconstitutional means are seditious" (Macdonald, *Criminal Law*, 229). Sedition is punishable by fine or imprisonment of both (8 Geo. IV. c. 47). A very large number of Acts of the Scottish Parliament dealt with sedition, beginning as early as 1184 with the assize of William the Lion, c. 29. Leasning-making is to be distinguished from sedition, as it attacked only the sovereign individually, not the Government.

United States.—In the Acts of Congress the word "sedition" appears to occur only in a summary and many articles. A soldier joining any sedition or who, being present at any sedition, does not use his utmost endeavour to suppress the same is punishable with death. A sailor uttering seditious words is punishable at the discretion of a court-martial. In 1798 an Act of Congress called the Sedition Act was passed, which expired by effluxion of time in 1801. Its constitutionality was violently assailed at the time (See STORY on the constitution of the United States, §§ 1298-4). Several prosecutions under the Act will be found in Wharton's *State Trials*. Sedition is also dealt with by the State laws, mostly in a very liberal spirit. Thus the Louisiana Code, § 394, enacts that "there is no such offence known to our law as defamation of the Government or either of its branches, either under the name of libel, slander, seditious writing, or other appellation." By § 111, to constitute the offence of sedition "there must be not only a design to dismember the State, or to subvert or change its constitution, but an attempt must be made to do it by force."

Continents of Europe.—The Continental codes as a rule are little more definite than English law in their treatment of sedition. In Germany a distinction is drawn between *Aufland*, the remaining together of a mob after the authorities have thrice bid it disperse, and *Aufruhr* or *Aufstand*, an organized resistance to the authorities; but no definition is given of the terms. The Hungarian

penal code defines *Aufstand* to be an armed assembly which has the intention of attacking a class of citizens, a nationality, or a religious body. The French penal code recognizes a difference between *sedition* and *revolunt seditione*. If carried out with sufficient numbers and sufficient force *sedition* becomes *rebellion*. Section 100 exempts from the penalties of sedition those who have merely been present at a seditious meeting without taking any active part therein, and have dispersed at the first warning of the military or civil authorities.

SEDLEY, SIR CHARLES (1639-1701), a noted "wit" and patron of literature in the Restoration period, the "Lucidus" of Dryden's *Essay of Dramatic Poesy*. He was born in 1639, the son of Sir John Sedley of Aylesford in Kent. Like many other men of rank and fashion at the court of "the merry monarch," Sedley had poetical ambition, and wrote comedies and songs. His most famous song, "Phyllis," is much more widely known now than the author's name. His first comedy, *The Mulberry Garden*, was published in 1668, but it does not sustain Sedley's contemporary reputation for wit in conversation. He was probably too indolent to master the art of providing continuous opportunities for brilliant sayings, although he continued to try, wrote two more comedies, and left a comedy and two tragedies behind him to be published after his death. An indecent frolic in Bow Street, for which he was heavily fined, made him notorious in his youth, but later on he sobered down, entered parliament for New Romney (Kent), and took an active part in politics. A speech of his on the civil list after the Revolution is cited by Macaulay as a proof (which his plays do not afford) that his reputation as a man of wit and ability was deserved. His *bon mot* at the expense of James II is another well-known fragment of his wit. The king had seduced his daughter and created her countess of Dorchester, whereupon Sedley remarked that he hated ingratitudes, and, as the king had made his daughter a countess, he would endeavour to make the king's daughter a queen. Sedley died on 20th August 1701.

SEDUCTION. The action for seduction of an unmarried woman in England stands in a somewhat anomalous position. The theory of English law is that the woman herself has suffered no wrong, the wrong has been suffered by the parent or person *in loco parentis*, who must sue for the damage arising from the loss of service caused by the seduction of the woman. Some evidence of service must be given, but very slight evidence will be sufficient. Although the action is nominally for loss of service, still exemplary damages may be given for the dishonour of the plaintiff's family beyond recompence for the mere loss of service. An action for seduction cannot be brought in the county court except by agreement of the parties. As to seduction of a married woman, the old action for criminal conversation was abolished by the Divorce Act, 1857, which substituted for it a claim for damages against the co-respondent in a divorce suit. Seduction in England is not as a rule a criminal offence. But a conspiracy to seduce is indictable at common law. And the Criminal Law Amendment Act, 1885 (which extends to the United Kingdom), makes it felony to seduce a girl under the age of thirteen, and misdemeanour to seduce a girl between thirteen and sixteen (48 and 49 Vict. c. 69, §§ 4, 5). The same Act also deals severely with the cognate offences of procuration, abduction, and unlawful detention with the intent to seduce a woman of any age. In Scotland the seduced woman may sue on her own account.

United States.—In the United States State legislation has generally modified the common law. In some States the father brings the action on the representative of the family whose purity has been invaded; in others the woman herself may bring the action. In many States there is a criminal as well as a civil remedy. The penal codes of New York, New Jersey, Louisiana, and other States make it a crime to seduce under promise of marriage an unmarried woman of good reputation. Subsequent intermarriage of the parties

is in most cases a bar to criminal proceedings. Massachusetts goes still further. By the law of that State if a man commits fornication with a single woman, each of them shall be punished by imprisonment not exceeding three months, or by fine not exceeding \$30. The seduction of a female passenger on a vessel of the United States is an offence punishable by fine or imprisonment. The fine may be ordered by the court to be paid to the person seduced or her child (Act of Congress of 24th March 1860). The State legislation of the United States is in remarkable opposition to the rule of the canon law, by which the seduction of a woman by her betrothed was not punishable on account of the inchoate right over her person given by the betrothal.

SEDULIUS, CELSIUS, a Christian poet of the 5th century, was the author of an abecedarian *Hymnus de Christo* in iambic dimeters, portions of which maintain their ground in the offices of the Church of Rome, viz. in the Christmas hymn "A solis ortus cardine," and in that for Epiphany (altered from "Herodes hostis impius"). His other works are *Paschale Carmen*, *s. Mirabilium Divinorum Liber V*, originally in four or five books in hexameter verse and afterwards enlarged and turned into prose, and *Vetus et Novæ Testamenti Collatio*, in elegiac verse. *De Verbi Incarnatione*, a Virgilian cento, has also been ascribed to him, but on insufficient grounds. Of his personal history nothing is known, except that he is called a presbyter by Isidore of Seville, by some other writers of less authority he is designated "antistes" or "episcopus." A Scotch-Irish origin has sometimes been claimed for him, but at all events he must not be confounded with Sedulius the grammarian, an Irish Scot who lived in the 9th century. The best edition of his works is that of Arevalus (4to, Rome, 1794).

SEDUM. About 120 species are enumerated in this genus of *Crassulaceæ*, mostly perennial herbs with succulent leaves of varied form, but never compound. The individual flowers are usually small and grouped in cymes. In colour they range from white and yellow to pink. They have a calyx of five sepals, as many petals, usually ten stamens, and five distinct carpels, which have as many glands at their base and ripen into as many dry seed-pods. Several species are British, including some with tuberous roots and large leaves (*Tetraphyllum*), and others of smaller size, chiefly found on rocks, walls, and dry banks. Many are cultivated for the beauty of their flowers, and many are remarkable for their prolonged vitality under adverse circumstances. Sedums are very closely allied to *Semperivivus* (see **HOUSELEEK**).

SEELAND See ZEALAND

SEES, a town of France and a bishop's see, in the department of Orne, is situated on the Orne, 4 miles from its source and 13 miles north of Alençon by the railway from Le Mans to Caen. The very fine cathedral, dating to a large extent from the 13th and 14th centuries, occupies the site of churches founded in 440, 996, and 1053. The west front has two stately spires of open work 230 feet high, which have been restored more than once in the 19th century. The nave, built in the beginning of the 13th century, was remodelled in its upper portion fifty or sixty years after its erection; the choir, built about 1230 and restored in 1260 after a great fire, is remarkable for the lightness of its construction,—the inner galleries of the presbytery being the boldest venture ever made in this kind. In the choir are four bas-reliefs of great beauty and delicacy representing scenes in the life of the Virgin, and the altar is adorned with another depicting the removal of the relics of St Gervais and St Protasius. Most of the stained windows are good. Around the cathedral are the cloisters of the canons; the episcopal palace (1778), with a pretty chapel, the great seminary, located in the old abbey of St Martin (supposed to be one of the fourteen or fifteen monasteries founded in the 6th century by St Evroult), the hôtel de ville, and the statue of Conté, a member of

the Egyptian expedition of 1798. The population of Sees was 3483 in 1881, and that of the commune 4687.

The first bishop of Sees (*Sagum*) was St Lamm, who lived at the close of the 3d or beginning of the 4th century. In the 9th century it was a fortified town and fell a prey to the Normans, and the stones from its ruined ramparts were used for the erection of a church in the close of the 10th century. In the 12th century Sees belonged to the count of Alençon and consisted of two distinct parts, separated by the Orne,—the bishop's burgh, and to the south the new or count's burgh (*Bourg le Comte*). Captured in 1154 by Henry II. of England, it was recovered in the following year by Guillaume de Bellême, and in 1138 it was partly banded by the count of Anjou. After being taken by Philip Augustus it enjoyed some years of peace, during which a hospital and a Franciscan monastery were built, but it was one of the first towns of Normandy to fall into the hands of the English (1417), who retained possession until their final expulsion from France. Pillaged by the Protestants during the Wars of Religion, Sees attached itself to the League in 1589, but voluntarily surrendered to Henry IV. in 1590.

SEETZEN, ULRICH JASPER (1767-1811), one of the most distinguished of modern travellers in the East, was born the son of a yeoman, in the little lordship of Jever in German Frisia, on 30th January 1767. His father, who was a man of substance, sent him to the university of Göttingen, where he graduated in medicine. His chief interests, however, were in natural history and technology, he wrote a number of papers on both these subjects which gained him some reputation, and had both in view in a series of journeys which he made from time to time through various parts of Holland and Germany. He also engaged practically in various small manufactures, and in 1802 obtained a Government post in Jever. In 1801, however, the interest which he had long felt in geographical exploration had culminated in a resolution to travel by Constantinople to Syria and Arabia, and then, when familiarized with Mohammedan ways, to try to penetrate into Central Africa. He relied mainly on his own resources, but received a small subvention from Gotha, where also he learned from Zach to make astronomical observations. In the summer of 1802 he started down the Danube with a companion Jacobson, who broke down at Smyrna a year later. His journey was by Constantinople, where he stayed six months, thence through Asia Minor to Smyrna, then again through the heart of Asia Minor to Aleppo, where he remained from November 1803 to April 1805, and made himself sufficiently at home with Arabic speech and ways to travel as a native and without an interpreter. Now began the part of his travels of which a full journal has been published (April 1805 to March 1809), a series of most instructive journeys in eastern and western Palestine and the wilderness of Sinai, and so on to Cairo and the Fayyûm. His chief exploit was a tour round the Dead Sea, which he made without a companion and in the disguise of a beggar. From Egypt he went by sea to Jeddah and reached Mecca as a pilgrim in October 1809. In Arabia he made extensive journeys, ranging from Medina to Lahak and returning to Mocha, from which place his last letters to Europe were written in November 1810. In September of the following year he left Mocha with the hope of reaching Muscat, and was found dead two days later, having, it is believed, been poisoned by the command of the imâm of Sana'a. For the parts of Seetzen's journeys not covered by the published journal (*Reisen*, ed. Kruse, 4 vols., Berlin, 1854) the only printed records are a series of letters and papers in Zach's *Monatliche Correspondenz* and Hammer's *Fundgruben*. Many papers and collections were lost through his death or never reached Europe. The collections that were saved form the Oriental museum and the chief part of the Oriental MSS. of the ducal library in Gotha.

SE-GAN FOO, the capital of the province of Shen-se in north-western China, is situated in 34° 17' N. lat. and 108° 58' E. long. Like most Chinese cities, Se-gan Foo has repeatedly changed its name during its history, which dates

back to the time of Che Hwang-te (246-210 B.C.), the first universal emperor, whose name will be ever notorious as that of the monarch who built the Great Wall, burnt the books, and established his capital at Kwan-chung, the site of the modern Se-gan Foo. Under the succeeding Han dynasty (206 B.C.-25 A.D.) this city was called Wei-nan and Nuy-she, under the Eastern Han (25-221 A.D.) it was known as Yung Chow, under the Tang (618-907) as Kwan-yü, under the Sung (960-1127) as Yung-hing, under the Yuen and Ming (1260-1644) as Gan-se, and under the present dynasty as Se-gan. During the T's'in, Han, and Tang dynasties it was the capital of the empire, and is at the present time second only to Peking in size, population, and importance. The city, which is a square, measuring 10 Chinese miles each way, is prettily situated on ground rising from the river Wei, and includes within its limits the two distinct cities of Ch'ang-gan and Hien-ning. Its walls are little inferior in height and massiveness to those of Peking, while its gates are handsomer and better defended than any of which the capital can boast. The population is said to be 1,000,000, of whom 50,000 are Mohammedans. Situated in the basin of the Wei river, along which runs the great road which connects northern China with Central Asia, at a point where the valley opens out on the plains of China, Se-gan Foo occupies a strategical position of great importance, and repeatedly in the annals of the empire has history been made around and within its walls. During the late Mohammedan rebellion it was besieged by the rebels for two years (1868-70), but owing to the strength of the fortifications it defied the efforts of its assailants. From its eastern side three great roads radiate, one reaching to Shan-se, one to Ho-nan, and one to Hoo-pih, while from it runs in a south-westerly direction the great highway into Sze-chuen. It is thus admirably situated as a trade centre and serves as a depot for the silk from Che-keang and Sze-chuen, the tea from Hoo-pih and Ho-nan, and the sugar from Sze-chuen destined for the markets of Kansu, Turkistan, Ili, and Russia. Marco Polo speaking of Kengau, as the city was then also called, says that it was a place "of great trade and industry. They have great abundance of silk, from which they weave cloths of silk, and gold of divers kinds, and they also manufacture all sorts of equipments for an army. They have every necessary of man's life very cheap." Many of the temples and public buildings are very fine, and not a few historical monuments are found within and about the walls. Of these the most notable is a Nestorian tablet,¹ which was accidentally discovered in 1625 in the Ch'ang-gan suburb

¹ The contents of this Nestorian inscription, which consists of 1780 characters, may be described as follows. (1) An abstract of Christian doctrine of a vague and figurative kind. (2) An account of the arrival of the missionary Iojan (probably a Chinese form of Babai = Monk), from T'ai'in in the year 635, bringing sacred books and images, of the translation of the said books; of the imperial approval of the doctrine and permission to teach it publicly. Then follows a decree of the emperor (T'ai-tung, a very famous prince), issued in 638, in favour of the new doctrine, and ordering a church to be built in the square of justice and peace (*tsing-fang*) in the capital. The emperor's portrait was to be placed in this church. After this comes a description of T'ai'in, and then some account of the fortunes of the church in China a inscription, which concludes with the date of erection, viz. 781, is followed by a series of short inscriptions in Syriac and the *Estrange* character, containing the date of the erection, the name of the reigning Nestorian patriarch, Mar Hannu Isha, that of Adam, bishop and pope of China, and those of the clerical staff of the capital. Then follow

The stone slab which bears the inscription is $7\frac{1}{2}$ feet high by 3 wide, and at present stands embedded in a brick wall, which forms part of a dilapidated temple.² From a Chinese point of view, however, the Pei Lin or "forest of tablets" is a place of even greater interest than the above-mentioned temple. For there are collected tablets of the Han, Tang, Sung, Yuen, and Ming dynasties, some of which bear historical legends, notably a set of stone tablets having the thirteen classics inscribed upon them, while others are symbolical or pictorial, among these last is a full-sized likeness of Confucius. As might be expected on a site which has played so prominent a part in Chinese history, antiquities are constantly being discovered in the neighbourhood of the city, e.g., rich stores of coins and bronzes, bearing dates ranging from 200 B.C. onwards.

SEGESTA, a very ancient city near the north-western extremity of Sicily, so named by the natives and by the Romans, while the Greeks called it Egesta or *Ægesta*. Its origin was ascribed by tradition sometimes to Trojan refugees and sometimes to Phocians, followers of Philoctetes, the accounts agree only in making Segesta older than the Greek colonization of Sicily in the 7th century B.C. A tribe named Elymi, distinct from both the Siculi and the Greeks, occupied the country round the city. The scanty references to the history of Segesta show it in continual warfare with the Greek city Selinus from the year 580 B.C. downwards. As early as 426 B.C. it concluded an alliance with Athens, and in 416 a great Athenian fleet sailed to Sicily, ostensibly to aid Segesta against its enemies Selinus and Syracuse, but really to attempt the conquest of the island. After the destruction of the Athenian fleet and army, the Segestans turned to the Carthaginians. But when Hannibal destroyed Selinus (see SELINUS) in 409 B.C. and Himera, and established the Carthaginian power firmly in the western part of Sicily, Segesta sank to the position of a dependant ally. In 397 it suffered a long siege from Dionysius of Syracuse, but at last was relieved by Himilo. In 307, however, the Greek arms had better success, Agathocles of Syracuse sold the inhabitants into slavery, after massacring 10,000 men, and changed the name of the city to Diroopolis. But it soon recovered its old name and passed again to the Carthaginians. In the beginning of the First Punic War the Segestans murdered the Carthaginian garrison and became allies of Rome. Being soon after besieged by the Carthaginians, they were relieved by the great naval victory of Dreux, 260 B.C. Segesta was always highly favoured by the Romans, both on account of its early adhesion to their cause and from its supposed Trojan origin. Its site is now deserted, having been exposed to the Saracen depredations in the 10th century, but the ruins are very fine. Segesta was about 6 miles from the sea, and the modern town of Castellamare probably occupies the site of the ancient harbour. The Crimisus, which is represented on coins of Segesta, is probably the river S. Bartolommeo, about 6 miles to the south. There were hot springs and baths not far from the city.

SEGOVIA, a province of Spain, formerly part of Old Castile, is bounded on the N. and N.E. by the provinces of Burgos and Soria, on the S.E. by those of Guadalajara and Madrid, on the S.W. by Avila, and on the N.W. by Valladolid. It has an area of 2670 square miles, and the population in 1877 was 149,961. The greater portion of the country consists of a dry arable tableland, lifted some

sixty-seven names of persons in Syriac characters, most of whom are characterized as priests, and sixty-one names of persons in Chinese, all priests but one.

2500 feet above the sea, monotonous enough in appearance, and burnt to a dull brown during summer, but yet producing some of the finest corn in the Peninsula. Along the whole south-eastern boundary the Guadarrama range of mountains rises up suddenly, like a huge barrier, separating Old from New Castile and the basin of the Douro from that of the Tagus,—affording, too, among its ravines and upon its slopes some remarkably fine scenery. There are two well-known passes or “puertos” over the sierra, those of the Nava Cerrada and of Somosierra. The former has been, until quite a recent date, the chief means of communication with the outer world, save when blocked by winter snows. It winds round the lower southern slope of the Peñalara (8500 feet). The Puerto de Somosierra lies north of the Peñalara. By it in 1808 Napoleon descended upon Madrid. Though to the eye of the stranger almost desert-like in appearance, the province of Segovia is well watered by the streams which rise in the Guadarrama range and flow northwards to the Douro, and by careful methods of irrigation. The Eresma, Cega, Duraton, and Riaza are the principal watercourses. With the exception of Segovia and Sepúlveda, there is no town of any importance,—the inhabitants being for the most part employed in agricultural and pastoral pursuits and backward in civilization. Since the completion (1883) of the railway from Medina del Campo to the city of Segovia, however, the towns *en route* have begun to show signs of animation, and, as the province contains monuments of deepest interest to the historian and ecclesiologist, it bids fair to receive its due measure of attention and enlightenment. At the foot of the Nava Cerrada pass lies the royal demesne and summer residences of La Granja, or San Ildefonso, one of the great show places of the Peninsula. The chief trades and manufactures formerly carried on in the province—weaving, tanning, making of earthenware, &c.—have been drawn away to more commercial centres. Paper-making holds its own to some extent, owing to the excellence of the water; and for the same reason, together with the superior quality of the breed of sheep, the picturesque scenes attendant upon the preparation of the fleeces may still be witnessed. Such prosperity, however, as Segovia retains is dependent upon its agricultural produce—wheat, rye, barley, peas, hemp, flax, &c.—together with the rearing of sheep, cattle, mules, and pigs. The sierras yield excellent granite, marble, and limestone, but hitherto the difficulty of transport has prevented any development of mineral wealth.

SEGOVIA, the capital of the above province, clusters upon a narrow ridge of rock which rises in the valley of the Eresma, where this river is joined by its turbulent little tributary the Clamores, and is one of the best specimens extant of the Gotho-Castilian cities. Founded originally as a Roman pleasured resort, it became in the Middle Ages a great royal and religious centre, and was surrounded by Alphonso VI with the walls and towers which still give to it, even in their dilapidation, the air of a military stronghold. The streets are steep, irregular, and narrow, and are lined with quaint old-fashioned houses as irregular and forbidding, built for the most part of granite from the neighbouring sierra. The place teems with records and monuments of the many vicissitudes of fortune and art through which it has passed, foremost among the latter being the ancient Alcázar, the cathedral, the aqueduct of Trajan, and a notable array of churches and other ecclesiastical edifices. The Alcázar is perched upon the western tip of the long tongue of rock upon which the city is built, and which at this point has a sheer descent upon three sides into the valley. Of the original Middle-Age fortress but little remains save the noble façade,—the building having been wantonly fired in 1862 by the students of the artillery school then domiciled within its walls, and all but destroyed. It

is now in course of slow but praiseworthy restoration. The work is Gotho-Moorish, with an admixture of Renaissance in the decoration. Some of the rooms deserve notice, especially the Sala del Trono and the Sala de Recibimiento. The views obtained over the outlying *vega* from the towers and windows are superb. The 16th-century cathedral (1531-1577), the work of Juan Gil de Ontañon and his son Rodrigo, occupies the site of a former church of the 11th century, of which the present cloisters, rebuilt in 1524, formed part. It is a well-proportioned and delicate piece of Late Gothic—the latest of its kind in Spain—317 feet long by 177 wide. The central nave rises 99 feet and the tower 330. The exterior is the least satisfactory portion, at once bald and over-decorated, the interior is light and pure, with an effectiveness greatly enhanced by some very fine stained glass. The churches of Segovia are legion, though many of them are closed and fast falling into disrepair. The most remarkable are those of La Vera Cruz (Knights Templar, Romanesque of the early 13th century), San Millán and San Juan (both Romanesque of second half of 13th century), El Parral (Gothic of early 16th century), and Corpus Christi, an ancient Jewish sanctuary and an interesting specimen of Moorish work. The towers and external cloistering, or *corredores*, of several of the later churches—especially those of San Esteban and San Martín—are fine. The great aqueduct, however, called El Puente del Diablo, ranks usually as the glory of Segovia, and is remarkable alike for its colossal proportions, its history, its picturesqueness, and the art with which it is put together. Erected first, according to fairly reliable tradition, in the time of the emperor Trajan, and several times barely escaping destruction, it is now, after nearly eighteen hundred years, in perfect working order, bringing the pure waters of the Rio Frio down from the Sierra Fofia, distant 10 miles to the south. The bridge portion striding across the valley into the city is 847 yards long, and consists of a double tier of superimposed arches, built of rough-hewn granite blocks, laid without lime or cement. The three centre arches are 102 feet in height. Segovia finally lost its ancient preeminence when it was taken and sacked by the French in 1808. Some insignificant manufactures of cloth, leather, paper, and rude earthenware still exist in the suburb of San Lorenzo, but the trade of the place languishes year by year. The city is the see of a bishop, suffragan to Valladolid. The population in 1877 was 11,318.

SEIGNORY, or SEIGNIORITY, is the relation of the lord of a fief or a manor to his tenant. There is no land in England without its lord. “Nulle terre sans seigneur” is the old feudal maxim. Where no other lord can be discovered the crown is lord as lord paramount. The principal incidents of a seignory were fealty and rent-service. In return for these privileges the lord was liable to forfeit his rights if he neglected to protect and defend the tenant or did anything injurious to the feudal relation. Every seignory now existing must have been created before the Statute of *Quia Emptores*, which forbade the future creation of estates in fee-simple by subinfeudation (see REAL ESTATE). The only seignories of any importance at present are the lordships of manors. They are regarded as incorporeal hereditaments, and are either appendant or in gross. A seignory appendant passes with the grant of the manor; a seignory in gross—that is, a seignory which has been severed from the demesne lands of the manor to which it was originally appendant—must be specially conveyed by deed of grant.

SEINE This, one of the chief rivers of France (Lat *Seguana*), rises on the eastern slope of the plateau of Langres, 18 miles to the north-west of Dijon. It keeps the same general direction (north-westwards) throughout its entire course, but has numerous windings: between its

source and its mouth in the English Channel the distance is only 250 miles, but that actually traversed (through the departments of Côte-d'Or, Aube, Seine-et-Marne, Seine-et-Oise, Seine, Eure, and Seine-Inférieure) is 483. Though shorter than the Loire and inferior in volume to the streams of the Rhine system when these are at their fullest, the Seine derives an exceptional importance from the regularity of its flow. This feature is due to the geological character of its basin, an area of 19,400,000 acres, entirely belonging to France (with the exception of a few communes in Belgium), and formed in three-fourths of its extent of permeable strata, which absorb the atmospheric precipitation to restore it gently to the river by perennial springs. It is believed that the Seine never attains a volume so high as 90,000 cubic feet per second. At Paris its average per second is 9000, and after it has received all its tributaries it ranges between 24,000 and 35,000 cubic feet. At Paris it falls as low as 2650 cubic feet and in exceptional droughts the figure of 1200 has been reached. During the flood of 1876, which lasted fifty-five days, the volume between the quays at Paris rose to 58,600 cubic feet per second.

Rising at a height of 1545 feet above sea-level, at the base of the statue of a nymph erected on the spot by the city of Paris, the Seine is at first such an insignificant streamlet that it is often dry in summer as far as Chatillon (729 feet) and Brie (681 feet), its waters feed the Haute-Seine Canal, so that there is uninterrupted navigation from this point to the sea (385 miles). At Troyes it has descended to 831 feet. It next passes Méry, and at Maucilly receives the Aube (right), from which point it becomes navigable; here it is deflected in a south-westerly direction by the heights of La Brie, the base of which it skirts past Nogent and Montcaumon, at the latter point receiving the Yonne, its most important left-hand tributary. It then crosses its general north-westerly direction, receiving the Loing (left) at Moret, then passing Melun (121 feet), being joined at Corbeil by the Essonne (left), and after its junction with the Marne (right), a tributary longer than itself by 31 miles, reaches Paris. From this point to the sea its channel has been so deepened by recent works that vessels of 9 to 10 feet draught can reach the capital. The river then winds through a pleasant champagne country past St. Germain, St. Denis, St. Germain, Comblains (where it is joined from the right by the Oise, 56 feet above the sea), Poissy, Mantes, Les Andelys, and Poves, where the tide first begins to be perceptible. It next receives the Eure (left), and passes Pont de l'Ancle, Elbeuf, and Rouen, where the sea navigation commences. The river has been dyked to Rouen so as to admit vessels of 20 feet draught, and large areas have thus been reclaimed for cultivation. At every tide there is a "hole" (*trou* or *marécage*), running usually from 8 to 10 feet. Between Rouen and the sea there are nine mounds, as in the neighbourhood of Paris, after Candebec and Quillebeuf (where the Risle is received from the left) the estuary begins, set with extensive sandbanks, between which flows a narrow navigable channel. At Tancarville (right) is the commencement of a canal to enable river boats for Havre to avoid the sea passage. The river finally falls into the English Channel between Honfleur on the left and Havre on the right. The Marne brings to the Seine the waters of the Omann, the Ourcq, and the Morin, the Oise those of the Aisne, the Yonne those of the Aisne-Auxon. The low elevation of the bounding hills has rendered it comparatively easy to connect the Seine and its affluents with adjoining river basins by means of canals. The Oise and Somme are connected by the Peadry or Cleot Canal, which in turn is continued to the Scheldt by means of the St. Quentin Canal and the Oise, and to the Somme by that of Oise and Samble. Between the Aisne and the Meuse is the Ardennes Canal, the Aisne and the Marne are united by a canal which passes Rheims. The Marne has similar communication with the Meuse and the Rhine, the Yonne with the Saône (by the Burgundy Canal) and with the Loire (by that of Nièvre). The Seine itself is connected with the Loire by the Loing Canal dividing at Montargis into two branches,—those of Orleans and Briare.

SEINE, the department of France which has Paris as its chief town, was formed in 1790 of the entire district of Brie (half of which belonged to Champagne and half to Île-de-France) and a portion of Gâtinais (from Île-de-France and Orléanais). Lying between 45° 7' and 49° 6' N. lat. and 2° 23' and 3° 13' E. long, it is bounded N. by the departments of Oise and Aisne, E. by Marne and Aube, S. by Yonne and Loiret, and W. by Seine-et-Oise. The whole department belongs to the basin of the Seine, and is drained partly by that river and partly by its tributaries the Yonne and the Loing from the left, and from the right the Vouzge, the Yeres, and the Marne, with its affluents the Ourcq, the Petit Morin, and the Grand Morin. With the exception of the Loing, flowing from south to north, all these streams cross the department from east to west,

acres, and of this surface a seventh or a sixth is occupied by Paris, the suburban villages also are close together and very populous. In actual population (2,799,329 in 1881) as well as in density (23.7 persons per acre) it holds the first place. Flowing from south-east to north-west through the department, the Seine forms three links: on the right it receives above Paris the Marne, and below Paris the Rouillon, and on the left hand the Bievre within the precincts of the city. The left bank of the Seine is in general higher than the right and consists of the Villaguf and Chatillon plateaus separated by the Bievre, the highest point (568 feet) is above Chatillon and the lowest (105) at the exit of the Seine. Below Paris the river flows between the plain of Gennevilliers and Nanterre (commanded by Mont Valérien) on the left and the plain of St. Denis on the right. On the right side, to the east of Paris, are the heights of Avron and Vincennes commanding the course of the Marne. Communication is further facilitated by various canals (see PARIS).

Market gardens occupy about 3700 acres within and without the city, and by means of irrigation and manuring are made to yield from ten to eleven crops per annum (see PARIS). Some districts are specially celebrated,—Montreuil for its peaches, Fontenay-aux-Roses for its strawberries and roses, and other places for flowers and nurseries. The department produced in 1883 326,326 bushels of wheat, 4042 of meal, 75,003 of rye, 3415 of barley, 887 of oats, 1,656,009 of potatoes, 14,650 of pulses, and 15,400 tons of beetroot. Altogether, 60,000 persons are engaged in agriculture. The live stock in 1881 comprised 95,798 horses (70,396 in Paris), 4174 cattle, 280 calves, 5169 sheep, 8626 pigs, and 660 goats. Vineyards, producing 366,748 gallons of wine annually, cover 2460 acres. The principal works (Boulogne and Vincennes) belong to Paris. It is partly owing to the number of quarries in the district that Paris owes its origin. Chatillon and Montreuil in the south yield freestone, and Bagneux and Clamart in the south and Montreuil and Rommancourt in the east possess the richest plaster quarries in France. Within the extent of Paris are certain old quarries, now quarries, and the stone of the industrial establishments in the department is estimated in Paris or at St. Denis. Pantin (17,857 inhabitants in 1881) on the Ourcq Canal is the seat of a national factory of tobacco, and also of glass-works, and Amboise (19,487) on the St. Denis Canal is the seat of great chemical works. Along the Seine, below Paris, Boulogne (26,616) is partly occupied by laundry establishments, Puteaux (15,588) manufactures woollen goods, and has dyeworks, printing works, cloth-dyeing works, and engraving works of considerable importance. Chelcy (24,320) manufactures crystal and has a large sawwork, &c. Above Paris, Ivry (18,442) has non-works and engineering works, Choisy-le-Roi (6978) has factories for the making of porcelain, glass, soda, chemicals, morocco, and waxcloth; Montreuil (18,698), near Vincennes, makes patent leather, porcelain, &c. The department is of course traversed by all the railway lines which converge in Paris, and also contains the inner circuit railway and part of the outer circuit,—making a total of 192 miles of railway, to which are to be added numerous hamways, 72 miles of national roads, and 458 of other roads. There are 3 arrondissements (Paris, St. Denis, and Sceaux), 28 cantons (20 in Paris), and 72 communes. The department forms the archiepiscopal diocese of Paris, falls within the jurisdiction of the Paris court of appeal, and is divided between the four *chefs d'arrondissement* of Amiens, Lorient, Le Mans, and Orleans. Among the important institutions in the department are the lycées of Vanves and Sceaux, the lunatic asylum at Charenton, the veterinary college of Maisons-Alfort, and the great Bictre hospital at Gentilly.

SEINE-ET-MARNE, a department of northern France, was formed in 1790 of almost the entire district of Brie (half of which belonged to Champagne and half to Île-de-France) and a portion of Gâtinais (from Île-de-France and Orléanais). Lying between 45° 7' and 49° 6' N. lat. and 2° 23' and 3° 13' E. long, it is bounded N. by the departments of Oise and Aisne, E. by Marne and Aube, S. by Yonne and Loiret, and W. by Seine-et-Oise. The whole department belongs to the basin of the Seine, and is drained partly by that river and partly by its tributaries the Yonne and the Loing from the left, and from the right the Vouzge, the Yeres, and the Marne, with its affluents the Ourcq, the Petit Morin, and the Grand Morin. With the exception of the Loing, flowing from south to north, all these streams cross the department from east to west,

¹ Comp. RYVEN ENGINEERING, vol. xx, p. 579, see also the valuable paper "The River Seine," in *Proc. Inst. Civ. Eng.*, vol. lxxxix., 1886, by L. F. Vernon-Harcourt.

following the general slope of the surface, which is broken up into several plateaus from 300 to 500 feet in height (highest point, in the north-east, 705 feet, lowest 105), and separated from each other by deep valleys. Most of the plateaus belong to the Brie, a fertile and well-wooded district of a clayey character. In the south-west lies the dry sandy district of the Fontainebleau sandstones. The climate is rather more "continental" than that of Paris,—the summers warmer, the winters colder, the annual rainfall does not exceed 16 inches. There is a striking difference between the south of the department, where the famous white grape (*chasselas*) of Fontainebleau ripens, and the country to the north of the Marne,—this river marking pretty exactly the northern limit of the vine.

With a total area of 1,417,534 acres, Seine-et-Marne had in 1879 261,074 under wheat, 274,908 under oats, 53,362 under beetroot, 51,130 under vines. Besides these, meslin, rye, barley, pulse, potatoes are the principal crops grown. In 1884 the yield was 8,567,547 bushels of wheat, 231,959 of meslin, 665,055 of rye, 471,251 of barley, 9,103,167 of oats, 3,038,167 of potatoes, 524,210 tons of beetroot, 401,437 tons of sweet fodder (maize, clover, sainfoin, &c.). The live stock in 1879 included 40,400 horses, 5190 asses, 522,700 sheep (173,290 superior breed), 101,100 cattle, 16,840 pigs, 174 goats, and 11,440 beehives (75 tons of honey, 15 of wax). Cereals occupy two-fifths of the department and yield an annual value of £2,400,000, while all other products of the soil do not reach £1,600,000. The wheat and oats of Brie are especially esteemed, as are also the white grapes of Fontainebleau and the roses of Provins (see vol. xix p. 836). Thousands of the well-known Brie cheeses are manufactured, and large numbers of calves and poultry are reared. The forests (covering a fifth of the surface) are planted with oak, beech, chestnut, hornbeam, birch, wild cherry, linden, willow, poplar, and conifers. Best known and most important is the forest of Fontainebleau, the annual product of which is worth £24,000. It is situated in the eastern part of the department, especially in the valley of the Long, mill-stones at La Ferté-sous-Jourarre, the Fontainebleau sandstone, used extensively for pavements, gives employment to 300 establishments, and the white sand which is found along with it is in great request for the manufacture of glass. Along the Marne are numerous plaster-quarries, lime-kilns occur throughout the department, and peat is found in the valleys of the Seine, the Yonne, and the Oise. Clay and porcelain clay supply the potteries of Fontainebleau, and especially those of Montcaumon, where upwards of 700 hands are employed. Other industrial establishments are the numerous large flour-mills, the sugar-factories, beet-root distilleries, paper-mills (the Marais paper-mill manufactures bank-notes, &c., both for France and foreign markets), saw-mills, foundries, printing works, tanneries, tawing works, glove factories, chemical works, &c. Most of the motive-power used in these establishments is supplied by the streams. The Seine, the Yonne, the Marne, and the Grand Morin are navigable, and, with the canals of the Long and the Ourcq and those of Chahfist, Comillon, and Chelles, which cut off the windings of the Marne, form a total waterway of 219 miles. There are 212 miles of railway. With its 348,991 inhabitants in 1881, Seine-et-Marne is in density of population slightly below the average of France. It has 5 arrondissements, 29 cantons, 630 communes, forms the district of Meaux, belongs to the jurisdiction of the Paris court of appeal, and to the district of the Orleans *courts d'arrondissement*. Among the places of note in the department, Montcaumon (7107 inhabitants in 1881), distinguished as Montcaumon-fant-Yonne because of its situation at the confluence of the Yonne with the Seine, deserves to be mentioned not only for its porcelain manufacture but also as a great railway station on the route from Paris to Lyons at the junction of the Troyes line, as the scene of the assassination of John the Bold, duke of Burgundy, and as one of the battlefields of Napoleon I. in the campaign of 1814. Its church is an historical monument of the 13th, 14th, 15th, and 16th centuries. A statue of Napoleon stands between the two bridges

SEINE-ET-OISE, a department of northern France, formed in 1790 of part of the old province of Ile-de-France, and traversed from south-east to north-west by the Seine, which is joined by the Oise from the right. Lying between 48° 17' and 49° 14' N lat and 1° 27' and 2° 37' E long, it is surrounded by the departments of Seine-et-Marne on the east, Loiret on the south, Eure-et-Loir on the west, Eure on the north-west, and Oise on the north. It encloses the department of Seine. The Epte on the north-west is almost the only natural boundary of the department. The streams (all belonging to the basin of

the Seine) are, on the right the Yvres, the Marne, the Oise, and the Epte, and on the left the Essonne (joined by the Junne, which passes by Étampes), the Orge, the Bièvre, and the Mauldre. Seine-et-Oise belongs in part to the tableland of Beauce in the south and to that of Brie in the east. In the centre are the high wooded hills which make the charm of Versailles, Marly, and St Germain. But it is in the north-west, in the Vexin, that the culminating point of 690 feet is reached, while the lowest point, where the Seine leaves the department, is hardly 40 feet above the sea. The mean temperature is 51° Fahr.

Of the 1,884,695 acres 912,205 are arable soil, 50,380 meadows, 42,562 vineyards, and 199,864 woods. In 1881 the live stock comprised 45,440 horses, 5628 asses, 162 mules, 70,000 cattle, 341,000 sheep (wool-clip, 1110 tons), 16,200 pigs, 4500 goats, and 18,500 beehives. Seine-et-Oise is a great agricultural and horticultural department. The crops in 1883 were—wheat, 5,817,858 bushels, meslin, 353,127, rye, 1,034,572, barley, 641,894, oats, 3,705,193, buckwheat, 3800, potatoes, 6,478,000, beetroot for sugar 206,645 tons, and for fodder 237,915, colza seed, 415 tons, hay, 48,242, clover, 15,500, lucerne, 140,354, sainfoin, 67,283. Oats, hornbeams, beech, chestnut are the prevailing trees. The principal crops, which belong to the state. Building, paving, and mill stones (1978 workmen), lime, plaster, mail, chalk, sand, clay, and peat (along the Essonne) are all found in the department. At Enghien are cold mineral springs, and Forges has a hydropathic establishment, where the town of Paris maintains a hospital for scrofulous children. The most important industrial establishments are the national porcelain factory at Sèvres, the Government powder-mills of St Jean and Bouchet, the paper-mills and card-board mills (1570 workmen) of Corbeil (population 6566 in 1881), Étampes (7466), and Pontosse (6675), but by far the largest is at Essonne (4999), the fax-spinning mills (3688 spindles), cotton-mills (17,830 spindles), silk-mills (5726), wool-mills (8890), the foundries and beat and bridge building yards, Argenteuil (10,167), the engineering and iron-ware works at Corbeil, where the agricultural implement factories at Domancourt (2819), the sugar-refineries with thousands of workmen, distilleries on most of the large farms, starch-works, laundries, large printing establishments close to Paris, factories for chemical products, candles, embroidery, hosiery, perfumery, shoes, and buttons, one of the finest zinc-works in France, saw-mills, &c. Besides the navigation of the Seine, the Marne, the Oise, and the Grand Morin, the department has 420 miles of railroad, 457 of national roads, and 9568 of other roads. The population of the department in 1881 was 577,798 inhabitants (one and a half times the average density of the French departments). There are 6 arrondissements, 37 cantons, and 686 communes; in the department forms the diocese of Versailles, is divided between the *courts d'arrondissement* of Amiens, Reims, Le Mans, and Orleans, and has its court of appeal at Paris. The commune of Argenteuil (11,849 inhabitants) is not at all important for its manufactures but also for its market gardens (asparagus, figs, grapes, &c.) and its church, rebuilt in the 19th century in the Romanesque style, is a fashionable place of pilgrimage.

SEINE INFÉRIEURE, a department of the north of France, formed in 1790 of four districts (Norman Vexin, Bray, Caux, and Roumois) belonging to the province of Normandy. Lying between 49° 15' and 50° 4' N lat. and 1° 52' and 0° 4' E long., it is bounded N.W. and N. by the English Channel for a distance of 80 miles, N.E. by Somme, from which it is separated by the Bresle, E. by Oise, S. by Eure and the estuary of the Seine, which separates the department from Calvados. It is divided almost equally between the basin of the Seine in the south and the basins of certain coast streams in the north. The Seine receives from the right hand before it reaches the department the Epte and the Andelle from the Bray district, and then the Darnétal, the Cailly, the Austreberthe, the Bolbec, and the Lézarde. The main coast streams are the Bresle (which forms the ports of Eu and Tréport), the Yvres, the Arques or Dieppe stream (formed by the junction of the Varennes, the Béthune, and the Eaulne), the Scie, the Saane, the Durdent. As a whole the department may be described as an elevated plateau culminating towards the east in a point 807 feet above the sea and terminating along the Seine in high bluffs and towards the sea in steep chalk cliffs 300 to 400 feet high, which are continually being eaten away and transformed into beds of shingle. There is no striking line of parting between the basins of

the Seine and the Channel, but deep valleys have been hollowed out by the streams. The Bray district in the south-east is a broad valley of denudation formed by the sea as it retired, and it is traversed by smaller valleys and covered with excellent pasture. In the comparatively regular outline of the coast there are a few breaks, as at Tréport, Dieppe, St Valéry-en-Caux, Fécamp, and Havre, the Cap de la Hève, which commands this last port, and Cape Antifer, 12 or 13 miles farther north. Tréport, Dieppe, Veules, St Valéry, Fécamp, Yport, Etretat, and Ste Adresse (to mention only the more important) are fashionable watering-places with the Parisians. The winters are not quite so cold nor is the summer so hot as in Paris, and the average temperature of the year is higher. The rainfall is 24 inches per annum, increasing from Rouen to Dieppe as the sea is approached.

With a total area of 1,491,466 acres, Seine Inférieure has 911,935 acres of arable ground, 151,125 of wood, 99,703 grass, 32,977 moorland and pasturage. Out of a total population of 814,068 in 1881 those dependent on agriculture numbered 233,536. The live stock in the same year comprised 81,561 horses of good breeds, 1421 asses, 125 mules, 238,498 cattle, 259,677 sheep of ordinary kinds, and 75,623 of special breeds (wool-clip, 550 tons), 76,186 pigs, 8341 goats, 13,202 beehives (54 tons of honey and 18 of wax) which give an average of 100 lbs of honey and 18 of wax. The principal crops are wheat, barley, oats, and Gonnay butter and Gonnay and Newfield cheese are in repute. The fens of the Caux plateau are each surrounded by an earthen dyke, on which are planted forest trees, generally beech and oak. Within the shelter thus provided apple and pear trees grow, which produce the cider generally drunk by the inhabitants (38,602,086 gallons in 1883). The other crops in 1883 were—wheat, 6,967,660 bushels, malt, 59,950, rye, 464,489, barley, 443,751, oats, 7,017,609, potatoes, 9,964,457, pulse, 438,734, beetroot for sugar 28,837 tons, and for fodder 113,098, colza seed, 29,076 tons, and 457,047 tons of ordinary fodder. In general the department is fertile and well cultivated. Along the Seine fine meadow-land has been reclaimed by dyking, and sandy and barren districts have been planted with trees, mostly with oaks and beeches, and they often attain magnificent dimensions, especially in the forest of Aigue and along the railway from Rouen to Tréport. *Forest of Aigue* is the principal component of the forest of Rouvray opposite Rouen. With the exception of a little peat and a number of quarries, employing 745 workmen, Seine Inférieure has no mineral source of wealth, but manufacturing industry is well developed. Rouen is the chief centre of the cotton trade, which is in the department represented by 190 spinning and weaving factories, employing 22,847 hands, 4,406,000 spindles, 11,000 power-looms, and 14,000 hand-looms, turning up 30,000 tons of cotton annually. Hand-loom weaving, carried on throughout the country districts, employs 18,000 looms, in the branch of the cotton trade known as *rouennerie* 190 manufacturers are employed, producing to the value of £2,400,000 per annum; in that of the *indianes* 20 establishments with 5000 workpeople turn out yearly 1,000,000 pieces of 115 yards each. There are 22 establishments for dyeing cotton cloth with 700 workmen, and for dyeing cotton yarn 23 establishments with 1200 workmen. The woollen manufacture, of which Elbeuf is the centre, employs 24,000 workmen and produces goods valued at about £2,500,000, with raw material valued at £1,720,000, mainly imported from Australia and partly from the La Plata ports. The wool-spinning mills (at Elbeuf and Darnétal) have 92,000 spindles, and there are 660 power-looms and 8300 hand looms. At Elbeuf (22,883 inhabitants in 1881) there are 17 dyeworks, 40 twist factories, a manufactory of carding machines, and 45 cloth-dressing factories. About 13,000 spindles are employed in flax-spinning, an industry more widely distributed throughout the department. Engineering works, foundries, and iron shipbuilding yards occur at Havre (population 105,540 in 1881) and Rouen (105,500). Wooden ships are also built at Havre, Rouen, Dieppe (21,585), and Fécamp (11,919). Other establishments of importance are the national tobacco-factories at Dieppe (1100 hands) and Havre (580 hands), sugar-refineries (£1,440,000 worth of sugar in 1881), glass-works (872 workmen), soap-works, chemical works, candle-factories, flour-mills, oil-factories, ivory-works, lace-works, clock-factories, &c. The total number of industrial establishments in the department is 975, and it is estimated that 365,460 persons depend on industrial pursuits. The fisheries are a great resource for the inhabitants of the seaboard. Fécamp sends yearly £100,000 worth of cod and £80,000 worth of herrings, mackerel, &c., into the market; Dieppe has the supplying of Paris with fresh fish; St Valéry sends its boats as far as Iceland. The principal ports for foreign trade are Havre, Rouen, and Dieppe. There are 384 miles of railway, 870 of national roads, 6548 of other roads, 88 of Seine navigation, and the Briele is canalized for 2 miles. In population Seine Inférieure stands fourth in the list of French departments;

it has consequently been proposed to divide it into the two departments of Seine Inférieure and Seine Maritime. The density of population is double the average of France. There are 5 arrondissements, 51 cantons (of which 3 are in Havre and 6 in Rouen), and 759 communes. The department forms the archbishopric of Rouen, the court of appeal and the headquarters of the *corps armés* are also in that city. Places of importance are Elbeuf, Fécamp, a fishing port, with sea-bathing, distilling, &c., Boibec (10,226 inhabitants), with weaving and spinning factories, and Eu (4827 inhabitants), with a celebrated castle belonging to Louis Philippe and the Orleans family.

SEISIN "Seisin of the freehold may be defined to be the possession of such an estate in land as was anciently thought worthy to be held by a free man" (Williams, *On Seisin*, p. 2). Seisin is now confined to possession of the freehold, though at one time it appears to have been used for simple possession without regard to the estate of the possessor. (See POSSESSION.) Its importance is considerably less than it was at one time owing to the old form of conveyance by feoffment with livery of seisin having been superseded by a deed of grant (see REAL ESTATE), and the old rule of descent from the person last seised having been abolished in favour of descent from the purchaser. (See INHERITANCE.) At one time the right of the wife to dower and of the husband to an estate by curtesy depended upon the doctrine of seisin. The Dower Act, 3 and 4 Will IV. c. 105, has, however, rendered the fact of the seisin of the husband of no importance, and the Married Women's Property Act, 1882, appears to have practically abolished the old law of curtesy. In the case of a conveyance operating under the Statute of Uses, seisin is deemed to be given by the effect of the statute. This constructive seisin may still be of importance where the question arises how long a person has been in actual possession. Thus in *Orme's Case* (Law Rep., 8 Common Pleas, 281) the right to a county vote depended upon the form of the conveyance of a rent-charge to the voter. If the conveyance had been under the statute, the claimant would have been seised for a sufficient time; the court, however, held that the conveyance was a common law grant, and that the grantee must have been in actual receipt of the rent in order to entitle him to be registered.

Primer seisin was a feudal burden at one time incident to the king's tenants *in capite*, whether by knight service or in socage. It was the right of the crown to receive of the heir, after the death of a tenant *in capite*, one year's profits of lands in possession and half a year's profits of lands in reversion. The right was abandoned by the Act abolishing feudal tenures (12 Car. II. c. 24).

In Scotch law the corresponding term is "sasine." Like seisin in England, sasine has become of little legal importance owing to recent legislation. By 8 and 9 Vict. c. 35 actual sasine on the lands was made unnecessary. By 21 and 22 Vict. c. 78 the moment of sasine was superseded by the recording of the conveyance with a warrant of registration thereon. For the register of sasines, see REGISTRATION.

SEISMOMETER. This name was originally given to instruments designed to measure the movement of the ground during earthquakes. Recent observations have shown that, in addition to the comparatively great and sudden displacements which occur in earthquakes, the ground is subject to other movements. Some of these, which may be called "earth-tremors," resemble earthquakes in the rapidity with which they occur, but differ from earthquakes in being imperceptible (owing to the smallness of the motion) until instrumental means are used to detect them. Others, which may be called "earth-titings," show themselves by a slow bending and unbending of the surface, so that a post stuck in the ground, vertical to begin with, does not remain vertical, but inclines now to one side and now to another, the plane of the ground in which it stands shifting relatively to the horizon. No sharp distinction can be drawn between these classes

of movements. Earthquakes and earth-tremors grade into one another, and in almost every earthquake there is some tilting of the surface. The term "seismometer" may conveniently be extended (and will here be understood) to cover all instruments which are designed to measure movements of the ground.

Measurements of earth-movements are of two distinct types. In one type, which is applicable to ordinary earthquakes and earth-tremors, the thing measured is the displacement of a point in the earth's crust. In the second type, which is applicable to slow tiltings, the thing measured is any change in the plane of the earth's surface relatively to the vertical. Under EARTHQUAKE mention is made of instruments designed by Palmieri and others to register the occurrence of earthquakes, and in some cases to give a general idea of their severity. While some of those instruments act well as seismoscopes, none of them serve to determine with precision the character or the magnitude of the motion. In this article notice will be taken only of instruments intended for exact measurement.

Earthquake displacements are in general vertical as well as horizontal. For the purpose of measurement it is convenient to treat the vertical component separately, and in some cases to resolve the horizontal motion into two components at right angles to each other.

Inertia Method.—In the first type of measurements what may be called the "inertia" method is followed. A mass is suspended with freedom to move in the direction of that component of the earth's motion which is to be measured. When an impulse causes the supports to move, but the mass is prevented by its inertia from accompanying them. It supplies a steady point, to be used as a standard of reference in determining the extent through which the ground has moved in the direction in question. But, in order that the suspended mass shall not acquire motion when its supports move, one essential condition must be satisfied. Its equilibrium

must be neutral, or nearly so, in order that when the supports are displaced, little or no force may be brought into operation tending to bring the mass into the same position relative to the supports as it occupied before disturbance. This can be made plain by considering the case of a common pendulum hung from a support which is rigidly fixed to the ground. When the ground moves in any horizontal direction, the pendulum's inertia causes a certain point in it (the centre of percussion) to remain for the instant at rest.

But this contrivance does not yield a steady point, because the stability of the pendulum makes the bob swing down to recover its place directly under the support, and in fact, if a succession of oscillations of the ground occur, the bob acquires a motion often much greater than the motion of the support itself. This tendency may be corrected, and the pendulum made fit to act as a seismometer, by one contrivance which (without introducing friction) will reduce its stability so much as to make the equilibrium of the bob very nearly neutral. In all instruments designed to furnish a steady point the suspended mass must have some small stability,

FIG 1—Duplex pendulum seismograph.

else it would be unmanageable, but its period of free oscillation must be much greater than that of the earthquake-motions which it is employed to measure. Even a simple pendulum can have its stability reduced sufficiently to fit it for seismometric work by making it very long. The same result is, however, much more conveniently achieved by combining a common pendulum with an inverted pendulum placed just beneath it. The common pendulum being stable and the inverted pendulum unstable, if the bobs are joined so that they must move together, the combination can be made as nearly astatic as may be desired.¹ Figs. 1 and 2 illustrate how this combination is applied in seismometry. The stable bob *a*, hung from a fixed support above by three parallel wires, is connected with the inverted pendulum *b* by a ball-and-tube joint. A lever *c*, carried by a gimbal joint in the fixed bracket *d*, is geared also by a ball-and-tube joint to the upper bob. Its long arm carries a jointed index *e*, which projects out and touches a smoked-glass plate *f*, held on a fixed shelf. Any horizontal motion of the ground acts on the lever by the bracket *d*, and causes the index to trace a magnified record on the smoked-glass plate. Fig. 3 is taken from a photograph of an instrument of this kind, constructed to give a much magnified record of small movements. When large earthquakes are to be recorded the multiplying lever is dispensed with, and the index is attached directly to one of the bobs. Observations with instruments of this class exhibit well the very complicated motion which the earth's surface undergoes during an earthquake. In small earthquakes (such as are only slightly or not at all destructive) the greatest amount of motion is often less than a millimetre, and rarely more than a centimetre, the disturbance nevertheless consists of a multitude of successive movements, quite irregular in amplitude, period, and direction. Fig. 3 is a facsimile of the record given by a duplex pendulum seismograph during one of the earthquakes which occur frequently in the plain of Yedo, Japan. The record, as enlarged, is three and a half times the earth's actual motion.

FIG 2—Duplex pendulum showing details.

Instead of two pendulums, a single inverted pendulum has been used, with a spring stretched between it and a fixed support above. By adjusting the spring so that a proper proportion of the weight is borne by it and the remainder by the rigid stem of the pendulum, an approach to neutral equilibrium can be made.² In Forbes's inverted pendulum seismometer³ a somewhat similar plan was adopted; the foot of the pendulum was attached to an elastic wire which tended to restore it to its normal vertical position when displaced.

Another group of instruments designed to furnish two degrees of freedom for the purpose of recording all motions in a horizontal plane, but much less satisfactory on account of their friction, is that in which a rolling sphere either itself supports or forms a support for a second mechanism. Probably the earliest was one used in Japan by Dr. G. F. Verbeek in 1876 (see fig. 4). On a marble table, ground plane and carefully levelled, four balls of rock-crystal were placed, carrying a massive block of hard wood. A pencil, sliding in a hole in the block, registered the relative motion of the table and the block on a sheet of paper fixed below. The motion registered is (or would be, if there were no friction) somewhat larger than the true motion of the table, for the system is kinetically equivalent to four upright needles whose centres of percussion lie in a plane nearly, but not quite, as high as the tops of the balls. This forms what may be called the steady plane, its position depends on the relative masses of block and balls, and is easily calculated. When the ground moves in any direction the block moves through a short distance in the opposite direction, and the record is magnified in a fixed ratio. Various forms of rolling-sphere seismometers have been

FIG 3—Record of earthquake motion.

FIG 4—Rolling sphere seismograph.

proposed by Mr T. Gray,¹ Mr C. A. Stevenson,² and others. Probably the best form would be that of a light spherical segment rolling on a level plane base and carrying a heavy bob fixed to it. To give some stability the bob should be placed so as to bring the centre of gravity a little under the centre of curvature. The centre of percussion, somewhat higher than this, would of course be the steady point, and a multiplying pointer must take the motion either from it or from any other convenient part of the rolling piece. All rolling seismometers—including rolling cylinders, which have been proposed by Mr Gray as single-freedom instruments, to register one component of horizontal motion—fail to act well, partly because of the comparatively great frictional or quasi-frictional resistance which is presented to the motion of the free mass, and partly because, owing to imperfections in the construction and want of perfect rigidity in the materials, the ball or cylinder takes up a position in which there is an objectionably great stability as regards very small displacements. These objections make the use of rolling seismometers inadvisable, except perhaps for the rough measurement of violent earthquakes.

The seismographs which have been described draw a horizontal plan of the path traced during an earthquake by a point on the earth's surface. They take no note of the relation of the displacement to time—an element which is required if we are to form any estimate of the violence of an earthquake from the record. With this view a different method of registration is also followed. The whole movement is resolved into rectilinear components, and these are separately recorded (by single-freedom seismometers) on a plate or drum which is kept in continuous movement, so that the record of each component takes the form of an undulating line, from which the number, succession, amplitude, velocity, and acceleration of the component movements can be deduced and the resultant motion determined. A single steady mass with two degrees of freedom may still be employed to record, separately, two components of horizontal motion, but it is generally preferable to provide two distinct masses, each with one degree of freedom. The principal instrument of this class is the horizontal pendulum seismograph, which has been used to record Japanese earthquakes since 1880. It consists of two horizontal pendulums, set at right angles to each other, each supplying a steady point with respect to horizontal motions transverse to its own length. Each pendulum is pivoted about two points, on an axis which is nearly vertical, but inclined slightly forwards to give a suitable degree of stability. In some forms of the instrument the pivotal frame to the pendulum is light, and the mass is substantially all furnished by a second piece of bob pivoted on the frame about a vertical axis through the centre of percussion of the frame. This construction has the advantage of compactness and of making the position of the steady point at once determinate. But a simpler construction is to attach the bob rigidly to the frame. This shifts the steady point a little way outwards from the position it would have if the bob were pivoted. In either case, however, a multiplying index, beyond the bob, forms a convenient multiplying index. Fig.

Fig. 5.—Horizontal pendulum seismograph

5 shows a complete horizontal pendulum seismograph (with pivoted bobs). Two rectangular components of earthquake motion are recorded radially on a revolving plate of smoked glass, which receives its motion through a friction roller from a clock furnished with a fluid-friction centrifugal governor. The clock may either be kept going continuously, in expectation of an earthquake at any moment,

or be started into motion by an electric seismoscope when the earliest indications of an earthquake are felt. The former plan is practicable only when the instrument can receive careful attendance and where earthquakes occur often. It has the drawback that the circle which is drawn by each pointer as the plate revolves below it gradually broadens, partly because of warping and temperature changes in the supports and partly because of actual tilting of the ground. As an earthquake generally begins with comparatively insignificant movements, there is not much to object to in having the plate at rest to begin with, provided a sufficiently sensitive starting seismoscope be used. A suitable arrangement for this purpose is one due to Palmieri: a short pendulum hangs over a cup of mercury, in the centre of which a depression is formed by a non-pan, whose top is a little lower than the surface of the mercury. The pendulum ends in a platinum point, which stands clear in the centre of this depression, but touches the edge whenever a horizontal movement of the ground takes place, thereby closing the circuit of an electro-magnet, which starts the clock. In the most recent form of the horizontal pendulum seismograph the bobs are fixed to the pivoted frames, and the pointers are arranged to trace their movement on the ground takes place, thereby closing the circuit of an electro-magnet, which starts the clock. In the most recent form of the horizontal pendulum seismograph the bobs are fixed to the pivoted frames, and the pointers are arranged to trace their movement on the ground takes place, thereby closing the circuit of an electro-magnet, which starts the clock. In the most recent form of the horizontal pendulum seismograph the bobs are fixed to the pivoted frames, and the pointers are arranged to trace their movement on the ground takes place, thereby closing the circuit of an electro-magnet, which starts the clock.

Fig. 6.—Record of earthquakes by horizontal pendulum seismograph, one-third full size

Contemporary parts of the two records are shown together, the straight radial lines marking seconds of time. The phases of the two components are continually changing, and when the two are compounded the result is a path having the same characteristics as those of the diagram in fig. 3. Fig. 7 gives the result of compounding the records of fig. 6 during three seconds, while the angle of movement was a maximum.

To register the vertical component of earthquake motions we require to suspend a mass with vertical freedom. Most ways of doing this give too much stability, as, for instance, when a weight is hung from a spiral spring or carried by a horizontal bar that is fixed to a wall or held by a flexible spring joint. This last is the vertical motion seismometer which was used by the British Association Committee at Cornhill in 1842. Another form, mechanically equivalent to this, is a weighted horizontal bar, pivoted on a fixed horizontal fulcrum, and held up by a spiral spring, stretched from a point near the fulcrum to a fixed support above. This mode of suspension is still too stable, though less so than if the spring were directly loaded. To make it nearly astatic Mr T. Gray³ proposed the use

of a tube containing mercury, connected with the bar in such a manner that when the bar goes down the mercury, running towards one end of the tube, has the effect of increasing the weight, and when the bar goes up an opposite effect occurs. This plan is open to the objection that the mercury is disturbed by horizontal movements of the ground. A simpler plan is shown in fig. 8.⁴ There the pull of the spring is applied at a short distance below the plane of the bar. Hence when the weight goes down the spring,

which then pulls with more force, pulls with a smaller leverage, and it is easy to adjust the distance z so that the moment of the pull of the spring remains sensibly equal to the moment of the weight, — the condition necessary to make the bar astatic. This is secured when $v = \frac{h}{z}$, h being the horizontal distance from the ful-

cum to the point at which the spring acts, and l the length by which the spring is stretched when the bar is undeflected. Stability is given by making v somewhat less than this. A vertical-motion seismograph, constructed on the principle which fig 8 illustrates diagrammatically, is arranged to trace its record on a revolving glass plate. This, along with a pair of horizontal pendulums recording on the same plate, completes a three-component seismograph.

An interesting mode of suspension, by which a mass is hung in neutral or nearly neutral equilibrium, with one degree of horizontal freedom, is shown in fig 9. It is based on the approximate straight line linkwork of Tchebicheff. When a bar is hung from fixed supports by crossed ties, at a distance below the supports equal to the distance between the supports, the length of the bar being equal to half that distance, its middle point moves in very nearly a straight line. By fixing a weight at the centre of the bar and adding a suitable recording apparatus, we have a very frictionless form of one-component horizontal seismometer. When a displacement of the ground occurs in the line of the bar, the bar is tilted through an angle which is proportional to the linear displacement, and the centre of the bar consequently shares, in a small and definite proportion, the motion of the ground, — a fact which is to be borne in mind in estimating the degree of multiplication given by the recording apparatus.

The instruments which have been described afford complete and satisfactory means of determining the motion which a point of the ground undergoes during any disturbance which would be recognized as an earthquake. For minute earth-tremors, however, a larger multiplication is necessary, and the absence of friction is of even more importance than in the measurement of earthquakes proper. Optical methods of magnifying the motion are accordingly resorted to. In the "normal seismometer" of Bertelli, used in Italy to detect earth-tremors, the bob of a pendulum, suspended by a fine wire from a fixed support, is viewed through a reflecting prism and its motion in any azimuth measured by a micrometer microscope. The great stability of the pendulum, which is only $1\frac{1}{2}$ metres long, prevents it from behaving as a steady-point seismometer; and, if successive earth-movements were by chance to occur with a period equal or nearly equal to its own free period, its acquired swing would altogether mask the legitimate indications. This kind of action has, in fact, been turned to account as a means of detecting very minute earth-tremors

by Rossi, who has devised a micro-seismoscope, consisting of a number of pendulums of various lengths, one or other of which is likely to be set swinging when the ground shakes to and fro repeatedly, through even the minutest range. To measure tremors, however, the instruments of Bertelli and Rossi are inappropriate; for that purpose, just as for the purpose of measuring larger motions, the suspended mass must be in nearly neutral equilibrium. To find a mode of suspension which is at once astatic and extremely frictionless is a matter of some difficulty, the crossed-link suspension, which has been already described, is probably the most satisfactory means hitherto suggested. It has been adopted in the micro-seismometer sketched in section in fig 10. Two bobs are separately suspended, in the manner shown by fig 9, at right angles to each other, one above the other, in a cast-iron case. A microscope, fixed to the top of the case and furnished with a micrometer eye-piece, is focused on a hair, which

Fig 10.—Microseismometer.

is stretched transversely across a vertical tube in the upper bob. This serves to measure horizontal motion in the plane of the drawing. Motion at right angles to this is shown by the lower bob c (drawn in section), which carries a similar transverse hair. A fixed lens b between the bobs gives an image of the lower hair in the plane of the upper hair, so that both appear crossed in the field of the microscope, thereby allowing both components of horizontal motion to be observed together.

Equilibrium Method.—In observing slow earth-tiltings an entirely different process is followed. The problem then is, not to measure displacements by aid of the inertia of a body which tends to preserve its original position, but to compare the direction of a line or plane fixed to the earth with the direction of the vertical. The earliest observations of earth-tiltings were made by the aid of spirit-levels. If a level be set on a table fixed to the rock, its bubble, watched through a microscope, will be seen to move slowly now to one side and now to another. The movements are so slow that the inertia of the fluid is unimportant. Observations with pans of levels, set at right angles to each other, have been carried on systematically for some years by M. P. Plantamour.² This is the simplest method of measuring earth-tiltings, but it is liable to errors which are not easily excluded. Another method of investigating changes in the direction of the vertical was initiated in 1858 by M. A. d'Abbadie,³ who had before that observed the movements of level-bubbles. Light from a fixed source is made to fall on a reflecting basin of mercury about 10 metres below it. Above the basin is a large lens of long focus, which brings the rays into parallelism during their passage to the mercury, and causes them to converge after reflection, so that an image of the surface is formed at a convenient distance from it, and in the same horizontal plane. The interval between the source and the image is measured (in amount and azimuth) at least twice a day by a micrometer microscope. The accuracy of the method depends on the fixity of the source of light relatively to the lens and to the surface of the ground, and to secure this M. d'Abbadie built a massive hollow cone of concrete for the support of his apparatus. His observations have shown that the earth's surface undergoes almost incessant slow tilting through angles which, in the course of a year, have been found to range over four seconds. He has also noticed the occurrence of earth-tremors by the occasional blurring of the image through agitation of the mercury. An improvement on his apparatus suggested by M. Wolf⁴ is shown in fig 11.

His light, instead of being reflected from the surface of mercury, is partly reflected from that and partly from a plane mirror (b) fixed to the rock. Two images are therefore formed, whose relative position measures the tilting of the surface. The advantage of this is that the position of the source of light need no longer be fixed, and the accuracy of the method depends only on the fixity of the mirror b with respect to the rock. Further, to avoid having the source and image at a great height above the surface, M. Wolf allows the light to reach and leave the apparatus horizontally, in the manner indicated in the sketch, by using a plane mirror inclined at 45° to the horizon. Still another mode of investigating slow changes of the vertical was followed (at the suggestion of Sir William Thomson) by Messrs G. H. and H. Darwin, in observations made by them with the view of measuring the lunar distance of gravity. The Reports of the British Association for 1881 and 1882 contain a full account of their apparatus, as well as notices of the work of other observers and a discussion of the cause of earth-tiltings. That instrument was a short pendulum hung in a vacuum jar, from a fixed support, by two wires arranged V -wise to leave the pendulum only one degree of freedom. Below the bob was a small mirror hung by two threads, one of which was attached to the pendulum bob and the other to a fixed support. The pendulum was free to swing at right angles to the plane of the threads, and any movement of this kind caused the mirror to rotate through an angle which was measured in the usual way by a telescope and scale. The method is unsuitable for very great delicacy, but Messrs Darwin found that when the instrument was adjusted to be specially sensitive its manipulation became extremely difficult. Wolf's modification of d'Abbadie's method appears to furnish, on the whole, the most promising apparatus for measurements of this type. The apparatus represented in fig 10 is also applicable. The method of measurement employed in the case of slow tiltings may be called the equilibrium method in contradistinction to the inertia method, which is used to measure comparatively sudden displacements. The

two methods are applicable to two widely different classes of movements. It is at least possible that between these classes there may be other modes of motion,—displacements which are too slow for the metric method, and which give rise to too little change of slope for the equilibrium method. How to measure them is, and must apparently remain, an unsolved problem in seismometry.

References—The Report of the British Association for 1888 contains an account by Mallet of some of the older and now obsolete forms of seismometers, (see also BARRICHAUD.) For accounts of modern instruments of the metric class, see the *Transactions of the Seismological Society of Japan* from 1880, also Prof. Bragg's *Lecture on Seismologic Measurement*, published by the University of Tokyo (1889). References to papers on the equilibrium method of measurement have been made in the text. (J. A. E.)

SEISTAN See SISTAN

SEJANUS, AELIUS (executed 31 A.D.), the famous minister of TIBERIUS (*q.v.*).

SELBY, a market town of the West Riding of Yorkshire, England, is situated on the navigable river Ouse and on the main line of the Great Northern Railway, 15 miles south of York and 20 east of Leeds. Of the ancient abbey for Benedictines, founded by William the Conqueror in 1069 and raised to the dignity of a mitred abbey by Pope Alexander II, there still remains the church of St Mary and St German, although it has been much changed by alterations and additions, the more ancient and notable features being the nave, transept, and west front. The church was made parochial in 1618. In the market-place there is a modern Gothic market cross. Among the public buildings are the drill hall and the mechanics' institute and public rooms. Flax scutching, seed-crushing, brick and tile making, boat-building, tanning, and brewing are the principal industries. There is a large trade in potatoes, flax, and mustard, and a considerable cattle-market. The town receives its water-supply from artesian wells. A local board of health was established in 1851, consisting of nine members. The population of the urban sanitary district (3193 in 1871), extended in 1881 from 514 to 3760 acres, was in that year 6057.

Henry I of England was born in the abbey, a fact which probably accounts for the special privileges conferred on it. In the early part of the Civil War it was held by the Parliament, and after being taken by the Royalists was recaptured by Fairfax.

SELDEN, JOHN (1684-1654), jurist, legal antiquary, and Oriental scholar, was born on 16th December 1584 at Salvington, in the parish of West Tarring, near Worthing, Sussex. His father, also named John Selden, held a small farm, and seems to have occasionally added to his livelihood by his labour as a wheelwright and his skill as a musician. It is said that his accomplishments as a violin-player gained him his wife, whose social position was somewhat superior to his own. She was Margaret, the only child of Thomas Baker of Rustington, a village in the vicinity of West Tarring, and was more or less remotely descended from a knightly family of the same name in Kent. John Selden commenced his education at the free grammar-school at Chichester, whence he proceeded in his sixteenth year with an exhibition to Hart Hall at Oxford. In 1603 he was admitted a member of Clifford's Inn, London, and in 1604 migrated to the Inner Temple, and in due course he was called to the bar. While still a student he appears to have been on terms of friendship with Ben Jonson, Drayton, and Camden; and among his more intimate companions were Edward Littleton, afterwards lord keeper; Henry Rolle, afterwards lord chief-justice; Edward Herbert, afterwards solicitor-general; and Thomas Gardener, afterwards recorder of London. His earliest patron was Sir Robert Cotton, the antiquary, by whom he seems to have been employed in copying and abridging certain of the parliamentary records then preserved in the Tower. For some reason which has not been explained, Selden never went into court as an advocate, save on rare and exceptional occasions. But his practice in chambers as a conveyancer and consulting counsel is stated to have been large, and, if we may judge

from the considerable fortune he accumulated, it must also have been lucrative.

It was, however, as a scholar and writer that Selden won his reputation both amongst his contemporaries and with posterity. His first work, an account of the civil administration of England before the Norman Conquest, is said to have been completed when he was only two- or three-and-twenty years of age. But if this was the *Analeton Anglo-Britannicum*, as is generally supposed, he withheld it from the world until 1615. In 1610 appeared his *England's Epitomes and Janus Anglorum, Fœces Altera*, which dealt with the progress of English law down to Henry II, and *The Duello, or Single Combat*, in which he traced the history of trial by battle in England from the Norman Conquest. In 1613 he supplied a series of notes, enriched by an immense number of quotations and references, to the first eighteen cantos of Drayton's *Polyolbion*. In 1614 he published *Titles of Honour*, which, in spite of some obvious defects and omissions, has remained to the present day the most comprehensive and trustworthy work of its kind that we possess, and in 1616 his notes on Fortescue's *De Laudibus Legum Anglorum* and Hengham's *Summe Magnæ et Parvæ*. In 1617 his *De Deus Syriæ* was issued from the press, and immediately established his fame as an Oriental scholar among the learned in all parts of Europe. After two centuries and a half, indeed, it is still not only the fundamental but also in many respects the best book which has been written on Semitic mythology. In 1618 his *History of Tithes*, although only published after it had been submitted to the censorship and duly licensed, nevertheless aroused the apprehension of the bishops and provoked the intervention of the king. The author was summoned before the privy council and compelled to retract his opinions, or at any rate what were held to be his opinions. Moreover, his work was suppressed and himself forbidden to reply to any of the controversialists who had come or might come forward to answer it.

This seems to have introduced Selden to the practical side of political affairs. The discontents which a few years later broke out into civil war were already forming themselves on public attention, and it is pretty certain that, although he was not in parliament, he was the instigator and perhaps the draftsman of the memorable protestation on the rights and privileges of the House affirmed by the Commons on the 18th of December 1621. He was with several of the members committed to prison, at first in the Tower and subsequently under the charge of Sir Robert Ducie, sheriff of London. During his detention, which only lasted a short time, he occupied himself in preparing an edition of Eadmer's *History* from a manuscript lent to him by his host or jailor, which he published two years afterwards. In 1623 he was returned to the House of Commons for the borough of Lancaster, and sat with Coke, Noy, and Pym on Sergeant Glanville's election committee. He was also nominated reader of Lyon's Inn, an office which he declined to undertake. For thus the benchers of the Inner Temple, by whom he had been appointed, fined him £20 and disqualified him from being chosen one of their number. But he was relieved from this incapacity after a few years, and became a master of the bench. In the first parliament of Charles I (1625), it appears from the "returns of members" printed in 1878 that, contrary to the assertion of all his biographers, he had no seat. In Charles's second parliament (1626) he was elected for Great Bedwin in Wiltshire, and took a prominent part in the impeachment of George Villiers, duke of Buckingham. In the following year, in the "benevolence" case, he was counsel for Sir Edmund Hampden in the Court of King's Bench. In 1628 he was returned to the third parliament of Charles for Ludgers-

hall in Wiltshire, and had a large and important share in drawing up and carrying the Petition of Right. In the session of 1629 he was one of the members mainly responsible for the tumultuous passage in the House of Commons of the resolution against the illegal levy of tonnage and poundage, and, along with Eliot, Holles, Long, Valentine, Strode, and the rest, he was sent once more to the Tower. There he remained for eight months, deprived for a part of the time of the use of books and writing materials. He was then removed, under less rigorous conditions, to the Marshalsea, until not long afterwards owing to the good offices of Archbishop Laud he was liberated. Some years before he had been appointed steward to the earl of Kent, to whose seat, Wrest in Bedfordshire, he now retired. In 1628 at the suggestion of Sir Robert Cotton he had compiled, with the assistance of two learned coadjutors, Patrick Young and Richard James, a catalogue of the Arundel marbles. He employed his leisure at Wrest in writing *De Successoribus in Bona Defuncti secundum Leges Ebraeorum* and *De Successione in Pontificatum Ebraeorum*, published in 1631. About this period he seems to have inclined towards the court rather than the popular party, and even to have secured the personal favour of the king. To him in 1635 he dedicated his *Mare Clausum*, and under the royal patronage it was put forth as a kind of state paper. It had been written sixteen or seventeen years before, but James I had prohibited its publication for political reasons, hence it appeared a quarter of a century after Grotius's *Mare Liberum*, to which it was intended to be a rejoinder, and the pretensions advanced in which on behalf of the Dutch fishermen to poach in the waters off the British coasts it was its purpose to explode. The fact that Selden was not retained in the great case of ship money in 1637 by John Hampden, the cousin of his former client, may be accepted as additional evidence that his zeal in the popular cause was not so warm and unsuspected as it had once been. During the progress of this momentous constitutional conflict, indeed, he seems to have been absorbed in his Oriental researches, publishing *De Jure Naturali et Gentium juxta Discipulum Ebraeorum* in 1640. He was not elected to the Short Parliament of 1640; but to the Long Parliament, summoned in the autumn, he was returned without opposition for the university of Oxford. Immediately after the opening of the session he was nominated a member of the committee of twenty-four appointed to draw up a remonstrance on the state of the nation. He was also a member of the committees entrusted with the preliminary arrangements for the impeachment of Strafford. But he was not one of the managers at the trial, and he voted against the Bill for his attainder. He was, moreover, a member of the committees nominated to search for precedents and frame the articles of impeachment against Archbishop Laud, although it does not appear that he was implicated in the later stages of the prosecution against him. He opposed the resolution against Episcopacy which led to the exclusion of the bishops from the House of Lords, and printed an answer to the arguments used by Sir Harbottle Grimston on that occasion. He joined in the protestation of the Commons for the maintenance of the Protestant religion according to the doctrines of the Church of England, the authority of the crown, and the liberty of the subject. He was equally opposed to the court on the question of the commissions of lieutenancy of array and to the parliament on the question of the militia ordinance. In 1643, however, he became a member and participated in the discussions of the assembly of divines at Westminster, and was appointed shortly afterwards keeper of the rolls and records in the Tower. In 1645 he was named one of the parliamentary commissioners of the admiralty, and was

elected master of Trinity Hall in Cambridge,—an office he declined to accept. In 1646 he subscribed the Solemn League and Covenant, and in 1647 was voted £5000 by the parliament as compensation for his sufferings in the evil days of the monarchy. He had not, however, relaxed his literary exertions during these years. He published in 1642 *Privileges of the Baronage of England when they sit in Parliament and Discourse concerning the Rights and Privileges of the Subject*, in 1644 *Dissertatio de Anno Civilis et Calendario Republicæ Judæicæ*, in 1646 his treatise on marriage and divorce among the Jews entitled *Uxor Ebraica*, and in 1647 the earliest printed edition of the old and curious English law-book *Fleta*. What course he adopted with regard to the trial and execution of the king is unknown, but it is said that he refused to answer the *Askon Basilike*, although Cromwell was anxious he should do so, the task which he declined being afterwards performed by Milton in his *Iconoclastes*. In 1650 Selden passed the first part of *De Synedrariis et Prefecturis Jurædicis Veterum Ebraeorum* through the press, the second and third parts being severally published in 1653 and 1655, and in 1652 he wrote a preface and collated some of the manuscripts for Sir Roger Twysden's *Historia Anglicæ Scriptores Decem*. His last publication was a vindication of himself from certain charges advanced against him and his *Mare Clausum* in 1653 by Theodore Graswinckel, a Dutch jurist.

After the death of the earl of Kent in 1639 Selden lived permanently under the same roof with his widow. It is believed that he was married to her, although their marriage does not seem to have ever been publicly acknowledged. He died at Friary House in Whitefriars on 30th November 1654, and was buried in the Temple Church, London. Within the last few years a brass tablet has been erected to his memory by the benchers of the Inner Temple in the parish church of West Tarring.

Several of Selden's minor productions were printed for the first time after his death, and a collective edition of his writings was published by Archdeacon Wilkins in 8 vols. folio in 1726, and again in 1729. His *Tabula Tituli*, by which he is perhaps best known, did not appear until 1889. It was edited by his amanuensis, Richard Milward, who affirms that "the sense and notion is wholly Selden's," and that "most of the words" are his also. Its genuineness has sometimes been questioned, although on insufficient grounds. In Hallam's opinion it "gives perhaps a more exalted notion of Selden's natural talents than any of his learned writings," and in Colledge's it contains "more weighty bulwark sense" than he had "ever found in the same number of pages of any unimpaired writer."

(London, 1885), Singer, *Table Title of John Selden* (London, 1847), and Wilkins, *John Selden's Opera Omnia*, 2d ed. (London, 1742). (P. D.R.)

SELECTION AND VARIATION. See **VARIATION AND SELECTION.**

SELENIUM AND TELLURIUM¹ are two rather rare chemical elements discovered, the latter by Müller von Reichenstein in 1782, the former by Berzelius in 1817. Both occur only in the mineral kingdom as components of very rare minerals, most of which are compounds of one or the other or of both and sulphur with silver, lead, bismuth, antimony, gold, and other metals.

Elementary Selenium.—This, like elementary sulphur, exists in a variety of forms, which are conveniently considered as modifications of the two genera now to be described. (1) *Non-metallic selenium* includes the flocculent scarlet precipitate produced by the reduction of solution of selenium by sulphurous acid in the cold. The scarlet flocks when dried without the aid of heat assume the form of a brown-red powder of sp. gr. 4.26, which dissolves in 1000 times its weight of boiling bisulphide of carbon (at 46° C.). The solution on cooling deposits most of its selenium in the form of minute monoclinic crystals of sp.

¹ Comp. CHEMISTRY, vol. v. pp. 493, 499, 501-508, 506, 508.

gr 4.5 (isomorphous with monoclinic sulphur), which retain their solubility in bisulphide of carbon up to 100° C. At 110° C or higher temperatures they pass into the metallic modification (see below) with evolution of heat. With the amorphous kind a similar change sets in at or above 80° C and attains its maximum of rapidity at a point between 125° and 180° C. Fused selenium when cooled down suddenly hardens into a very dark-coloured glass of 4.28 sp gr, soluble in bisulphide of carbon, on gradual cooling it becomes more or less completely "metallic" (2).

Metallic selenium is a dark grey or black solid of 4.8 sp gr, it exhibits metallic lustre, stretches perceptibly under the hammer, and its fracture is similar to that of grey cast iron. It is insoluble in bisulphide of carbon. Its fusing point is sharply defined and lies at 217° C. At the ordinary temperature it conducts electricity, while the non-metallic modification does not, at higher temperatures, or after temporary exposure to higher temperatures, the conductivity on either side becomes an eminently variable quantity. According to Draper and Moss, glassy selenium begins to conduct electricity at 165° to 175° C, and the conductivity increases regularly as the temperature rises to near the boiling-point. With metallic selenium, which behaves similarly, the increase of conductivity is proportional to the increase of temperature to near the fusing point (217° C); but from this point upwards it decreases rapidly and attains its minimum at 250° C. According to W. Siemens, however, selenium by long exposure to 200° C becomes what one may call electrically metallic, the conductivity then decreases when the temperature rises, just as it does with ordinary metals. But this electrometallicity is not permanent; on continued exposure to a lower temperature it vanishes gradually, until the proportion of quasi-metal has fallen to a limit-value depending on that temperature. Very surprising is the observation of Sale that the electric conductivity of metallic selenium increases on exposure to the light; the red and ultra-red rays, as he found, act most powerfully. The effect of insulation is almost instantaneous, but on re-exposure to darkness the original condition is re-established only very gradually. W. Siemens found that his electro-metallic selenium (as produced at 200° C.) is more sensitive to light than any other kind. The conductivity of such selenium starting from darkness is raised twofold by diffuse and tenfold by direct sunlight. The specific heat of selenium, according to Regnault, is 0.0746 both in the glassy and in the metallic modification. Selenium (of any kind) boils at 700° C (Mitscherlich). The vapour has an intense colour intermediate between that of chlorine and that of sulphur. According to Deville and Troost, at 880° C it is 7.67 times, and at 1420° is 5.68 times, as heavy as air; theory, for $Se_2 = 1$ molecule, demands 5.47.

Elementary Tellurium.—This, the compact form, is a silver-white resplendent metal of markedly crystalline structure, the crystals are rhombohedra, and the ingot consequently is very brittle. Specific gravity 6.2. The metal fuses at about 500° C, and is distillable at very high temperatures. Its vapour is golden yellow and has a very brilliant absorption-spectrum. The vapour density, according to Deville and Troost, is 9.08 at 1439° C. (air = 1), corresponding to $Te_2 = 1$ molecule. A bar of tellurium becomes feebly electrical when rubbed with a woollen cloth. The electric conductivity, like that of selenium, is largely influenced by the temperature and previous exposure to heat, and it increases after exposure to light, though not to the same extent as selenium does. Starting from the ordinary temperature the conductivity decreases up to some point between 90° and 145° C.; it then increases up to 200° C (the highest temperature tried); on cooling it decreases steadily, and finally is only one-fifth or one-sixth of

what it was at 200°. The numerical value at 200° (silver = 100) was found equal to 0.0035 to 0.0031 (F. Exner).

Basic action of the Elementary Substances.—If seleniferous sulphur or pyrites is used for the manufacture of oil of vitriol by the chamber process, most of the selenium accumulates as such in the "chamber mud," from which it may be extracted by the following method of Wohlfarth. The mud, after having been thoroughly washed and dried, is fused with alkaline nitrate and carbonate, to convert the selenium into selenate (SeO_4^{2-} or SeO_3^{2-}), which is extracted by means of water. The filtered solution is boiled with hydrochloric acid to convert the selenic into selenous acid ($SeO_3 + 2HCl = Cl_2 + H_2O + SeO_2$), and this last is then reduced by addition of sulphurous acid and heating, when the selenium comes down as a red precipitate ($SeO_2 + 2SO_2 = 2SO_3 + Se$). A heavier material than chamber mud is seleniferous oil-smoke as produced in Mansfeld, which likewise contains free selenium. Its extraction, according to O. Petersen and F. Nilson, is best effected by digestion with concentrated solution of cyanide of potassium at 80° C, which converts the selenium into selenocyanide ($SeNCN$), easily extractable by water. The filtered solution is acidified with hydrochloric acid and allowed to stand, when the selenium (through the spontaneous decomposition of the $SeNCN$ into NH_4Cl and Se) comes down as a precipitate.

Tellurium is generally prepared from Transylvanian gold ore. The powdered ore is oxidized by means of hot nitric acid, and the least sufficient amount of hydrochloric acid the excess of nitric acid being chased away by evaporation, and the residue mixed with sulphuric acid (to convert the lead into insoluble sulphate), and with some tartaric acid to prevent precipitation of tellurous acid (TeO_2) in the subsequent treatment with water. From the filtered aqueous solution the gold is removed by addition of ferrous sulphate and by filtration. The filtrate is treated with sulphurous acid to reduce the tellurous acid to tellurium, which separates out as a black precipitate. The precipitated metal is fused down and then sublimed at a very high temperature, in a porcelain tube, in a current of hydrogen, to remove non-volatile impurities and eliminate the last traces of selenium (SeH_2).

Chemical Relations.—Selenium and tellurium are similar in their chemical characters to sulphur, the gradation of properties within the triad is in the order of the atomic weights, which are $S = 32.06$, $Se = 79.07$, $Te = 128$ ($O = 16$). In oxygen, as in the elementary substances, but readily into (solid) dioxides (SeO_2 , TeO_2), in the case of selenium with production of a characteristic stretch of purple radii, owing probably to the formation of a trace of hydride, SeH_2 . Nitric acid, in the heat, converts sulphur directly into sulphuric acid. In the case of the two rare elements the oxidation stops at the stage corresponding to sulphurous acid. The acids SeO_3H_2 and TeO_3H_2 are not liable to further oxidation by any of the well-known reagents (HNO_3 , H_2O and Cl_2 , Br_2 , I_2 , &c.) which convert sulphurous into sulphuric acid.

By fusion with nitric and alkaline carbonate the three elements, in their elementary or less oxygenated forms, are readily converted into salts, R_2SeO_4 (sulphates, &c., $Z = S, Se, Te$). Selenic and telluric acids (H_2SeO_4), unlike sulphuric, when boiled with aqueous hydrochloric acid, are gradually reduced to the lower acids (Se or TeO_2H_2), with evolution of chlorine; and the lower acids are readily reduced to (precipitates of) elementary selenium and tellurium respectively by the action of sulphurous acid in the heat. Chlorine combines readily with elementary selenium and tellurium into dichlorides (Se or $TeCl_2$), which, however, on continued chlorination are at last completely converted into the tetrachlorides (Se or $TeCl_4$). These last, unlike the corresponding sulphur compound, are distillable without decomposition. Metals capable of uniting directly with sulphur as a rule unite also with selenium and tellurium into corresponding compounds. Hydrogen unites with elementary selenium and tellurium in the heat into gaseous hydrides (Se or TeH_2) closely similar to sulphuretted hydrogen. But, as these hydrides are liable to dissociation, the pure compounds must be prepared by the decomposition of the zinc compounds $ZnSe$ with hydrochloric acid. For the description of individual compounds reference must be made to the handbooks of chemistry (W. D.).

SELEUCIA, or SELEUCIA ($\Sigma\epsilon\lambda\epsilon\upsilon\kappa\epsilon\alpha$) Of the numerous ancient towns of this name the most famous are—(1) the great city on the Tigris founded by Seleucus I. Nicator (see vol. xviii. p. 587), of the greatness and decay of which an account has been given in vol. xviii. p. 601; (2) a city on the northern frontier of Syria towards Cilicia, some miles north of the mouth of the Orontes, also founded by Seleucus I., and forming with Antioch, Apamea, and Laodicea the Syrian Tetrapolis. It served as the port of Antioch (Acts xiii. 4). Considerable ruins are still visible, especially a great cutting through solid rock, about two-thirds of a mile long, which Polybius speaks of as the road from the city to the sea.

SELEUCIDS See MACEDONIAN EMPIRE, vol xv p 142, and PERSIA, vol xviii p 585 sq.

SILIM or SALIM, the title borne by three emperors of the Ottoman Turks For SILIM I, emperor from 1512 to 1520, see PERSIA, vol xviii pp 635-636, and TURKEY SILIM II, grandson of the preceding, was sultan from 1566 to 1574 See TURKEY SILIM III, son of Sultan Mustafa III, succeeded his father in 1789 and was deposed in 1807 See TURKEY

SILINIA See SLIVEN

SILINUS (Σελίνος), one of the most important of the Greek colonies in Sicily, near the rivers Hypsas and Selinus on the south-west coast, was founded, probably about 628 B.C., by colonists from Megara Hyblaea in the east of Sicily and others from the parent city of Megara on the Saronic Gulf of Greece (see Thuc., vi 4, vii 57, and Strabo, vi p 272). The name of the city and the little river (see H in fig.) on which it stands was derived from the wild parsley (σέλινον) which grew there in abundance (comp. vol xvii p 639). Many autonomous coins of Selinus exist, dating from the 5th and 4th centuries B.C. The tetradrachms have on the obverse a youth, representing the river Selinus, sacrificing at an altar,¹ and, in the field, a parsley leaf,—legend, ΣΕΛΙΝΟΣ, on the reverse, Apollo and Artemis in a biga,—legend, ΣΕΛΙΝΟΝΤΙΟΝ (retrograde). Didrachms have a similar obverse with the river Hypsas,—legend, ΗΥΨΑΣ, reverse, Heracles slaying a bull,—legend, ΣΕΛΙΝΟΝΤΙΟΝ. As early as 580 B.C. the citizens of Selinus were at war with the adjoining people of Segesta, a non-Hellenic race who occupied the province north of Selinus, the success of the Segestans on this occasion was mainly owing to aid given them by colonists from Rhodes and Cnidus. Little is known about the early history of Selinus; but the city evidently grew rapidly in wealth and importance, and soon extended its borders 15 miles westwards to the river Mazarus and eastwards as far as the Halycus (Diod., xii 54, Herod., v 46). Thucydides (vi 20) mentions its power and wealth and especially the rich treasures in its temples. From its early oligarchical form of government Selinus passed to a short-lived despotism under the tyrant Pithagoras, who was deposed soon after 510 B.C. In 480 B.C., when the Carthaginian Hamilcar invaded Sicily, the city took his side against their fellow Hellenes. In 416 B.C. a new dispute between Selinus and Segesta was eventually the cause of the fatal Athenian expedition against Sicily, the Athenians acting as allies of Segesta and the Syracusans as allies of Selinus. The conclusion of this expedition (see SYRACUSE) left Segesta at the mercy of the Selinuntines, whose rapacity and cruelty soon brought about their own destruction, through the aid which the Segestans obtained from Carthage. In 409 B.C. Hannibal, with an overwhelming force, took and destroyed the city, the walls of which were razed to the ground. He killed about 16,000 of the inhabitants, took 5000 prisoners, and only a remnant of 2600 escaped to Agrigentum (Diod., xii 54-59). The survivors were afterwards allowed to return and to rebuild Selinus as a city subject to the Carthaginians, under whose yoke, in spite of their attempts to regain freedom, the Selinuntines remained till c. 250, the close of the First Punic War, after this the Carthaginians transferred the inhabitants of Selinus to Lilybaeum, and completely destroyed the city (Diod. xxiv). It was never rebuilt, and is mentioned by Strabo (vi. p. 272) as being one of the extinct cities of Sicily.²

¹ Sculptured on the altar is a cock, in allusion to the aid given by Asculapian against the fever which was caused by the marshy site. Drainage works directed by Empedocles are said to have rendered the site healthy (Dion. Laer., vii. 2, 11).

² Roman sulphur baths existed under the name Thermae Selinuntinae, but these were about 20 miles east of the site of the ancient Selinus.

The ancient city occupied two elevated plateaus at the edge of the sea and also part of the surrounding plain. The western of these elevations formed the acropolis, on the other was the agora. The walls of the acropolis can still be traced round the whole circuit, the only entrance was on the north-east. Remains also exist of long walls connecting the city and its port. The chief glory of Selinus was its double group of great temples,—three on the acropolis and three in the agora, one of which was the largest peripteral temple in the world. All are completely ruined, but the materials of each still remain almost perfect, though scattered in confused heaps of stone, the extraordinary completeness of these fragments is owing to the fact that the site has never been occupied since the final transference of the inhabitants to c. 250 B.C., and the scattered blocks have never been taken as materials for later structures. Of all the six temples³ none are later than the 5th century B.C., and those on the acropolis probably date from about 628 B.C., soon after the first settlement. The sculptured metopes from three of the temples are among the most important examples of early Hellenic art (see ARCHÆOLOGY, vol. i p 349, and Beundorf, *Die Metopen von Selinus*). The buildings themselves are of the highest interest, being the earliest known examples of the Doric style, and differing in many important details from all other examples, even such early ones as the temples at Corinth and Syracuse.

The three temples on the acropolis (A, C, D in fig.) stand side by side, with their axes north-west to south-east, all are hexastyle and peripteral, with either thirteen or fourteen columns on the sides.

Then stylolates have four high steps along the sides, with an easy approach of more steps at the north-west fronts. To the middle one of the three belong the very archaic metopes described in vol. i p 349. All have a rather narrow cella with pronaos and opisthodomus. Then archaic peculiarities are the rapid diminution of the columns, the absence of entasis, the narrow mutules over the metopes, and especially a curious cavetto or necking under the usual hypotaechia. No other example of this feature was A, C, D, Temples on acropolis. B, Small pseudo-ionic temple c. 1884, when style later than archaic. A, G, on eastern hill. α, c, Remains of buildings outside acropolis walls. H, River Selinus.

similar Doric capital among the ruins of the citadel of Tyrrhus. The Tyrrhus capital dates probably from a little before 800 B.C. and appears to be nearly contemporary with that at Selinus. Between temples A and C are remains of a small postyle tetrastyle schola (B) of the Doric order.⁴ The second group of three Doric temples (E, F, G) belongs to a rather later date,—probably 500 to 440 B.C. The first two (E and F) have very narrow cella, so that they are pseudo-dipteral. They also are hexastyle, with fourteen columns on the sides. Though still early in detail, they are without the curious necking of the acropolis temples. The sculptured metopes of temple E are of extraordinary beauty and interest, and appear to date from the finest period of Greek art—the age of Phidias or perhaps that of Myron. The chief subjects are Zeus and Heracles on Mount Olympus, Artemis and Actaeon, and Heracles defeating an Amazon. They are of the noblest style, simple and highly sculptural in treatment, and full of grace and expression. One remarkable peculiarity in their technique is that the nude parts of the female figures (heads, feet, and hands) are executed in white marble, while the rest of the figures are in the native grey tuff, which originally was covered with marble dust, stone, and then painted. The whole of the stonework of all the temples was treated in a similar way, and gives most valuable examples of early Greek coloured decoration. Recent excavations at Selinus have shown that in many cases the cornices and other architectural features were covered with moulded slabs of terra cotta, all richly coloured.

³ The stone of which all these temples were built came from a quarry a few miles north-west of Selinus (mod. Campobello). The ancient workings are very visible, and unfinished drums of columns and other blocks still exist in the quarry. It is a brown tuff-like stone.

⁴ Strange to say, Hittorff and Zanthi (*Archæologie Antiqua de Sicile*, Paris, 1870), in their elaborate work on this subject, restore this schola with a Doric entablature on Ionic columns, a good many other similar absurdities occur in this richly illustrated work. More judgment is shown in the *Antiqua de Sicilia* (Palermo, 1881-82), though it is not always accurate in measurements.

(see Dörpfeld *Die Verwundung von Persepolis*, Berlin, 1881, and TERRACOTTA) The great temple of Zens¹ (G in fig) was the largest peripteral temple of the whole Hellenic world, being almost exactly the same size as the enormous pseudo-peripteral Olympæum at the neighbouring Agriguntum. It was octastyle, pseudodipteral, with seventeen columns on the sides, and measured 360 by 162 feet, the columns are 16 feet 7½ inches at the base and were 48 feet 7 inches high. This gigantic building was never quite completed, though the whole of the main structure was built. Most of the columns still remain unfluted. In spite of the proportional narrowness of its cells, it had an internal range of columns, probably two orders high, like those within the cella at Paestum. The axes of these last three temples have exactly the same inclination as those on the acropolis. The great temple of Zeus possesses some of the curious archaisms of the acropolis temples, and, though never completed, it was probably designed and begun at an earlier date than the two adjacent buildings. These peculiarities are the ungracefully rapid diminution of the shaft and the cavetto under the necking of the capitals. The whole of these six massive buildings now lie in a complete state of ruin, a work of evidently wilful destruction on the part of the Cathaginians, as the temple at Segesta, not many miles distant, has still every column and its whole entablature quite perfect, so it is impossible to suppose that an earthquake was the cause of the utter ruin at Selinus. Few or no marks of fire are visible on the stone blocks (J H M)

SELJUKS is the name of several Turkish dynasties, issued from one family, which reigned over large parts of Asia in the 11th, 12th, and 13th centuries of our era. The history of the Seljuks forms the first part of the history of the Turkish empire. Proceeding from the deserts of Turkestan, the Seljuks reached the Hellespont, but this barrier was crossed and a European power founded by the Ottomans (Osmanli). The Seljuks inherited the traditions and at the same time the power of the previous Arabian empire, of which, when they made their appearance, only the shadow remained in the person of the 'Abbâsîd caliph of Baghdâd. It is their merit from a Mohammedan point of view to have re-established the power of orthodox Islam and delivered the Moslem world from the supremacy of the caliph's Shi'ite competitors, the Fâtimites of Egypt, and from the subversive influence of ultra-Shi'ite tenets, which constituted a serious danger to the duration of Islam itself. Neither had civilization anything to fear from them, since they represented a strong national power, which made the intimate union of Persian and Arabian elements possible, almost at the expense of the national Turkish, — literary monuments in that language being during the whole period of the Seljuks rule exceedingly rare.

The first Seljuk rulers were Toghrul Beg, Chakir Beg, and Ibrahim Niyal, the sons of Mikail, the son of Seljuk, the son of Tukak (also styled Timur-yahik, "iron bow"). They belonged to the Turkish tribe of the Ghuzz (Oğuz of Count Porphyry and the Byzantine writers), which traced its lineage to Oghuz, the famous epic heroic hero not only of this but of all Turkish tribes. There arose, however, at some undefined epoch a strife on the part of this tribe and some others with the rest of the Turks, because, as the latter allege, Ghuzz, the son (or grandson) of Yafeth (Japhet), the son of Nûh (Noah), had stolen the genuine rain-stone, which Turk, also a son of Yafeth, had inherited from his father. By this party, as appears from this tradition, the Ghuzz were not considered to be genuine Turks, but to be Turkman (that is, according to a popular etymology, resembling Turks). But the native tradition of the Ghuzz was unquestionably right, as they spoke a pure Turkish dialect. The fact, however, remains that there existed a certain animosity between the Ghuzz and their allies and the rest of the Turks, which increased as the former became converted to Islam (in the course of the 4th century of the Flight). The Ghuzz were settled at that time in Transoxiana, especially at Jand, a well-

known city on the banks of the Jaxartes, not far from its mouth. Some of them served in the armies of the Ghaznavids Sebuktigin and Mahmûd (997-1030), but the Seljuks, a royal family among them, had various relations with the reigning princes of Transoxiana and Khârizm, which cannot be narrated here.² But, friends or foes, the Ghuzz became a serious danger to the adjoining Mohammedan provinces from their predatory habits and continual raids, and the more so as they were very numerous. It may suffice to mention that, under the leadership of Israil or Pigu Arslan, they crossed the Oxus and spread over the eastern provinces of Persia, everywhere plundering and destroying. The imprisonment of this chieftain by Mas'ûd, the son and successor of Mahmûd, was of no avail: it only furnished his nephews with a ready pretext to cross the Oxus likewise in arms against the Ghaznavids. We pass over their first conflicts and the unsuccessful agreements that were attempted, to mention the decisive battle near Merv (1040), in which Mas'ûd was totally defeated and driven back to Ghazna (Ghazni). Persia now lay open to the victors, who proclaimed themselves independent at Merv (which became from that time the official capital of the principal branch of the Seljuks), and acknowledged Toghrul Beg as chief of the whole family. After this victory the three princes Toghrul Beg, Chakir Beg, and Ibrahim Niyal separated in different directions and conquered the Mohammedan provinces east of the Tigris, the last-named, after conquering Hamadân and the province of Jebel, penetrated as early as 1048, with fresh Ghuzz troops, into Armenia and reached Melaskêr, Erzerûm (Ezeroum), and Trebizond. This excited the jealousy of Toghrul Beg, who summoned him to give up Hamadân and the fortresses of Jebel, but Ibrahim refused, and the progress of the Seljukian arms was for some time checked by internal discord, — an era-recurring event in their history. Ibrahim was, however, compelled to submit.

At this time the power of the 'Abbâsîd caliph of Baghdâd (Al-Kâim bi-amr illâh) was reduced to a mere shadow, as the Shi'ite dynasty of the Bûyids and afterwards his more formidable Fâtimites rivals had left him almost wholly destitute of authority. The real ruler at Baghdâd was a Turk named Basâsîrî, lieutenant of the last Bûyîd, Al-Malik ar-Rahîm. Nothing could, therefore, be more acceptable to the caliph than the protection of the orthodox Toghrul Beg, whose name was read in the official prayer (khutba) as early as 1050. At the end of the same year the Seljuk entered the city and after a tumult seized the person of Malik ar-Rahîm. Basâsîrî had the good fortune to be out of his reach, after acknowledging the right of the Fâtimites, he gathered fresh troops and incited Ibrahim Niyal to rebel again, and he succeeded so far that he re-entered Baghdâd at the close of 1058. The next year, however, Toghrul Beg got rid of both his antagonists, Ibrahim being taken prisoner and strangled with the bowstring, while Basâsîrî fell in battle. Toghrul Beg now re-entered Baghdâd, re-established the caliph, and was betrothed to his daughter, but died before the consummation of the nuptials (September 1063). Alp Arslan, the son of Chakir Beg, succeeded his uncle and extended the rule of his family beyond the former frontiers. He made himself master, e.g., of the important city of Aleppo; and during his reign a Turkish emir, Atsiz, wrested Palestine and Syria from the hands of the Fâtimites. Nothing, however, added more to his fame than his successful expeditions against the Greeks, especially that of 1071, in which the Greek emperor Romanus Diogenes was taken prisoner and forced to ransom himself for a

¹ The dedication of the five smaller temples is unknown; some were probably consecrated to Poseidon, Apollo, and Artemis. The existing metallo reliefs are preserved in the museum at Palermo.

² Comp. Sachau, "Zur Geschichte und Chronologie von Khwârizm," in *Sitzungsberichte* of the Vienna Acad., lxxiv. 304 sq.

large sum. The foundation of the Seljûk empire of Rûm (Asia Minor, see below) was the immediate result of this great victory. Alp Arslân afterwards undertook an expedition against Turkestan, and met with his death at the hands of a captured chief, Jusuf Barzami, whom he had intended to shoot with his own hand.

Malik Shâh, the son and successor of Alp Arslân, had to encounter his uncle Kâwurd, founder of the Seljûkian empire of Kermân (see below), who claimed to succeed Alp Arslân in accordance with the Turkish laws, and led his troops towards Hamadân. However, he lost the battle that ensued, and the bowstring put an end to his life (1073). Malik Shâh regulated also the affairs of Asia Minor and Syria, conceding the latter province as an hereditary fief to his brother Tutush, who established himself at Damascus and killed Atsiz. He, however, like his father Alp Arslân, was indebted for his greatest fame to the wise and salutary measures of their vizier, Nizâm al-Mulk. This extraordinary man, associated by tradition with 'OMAR KHAYYÂM (*q.v.*), the well-known mathematician and free-thinking poet, and with Hasan b. Sabbâh, afterwards the founder of the Ismaelites or Assassins, was a renowned author and statesman of the first rank, and immortalized his name by the foundation of several universities (the Nizâmîyah at Baghdâd), observatories, mosques, hospitals, and other institutions of public utility. At his instigation the calendar was revised and a new era, dating from the reign of Malik Shâh and known as the Jelsâni, was introduced. Not quite forty days before the death of his master this great man was murdered by the Ismaelites. He had fallen into disfavour shortly before because of his unwillingness to join in the intrigues of the princess Turkan Khâtûn, who wished to secure the succession to the throne for her infant son Mahmûd at the expense of the elder sons of Malik Shâh.

Constitution and Government of the Seljûk Empire—It has been already observed that the Seljûks considered themselves the defenders of the orthodox faith and of the 'Abbasid caliphate, while they on their side represented the temporal power which received its title and sanction from the successor of the Prophet. All the members of the Seljûk house had the same obligations in this respect, but they had not the same rights, as one of them occupied relatively to the others a place almost analogous to that of the great khân of the Mongols in later times. This position was inherited from father to son, though the old Turkish idea of the rights of the elder brother often caused rebellions and violent family disputes. After the death of Malik Shâh the head of the family was not strong enough to enforce obedience, and consequently the central government broke up into several independent dynasties. Within the limits of these minor dynasties the same rules were observed, and the same may be said of the hereditary fiefs of Turkish emirs not belonging to the royal family, who bore ordinarily the title of *atabek* (properly "father bey"), e.g. the atabeks of Fars, of Adharbâidjân (Azerbaijan), of Syria, &c. The title was first given to Nizâm al-Mulk and expressed the relation in which he stood to the prince,—as *idâra*, "tutor." The affairs of state were managed by the *divân* under the presidency of the vizier, but in the empire of Rûm its authority was inferior to that of the *perwânch*, whom we may name "lord chancellor." In Rûm the feudal system was extended to Christian princes, who were acknowledged by the sultan on condition of paying tribute and serving in the armies. The court dignitaries and their titles were manifold, not less manifold were the royal prerogatives, in which the sultans followed the example set by their predecessors, the Bûyids.

Notwithstanding the intrigues of Turkan Khâtûn, Malik Shâh was succeeded by his elder son Barkiyârok (1092-1104), whose short reign was a series of rebellions and strange adventures such as one may imagine in the story of a youth who is by turns a powerful prince and a miserable fugitive.¹ Like his brother Mohammed (1104-1118), who successfully rebelled against him, his most dangerous enemies were the Ismaelites, who had succeeded in taking the fortress of Alamut (north of Kasvin) and become a

formidable political power by the organization of bands of *fiddawis*, who were always ready, even at the sacrifice of their own lives, to murder any one whom they were commanded to slay (see ASSASSINS).

Mohammed had been successful by the aid of his brother Sinjar, who from the year 1097 held the province of Khorâsan with the capital Merv. After the death of Mohammed Sinjar became the real head of the family, though 'Irâk acknowledged Mahmûd, the son of Mohammed. Thus there originated a separate dynasty of 'Irâk with its capital at Hamadân; but Sinjar during his long reign often interfered in the affairs of the new dynasty, and every occupant of the throne had to acknowledge his supremacy. In 1117 he led an expedition against Ghazna and bestowed the throne upon Behrâm Shâh, who was also obliged to mention Sinjar's name first in the official prayer at the Ghaznavid capital,—a prerogative that neither Alp Arslân nor Malik Shâh had attained. In 1134 Behrâm Shâh failed in this obligation and brought on himself a fresh invasion by Sinjar in the midst of winter, a third one took place in 1152, caused by the doings of the Ghurids (Hosam Jihânsûz, or "world-burner.") Other expeditions were undertaken by him against Khârizm and Turkestan, the government of the former had been given by Barkiyârok to Mohammed b. Anushtegin, who was succeeded in 1128 by his son Atsiz, and against him Sinjar marched in 1138. Though victorious in this war, Sinjar could not hinder Atsiz from afterwards joining the gûrkhan (great khân) of the then rapidly rising empire of the Karachitai, at whose hands the Seljûk suffered a terrible defeat at Samarkand in 1141. By the invasion of these hordes several Turkish tribes, the Ghuzz and others, were driven beyond the Oxus, where they killed the Seljûk governor of Balkh, though they professed to be loyal to Sinjar. Sinjar resolved to punish this crime; but his troops deserted and he himself was taken prisoner by the Ghuzz, who kept him in strict confinement during two years (1153-55), though treating him with all outward marks of respect. In the meantime they plundered and destroyed the flourishing cities of Merv and Nishâpûr, and when Sinjar, after his escape from captivity, revisited the site of his capital he fell sick of sorrow and grief and died soon afterwards (1157). His empire fell to the Karachitai and afterwards to the shâh of Khârizm. Of the successors of Mohammed in 'Irâk we give only the names with the date of the death of each:—Mahmûd (1131), Toghrul, son of Mohammed, proclaimed by Sinjar (1134), Mas'ûd (1152), Malik Shâh and Mohammed (1159), sons of Mahmûd; Sulaimân Shâh, brother (1161), Arslân, son of Toghrul (1175), and Toghrul, son of Arslân, killed in 1194 by Inânu, son of his atabek, Mohammed, who was in confederation with the Khârizm shâh of the epoch, Takash. This chief inherited his possessions, Toghrul was the last representative of the Seljûks of 'Irâk.

The province of Kermân was one of the first conquests of the Seljûks, and became the hereditary fief of Kâwurd, the son of Châkr Beg. Mention has been made of his war with Malik Shâh and of his ensuing death (1073). Nevertheless his descendants were left in possession of their ancestor's dominions, and till 1170 Kermân, to which belonged also the opposite coast of 'Omân, enjoyed a well-ordered government, except for a short interruption caused by the deposition of Irân Shâh, who had embraced the tenets of the Ismaelites, and was put to death (1101) in accordance with a fatwa of the ulema. But after the death of Toghrul Shâh (1170) his three sons disputed with each other for the possession of the throne, and implored foreign assistance, till the country became utterly devastated and fell an easy prey to some bands of Ghuzz, who, under the leadership of Malik Dînâr (1185), marched into

¹ A sketch of his reign has been given by Deffémery, *Journ. Asiatique*, 1858, i. 425 sq., n. 217 sq.

Kermán after harassing Sogja's dominions. Afterwards the shahs of Khárizm took this province.¹

The Seljukian dynasty of Syria came to an end after three generations, and its later history is interwoven with that of the crusaders. The first prince was Tutush, mentioned above, who perished, after a reign of continuous fighting, in battle against Barkiyárok near Rai (1095). Of his two sons, the elder, Ridhwán, established himself at Aleppo (died 1113), the younger, Dukak, took possession of Damascus, and died in 1103. The sons of the former, Alp Arslán and Suláimán Sháh, reigned a short time nominally, though the real power was exercised by Láliú till 1117. We cannot, however, enter here into the very complicated history of these two cities, which changed their masters almost every year till the time of Zengi and Núr ed-dín.

After the great victory of Alp Arslán in which the Greek emperor was taken prisoner (1071), Asia Minor lay open to the inroads of the Turks. Hence it was easy for Suláimán, the son of Kutulmish,² the son of Arslán Fíru (Israel), to penetrate as far as the Hellespont, the more so as after the captivity of Romanus, two rivals, Nicephorus Bryennius in Asia and another Nicephorus named Botaniates in Europe, disputed the throne with one another. The former appealed to Suláimán for assistance, and was by his aid brought to Constantinople and seated on the imperial throne. But the possession of Asia Minor was insecure to the Seljuks as long as the important city of Antioch belonged to the Greeks, so that we may date the real foundation of this Seljuk empire from the taking of that city by the treason of its commander Philaretus in 1084, who afterwards became a vassal of the Seljuks. The conquest involved Suláimán in war with the neighbouring Mohammedan princes, and he met his death soon afterwards (1086), near Shaizar, in a battle against Tutush. Owing to these family discords the decision of Malik Sháh was necessary to settle the affairs of Asia Minor and Syria, he kept the sons of Suláimán in captivity, and committed the war against the unbelieving Greeks to his generals Bursuk (Πυρρικός) and Buzán (Πουζάνος). Barkiyárok, however, on his accession (1092), allowed Kilig Arslán, the son of Suláimán, to return to the dominions of his father. Acknowledged by the Turkish emirs of Asia Minor, he took up his residence in Nicaea, and defeated the first bands of crusaders under Walter the Penniless and others (1096), but, on the arrival of Godfrey of Bouillon and his companions, he was prudent enough to leave his capital in order to attack them as they were besieging Nicaea. He suffered, however, two defeats in the vicinity, and Nicaea surrendered on 23d June 1097. As the crusaders marched by way of Dorylaeum and Iconium towards Antioch, the Greeks subdued the Turkish emirs residing at Smyrna, Ephesus, Sardis, Philadelphia, Laodicea, Lampes, and Polybotus,³ and Kilig Arslán, with his Turks, retired to the north-eastern parts of Asia Minor, to act with the Turkish emirs of Sivas (Sebaste), known under the name of the Danishmand.

The history of the dynasty of the Danishmand is still very obscure, notwithstanding the efforts of Moillmann, Solhuber, Karabacek, Sallet, and others to fix some chronological details, and it is almost impossible to harmonize the different statements of the Armenian, Syrian, Greek, and Western chronicles with those of the Arabic, Persian, and Turkish. The coins are few in number, very difficult to decipher, and often without date. The founder of the dynasty was a certain Talu, who is said to have been a schoolmaster (Danishmand), probably because he understood Arabic and Persian. His descendants, therefore, took the style of "Ibn Danishmand," often without their own name. They took possession

¹ An outline of the history of this branch of the Seljuks is given in *S. J. M. G.*, 1885, pp. 362-401.

² This prince rebelled against Alp Arslán in 1064, and was found dead after a battle.

³ The Turkicmen who dwelt in these western parts of Asia Minor, which were never regained by the Seljuks, were called Uch (Outsiders).

son of Sivas, Tokát, Nicvár, Ahlastán, Malatiah, probably after the death of Suláimán, though they may have established themselves in one or more of these cities much earlier, perhaps in 1071, after the defeat of Romanus Diogenes. During the first crusade the reigning prince was Kumshtegin (Ahmed Ghazi), who defeated the Franks and took prisoner the prince of Antioch, Bohemond, afterwards insombed. He died probably in 1106, and was succeeded by his son Mohammed (d. 1148), after whom reigned Ighi Basin, but it is very probable that other members of the same dynasty reigned at the same time in the cities already named, and in some others, e.g., Kastamuni.

Afterwards there arose a natural rivalry between the Seljuks and the Danishmand, which ended with the extinction of the latter about 1175. Kilig Arslán took possession of Mosul in 1107, and declared himself independent of the Seljuks of Irak; but in the same year he was drowned in the Chaboras through the treachery of his own emirs, and the dynasty seemed again destined to decay, as his sons were in the power of his enemies. The sultan Mohammed, however, set at liberty his eldest son Malik Sháh, who reigned for some time, until he was treacherously murdered (it is not quite certain by whom), being succeeded by his brother Mas'úd, who established himself at Konieh (Iconium), from that time the residence of the Seljuks of Rúm. During his reign—he died in 1155—the Greek emperors undertook various expeditions in Asia Minor and Armenia; but the Seljuk was cunning enough to profess himself their ally and to direct them against his own enemies. Nevertheless the Seljukian dominion was petty and unimportant and did not rise to significance till his son and successor, Kilig Arslán II, had subdued the Danishmands and appropriated their possessions, though he thereby risked the wrath of the powerful atabek of Syria, Nur ed-dín, and afterwards that of the still more powerful Saladin. But as the sultan grew old his numerous sons, who held each the command of a city of the empire, embittered his old age by their mutual rivalry, and the eldest, Kotb ed-dín, tyrannized over his father in his own capital, exactly at the time that Frederick I (Barbarossa) entered his dominions on his way to the Holy Sepulchre (1190). Konieh itself was taken and the sultan forced to provide guides and provisions for the crusaders. Kilig Arslán lived two years longer, finally under the protection of his youngest son, Kaikhosrau, who held the capital after him (till 1199) until his elder brother, Rokm ed-dín Suláimán, after having vanquished his other brothers, ascended the throne and obliged Kaikhosrau to seek refuge at the Greek emperor's court. This valiant prince saved the empire from destruction and conquered Erzerúm, which had been ruled during a considerable time by a separate dynasty, and was now given in fief to his brother, Muhtif ed-dín Toghrul Sháh. But, marching thence against the Georgians, Suláimán's troops suffered a terrible defeat, after this Suláimán set out to subdue his brother Mas'úd Sháh, at Angora, who was finally taken prisoner and treacherously murdered. This crime is regarded by Oriental authors as the reason of the premature death of the sultan (in 1204); but it is more probable that he was murdered because he displeased the Mohammedan clergy, who accused him of atheism. His son, Kilig Arslán III, was soon deposed by Kaikhosrau (who returned), assisted by the Greek Maurozomes, whose daughter he had married in exile. He ascended the throne the same year in which the Latin empire was established in Constantinople, a circumstance highly favourable to the Turks, who were the natural allies of the Greeks (Theodore Lascaris) and the enemies of the crusaders and their allies, the Armenians. Kaikhosrau, therefore, took in 1207 from the Italian Adalbrandini the important harbour of Attalia (Adalia); but his conquests in this direction were put an end to by his attack upon Lascaris, for in the battle that ensued he perished in single combat with his royal antagonist (1211).

His son and successor, Kaikavús, made peace with Lascaris and extended his frontiers to the Black Sea by the conquest of Sinope (1214). On this occasion he was fortunate enough to take prisoner the Comnenian prince (Alexis) who ruled the independent empire of Trebizond, and he compelled him to purchase his liberty by acknowledging the supremacy of the Seljuks, by paying tribute, and by serving in the armies of the sultan. Elated by this great success and by his victories over the Armenians, Kaikavús was induced to attempt the capture of the important city of Aleppo, at this time governed by the descendants of Saladin, but the affair miscarried. Soon afterwards the sultan died (1219) and was succeeded by his brother, Alá ed-dín Kaikobád, the most powerful and illustrious prince of this branch of the Seljuks, renowned not only for his successful wars but also for his magnificent structures at Koneh, Alaja, Sivás, and elsewhere, which belong to the best specimens of Saracenic architecture. The town of Alaja was the creation of this sultan, as previously there existed on that site only the fortress of Candelor, at that epoch in the possession of an Armenian chief, who was expelled by Kaikobád, and shared the fate of the Armenian and Frankish knights who possessed the fortresses along the coast of the Mediterranean as far as Seleucia (Seleucia). Kaikobád extended his rule as far as this city, and desisted from further conquest only on condition that the Armenian princes would enter into the same kind of relation to the Seljuks as had been imposed on the Comnenians of Trebizond. But his greatest military fame was won by a war which, however glorious, was to prove fatal to the Seljuk empire in the future in conjunction with his ally, the Eyyubid prince Al-Ashraf, he defeated the Khánizim sháh Jeld ed-dín near Arzenágán (1230). This victory removed the only barrier that checked the progress of the Mongols. During this war Kaikobád put an end to the collateral dynasty of the Seljuks of Erzerúm and annexed its possessions. He also gained the city of Khelát with dependencies that in former times had belonged to the Sháh-i-Armen, but shortly before had been taken by Jeld ed-dín, this aggression was the cause of the war just mentioned. The acquisition of Khelát led, however, to a new war, as Kaikobád's ally, the Eyyubid prince, envied him this conquest. Sixteen Mohammedan princes, mostly Eyyubids, of Syria and Mesopotamia, under the leadership of Al-Malik al-Kámil, prince of Egypt, marched with considerable forces into Asia Minor against him. Happily for Kaikobád, the princes mistrusted the power of the Egyptian, and it proved a difficult task to penetrate through the mountainous well-fortified accesses to the interior of Asia Minor, so that the advantage rested with Kaikobád, who took Kharput, and for some time even held Harán, Ar-Roha, and Rakka (1232). The latter conquests were, however, soon lost, and Kaikobád himself died in 1234 of poison administered to him by his son and successor, Ghiyáts ed-dín Kaikhosrau II. This unworthy son inherited from his father an empire embracing almost the whole of Asia Minor, with the exception of the countries governed by Vataces (Vataces) and the Christian princes of Trebizond and Lesser Armenia, who, however, were bound to pay tribute and to serve in the armies,—an empire celebrated by contemporary reports for its wealth.¹ But the Turkish soldiers were of little use in a regular battle, and the sultan relied mainly on his Christian troops, so much so that an insurrection of dervishes which occurred at this period could only be put down by their assistance. It was at this epoch also that there flourished at Koneh the greatest mystical poet of Islam, and the founder of the order of the Mawlawis, Jeld ed-dín Rúmí

(d. 1273, see Rúmí), and that the dervish fraternities spread throughout the whole country and became powerful bodies, often discontented with the liberal principles of the sultans, who granted privileges to the Christian merchants and held frequent intercourse with them. Notwithstanding all this, the strength and reputation of the empire were so great that the Mongols hesitated to invade it, although standing at its frontiers. But, as they crossed the border, Kaikhosrau marched against them, and suffered a formidable defeat at Kuzadág (between Arzenágán and Sivás) in 1243, which forced him to purchase peace by the promise of a heavy tribute. The independence of the Seljuks was now for ever lost. The Mongols retired for some years, but, Kaikhosrau dying in 1245, the joint government of his three sons gave occasion to fresh inroads, till one of them died and Hulagu divided the empire between the other two, 'Izz ed-dín ruling the districts west of the Halys and Rókn ed-dín the eastern provinces (1259). But the former, intruding with the Mameluke sultans of Egypt to expel his brother and gain his independence, was defeated by a Mongol army and obliged to flee to the imperial court. Heie he was imprisoned, but afterwards released by the Tatars of the Crimea, who took him with them to Sarai, where he died. Rókn ed-dín was only a nominal ruler, the real power being in the hands of his pervánéh, Muín ed-dín Sulaimán, who in 1267 procured an order of the Mongol Khán Abaka for his execution. The minister raised his infant son, Ghiyáts ed-dín Kaikhosrau III, to the throne, and governed the country for ten years longer, till he was entangled in a conspiracy of several emirs, who proposed to expel the Mongols with the aid of the Mameluke sultan of Egypt (Beybars or Bibars). The latter marched into Asia Minor and defeated the Mongols in the bloody battle of Abblastán (1277), but, when he advanced farther to Cæsarea, the pervánéh retired, hesitating to join him at the very moment of action. Beybars, therefore, in his turn fell back, leaving the pervánéh to the vengeance of the khán, who soon discovered his treason and ordered a barbarous execution. Ghiyáts ed-dín continued to reign in name till 1284, though the country was in reality governed by a Mongol viceroy. Mas'úd, the son of 'Izz ed-dín, who on the death of his father had fled from the Crimea to the Mongol khán and had received from him the government of Sivás, Arzenágán, and Erzerúm during the lifetime of Ghiyáts ed-dín, ascended the Seljuk throne on the death of Ghiyáts. But his authority was scarcely respected in his own residence, for several Turkish emirs assumed independence and could only be subdued by Mongol aid, when they retired to the mountains, to reappear as soon as the Mongols were gone. Mas'úd fell, probably about 1295, a victim to the vengeance of one of the emirs, whose father he had ordered to be put to death. After him Kaikobád, son of his brother Farámarz, entered Koneh as sultan in 1298, but his reign is so obscure that nothing can be said of it, some authors assert that he governed only till 1300, others till 1315. With him ended the dynasty of the Seljuks, but the Turkish empire founded by them continued to exist under the rising dynasty of the Ottomans. (See TURKEY)

Bibliography.—The best, though insufficient, account of the Seljuks is still De Guignes, *Histoire Generale des Huns*, lks x.-xii, from whom Gibbon borrowed his dates. Among translations from original sources (of which the most trustworthy are yet unedited), comp. Mirkhond's *Geschichte der Seldschuken* (ed. Vulliez), Gressan, 1838, *Turkik-A Gudelek*, French translation by Defémery in the *Journal Asiatique*, 1848, I. 417 sq., II. 359 sq., 384 sq., *Seid Joumani az Libris Turanias gu Ordhuwane insabih-e Ezergeta* (ed. J. H. W. Lagns), Helsingfors, 1854 (on the Seljuks of Asia Minor exclusively, but of little value). Information respecting certain periods is given incidentally in the well-known works of Von Hammer and D'Osson (M. T. H.)

¹ See the details in Vincent of Beauvais, *Speculum Historiale*, bk xxx chaps. 143, 144

SELKIRK, a lowland county of Scotland, of tortuous outline, is bounded by Midlothian on the N, by Peebles on the N and W, by Dumfries on the S, and by Roxburgh on the E. Its extreme length from south-west to north-east is 28 miles, its greatest breadth from east to west 17, and its total area 260 square miles or 166,524 acres, of which 1997 are water. This includes two detached portions, one to the north-west, surrounded by Peebles, and another on the east, the estate and barony of Sinton, separated from Roxburgh in the reign of William the Lion on the appointment of Andrew de Synton to the sheriffship of Selkirk. From its lowest altitude (300 feet) at the junction of the Gala and the Tweed the surface rises to 2433 feet at Dun Rig, a wild and desolate summit on the western boundary. Level haughs, beds of ancient lakes, occur in the courses of the rivers, but the country is otherwise wholly mountainous and only a small proportion of it arable. Of its principal summits, Etrick Pen (2269), Capel Fell (2523), Deer Law (2064), Herman Law (2014), are in the south, and Windlestrae Law (2161) in the north, about a mile from the borders of Midlothian. Broadly speaking, Selkirk may be said to consist of the two entire valleys of Etrick and Yarrow and a section of the valley of Tweed, the first two sloping from the south until they merge in the last, which forms the northern portion of the county. Besides St Mary's Loch and its adjunct the Loch of the Lowes, together about $4\frac{1}{2}$ miles long, there are several others of considerable size, mostly in the eastern uplands between Etrick and Teviotdale—the two lochs of Shaws, Clearburn Loch, Kingside Loch, Hellmuir Loch, Alemuir Loch, and Akermuir Loch. These, with the larger rivers and the mountain "burns" attract anglers to Selkirk from all parts of the kingdom.

Geologically, the Selkirk rocks are a portion of that great Silurian mass which occupies the south of Scotland from Wigton to the north-east coast of Berwick. At no part are they known to be covered by rocks of later formation, but here and there (at Windlestrae Law and Priesthope, for example) igneous rocks protrude in massive outcrops, almost granitic, one measuring over 100 feet in thickness. The hillsides yield inexhaustible supplies of blue-grey whinstone, suitable for building; but repeated efforts to establish slate-quarries and lead-mines have ended in failure. According to records of the 16th century, gold was found at Mount Benger, Douglas Craig, and Linghie Burn—"an ingenious gentleman" named Bevis Bulmer having been "most successful upon Henderland Moor in Etrick Forest, where he got the greatest gold—the like to it in no other place before of Scotland."

Corresponding with the high average altitude, the prevailing climate is cold and wet, and, as the soil is mostly thin, over a close subsoil of clayey "till," agriculture is carried on at a disadvantage. About the middle of the 19th century large areas of virgin soil were brought under tillage, but the prudence of the "improvement" is now greatly doubted, in regard to a large proportion at least,—its restoration to permanent pasture being now found almost impracticable.

In 1884 23,283 acres, or nearly a seventh of the whole, were under cultivation and 9228 under wood. The rotation of crops most commonly followed is a six-course shift of (1) turnips, (2) barley or oats, (3), (4), (5) grass or pasture, and (6) oats. Horses in 1884 numbered 580, cattle 2657, sheep 165,061. Till about a century ago the upper farms of the county were stocked exclusively with sheep of the blackfaced breed, and in high heathery tracts these still predominate. But as altitude diminishes sheep improve in quality, from pure Cheviot to half-bred and three-quarters-bred Leicester-Cheviot. Upwards of 60,000 acres, more than a third of the county, belong to the Duke of Buccleuch, whose title is derived from an ancient possession of his family in the vale of Ranelagh. Other principal landowners are Mr Maxwell-Stuart of Traquair (9765 acres) and Lord Napier and Etrick (9898 acres).

Manufactures.—So early as the beginning of the 17th century

the village of Galashiels had a considerable local trade in woollen cloth, then or shortly afterwards known as "Galashiels grey," and towards the end of the 18th century this industry was greatly stimulated by judicious giants from "the equivalent" paid by England at the Union. About the end of the first quarter of the 19th century a few novelties in pattern (mostly accidental) led to the opening up of what has now become a vast industry—the Tweed trade, which still has its acknowledged centre in Selkirk.

Administration and Population.—Selkirkshire with Peeblesshire forms one parliamentary constituency. Of entire civil parishes it contains only two, with parts of nine others; these are also, taken from these, three *quoad sacra* parishes and part of a fourth of the population, 4987 in 1755 and 9809 in 1851, was in 1881 returned at 26,564,—an increase partly due to the annexation of a portion of Galashiels formerly reckoned in Roxburgh. Outside the two towns of Galashiels (population 9140 in 1881) and Selkirk population has been almost stationary for more than a century, that of the landward parishes in 1755 and 1881 being respectively as follows—Ashkirk, 200 and 138, Innelathen, 60 and 61, Etrick, 397 and 397, Stow, 260 and 441, Yarrow, 1180 and 611, Robertson, 250 and 250.

Antiquities and History.—The shire is not rich in antiquities, although its hillsides here and there reveal earthen enclosures known as "Butch camps," as well as tumuli yielding human remains and the usual fragments of rude pottery. A mysterious ditch, known as "the Catrail," beginning at the north end of the county, traverses its entire extent before entering Roxburgh on its way to the English border. Besides smaller indications of its site on its line, at Rank in Galashiels, there is a well-preserved enclosure of formidable strength and dimensions. Near Melrose the Catrail is crossed by "Wallace's trench," when, according to an historical document recently published, the Scottish patriot defied for a while the generals of Edward I. Close by is the hill-tiack by which Montrose escaped from the disastrous field of Philiphaugh in 1645. Newark Castle, built by James II, still stands in fair preservation, notable enough historically, but more famous as the burial-place of the "last monarch" of the Stuart line. The county is dotted over with other towns of smaller size, in various stages of decay. Around them cluster those traditions which, sung in ballads full of simple force and tenderness, have made Selkirk the poet's chosen haunt. Yarrow, "galauded with rhyme," has, without hyperbole, been termed "the Tempe of the West." Selkirk was long known officially as the "Shire of the Forest," an appellation its famous sheriff Sir Walter Scott is said to recall. Except the burgh of Selkirk, its lands, and a large tract in Upper Etrick belonging to Melrose Abbey, the county remained long under the jurisdiction of a forest court, and its forest-steadings were held by tack from the crown till the time of Queen Mary. It was a favourite hunting-ground of Scottish monarchs and formed the dowry-land of at least two foreign princesses who became queens of Scotland.

See T. Craig-Brown, *Hist. of Selkirkshire*.

SELKIRK, the county town of Selkirkshire, is on the river Etrick, between its absorption of the Yarrow and its junction with the Tweed, and is connected by a branch railway with the Waverley line from Scotland to England. Although almost entirely a manufacturing town, having several large mills for woollen cloth and yarn, it is not without importance as the centre of an extensive pastoral area. The county offices and prison excepted, the public buildings of Selkirk are not striking. The population of the burgh was 1053 in 1735, 1800 in 1831, and 6090 in 1881.

From the site, by which David I, while prince of Northumbria, established in Selkirk the Benedictine abbey afterwards removed to Kelso, it appears that even at that remote period (1119-24) it was an old town and the prince's residence. David's castle continued to be a frequent resort of his successors on the throne, particularly of William the Lion, many of whose charters were signed "in plena curia apud Selkirkshire." Enlarged and strengthened by Edward I, the fortress was captured by the patriotic party soon after Wallace's return from France. Nothing now remains of it but green mounds and the name "Peel Hill." It is significant of the destruction wrought by repeated conquests and reconquests that Selkirk, notwithstanding its antiquity and early importance, boasts not of any building a century and a half old. As its early name (Schelochslyrehe) implies, it was originally a collection of forest "shells" beside which an early church was planted, probably by the Cuthberts of Old Melrose. Clear light is thrown upon the manners and customs of old border towns by the ancient records of this burgh, still extant (with gaps) from 1503. A minute of 1513 mentions the steps taken to comply with the king's letter ordering the levy before Flodden, when, according to tradition, the burgesses of Selkirk fought with stubborn valour. James V. granted the community right to enclose 1000 acres from the common and gave them leave to elect a provost, the first to fill that office being slain

in defence of the bugh lands. From an early period shoemakers were a numerous craft in Selkirk, and in 1715 and 1745 they were forced to furnish several thousand pairs of shoes to the Jacobite armies. "Souters of Selkirk" is still a synonym for the inhabitants.

SELKIRK, or SELCRAIG, ALEXANDER (1676-1723), a sailor who is supposed to have been the prototype of Defoe's "Robinson Crusoe," was the son of a shoemaker and tanner in Largo, Fifehire, and was born in 1676. In his youth he displayed a quarrelsome and unruly disposition, and, having been summoned on 27th August 1695 before the kirk-session for his indecent behaviour in church, "did not compare, being gone away to the seas." At an early period he was engaged in buccaneer expeditions to the South Seas, and in 1703 joined the "Cinque Ports" galley as sailing master. The following year he had a dispute with the captain, and at his own request was in October put ashore on the island of Juan Fernandez, where, after a solitary residence of four years and four months, he was taken off by Captain Woods Rogers, commander of a privateer, who made him his mate and afterwards gave him the independent command of one of his prizes. He returned home in 1712, but in 1717 he eloped with a country girl and again went to sea. He died in 1723 while lieutenant on board the royal ship "Weymouth."

See Howell, *Life and Adventures of Alexander Selkirk*, 1829.

SELMA, a city of the United States, in Dallas county, Alabama, at the head of steamboat navigation of the Alabama river, occupies a plateau on the bluff of the right bank, 95 miles below Montgomery. It has cotton warehouses, railroad machine-shops, and various factories. The population was 6484 (3660 coloured) in 1870 and 7529 (4184 coloured) in 1880. Selma, which was strongly fortified during the Civil War and the seat of a Confederate arsenal (where 1800 men were employed), was captured by the Federal major-general J. H. Wilson on 2d April 1865.

SEMPALATINSK, an extensive province (*oblast*) of the Russian dominions in Central Asia, administratively it forms a part of the general-governorship of the Steppes, although its northern portions really belong to the Irish plains of West Siberia. It has an area of 188,800 square miles, and is bounded on the N by Tobolsk and Tomsk, on the SE by Chma, on the S by Semirychensk, and on the W by Akmolinsk. As regards configuration, it differs widely in its northern and southern parts. The snowclad ridges (9000 to 10,000 feet) of the great Altai and Naryn enter its south-eastern portion, stretching southwards to Lake Zaisan. Another complex of mountains, Kandygatai and Kaibinsk, rising to 5000 and 6000 feet above the sea, continues them towards the west, a broad valley intervenes, through which the Irish finds its way from the Zaisan terrace to the lowlands of Siberia. Many extensions of these mountains and subordinate ridges stretch towards the north. The still lower but wild Jinghiz-tau mountains fill the south-western part of Sempalatinsk, sending out their rocky spurs into the steppe region. In the south, the Tarbagatai (Marmots') range (9000 to 10,000 feet) separates Sempalatinsk from Semirychensk and the Chinese province of Jugutchak. Wide steppes fill up the spaces between the mountains such as the Zaisan steppe (1200 to 1500 feet), between the Tarbagatai and the Altai ranges, the plains of Lake Balkash, some 300 feet lower, to the south of the Jinghiz-tau; and the plains of the Irish, which hardly rise 600 feet above the sea. All kinds of crystalline rocks—granites, syenites, diorites, and porphyries, as also crystalline slates of all descriptions—are met with in the mountain tracts, which contain also rich gold-bearing sands, silver and lead mines, graphite, coal, and the less valuable precious stones. The geology of the region and even its

topography are still but imperfectly known. Numerous boulders widely scattered among the mountains testify to a much wider extension of glaciers in former times. The chief river of the province, the Irtysh, which issues from Lake Zaisan, flows north and north-west and waters Sempalatinsk for more than 780 miles. Between Bukhtarma and Ust-Kamenogorsk it crosses the Altai by a wild gorge, with dangerous rapids, through which, however, boats are floated. Lake Zaisan, 80 miles long and from 10 to 20 wide, has depth sufficient for steamboat navigation, steamers traverse also for some 100 miles the lower course of the Black Irtysh, which flows from Kuldja to Lake Zaisan. The Kurichum, the Naryn, and the Bukhtarma are the chief right-hand tributaries of the Irtysh, while the Bukoiñ, the Kizil-su, and many smaller ones join it from the left, none are navigable, neither are the Kokbekty and Bugaz, which enter Lake Zaisan on the west. Lake Balkash, which borders Sempalatinsk in the south-west, formerly received several tributaries from the Jinghiz-tau. Many smaller lakes (some of them merely temporary) occur on the Irtysh plain, and yield salt. The whole of the country is rapidly drying up. The climate is severe. The average yearly temperature reaches 43° in the south and 34° in the north, the winter is very cold, and frosts of -44° Fahr. are not uncommon, while heats raising the thermometer to 123° in the shade are experienced in the summer. The yearly amount of rain and snow is trifling, although snow-storms are very common, strong winds prevail. Forests are plentiful in the hilly districts and on the Irtysh plain, the flora being Siberian in the north and more Central Asiatic towards Lakes Balkash and Zaisan.

The chief inhabitants are Kirghiz-kazaks, who acknowledged the supremacy of Russia in 1732 and may number now (1886) nearly half a million (478,750 in 1876, of whom 10,850 were settled in towns). The Russian population, which in the same year amounted to nearly 50,000 Cossacks and peasants, has slowly increased since. The aggregate population was in 1882 estimated at 538,400, of whom 34,550 lived in towns. The Russians are chiefly agriculturists, and have wealthy settlements on the right bank of the Irtysh, as well as a few patches in the south, at the foot of the mountains. The Kirghizes are almost exclusively live-breeders and keep large flocks of sheep, horses, and horned cattle, as also camels. Hunting and fishing (on Lake Zaisan) are favourite and profitable occupations with the Cossacks and the Kirghizes. Industries are of course insignificant, except that of mining—gold being obtained within the province to the amount of from 800 to 400 lb every year, the extraction of silver and lead is very limited. Trade is of some importance, and is increasing—Russian manufactured articles being exchanged for the raw produce (hides, tallow, cattle) of the region. The province is divided into four districts, the chief towns of which are Sempalatinsk (17,820 inhabitants in 1881), Pavlodar (2260), Kokbekty (3680), and Kakanalinsk (2030). All these towns, lost amidst the sandy steppes, are mere administrative centres. Bukhtarma and Ust-Kamenogorsk (3400), among the mountains, are also worthy of mention.

SEMPALATINSK, capital of the above province, is situated on the right bank of the Irtysh, on the highway from Central Asia to northern Europe. At the end of the 18th century it began to be a centre for trade, reaching its greatest development in 1850-60. Kazan and Turkestan Tatars formed the bulk of its population. The town still remains, however, a collection of old wooden houses scattered among unfenced spaces of sand. The Tatar town has a somewhat better aspect than the Russian. The inhabitants (17,820 in 1881) consist of officials, merchants, and agriculturists.

SEMIIRAMIS. According to the legend which the Greeks received from Ctesias, and which is most fully preserved by Diodorus (book ii) in a form that, according to the researches of C. Jacoby (*Rhean Museum*, 1875, p. 555 sq.), is not taken direct from Ctesias but comes through Chitarchus, and has been modified by traits borrowed from the history of Alexander the Great, the Assyrian empire over all Asia as far as the borders of India was created by

Ninus, the founder of Nineveh, and his greater spouse Semramis, who was first the wife of his captain, Onnes, but won the king's love by an heroic exploit, the capture of Bactra, which had defied the royal forces. Ninus died, and Semramis, succeeding to his power, traversed all parts of the empire, erecting great cities (especially Babylon) and stupendous monuments or opening roads through savage mountains. She was unsuccessful only in an attack on India. At length, after a reign of forty-two years, she delivered up the kingdom to her son Ninyas and disappeared, or, according to what seems to be the original form of the story, was turned into a dove and was thenceforth worshipped as a deity. This legend is certainly not Assyrian or Babylonian; Ctesias must have had it from Persians or Medes, and the fulness of detail, the multitude of proper names, favour the conjecture that Ninus and Semramis were celebrated in some Median epic tale which went on to tell of the fall of Assyria before the Medes (Duncker, *Gesch d. Alt.*, 5th ed., p. 18 sq.). In this legend all the conquests of Assyria were crowded together into one lifetime, and King Ninus and his son Ninyas are mere eponyms of Nineveh, personifications of the Assyrian monarchy. But it is round the figure of Semramis that all the real interest of the legend gathers, nor can she be the arbitrary creation of a poet, for it is certain that her name was popularly connected with many famous places and monuments. "The works of Semramis," says Strabo (xvi. 1, 2), "are pointed out through almost the whole continent, earthworks bearing her name, walls and strongholds, aqueducts, and star-like roads over mountains, canals, roads, and bridges." Ultimately every stupendous work of antiquity by the Euphrates or in Iran seems to have been ascribed to her,—even the Behistun inscriptions of Darius (Diod., ii. 13). Of this we already have evidence in Herodotus, who, though he does not know the legend afterwards told by Ctesias, ascribes to her the banks that confined the Euphrates (i. 184) and knows her name as borne by a gate of Babylon (ii. 155). Various places in Media bore the name of Semiramis, but slightly changed, even in the Middle Ages (Hoffmann, *Syrische Akten*, p. 137), and the old name of Van was Shamiramagard, Armenian tradition regarding her as its founder (St. Martin, *Mém. sur l'Arménie*, i. 138). These facts are to be explained by observing that in her birth as well as in her disappearance from earth Semramis clearly appears not as a mere woman but as a great goddess. In Diodorus's account she is the daughter of the Derecto of Ascalon and miraculously brought up by doves, and again she is finally transformed into a dove, and therefore the Assyrians pay divine honours to this bird. Semramis, therefore, is a dove-goddess associated with Derecto the fish-goddess. The same association of the fish and dove goddesses appears at Hierapolis (Bambyce, Mabbug), the great temple at which according to one legend was founded by Semramis (*De Dea Syria*, 14), and where her statue was shown with a golden dove on her head (*ibid.*, 33, comp. 39).¹ But the Semitic dove-goddess is Ishtar or Astarte, the great goddess of Assyria and Babylon, and the irresistible charms of Semramis, her sexual excesses (see especially Dmon in *Elhan*, v. H., vi. 1), and other features of the legend all bear out the view that she is primarily a form of Astarte, and so fittingly conceived as the great queen of Assyria. The word Semramis in Semitic form, as the Syrians write it, is Šmūrirām (Hoffmann, *ut supra*), an epithet rather than a proper name, which may be rendered "the highly celebrated," or perhaps rather "name [manifestation] of the god Rām." The historical inference

from all this is that Semitic worship was carried by the Assyrians far into Media and Armenia.

On an Assyrian inscription the name Sammūmat appears as borne by the "lady of the palace" of Rammanīvar (812-783 B.C.), see Schrader, *KAT*, 2d ed., p. 386. E. Meyer (*Gesch. des Alterth.*, p. 409) combines this with the statement of Herodotus that Semiramis lived five generations before Ninus, which would make her date 766 B.C. Possibly Herodotus identified the two names, but it is very doubtful whether they are really connected. Šhemamoth (i. Chion xv. 18) perhaps means "statues of Semramis," and, it so, was originally a place-name (Ewald, *al.*)

SEMI-REYETCHENSK, a province of Russian Turkestan, including the steppes south of Lake Balkash and parts of the Tian-Shan Mountains around Lake Issik-kul. It has an area of 155,300 square miles and is bounded by Semipalatinsk on the N., by China (Jungtshak, Kuldja, Aksu, and Kashgaria) on the E. and S., and by the Russian provinces of Ferganah, Syr-Darya, and Akmoinsk on the W. It owes its name (*Sity-su*, *Semi-reyche*, *re*, "Seven Rivers") to the rivers which flow from the south-east into Lake Balkash. The Jungarian Ala-tau, which separates it from north-western Kuldja, penetrates into its central portions, extending south-west towards the river Il, with an average height of 6000 feet above the sea, several isolated snow-clad peaks reaching about 12,000 feet. In the south Semireyetchensk embraces the intricate systems of the Trans-Ili Ala-tau and the Tian-Shan (see TURKESTAN). Two ranges of the former, connected about their middle by a single mountain-mass, extend east-north-eastwards along the northern shore of Lake Issik-kul, both ranging from 10,000 to about 15,000 feet and both partially snow-clad. To the south of the lake two immense ranges of the Tian-Shan, separated by the valley of the Naryn, stretch in the same direction, raising their icy peaks to above 15,000 and 16,000 feet; while westwards from the lake the vast walls of the Alexandrovsky ridge, 9000 to 10,000 feet high, with peaks rising some 2000 feet higher, extend to the province of Syr-Darya. Another mountain complex of much lower elevation runs north-westwards from the Trans-Ili Ala-tau towards the southern extremity of Lake Balkash. In the north, where the province borders Semipalatinsk, it includes the western parts of the Tarbagatai range, the summits of which (10,000 feet) do not reach the limit of perpetual snow. The remainder of the province consists of a rich steppe in the north-east (Serghipol), and vast uninhabitable sand-steppes on the south-east of Lake Balkash. Southwards from the last-named, however, at the foot of the mountains and at the entrance to the valleys, there are rich areas of fertile land, which are rapidly being colonized by Russian immigrants, who have also spread into the Tian-Shan, to the east of Lake Issik-kul. The climate is relatively temperate (average yearly temperature 44° Fahr. at Vyernyi, 2500 feet above the sea) and the vegetation rich.

The chief river is the Il, which enters the province from Kuldja, makes its way through the spurs of the Trans-Ili Ala-tau, flows north-west in a bed varying from 200 to 1000 yards in width, and waters the province for 260 miles before it enters Lake Balkash by several mouths forming a wide delta. Its tributaries from the left are the Naryn, the Tobik, and the Kurta, several others become lost in the sands. The Karatal, the Akent, and the Lepsa likewise fall into Lake Balkash. The Teln rises in the Tian-Shan Mountains and flows north-westwards to Lake Sammal-kul; and the Naryn flows south-westwards along a longitudinal valley of the Tian-Shan and enters Ferganah to join the Syr-Darya. The province contains several important lakes. Lake Balkash, or Doulghiz, in the north (8880 square miles), is crescent-shaped, 400 miles long and 55 wide in its broader part; but its area is much less than it formerly was, and it is rapidly drying up,—notably since 1863. Lake Ala-kul, which was connected with Balkash in the Post-Thucene period, now stands some hundred feet higher, and is connected by a chain of small lakes with Shu-kul. Lake Issik-kul (2260 square miles) is a deep mountain lake, 120 miles long and 37 wide, 5300 feet above the sea. The alpine lakes Son-kul (9400 feet) and Tchatur-kul (11,100 ft) south-west of Issik-kul.

The population, which was estimated at 748,800 by M. Kostenko in 1880 (39,660 being in the Kuldja region), has since increased,

¹ It is noteworthy in this connexion that Mabbug is the *Ninus vetus* of Ammianus and Philostorgius.

² Cp. the Phoenician "Astarte" שִׁמְרַת (*O.S.*, i. 1, No. 8, l. 18)

the latest official figures (1882) giving 635,950 for the province, exclusive of the Kuldja region. Of these Russians numbered, according to Kostenko, 44,585, 20,640 being Cossacks, who are very poor as compared with the free Russian emigrants. The majority of the population are English (595,237), next come Tatars (38,265), Kalmucks (about 25,000), Mongols and Manchurians (22,000), and Dzungars (19,657), these last two mostly in Kuldja, while Tatars and Sarts are each represented by some 3000 or 3500 (all the foregoing figures include those for Kuldja). The

province is subdivided into five districts, Yyeeny (18,423 inhabitants in 1879, of whom 3586 were military), the chief town of the province, formerly Almaty, is situated at the foot of the Trans-Ilian Ala-tau, and has a mixed population of Russians, Tatars, Sarts, Kirghiz, Kalmucks, and Jews; its trade with Kuldja and Kashgar is increasing rapidly, and it has now two lycœums, for boys and girls, and several other schools. The other towns—Kopal (5450 inhabitants), Scorghopol (1045), Tokmak (1770), and Kairakol (2780)—are merely administrative centres.

SEMITIC LANGUAGES

THE name "Semitic languages" is used to designate a group of Asiatic and African languages, some living and some dead, namely, Hebrew and Phœnician, Aramaic, Assyrian, Arabic, Ethiopic (Ge'ez and Amharic). The name, which was introduced by Eichhorn,¹ is derived from the fact that most nations which speak or spoke these languages are descended, according to Genesis, from Shem, son of Noah. But the classification of nations in Genesis x is founded neither upon linguistic nor upon ethnographical principles: it is determined rather by geographical and political considerations. For this reason Elam and Lud are also included among the children of Shem, but neither the Elamites (in Susiana) nor the Lydians appear to have spoken a language connected with Hebrew. On the other hand, the Phœnicians (Canaanites), whose dialect closely resembled that of Israel, are not counted as children of Shem. Moreover, the compiler of the list in Genesis x had no clear conceptions about the peoples of south Arabia and Ethiopia. Nevertheless it would be undesirable to give up the universally received terms "Semites" and "Semitic." There exist large groups of languages and peoples which bear no natural collective appellations, because the peoples grew up unconscious of their mutual relationship, so science must needs give them artificial designations, and it would be well if all such terms were as short and precise as "Semitic."

The connexion of the Semitic languages with one another is somewhat close, in any case closer than that of the Indo-European languages. The more ancient Semitic tongues differ from one another scarcely more than do the various Teutonic dialects. Hence even in the 17th century such learned Orientalists as Hottinger, Bochart, Castell, and Ludolf had a tolerably clear notion of the relationship between the different Semitic languages with which they were acquainted, indeed the same may be said of some Jewish scholars who lived many centuries earlier, as, for instance, Jehuda ben Koraish. It is not difficult to point out a series of characteristic marks common to these languages,—the predominance of triconsonantal roots, or of roots formed after the analogy of such, similarity in the formation of nominal and verbal stems, a great resemblance in the forms of the personal pronouns and in their use for the purpose of verbal inflexion, the two principal tenses, the importance attached to the change of vowels in the interior of words, and lastly considerable agreement with regard to order and the construction of sentences. Yet even so ancient a Semitic language as the Assyrian appears to lack some of these features, and in certain modern dialects, such as New Syriac, Mahri, and more particularly Amharic, many of the characteristics of older Semitic speech have disappeared. But the resemblance in vocabulary generally diminishes in proportion to the modernness of the dialects. Still we can trace the connexion between the modern and the ancient dialects, and show, at least approximately, how the former were developed out of the latter. Where a development of this kind can be proved to have taken place, there a relationship must

exist, however much the individual features may have been effaced. The question here is not of logical categories but of organic groups.

All these languages are descendants of a primitive Semitic stock which has long been extinct. Many of its most important features may be reconstructed with at least tolerable certainty, but we must beware of attempting too much in this respect. When the various cognate languages of a group diverge in essential points, it is by no means always possible to determine which of them has retained the more primitive form. The history of the development of these tongues during the period anterior to the documents which we possess is often extremely obscure in its details. Even when several Semitic languages agree in important points of grammar we cannot always be sure that in these particulars we have what is primitive, since in many cases analogous changes have taken place independently. To one who should assert the complete reconstruction of the primitive Semitic language to be possible, we might put the question, Would the man who is best acquainted with all the Romance languages be in a position to reconstruct their common mother, Latin, if the knowledge of it were lost? And yet there are but few Semitic languages which we can know as accurately as the Romance languages are known. As far as the vocabulary is concerned, we may indeed maintain with certainty that a considerable number of words which have in various Semitic languages the form proper to each were a part of primitive Semitic speech. Nevertheless even then we are apt to be misled by independent but analogous formations and by words borrowed at a very remote period.² Each Semitic language or group of languages has, however, many words which we cannot point out in the others. Of such words a great number no doubt belonged to primitive Semitic speech, and either disappeared in some of these languages or else remained in use, but not so as to be recognizable by us. Yet many isolated words and roots may in very early times have been borrowed by the Hebrew, the Aramaic, the Ethiopic, &c., perhaps from wholly different languages, of which no trace is left.

The question which of the known Semitic dialects most resembles the primitive Semitic language is less important than one might at first suppose, since the question is one not of absolute but only of relative priority. After scholars had given up the notion (which, however, was not the fruit of scientific research) that all Semitic languages, and indeed all the languages in the world, were descendants of Hebrew or of Aramaic, it was long the fashion to maintain that Arabic bore a close resemblance to the primitive Semitic language.³ But, just as it is now recognized with ever-increasing clearness that Sanskrit is far from having retained in such a degree as was even lately supposed the characteristics of primitive Indo-European

¹ The more alike two languages are the more difficult it usually is to detect, as borrowed elements, those words which have passed from one language into the other.

² This theory is carried to its extreme limit in Olshausen's very valuable *Hebræo Grammatica* (Brunswick, 1851).

¹ *Einleitung in das A. T.*, 2d ed., p. 45 (Leipzig, 1878).

speech, so in the domain of the Semitic tongues we can assign to Arabic only a relative antiquity. It is true that in Arabic very many features are preserved more faithfully than in the cognate languages,—for instance, nearly all the original abundance of consonants, the short vowels in open syllables, particularly in the interior of words, and many grammatical distinctions which in the other languages are more or less obscured. But, on the other hand, Arabic has come, simply from analogy, a great number of forms which, owing to their extreme simplicity, seem at the first glance to be primitive, but which nevertheless are only modifications of the primitive forms, whilst perhaps the other Semitic languages exhibit modifications of a different kind. In spite of its great wealth, Arabic is characterized by a certain monotony, which can scarcely have existed from the beginning. Both Hebrew and Aramaic are in many respects more ancient than Arabic. This would no doubt be far more apparent if we knew Hebrew more completely and according to the original pronunciation of its vowels, and if we could discover how Aramaic was pronounced about the 13th century before our era. It must always be borne in mind that we are far more fully and accurately acquainted with Arabic than with the other Semitic languages of antiquity. The opinion sometimes maintained by certain over-zealous Assyriologists, that Assyrian is the "Sanskrit of the Semitic world," has not met with the approval even of the Assyriologists themselves, and is unworthy of a serious refutation.

A comparative grammar of the Semitic languages must of course be based upon Arabic, but must in every matter of detail take into consideration all the cognate languages, as far as they are known to us. In the reconstruction of the primitive Semitic tongue Hebrew might perhaps afford more assistance than Ethiopic; but Aramaic, Assyrian, and even the less known and the more modern dialects might furnish valuable materials.

It is not a formidable undertaking to describe in general terms the character of the Semitic mind, as has been done, for example, by Lassen (*Indische Alterthumskunde*, i. 414 ff.) and by Renan in the introduction to his *Histoire des Langues Semitiques*. But still there is a danger of assuming that the most important characteristics of particular Semitic peoples, especially of the Israelites and of the Arabs, are common to all Semites, and of ascribing to the influence of race certain striking features which are the result of the external conditions of life, and which, under similar circumstances, are also developed among non-Semitic races. And, though it is said, not without reason, that the Semites possess but little talent for political and military organization on a large scale, yet we have in the Phœnicians, especially the Carthaginians, in Hamitic and in Hannibal, a proof that under altered conditions the Semites are not incapable of distinguishing themselves in these domains. It is a poor evasion to deny that the Phœnicians are genuine Semites, since even our scanty sources of information suffice to show that in the matter of religion, which among Semites is of such supreme importance, they bore a close resemblance to the ancient Hebrews and Arameans. In general descriptions of this kind it is easy to go too far. But to give in general terms a correct idea of the Semitic languages is a task of very much greater difficulty. Renan's brilliant and most interesting sketch is in many respects open to serious criticism. He cites, for example, as characteristic of the Semitic tongues, that they still retain the practice of expressing psychological processes by means of distinct imagery. In saying this he is taking scarcely any language but Hebrew into account. But the feature to which he here alludes is owing to the particular stage of intellectual development that had been reached by the Israelites, is in part peculiar to the poetical

style, and is to be found in like manner among wholly different races. That the Semitic languages are far from possessing the fixity which Renan attributes to them we shall see below. But, however this may be, certain grammatical peculiarities of the Semitic languages—above all, the predominance of trilateral roots—are so marked that it is scarcely possible to doubt whether any language with which we are tolerably well acquainted is or is not Semitic. Only when a Semitic language has been strongly influenced not only in vocabulary but also in grammar by some non-Semitic speech, as is the case with Amharic, can such a doubt be for a moment entertained.

Many attempts have been made, sometimes in a very superficial fashion and sometimes by the use of scientific methods, to establish a relationship between the Semitic languages and the Indo-European. It was very natural to suppose that the tongues of the two races which, with the single exceptions of the Egyptians and the Chinese, have formed and moulded human civilization, who have been near neighbours from the earliest times, and who, moreover, seem to bear a great physical resemblance to one another can be nothing else than two descendants of the same parent speech. But all these endeavours have wholly failed. It is indeed probable that the languages, not only of the Semites and of the Indo-Europeans, but also those of other races, are derived from the same stock, but the separation must have taken place at so remote a period that the changes which these languages underwent in prehistoric times have completely effaced what features they possessed in common, if such features have sometimes been preserved, they are no longer recognizable. It must be remembered that it is only in exceptionally favourable circumstances that cognate languages are so preserved during long periods as to render it possible for scientific analysis to prove their relationship with one another.¹

On the other hand, the Semitic languages bear so striking a resemblance in some respects to certain languages of northern Africa that we are forced to assume the existence of a tolerably close relationship between the two groups. We allude to the family of languages known in modern times as the "Hamitic," and composed of the Egyptian, Beber, Boga (Bishari, &c.), and a number of tongues spoken in Abyssinia and the neighbouring countries (Agaw, Galla, Dankali, &c.). It is remarkable that some of the most indispensable words in the Semitic vocabulary (as, for instance, "water," "mouth," and certain numerals) are found in Hamitic also, and that these words happen to be such as cannot well be derived from trilateral Semitic roots, and are more or less independent of the ordinary grammatical rules. We notice, too, important resemblances in grammar,—for example, the formation of the feminine by means of a prefixed or affixed, that of the causative by means of a similarity in the suffixes and prefixes of the verbal tenses, and, generally, similarity in the personal pronouns, &c. It must be admitted that there is also much disagreement,—for instance, the widest divergence in the mass of the vocabulary; and this applies to the Semitic languages as compared not only with those Hamitic languages that are gradually becoming known to us at the present day but with the Egyptian, of which we possess documents dating from the fourth millennium before the Christian era. The question is here involved in great difficulties. Some isolated resemblances may, improbable as it appears, have been produced by the bor-

¹ The following is an instance of the manner in which we may be deceived by isolated cases. "Siu" is in Hebrew *sheen*, almost exactly like the Sanskrit and modern Persian *shah*, the Latin *seu*, &c. But the Indo-European root is *seueks*, or perhaps even *seueksa*, whereas the Semitic root is *shiddu*, so that the resemblance is a purely accidental one, produced by phonetic change.

rowing of words. Uncivilized races, as has been proved with certainty, sometimes borrow from others elements of speech in cases where we should deem such a thing impossible,—for example, numerals and even personal suffixes. But the great resemblances in grammatical formation cannot be reasonably explained as due to borrowing on the part of the Hamites, more especially as these points of agreement are also found in the language of the Berbers, who are scattered over an enormous territory, and whose speech must have acquired its character long before they came into contact with the Semites. We are even now but imperfectly acquainted with the Hamitic languages, it is not yet certain into what groups they fall, and the relation in which Egyptian stands to Berber on the one hand and to the south Hamitic languages on the other requires further elucidation. The attempt to write a comparative grammar of the Semitic and Hamitic languages would be, to say the least, very premature.¹

The connexion between the Semitic languages and the Hamitic appears to indicate that the primitive seat of the Semites is to be sought in Africa, for it can scarcely be supposed that the Hamites, amongst whom there are gradual transitions from an almost purely European type to that of the Negroes, are the children of any other land than "the dark continent." There seems, moreover, to be a considerable physical resemblance between the Hamites and the Semites, especially in the case of the southern Arabs, we need mention only the slight development of the calf of the leg, and the sporadic appearance amongst Semites of woolly hair and prominent jaws.² But both Semites and Hamites have been mingled to a large extent with foreign races, which process must have diminished their mutual similarity. All this, however, is offered not as a definite theory but as a modest hypothesis.

It was once the custom to maintain that the Semites came originally from certain districts in Armenia. This supposition was founded on the book of Genesis, according to which several of the Semitic nations are descended from Arphaxad, i.e., the eponym of the district of Arrapachitis, now called Albat, on the borders of Armenia and Kurdistan. It was also thought that this region was inhabited by the primitive race from which both the Semites and the Indo-Europeans derived their origin. But, as we saw above, this ancient relationship is a matter of some doubt; in any case, the separation does not date from a period so recent that the Semites can be supposed to have possessed any historical tradition concerning it. There cannot be a greater mistake than to imagine that nations have been able to preserve during long ages their recollection of the country whence their supposed ancestors are said to have emigrated. The fantastic notion once in vogue as to the permanence of historical memories among uncivilized races must be wholly abandoned. The period in which the Hebrews, the Arabs, and the other Semitic nations together formed a single people is so distant that none of them can possibly have retained any tradition of it. The opinion that the Hebrews and the tribes most closely related to them were descendants of Arphaxad is apparently due to the legend that Noah's ark landed near this district. The notion has therefore a purely mythical origin. Moreover, in Genesis itself we find a totally different account of the matter, derived from another source, which represents all nations, and therefore the Semites among them, as having come from Babylon

Scarcely any man of science now believes in the northern origin of the Semites.

Others, as Sprenger and Schüder,³ consider the birth-place of the Semitic race to have been in Arabia. There is much that appears to support this theory. History proves that from a very early period tribes from the deserts of Arabia settled on the cultivable lands which border them and adopted a purely agricultural mode of life. Various traces in the language seem to indicate that the Hebrews and the Arameans were originally nomads, and Arabia with its northern prolongation (the Syrian desert) is the true home of nomadic peoples. The Arabs are also supposed to display the Semitic character in its purest form, and their language is, on the whole, nearer the original Semitic than are the languages of the cognate races. To this last circumstance we should, however, attach little importance. It is by no means always the case that a language is most faithfully preserved in the country where it originated. The Lithuanians speak the most ancient of all living Indo-European languages, and they are certainly not autochthones of Lithuania, the Romance dialect spoken in the south of Sardinia is far more primitive than that spoken at Rome, and of all living Teutonic languages the most ancient is the Icelandic. It is even doubtful whether the ordinary assumption be correct, that the most primitive of modern Arabic dialects are those spoken in Arabia. Besides, we cannot unreservedly admit that the Arabs display the Semitic character in its purest form; it would be more correct to say that, under the influence of a country indescribably monotonous and of a life ever changing yet ever the same, the inhabitants of the Arabian deserts have developed most exclusively certain of the principal traits of the Semitic race. All these considerations are indecisive, but we willingly admit that the theory which regards Arabia as the primitive seat of all Semites is by no means untenable.

Finally, one of the most eminent of contemporary Orientalists, Ignazio Gudi,⁴ has attempted to prove that the home of the Semites is on the lower Euphrates. He contends that the geographical, botanical, and zoological conceptions which are expressed in the various Semitic languages by the same words, preserved from the time of the dispersion, correspond to the natural characteristics of no country but the above-mentioned. Great as are the ingenuity and the caution which he displays, it is difficult to accept his conclusions. Several terms might be mentioned which are part of the common heritage of the northern and the southern Semites, but which can scarcely have been formed in the region of the Euphrates. Moreover, the vocabulary of most Semitic languages is but very imperfectly known, and each dialect has lost many primitive words in the course of time. It is therefore very unsafe to draw conclusions from the fact that the various Semitic tongues have no one common designation for many important local conceptions, such as "mountain." The ordinary words for "man," "old man," "boy," "tent," are quite different in the various Semitic languages, and yet all these are ideas for which the primitive Semites must have had names.

We must therefore for the present confess our inability to make any positive statement with regard to the primitive seat of the original Semitic race.

It is not very easy to settle what is the precise connexion between the various Semitic languages, considered individually. In this matter one may easily be led to hasty conclusions by isolated peculiarities in vocabulary or in language.

¹ This of course applies yet more strongly to Benfey's work, *Ueber das Verhältniss der ägyptischen Sprache zum semitischen Sprachstamm* (Leipzig, 1844), but his book has the permanent merit of having for the first time examined this relationship in a scientific manner.

² Comp. G. Gerland, *Atlas der Ethnographie* (Leipzig, 1876), p. 40 of the text.

³ The former has maintained this view in several of his works, the latter in *EDM G*, xxvii 417 ff.

⁴ "Della Sede Primativa dei Popoli Semitici," in the *Proceedings* of the Accademia dei Lincei, 1878-79.

grammar. Each of the older Semitic languages occasionally agrees in grammatical points with some other to which in most respects it bears no very close resemblance, while dialects much more nearly related to it are found to exhibit different formations. Each Semitic tongue also possesses features peculiar to itself. For instance, the Hebrew-Phoenician group and the Arabic have a prefixed definite article (the etymological identity of which is, however, not quite certain), the dialect nearest to Arabic, the Sabeian, expresses the article by means of a suffixed *n*; the Aramaic, which in general more closely resembles Hebrew than does the Arabic group, expresses it by means of a suffixed *ā*, whereas the Assyrian in the north and the Ethiopic in the south have no article at all. Of this termination *n* for the definite article there is no trace in either Arabic or Hebrew, the Sabeian, the Ethiopic, and the Aramaic employ it to give emphasis to demonstrative pronouns, and the very same usage has been detected in a single Phoenician inscription¹. In this case, therefore, Hebrew and Arabic have, independently of one another, lost something which the languages most nearly related to them have preserved. In like manner, the strengthening of the pronoun of the third person by means of *t* (or *th*) is only found in Ethiopic, Sabeian, and Phoenician. Aramaic alone has no certain trace of the reflexive conjugation formed with prefixed *n*, Hebrew alone has no certain trace of the causative with *šā*². In several of the Semitic languages we can see how the formation of the passive by means of internal vocal change (as *kuṭima*, "he was addressed," as distinguished from *kuṭama*, "he addressed") gradually dropped out of use, in Ethiopic this process was already complete when the language first became literary, but in Aramaic it was not wholly so. In a few cases phonetic resemblances have been the result of later growth. For example, the termination of the plural masculine of nouns is in Hebrew *īm*, in Aramaic *ān*, as in Arabic. But we know that Aramaic also originally had *m*, whereas the ancient Arabic forms have after the *n* an *a*, which appears to have been originally a long *ā* (*āna*, *āna*); in this latter position (that is, between two vowels) the change of *m* into *n* is very improbable. These two similar terminations were therefore originally distinct. We must indeed be very cautious in drawing conclusions from points of agreement between the vocabularies of the various Semitic tongues. The Ethiopians and the Hebrews have the same word for many objects which the other Semites call by other names,—for instance, "stone," "tree," "enemy," "enter," "go out"; and the same may be said of Hebrew as compared with Sabeian. But to build theories upon such facts would be unsafe, since the words cited are either found, though with some change of meaning, in at least one of the cognate languages, or actually occur, perhaps quite exceptionally and in archaic writings, with the same signification. The sedentary habits of the Ethiopians and the Sabeians may possibly have rendered it easier for them to retain in their vocabulary certain words which were used by the civilized Semites of the north, but which became obsolete amongst the Arabian nomads. To the same cause we may attribute the fact that in religion the Sabeians resemble the northern Semites more closely than do the tribes of central Arabia; but these considerations prove nothing in favour of a nearer linguistic affinity.

One thing at least is certain, that Arabic (with Sabeian) and Ethiopic stand in a comparatively close relationship to one another, and compose a group by themselves, as contrasted with the other Semitic languages, Hebrew-Phoenician, Aramaic, and Assyrian, which constitute the

northern group. Only in these southern dialects do we find, and that under forms substantially identical, the important innovation known as the "broken plurals." They agree, moreover, in employing a peculiar development of the verbal root, formed by inserting an *ā* between the first and second radicals (*kāḍala*, *taḥāṣala*), in using the vowel *a* before the third radical in all active perfects—for example, (*h*)*akāṭala*, *katāṭala*, instead of the *hakkāl*, *kattāl* of the northern dialects—and in many other grammatical phenomena. This is not at all contradicted by the fact that certain aspirated dentals of Arabic (*th*, *dh*, *ṭh*) are replaced in Ethiopic, as in Hebrew and Assyrian, by pure sibilants—that is, *s* (Hebrew and Assyrian *sh*), *z*, *ṣ*—whereas in Aramaic they are replaced by simple dentals (*t*, *d*, *ṭ*), which seem to come closer to the Arabic sounds. After the separation of the northern and the southern groups, the Semitic languages possessed all these sounds, as the Arabic does, but afterwards simplified them, for the most part, in one direction or the other. Hence there resulted, as it were by chance, occasional similarities. Even in modern Arabic dialects *th*, *dh* have become sometimes *t*, *d*, and sometimes *s*, *z*. Ethiopic, moreover, has kept *d*, the most peculiar of Arabic sounds, distinct from *ṣ*, whereas Aramaic has confounded it with the guttural *āin*, and Hebrew and Assyrian with *ṣ*. It is therefore evident that all these languages once possessed the consonant in question as a distinct one. One sound, *š*, appears only in Hebrew, in Phoenician, and in the older Aramaic. It must originally have been pronounced very like *sh*, since it is represented in writing by the same character; in later times it was changed into an ordinary *s*. Assyrian does not distinguish it from *sh*.³ The division of the Semitic languages into the northern group and the southern is therefore justified by facts. Even if we were to discover really important grammatical phenomena in which one of the southern dialects agreed with the northern, or *vice versa*, and that in cases where such phenomena could not be regarded either as remnants of primitive Semitic usage or as instances of parallel but independent development, we ought to remember that the division of the two groups was not necessarily a sudden and instantaneous occurrence, that even after the separation intercourse may have been carried on between the various tribes who spoke kindred dialects and were therefore still able to understand one another, and that intermediate dialects may once have existed, perhaps such as were in use amongst tribes who came into contact sometimes with the agricultural population of the north and sometimes with the nomads of the south (see below). All this is purely hypothetical, whereas the division between the northern and the southern Semitic languages is a recognized fact.

Although we cannot deny that there may formerly have existed Semitic languages quite distinct from those with which we are acquainted, yet that such was actually the case cannot be proved. Nor is there any reason to think that the domain of the Semitic languages over extended very far beyond its present limits. Some time ago many scholars believed that they were once spoken in Asia Minor and even in Europe, but, except in the Illyrian colonies, this notion rested upon no solid proof. It cannot be argued with any great degree of plausibility that even the Chinese, who from a very early period held constant intercourse with the Syrians and the Phœnicians, spoke a Semitic language.

² It is not quite certain whether all the Semitic languages originally had the hardest of the gutturals *ph* and *kh* in exactly the same places that they occupy in Arabic. In the case of *kh*—where Ethiopic agrees with Arabic—this is at least, probably, since there seem to be traces of it in Assyrian. But it would appear that in Hebrew and Aramaic the distinction between *ph* and *qayn*, between *kh* and *h*, was often different from what it is in Arabic.

¹ Viz., the great inscription of Byblus, *C.I.S.*, fasc. 1. No. 1.

² *Shalhebeth*, "flame," is borrowed from Aramaic.

Hebrew *Hebrew*—Hebrew and Phœnician are but dialects of one and the same language. It is only as the language of the people of Israel that Hebrew can be known with any precision. Since in the Old Testament a few of the neighbouring peoples are represented as being descended from Eber, the eponym of the Hebrews, that is, are regarded as nearly related to the latter, it was natural to suppose that they likewise spoke Hebrew,—a supposition which, at least in the case of the Moabites, has been fully confirmed by the discovery of the Mesha inscription (date, soon after 900 B.C.). The language of this inscription scarcely differs from that of the Old Testament, the only important distinction is the occurrence of a reflexive form (with *t* after the first radical), which appears nowhere else but in Arabic. We may remark in passing that the style of this inscription is quite that of the Old Testament, and enables us to maintain with certainty that a similar historical literature existed amongst the Moabites. But it must be remembered that ancient Semitic inscriptions exhibit, in a sense, nothing but the skeleton of the language, since they do not express the vowels at all, or do so only in certain cases, still less do they indicate other phonetic modifications, such as the doubling of consonants, &c. It is therefore very possible that to the ear the language of Moab seemed to differ considerably from that of the Judeans.

The Mesha inscription is the only non-Israelite source from which any knowledge of ancient Hebrew can be obtained (See *HEBREW LANGUAGE AND LITERATURE*). Some fragments in the Old Testament belong to the second millennium before our era,—particularly the song of Deborah (*Judges v*), a document which, in spite of its many obscurities in matters of detail, throws much light on the condition of the Israelites at the time when the Canaanites were still contending with them for the possession of the country. The first rise of an historical literature may very probably date from before the establishment of the monarchy. Various portions of the Old Testament belong to the time of the earlier kings; but it was under the later kings that a great part of extant Hebrew literature came into shape. To this age also belong the Silcan inscription and a few seals and gems bearing the names of Israelites. The Hebrew language is thus known to us from a very ancient period. But we are far from being acquainted with its real phonetic condition in the time of David or Isaiah. For, much as we owe to the labours of the later Jewish schools, which with infinite care fixed the pronunciation of the sacred text by adding vowels and other signs, it is evident that even at the best they could only represent the pronunciation of the language in its latest stage, not that of very early ages. Besides, their object was not to exhibit Hebrew simply as it was, but to show how it should be read in the solemn chant of the synagogue. Accordingly, the pronunciation of the older period may have differed considerably from that represented by the punctuation. Such differences are now and then indicated by the customary spelling of the ancient texts,¹ and sometimes the orthography is directly at variance with the punctuation.² In a few rare cases we may derive help from the somewhat older tradition contained in the representation of Hebrew words and proper names by Greek letters, especially in the ancient Alexandrine translation of the Bible (the so-called Septuagint). It is of particular importance to remark that this older tradition still retains an original *α* in many cases where the

punctuation has the later *ε* or *ι*. We have examined this point somewhat in detail, in order to contradict the false but ever-recurring notion that the ordinary text of the Bible represents without any essential modification the pronunciation of ancient Hebrew, whereas in reality it expresses (in a very instructive and careful manner, it is true) only its latest development, and that for the purpose of solemn public recitation. A clear trace of dialectal differences within Israel is found in *Judges xii 6*, which shows that the ancient Ephraimites pronounced *s* instead of *sh*.

The destruction of the Judean kingdom dealt a heavy blow to the Hebrew language. But it is going too far to suppose that it was altogether banished from ordinary life at the time of the exile, and that Aramaic came into use among all the Jews. In the East even small communities, especially if they form a religious body, often cling persistently to their mother-tongue, though they may be surrounded by a population of alien speech, and such was probably the case with the Jews in Babylonia. See *HEBREW LANGUAGE*, vol. xi p. 597. Even so late as the time of Ezra Hebrew was in all probability the ordinary language of the new community. In *Neh. xiii 24* we find a complaint that the children of Jews by wives from Ashdod and other places spoke half in the "Jewish" language and half in the language of Ashdod, or whatever else may have been the tongue of their mothers. No one can suppose that Nehemiah would have been particularly zealous that the children of Jews should speak an Aramaic dialect with correctness. He no doubt refers to Hebrew as it was then spoken,—a stage in its development of which Nehemiah's own work gives a very fair idea. And, moreover, the inhabitants of Ashdod spoke Hebrew. G. Hoffmann³ has deciphered inscriptions (written in Greek letters, but, after the Hebrew fashion, from right to left) on two coins struck about 150 years after Nehemiah, which are in pure Hebrew⁴, nor does the language seem to diverge at all from that of the Old Testament. It is therefore probable that Nehemiah alludes only to a slightly different local dialect. If the Philistines of Ashdod still continued to speak Hebrew about the year 300 B.C., it cannot be supposed that the Jews had given up thus their own language nearly three centuries earlier. We may also conclude that the Philistines from the earliest period spoke the same language as their eastern neighbours, with whom they had so often been at war, but had also lived in close pacific intercourse.

After the time of Alexander large bodies of the Jewish population were settled in Alexandria and other western cities, and were very rapidly Hellenized. Meanwhile the principal language of Syria and the neighbouring countries, Aramaic, the influence of which may be perceived even in some pre-exilic writings, began to spread more and more among the Jews. Hebrew gradually ceased to be the language of the people and became that of religion and the schools. The book of Daniel, written in 167 or 165 B.C., begins in Hebrew, then suddenly passes into Aramaic, and ends again in Hebrew. Similarly the redactor of Ezra (or more correctly of the Chronicles, of which Ezra and Nehemiah form the conclusion) borrows large portions from an Aramaic work, in most cases without translating them into Hebrew. No reason can be assigned for the use of Aramaic in Jewish works intended primarily for Jerusalem, unless it were already the dominant speech, whilst, on the other hand, it was very natural for a pious Jew to write in the

¹ For example, we may conclude with tolerable certainty, from the presence and absence of the vowel-letters *ו* and *ש*, that in older times the accented *e* and *o* were not pronounced long, and that, on the other hand, the diphthongs *au* and *ou* were used for the later *ε* and *ι*.

² The very first word of the Bible contains an Aleph (*ayin* *וַיְהי*), which is required by etymology and was once audible, but which the pronunciation represented by the point-system ignores.

³ See Sallet's *Zetochrift für Numismatik*, 1882 (Berlin).

⁴ The inscriptions, short as they are, exhibit the exclusively Hebrew word *ν* (*נ*), "town," and the feminine *ααα* (*האשה*), "the strong," with the termination *α* (*נ* not *ε*, as in Phœnician). Had the Ashdodites been accustomed to use a dead language on their coins they would certainly have employed the native Semitic writing.

ancient "holy" language even after it had ceased to be spoken. Esther, Ecclesiastes, and a few Psalms, which belong to the 3d and 2d centuries before our era, are indeed written in Hebrew, but are so strongly tinctured by the Aramaic influence as to prove that the writers usually spoke Aramaic. We are not likely to be far wrong in saying that in the Maccabean age Hebrew had died out among the Jews, and there is nothing to show that it survived longer amongst any of the neighbouring peoples.

Hebrew of the schools

But in the last period of the history of Jerusalem, and still more after the destruction of the city by Titus, the Jewish schools played so important a part that the life of the Hebrew language was in a manner prolonged. The lectures and discussions of the learned were carried on in that tongue. We have very extensive specimens of this more modern Hebrew in the Mishnah and other works, and scattered pieces throughout both Talmuds. But, just as the "classical" Sanskrit, which has been spoken and written by the Brahmans during the last twenty-five centuries, differs considerably from the language which was once in use among the people, so this "language of the learned" diverges in many respects from the "holy language"; and this distinction is one of which the rabbis were perfectly conscious. The "language of the learned" borrows a great part of its vocabulary from Aramaic,¹ and this exerts a strong influence upon the grammatical forms. The grammar is perceptibly modified by the peculiar style of these writings, which for the most part treat of legal and ritual questions in a strangely laconic and pointed manner. But, large as is the proportion of foreign words and artificial as this language is, it contains a considerable number of purely Hebrew elements which do not appear in the Old Testament. Although we may generally assume, in the case of a word occurring in the Mishnah but not found in the Old Testament, that it is borrowed from Aramaic, there are several words of this class which, by their radical consonants, prove themselves to be genuine Hebrew. And even some grammatical phenomena of this language are to be regarded as a genuine development of Hebrew, though they are unknown to earlier Hebrew speech.

Character of ancient Hebrew.

From the beginning of the Middle Ages down to our own times the Jews have produced an enormous mass of writings in Hebrew, sometimes closely following the language of the Bible, sometimes that of the Mishnah, sometimes introducing in a perfectly inorganic manner a great quantity of Aramaic forms, and occasionally imitating the Arabic style. The study of these variations has but little interest for the linguist, since they are nothing but a purely artificial imitation, dependent upon the greater or less skill of the individual. The language of the Mishnah stands in much closer connexion with real life, and has a definite *raison d'être*; all later Hebrew is to be classed with mediæval and modern Latin. Much Hebrew also was written in the Middle Ages by the hostile brethren of the Jews, the Samaritans; but for the student of language these productions have, at the most, the charm attaching to curiosities.

Character of ancient Hebrew

The ancient Hebrew language, especially in the matter of syntax, has an essentially primitive character. Parataxis of sentences prevails over hypotaxis to a greater extent than in any other literary Semitic language with which we are well acquainted. The favourite method is to link sentences together by means of a simple "and." There is a great lack of particles to express with clearness the more subtle connexion of ideas. The use of the verbal tenses is in a great measure determined by the imagination,

¹ It is a characteristic feature that "my father" and "my mother" are here expressed by purely Aramaic forms. Even the learned did not wish to call their "peeps" and "mammies" by any other names than those to which they had been accustomed in infancy.

which regards things unaccomplished as accomplished and the past as still present. There are but few words or inflexions to indicate slight modifications of meaning, though in ancient times the language may perhaps have distinguished certain moods of the verb somewhat more plainly than the present punctuation does. But in any case this language was far less suited for the definite expression of studied thought, and less suited still for the treatment of abstract subjects, than for poetry. We must remember, however, that as long as Hebrew was a living language it never had to be used for the expression of the abstract. Had it lived somewhat longer it might very possibly have learnt to adapt itself better to the formulating of systematic conceptions. The only book in the Old Testament which attempts to grapple with an abstract subject in plain prose—namely, Ecclesiastes—dates from a time when Hebrew was dying out or was already dead. That the gifted author does not always succeed in giving clear expression to his ideas is partly due to the fact that the language had never been employed for any scientific purposes whatsoever. With regard to grammatical forms, Hebrew has lost much that is still preserved in Arabic, but the greater richness of Arabic is in part the result of later development.

The vocabulary of the Hebrew language is, as we have Vocabularies said, known but imperfectly. The Old Testament is no very large work, it contains, moreover, many repetitions, and a great number of pieces which are of little use to the lexicographer. On the other hand, much may be derived from certain poetical books, such as Job. The numerous *παροιμια* are a sufficient proof that many more words existed than appear in the Old Testament, the writers of which never had occasion to use them. Were we in possession of the whole Hebrew vocabulary in the time of Jeremiah, for example, we should be far better able to determine the relation in which Hebrew stands to the other Semitic languages, the Old Testament would be far more intelligible to us, and it would be very much easier to detect the numerous corrupt passages in our text.

Phœnician.—This dialect closely resembles Hebrew, and Phœnician is known to us from only one authentic source, namely, inscriptions, some of which date from about 600 B.C. or earlier, but the great mass of them begin with the 4th century before our era. These inscriptions² we owe to the Phœnicians of the mother-country and the neighbouring regions (Cyprus, Egypt, and Greece), as well as to the Phœnicians of Africa, especially Carthage. Inscriptions are, however, a very insufficient means for obtaining the knowledge of a language. The number of subjects treated in them is not large; many of the most important grammatical forms and many of the words most used in ordinary life do not occur. Moreover, the "lapidary style" is often very hard to understand. The repetition of obscure phrases, in the same connexion, in several inscriptions does not help to make them more intelligible. Of what use is it to us that, for instance, thousands of Carthaginian inscriptions begin with the very same incomprehensible dedication to two divinities? The difficulty of interpretation is greatly increased by the fact that single words are very seldom separated from one another, and that vowel-letters are used extremely sparingly. We therefore come but too often upon very ambiguous groups of letters. In spite of this, our knowledge of Phœnician has made considerable progress of late. Some assistance is also got from Greek and Latin writers, who cite not only many Phœnician proper names but single Phœnician words. Plautus in particular inserts in the *Pœnulus* whole passages in Punic, some of which are accompanied by a Latin

² The scattered materials are being collected in the *Corpus Inscriptionum Semiticarum* of the Paris Academy.

translation. This source of information must, however, be used with great caution. It was not the object of Plautus to exhibit the Punic language with precision, a task for which the Latin alphabet is but ill adapted, but only to make the populace laugh at the jargon of the hated Carthaginians. Moreover, he had to force the Punic words into Latin *sewari*, and finally the text, being unintelligible to copyists, is terribly corrupt. Much ingenuity has been wasted on the Punic of Plautus, but the passage yields valuable results to cautious investigation which does not try to explain too much.¹ In its grammar Phœnician closely resembles Hebrew. In both dialects the consonants are the same, often in contrast to Aïmaic and other cognate languages.² As to vowels, Phœnician seems to diverge rather more from Hebrew. The connecting of clauses is scarcely carried further in the former language than in the latter. A slight attempt to define the tenses more sharply appears once at least in the joining of *kên* (tuit) with a perfect, to express complete accomplishment (or the pluperfect).³ One important difference is that the use of *uôis* conversive with the imperfect—so common in Hebrew and in the inscription of Mesha—is wanting in Phœnician. The vocabulary of the language is very like that of Hebrew, but words rare in Hebrew are often common in Phœnician. For instance, "to do" is in Phœnician not *ʿad* but *paʿal* (the Arabic *faʿala*), which in Hebrew occurs only in poetry and elevated language. "Gold" is not *zahab* (as in most Semitic languages) but *harâq* (Assyrian *hurâq*), which is used occasionally in Hebrew poetry. Traces of dialectical distinctions have been found in the great inscription of Byblus, the inhabitants of which seem to be distinguished from the rest of the Phœnicians in Josh xii 5 (and 1 Kings v. 32¹ [A v 18]). It is probable that various differences between the language of the mother-country and that of the African colonies arose at an early date, but our materials do not enable us to come to any definite conclusion on this point. In the later African inscriptions there appear certain phonetic changes, especially in consequence of the softening of the gutturals,—changes which show themselves yet more plainly in the so-called Neo-Punic inscriptions (beginning with the 1st, if not the 2d, century before our era). In these the gutturals, which had lost their real sound, are frequently interchanged in writing, and other modifications may also be perceived. Unfortunately the Neo-Punic inscriptions are written in such a debased indistinct character that it is often impossible to discover with certainty the real form of the words. This dialect was still spoken about 400, and perhaps long afterwards, in those districts of North Africa which had once belonged to Carthage. It would seem that in the mother-country the Phœnician language withstood the encroachment of Greek on the one hand and of Aïmaic on the other somewhat longer than Hebrew did.

Aramæic—Aramæic is nearly related to Hebrew-Phœnician, but there is nevertheless a sharp line of demarcation between the two groups. Of its original home nothing certain is known. In the Old Testament "Aram" appears at an early period as a designation of certain districts in Syria ("Aram of Damascus" &c) and in Mesopotamia ("Aram of the Two Rivers"). The language of the

Aramæans gradually spread far and wide, and occupied all Syria, both those regions which were before in the possession of the Kheta, probably a non-Semitic people, and those which were most likely inhabited by Canaanite tribes, last of all, Palestine became Aramæized. Towards the east this language was spoken on the Euphrates, and throughout the districts of the Tigris south and west of the Armenian and Kurdish mountains, the province in which the capitals of the Arsacides and the Sâsânians were situated was called "the country of the Aramæans." In Babylonia and Assyria a large, or perhaps the larger, portion of the population were most probably Aramæans, even at a very early date, whilst Assyrian was the language of the Government.

The oldest extant Aramæic documents consist of inscriptions on monuments and on seals and gems. In the Persian period Aïmaic was the official language of the provinces west of the Euphrates, and this explains the fact that coins which were struck by governors and vassal princes in Asia Minor, and of which the stamp was in some cases the work of skilled Greek artists, bear Aramæic inscriptions, whilst those of other coins are Greek. This, of course, does not prove that Aramæic was ever spoken in Asia Minor and as far north as Sinope and the Hellespont. In Egypt Aïmaic inscriptions have been found of the Persian period, one bearing the date of the fourth year of Xerxes (483 B.C.); we have also official documents on papyrus, unfortunately in a very tattered condition for the most part, which prove that the Persians preferred using this convenient language to mastering the difficulties of the Egyptian systems of writing. It is, further, very possible that at that time there were considerable numbers of Aramæans in Egypt, just as there were of Phœnicians, Greeks, and Jews. But probably this preference for Aramæic originated under the Assyrian empire, in which a very large proportion of the population spoke Aramæic, and in which this language would naturally occupy a more important position than it did under the Persians. We therefore understand why it was taken for granted that a great Assyrian official could speak Aramæic (2 Kings xviii. 26; Isa xxxvi. 11), and for the same reason the dignities of Judah appear to have learned the language (*bid*), namely, in order to communicate with the Assyrians.⁴ The short dominion of the Chaldeans very probably strengthened this preponderance of Aïmaic. A few ancient Aramæic inscriptions have lately been discovered far within the limits of Arabia, in the palm oasis of Temâ (in the north of the Hîjaz), the oldest and by far the most important of these was very likely made before the Persian period. We may presume that Aramæic was introduced into the district by a mercantile colony, which settled in this ancient seat of commerce, and in consequence of which Aramæic may have remained for some time the literary language of the neighbouring Arabs. All these older Aïmaic monuments exhibit a language which is almost absolutely identical. One peculiarity which distinguishes it from later Aramæic is that in the relative and demonstrative pronoun the sound originally pronounced *dh* is changed into *z*, as in Hebrew, not into *d*, as is required by a rule universal in the Aramæic dialects.⁵ The Egyptian monuments at least bear marks of Hebrew, or more correctly Phœnician, influence.

The Aramæic portions of the Old Testament show us Biblical the form of the language which was in use among the Aramæic Jews of Palestine. Isolated passages in Ezra perhaps

⁴ See the Palæographical Society's *Oriental Series*, plate lxii.

⁵ We possess certain small documents in Semitic writing which date from the Assyrian period, but of which the linguistic character is still very obscure; they contain Aramæic, Phœnician, and probably Assyrian forms. See *EDMG*, xxxiii 321.

⁶ Some traces of this phenomenon are found in later

¹ See Gillemeaster, in Ritschl's *Plautus* (vol. II fasc. v, Leipzig, 1884).

² At an early period the Phœnician pronunciation may have distinguished a greater number of original consonants than are distinguished in writing. It is at least remarkable that the Greeks render the name of the city of Car (Hebrew *Qôr*), which must originally have been pronounced *Thurr*, with a *r* (*Therr*), and the name of *Clidon*, where the *r* runs through all the Semitic languages, with a *c* (*Clidôn*). Distinctions of this kind, justified by etymology, have perhaps been obscured in Hebrew by the imperfection of the alphabet. In the case of *stn* and *shn* this can be positively proved.

³ *Kân nadâr*, "had vowed," *Idol* 5 (*CJS*, Phœn., No. 93).

belong to the Persian period, but have certainly been remodelled by a later writer.¹ Yet in Ezra we find a few antique forms which do not occur in Daniel. The Aramaic pieces contained in the Bible have the great advantage of being furnished with vowels and other orthographical signs, though these were not inserted until long after the composition of the books, and are sometimes at variance with the text itself. But, since Aramaic was still a living language when the punctuation came into existence, and since the lapse of time was not so very great, the tradition is less risk of corruption than in the case of Hebrew. Its general correctness is further attested by the innumerable points of resemblance between this language and Syriac, with which we are accurately acquainted. The Aramaic of the Bible exhibits various antique features which afterwards disappeared,—for example, the formation of the passive by means of internal vowel-change, and the causative with *ka* instead of with *a*,—phenomena which have been falsely explained as Hebraisms. Biblical Aramaic agrees in all essential points with the language used in the numerous inscriptions of Palmyra (beginning soon before the Christian era and extending to about the end of the 3d century) and on the Nabatean coins and stone monuments (concluding about the year 100). Aramaic was the language of Palmyra, the aristocracy of which were to a great extent of Arabian extraction. In the northern portion of the Nabatean kingdom (not far from Damascus) there was probably a large Aramaic population, but farther south Arabic was spoken. At that time, however, Aramaic was highly esteemed as a cultivated language, for which reason the Arabs in question made use of it, as their own language was not reduced to writing, just as in those ages Greek inscriptions were set up in many districts where no one spoke Greek. That the Nabateans were Arabs is sufficiently proved by the fact that, with the exception of a few Greek names, almost all the numerous names which occur in the Nabatean inscriptions are Arabic, in many cases with distinctly Arabic terminations. A further proof of this is that in the great inscriptions over the tombs of Hegr (not far from Teima) the native Arabic continually shows through the foreign disguise,—for instance, in the use of Arabic words whenever the writer does not happen to remember the corresponding Aramaic terms, in the use of the Arabic particle *fa*, of the Arabic *ghawr*, “other than,” and in several syntactic features. The great inscriptions cease with the overthrow of the Nabatean kingdom by Trajan (105), but the Arabian nomads in those countries, especially in the Sinaitic peninsula, often scratched their names on the rocks down to a later period, adding some benedictory formula in Aramaic. The fact that several centuries afterwards the name of “Nabatean” was used by the Arabs as synonymous with “Aramean” was probably due to the gradual spread of Aramaic over a great part of what had once been the country of the Nabateans. In any case Aramaic then exercised an immense influence. This is also proved by the place which it occupies in the strange Pahlavi writing, various branches of which date from the time of the Parthian empire (see PAHLAVI). Biblical Aramaic, as also the language of the Palmyrene and Nabatean inscriptions, may be described as an older form of Western Aramaic. The opinion that the Palestinian Jews brought their Aramaic dialect direct from Babylon—whence the incorrect name “Chaldee”—is altogether untenable.

Aramaic
of Targum,
gum, &c.

We may now trace somewhat further the development of Western Aramaic in Palestine, but unhappily few of

the sources from which we derive our information can be thoroughly trusted. In the synagogues it was necessary that the reading of the Bible should be followed by an oral “*targūm*” or translation into Aramaic, the language of the people. The Targum was at a later period fixed in writing, but the officially sanctioned form of the Targum to the Pentateuch (the so-called Targum of Onkelos) and of that to the prophets (the so-called Jonathan) was not finally settled till the 4th or 5th century, and not in Palestine but in Babylonia. The redactors of the Targum preserved on the whole the older Palestinian dialect, yet that of Babylon, which differed considerably from the former, exercised a vitiating influence. The punctuation, which was added later, first in Babylonia, is far less trustworthy than that of the Aramaic pieces in the Bible. The language of Onkelos and Jonathan differs but little from Biblical Aramaic. The language spoken some time afterwards by the Palestinian Jews, especially in Galilee, is exhibited in a series of rabbinical works, the so-called Jerusalem Targums (of which, however, those on the Hagiographa are in some cases of later date), a few Midrashic works, and the Jerusalem Talmud. Unfortunately all these books, of which the Midrashim and the Talmud contain much Hebrew as well as Aramaic, have not been handed down with care, and require to be used with great caution for linguistic purposes. Moreover, the influence of the older language and orthography has in part obscured the characteristics of these popular dialects; for example, various gutturals are still written, although they are no longer pronounced. The adaptation of the spelling to the real pronunciation is carried furthest in the Jerusalem Talmud, but not in a consistent manner. Besides, all these books are without vowel-points, but the frequent use of vowel-letters in the later Jewish works renders this defect less sensible.

Not only the Jews but also the Christians of Palestine retained their native dialect for some time as an ecclesiastical and literary language. We possess translations of the Gospels and fragments of other works in this dialect by the Palestinian Christians dating from about the 5th century, accompanied by a punctuation which was not added till some time later. This dialect closely resembles that of the Palestinian Jews, as was to be expected from the fact that those who spoke it were of Jewish origin.

Finally, the Samaritans, among the inhabitants of Palestine, translated their only sacred book, the Pentateuch, ten into their own dialect. The critical study of this translation proves that the language which lies at its base was very much the same as that of the neighbouring Jews. Perhaps, indeed, the Samaritans may have carried the softening of the gutturals a little further than the Jews of Galilee. Their absurd attempt to embellish the language of the translation by arbitrarily introducing forms borrowed from the Hebrew original has given rise to the false notion that Samaritan is a mixture of Hebrew and Aramaic. The introduction of Hebrew and even of Arabic words and forms was practised in Samaria on a still larger scale by copyists who lived after Aramaic had become extinct. The later works written in the Samaritan dialect are, from a linguistic point of view, as worthless as the compositions of Samaritans in Hebrew, the writers, who spoke Arabic, endeavoured to write in languages with which they were but half acquainted.

All these Western Aramaic dialects, including that of the oldest inscriptions, have this feature among others in common, that they form the third person singular masculine and the third person plural masculine and feminine in the imperfect by prefixing *ʔ*, as do the other Semitic languages. And in these dialects the termination *a* (the so-called “status emphaticus”) still retained

¹ The defence which is said to have been sent by Ezra is in its present form a comparatively late production.

the meaning of a definite article down to a tolerably late period

As early as the 7th century the conquests of the Moslems greatly circumscribed the domain of Aramaic and a few centuries later it was almost completely supplanted in the west by Arabic. For the Christians of those countries, who, like every one else, spoke Arabic, the Palestinian dialect was no longer of importance, and they adopted as their ecclesiastical language the dialect of the other Aramaean Christians, the Syriac (or Edessene). The only localities where a Western Aramaic dialect still survives are a few villages in Anti-Libanus. Our information upon this subject is but slight and fragmentary, but it is hoped that Professors Prym and Socin will soon be able to furnish more ample details.

The popular Aramaic dialect of Babylonia from the 4th to the 6th century of our era is exhibited in the Babylonian Talmud, in which, however, as in the Jerusalem Talmud, there is a constant mingling of Aramaic and Hebrew passages. To a somewhat later period, and probably not to exactly the same district of Babylonia, belong the writings of the MANDAEANS (*qv*), a strange sect, half Christian and half heathen, who from a linguistic point of view possess the peculiar advantage of having remained almost entirely free from the influence of Hebrew, which is so perceptible in the Aramaic writings of Jews as well as of Christians. The orthography of the Mandaeans comes nearer than that of the Talmud to the real pronunciation, and in it the softening of the gutturals is most clearly seen. In other respects there is a close resemblance between Mandaean and the language of the Babylonian Talmud. The forms of the imperfect which we have enumerated above take in these dialects *n* or *l*.¹ In Babylonia, as in Syria, the language of the Arabic conquerors rapidly drove out that of the country. The latter has long been totally extinct, unless possibly a few surviving Mardaeans still speak among themselves a more modern form of their dialect.

At Edessa, in the west of Mesopotamia, the native dialect had already been used for some time as a literary language, and had been reduced to rule through the influence of the schools (as is proved by the fixity of the grammar and orthography) even before Christianity acquired power in the country in the 2d century. At an early period the Old and New Testaments were here translated, with the help of Jewish tradition. This version (the so-called *Peshitta* or *Peshuto*) became the Bible of Aramaean Christianity, and Edessa became its capital. Thus the Aramaean Christians of the neighbouring countries, even those who were subjects of the Persian empire, adopted the Edessan dialect as the language of the church, of literature, and of cultivated intercourse. Since the ancient name of the inhabitants, "Arameans," just like that of "Ελληνες," had acquired in the minds of Jews and Christians the unpleasant signification of "heathens," it was generally avoided, and in its place the Greek terms "Syrians" and "Syriac" were used. But "Syriac" was also the name given by the Jews and Christians of Palestine to their own language, and both Greeks and Persians designated the Arameans of Babylonia as "Syrians." It is therefore, properly speaking, incorrect to employ the word "Syriac" as meaning the language of Edessa alone, but, since it was the most important of these dialects, it has the best claim to this generally received appellation. It has, as we have said, a shape very definitely fixed, and in it the above-mentioned forms of the imperfect take an *n*. As in the Babylonian dialects, the termination *d* has become so completely a part of the substantive to which it is added that it has wholly lost the meaning of the definite

article, whereby the clearness of the language is perceptibly impaired. The influence exercised by Greek is very apparent in Syriac. From the 3d to the 7th century an extensive literature was produced in this language, consisting chiefly, but not entirely, of ecclesiastical works. In the development of this literature the Syrians of the Persian empire took an eager part. In the Eastern Roman empire Syriac was, after Greek, by far the most important language; and under the Persian kings it virtually occupied a more prominent position as an organ of culture than the Persian language itself. The conquests of the Arabs totally changed this state of things. But meanwhile, even in Edessa, a considerable difference had arisen between the written language and the popular speech, in which the process of modification was still going on. About the year 700 it became a matter of absolute necessity to systematize the grammar of the language and to introduce some means of clearly expressing the vowels. The principal object aimed at was that the text of the Syriac Bible should be recited in a correct manner. But, as it happened, the eastern pronunciation differed in many respects from that of the west. The local dialects had to some extent exercised an influence over the pronunciation of the literary tongue, and, on the other hand, the political separation between Rome and Persia, and yet more the ecclesiastical schism—since the Syrians of the east were mostly Nestorians, those of the west Monophysites and Catholics—had produced divergences between the traditions of the various schools. Starting, therefore, from a common source, two distinct systems of punctuation were formed, of which the western is the more convenient, but the eastern the more exact and generally the more in accordance with the ancient pronunciation, it has, for example, *d* in place of the western *ḏ*, and *ḏ* in many cases where the western Syrians pronounce *d*. In later times the two systems have been intermingled in various ways.

Arabic everywhere put a speedy end to the predominance of Aramaic—a predominance which had lasted for more than a thousand years—and soon began to drive Syriac out of use. At the beginning of the 11th century the learned metropolitan of Nisibis, Elias bar Shinnéyâ, wrote his books intended for Christians either entirely in Arabic or in Arabic and Syriac arranged in parallel columns, that is, in the spoken and in the learned language. Thus, too, it became necessary to have Syriac-Arabic glossaries. Up to the present day Syriac has remained in use for literary and ecclesiastical purposes, and may perhaps be even spoken in some monasteries and schools; but it has long been a dead language. When Syriac became extinct in Edessa and its neighbourhood is not known with certainty.

This language, called Syriac *par excellence*, is not the Neo-Syriac source whence are derived the Aramaic dialects still surviving in the northern districts. In the mountains known as the Tûr 'Abdin in Mesopotamia, in certain districts east and north of Mosul, in the neighbouring mountains of Kurdistan, and again beyond them on the western coast of Lake Urmia, Aramaic dialects are spoken by Christians and occasionally by Jews, and some of these dialects we know with tolerable precision. The dialect of Tûr 'Abdin seems to differ considerably from all the rest, the country beyond the Tigris is, however, divided, as regards language, amongst a multitude of local dialects. Among these, that of Urmia has become the most important, since American missionaries have formed a new literary language out of it. Moreover, the Roman Propaganda has printed books in two of the Neo-Syriac dialects. All these dialects exhibit a complete transformation of the ancient type, to a degree incomparably greater than is the case, for example, with Mandaean. In particular, the ancient

¹ See Noldeke, *Mandäische Grammatik* (Halle, 1875).

verbal tenses have almost entirely disappeared, but have been successfully replaced by new forms derived from participles. There are also other praiseworthy innovations. The dialect of Tūr 'Abdin has, for instance, again coined a definite article. By means of violent contractions and phonetic changes some of these dialects, particularly that of Urmia, have acquired a euphony scarcely known in any other of the Semitic languages, with their "stridentia anhelantiaque verba" (Jerome). These Aramaeans have all adopted a motley crowd of foreign words, from the Aïabs, Kurds, and Turks, on whose borders they live and of whose languages they can often speak at least one.

Charac-
teristics
of
Aramaic

Aramaic is frequently described as a *poor* language. This is an opinion which we are unable to share. It is quite possible, even now, to extract a very large vocabulary from the more ancient Aramaic writings, and yet in this predominantly theological literature a part only of the words that existed in the language have been preserved. It is true that Aramaic, having from the earliest times come into close contact with foreign languages, has borrowed many words from them, in particular from Persian and Greek, but, if we leave out of consideration the fact that many Syrian authors are in the habit of using, as ornaments or for convenience (especially in translations), a great number of Greek words, some of which were unintelligible to their readers, we shall find that the proportion of really foreign words in older Aramaic books is not larger, perhaps even smaller, than the proportion of Romance words in German or Dutch. The influence of Greek upon the syntax and phraseology of Syriac is not so great as that which it has exercised, through the medium of Latin, upon the literary languages of modern Europe. With regard to sounds, the most characteristic feature of Aramaic (besides its peculiar treatment of the dentals) is that it is poorer in vowels than Hebrew, not to speak of Arabic, since nearly all short vowels in open syllables either wholly disappear or leave but a slight trace behind them (the so-called *shwāw*). In this respect the punctuation of Biblical Aramaic agrees with Syriac, in which we are able to observe from very early times the number of vowels by examining the metrical pieces constructed according to the number of syllables, and with the Mandæan, which expresses every vowel by means of a vowel-letter. When several distinct dialects so agree, the phenomenon in question must be of great antiquity. There are nevertheless traces which prove that the language once possessed more vowels, and the Aramaeans, for instance, with whom David fought may have pronounced many vowels which afterwards disappeared. Another peculiarity of Aramaic is that it lends itself far more readily to the linking together of sentences than Hebrew and Arabic. It possesses many conjunctions and adverbs to express slight modifications of meaning. It is also very free as regards the order of words. That this quality, which renders it suitable for a clear and limpid prose style, is not the result of Greek influence may be seen by the Mandæan, on which Greek has left no mark. In its attempts to express everything clearly Aramaic often becomes prolix,—for example, by using additional personal and demonstrative pronouns. The contrast between Aramaic as the language of prose and Hebrew as the language of poetry is one which naturally strikes us, but we must beware of carrying it too far. Even the Aramaeans were not wholly destitute of poetical talent. Although the religious poetry of the Syrians has but little charm for us, yet real poetry occurs in the few extant fragments of Gnostic hymns. Moreover, in the modern dialects popular songs have been discovered which, though very simple, are fresh and full of feeling.¹ It is therefore by no

means improbable that in ancient times Aramaic was used in poems which, being contrary to the theological tendency of Syrian civilization, were doomed to total oblivion.

Assyrian.—Long before Aramaic another Semitic lan-

guage flourished in the regions of the Tigris and on the lower Euphrates which has been preserved to us in the cuneiform inscriptions. It is usually called the Assyrian, after the name of the country where the first and most important excavations were made, but the term "Babylonian" would be more correct, as Babylon was the birthplace of this language and of the civilization to which it belonged. Certain Babylonian inscriptions appear to go back to the fourth millennium before our era, but the great mass of these cuneiform inscriptions date from between 1000 and 500 B.C. Assyrian seems to be more nearly related to Hebrew than to Aramaic, we may cite, for example, the relative particle *sha*, which is also used as a sign of the genitive, and is identical with the Phœnician *ash* and the Hebrew *asher* (*she*, *sha*), also the similarity between Assyrian and Hebrew in the treatment of the aspirated dentals. On the other hand, Assyrian differs in many respects from all the cognate languages. The ancient perfect has wholly disappeared, or left but few traces, and the gutturals, with the exception of the hard *kh*, have been smoothed down to a degree which is only paralleled in the modern Aramaic dialects. So at least it would appear from the writing, or rather from the manner in which Assyriologists transcribe it. The Babylonian form *bēl* (occurring in Isa. xlv. 1, Jer. l. 2 and l. 44,—passages all belonging to the 6th century B.C.), the name of the god who was originally called *beʾl*, is a confirmation of this, but, on the other hand, the name of the country where Babylon was situated, viz., *Shin'ar*, and that of a Babylonian god, 'Anammelek (2 Kings xvii. 31), as well as those of the tribes *Shō'a* and *Kō'a* (Ezek. xxiii. 23) who inhabited the Assyro-Babylonian territory, seem to militate against this theory, as they are spelt in the Old Testament with *am*. The Assyrian system of writing is so complicated, and, in spite of its vast apparatus, is so imperfect an instrument for the accurate representation of sounds, that we are hardly yet bound to regard the transcriptions of contemporary Assyriologists as being in all points of detail the final dictum of science. It is, for example, very doubtful whether the vowels at the end of words and the appended *m* were really pronounced in all cases, as this would presuppose a complete confusion in the grammar of the language. However this may be, the present writer does not feel able to speak at greater length upon Assyrian, not being an Assyriologist himself nor yet capable of satisfactorily distinguishing the certain from the uncertain results of Assyriological inquiry.

The native cuneiform writing was used in Babylonia not only under the Persian empire but also in the Greek period, as the discovery of isolated specimens proves. It does not of course necessarily follow from this that Assyrian was still spoken at that time. Indeed, this language may possibly have been banished from ordinary life long before the destruction of Nineveh, surviving only as the official and sacerdotal tongue. These inscriptions, in any case, were intended for none but a narrow circle of learned persons.

Arabic.—The southern group of Semitic languages consists of Arabic and Ethiopic. Arabic, again, is subdivided into the dialects of the larger portion of Arabia and those of the extreme south (the Sabæan, &c.). At a very much earlier time than we were but lately justified in supposing, some of the northern Arabs reduced their language to writing. For travellers have quite recently discovered in the northern parts of the Hijāz inscriptions in a strange character, which seem to have been written long before our times.

The-
mutil-
inscrip-
tions

era. The character resembles the Sabeian, but perhaps represents an earlier stage of graphical development. These inscriptions have been called "Thamudic," because they were found in the country of the Thamūd, but this designation is scarcely a suitable one, because during the period when the power of the Thamūd was at its height, and when the buildings mentioned in the Koran were hewn in the rocks, the language of this country was Nabataean (see above). Unfortunately the inscriptions hitherto discovered are all short¹ and for the most part fragmentary, and consequently furnish but little material to the student of languages. But there can be no doubt that they are written in an Arabic dialect. The treatment of the dentals, among other things, is a sufficient proof of this. At least in one point they bear a striking resemblance to Hebrew: they have the article *ha* (not *hal*, as we might expect). It is possible that the tribes living on Arabian soil which are regarded in the Old Testament as nearly related to Israel, that is, the Ishmaelites, the Midianites, and even the Edomites, may have spoken dialects occupying a middle position between Arabic and Hebrew. They are perhaps traces of some such intermediate link that have been preserved to us in these inscriptions.

The numerous inscriptions scattered over the north-west of Arabia, especially over the wild and rocky district of Safa, near Damascus, probably date from a later period. They are written in peculiar characters, which, it would seem, are likewise related to those used by the Sabeans. They are all of them short and indistinct, scratched hurriedly and irregularly upon unheaven stone. What we at present understand of them—they consist almost entirely of proper names—is owing in nearly every case to the ingenuity of Halévy.² In matters of detail, however, much still remains uncertain. To decipher them with absolute certainty will no doubt always be impossible on account of their careless execution. These inscriptions are probably the work of Arab emigrants from the south.

The Arabs who inhabited the Nabataean kingdom wrote in Aramaic, but, as has been remarked above, their native language, Arabic, often shows through the foreign disguise. We are thus able to satisfy ourselves that these Arabs, who lived a little before and a little after Christ, spoke a dialect closely resembling the later classical Arabic. The nominative of the so-called "triptote" nouns has, as in classical Arabic, the termination *u*; the genitive has *i* (the accusative therefore probably ended in *a*), but without the addition of *n*. Generally speaking, those proper names which in classical Arabic are "diplothes" are here devoid of any inflexional termination. The *n* of the nominative appears also in Arabic proper names belonging to more northern districts, as, for example, Palmyra and Edessa. All these Arabs were probably of the same race. It is possible that the two oldest known specimens of distinctively Arabic writing—namely, the Arabic portion of the trilingual inscription of Zabab, south-east of Haleb (Aleppo), written in Syriac, Greek, and Arabic, and dating from 512 or 513 A.D.,³ and that of the bilingual inscription of Harran, south of Damascus,⁴ written in Greek and Arabic, of 568—represent nothing but a somewhat more modern form of this dialect. In both these inscriptions proper names take in the genitive the termination *n*, which shows that the meaning of such inflexions was no longer felt. These two inscriptions, especially that of Zabab, which is badly

written, have not yet been satisfactorily interpreted in all their details.

During the whole period of the preponderance of Aramaic this language exercised a great influence upon the vocabulary of the Arabs. The more carefully we investigate the more clearly does it appear that numerous Arabic words, used for ideas or objects which presuppose a certain degree of civilization, are borrowed from the Aramaeans. Hence the civilizing influence of their northern neighbours must have been very strongly felt by the Arabs, and contributed in no small measure to prepare them for playing so important a part in the history of the world.

In the 6th century the inhabitants of the greater part of Arabia proper spoke everywhere essentially the same Arabic language, which, as being by far the most important of all Arabic dialects, is known simply as the Arabic language. Arabic poetry, at that time cultivated throughout the whole of central and northern Arabia as far as the lower Euphrates and even beyond it, employed one language only. The extant Arabic poems belonging to the heathen period were not indeed written down till much later, and meanwhile underwent considerable alterations⁵, but the absolute regularity of the metre and rhyme is a sufficient proof that on the whole these poems all obeyed the same laws of language. It is indeed highly probable that the rhapsodists and the grammarians have effaced many slight dialectal peculiarities, in a great number of passages, for example, the poets may have used, in accordance with the fashion of their respective tribes, some other case than that prescribed by the grammarians, and a thing of this kind may afterwards have been altered, unless it happened to occur in rhyme, but such alterations cannot have extended very far. A dialect that diverged in any great measure from the Arabic of the grammarians could not possibly have been made to fit into the metres. Moreover, the Arabic philologists recognize the existence of various small distinctions between the dialects of individual tribes and of their poets, and the traditions of the more ancient schools of Koran readers exhibit very many dialectal nuances. It might indeed be conjectured that for the majority of the Arabs the language of poetry was an artificial one,—the speech of certain tribes having been adopted by all the rest as a *dialectus poetica*. And this might be possible in the case of wandering minstrels whose art gained them their livelihood, such as Nabigha and A'sha. But, when we find that the Bedouin goat-herds, for instance, in the mountainous district near Mecca composed poems in this very same language upon their insignificant feuds and personal quarrels, that in it the proud chiefs of the Taghibites and the Bekrites addressed defiant verses to the king of Hira (on the Euphrates), that a Christian inhabitant of Hira, Adī b. Zaid, used this language in his serious poems,—when we reflect that, as far as the Arabic poetry of the heathen period extends, there is nowhere a trace of any important linguistic difference, it would surely be a paradox to assume that all these Arabs, who for the most part were quite illiterate and yet extremely jealous of the honour of their tribes, could have taken the trouble to clothe their ideas and feelings in a foreign, or even a perfectly artificial, language. The Arabic philologists also invariably regarded the language of the poets as being that of the Arabs in general. Even at the end of the 2d century after Mohammed the Bedouins of Arabia proper, with the exception of a few outlying districts, were considered as being in possession of this pure Arabic. The most learned grammarians were in the habit of appealing to any uneducated man who happened to have just arrived with his camels from the desert, though he did not know by heart twenty verses of the Koran, and had no conception of theo-

¹ The decipherment of these inscriptions was begun by Halévy, who followed the drawings of Doughty. The subject is now being further investigated by D. H. Müller of Vienna from Rubing's copies.

retical grammar, in order that he might decide whether in Arabic it were allowable or necessary to express oneself in this or that manner. It is evident that these profound scholars knew of only one classical language, which was still spoken by the Bedouins. The tribes which produced the principal poets of the earlier period belonged for the most part to portions of the Hiyāz, to Nejd and its neighbourhood, and to the region which stretches thence towards the Euphrates. A great part of the Hiyāz, on the other hand, plays a very unimportant part in this poetry, and the Arabs of the north-west, who were under the Roman dominion, have no share whatever in it. The dialects of these latter tribes probably diverged further from the ordinary language. The fact that they were Christians does not explain this, since the Taghlibites and other tribes who produced eminent poets also professed Christianity. Moreover, poets from the interior were gladly welcomed at the court of the Ghassanian princes, who were Christian vassals of the emperor residing near Damascus, in this district, therefore, their language was at least *understood*. It may be added that most of the tribes which cultivated poetry appear to have been near neighbours at an epoch not very far removed from that in question, and afterwards to have been scattered in large bands over a much wider extent of country. And nearly all those who were not Christians paid respect to the sanctuary of Mecca. It is a total mistake, but one frequently made by Europeans, to designate the Arabic language as "the Koraishite dialect." This expression never occurs in any Arabic author. True, in a few rare cases we do read of the dialect of the Koraish, by which is meant the peculiar local tinge that distinguished the speech of Mecca, but to describe the Arabic language as "Koraishite" is as absurd as it would be to speak of English as the dialect of London or of Oxford. This unfortunate designation has been made the basis of a theory very often repeated in modern times,—namely, that classical Arabic is nothing else but the dialect of Mecca, which the Koran first brought into fashion. So far from this being the case, it is certain that the speech of the *towns* in the Hiyāz did not agree in every point with the language of the poets, and, as it happens, the Koran itself contains some remarkable deviations from the rules of the classical language. This would be still more evident if the punctuation, which was introduced at a later time, did not obscure many details. The traditions which represent the Koraish as speaking the purest of all Arabic dialects are partly the work of the imagination and partly compliments paid to the rulers descended from the Koraish, but are no doubt at variance with the ordinary opinion of the Arabs themselves in earlier days. In the Koran Mohammed has imitated the poets, though, generally speaking, with little success, the poets, on the other hand, never imitated him. Thus the Koran and its language exercised but very little influence upon the poetry of the following century and upon that of later times, whereas this poetry closely and slavishly copied the productions of the old heathen period. The fact that the poetical literature of the early Moslems has been preserved in a much more authentic form than the works of the heathen poets proves that our idea of the ancient poetry is on the whole just.

The Koran and Islam raised Arabic to the position of one of the principal languages of the world. Under the leadership of the Koraish the Bedouins subjected half the world to both their dominion and their faith. Thus Arabic acquired the additional character of a sacred language. But soon it became evident that not nearly all the Arabs spoke a language precisely identical with the classical Arabic of the poets. The north-western Arabs played a particularly important part during the period of

the Omayyads. The ordinary speech of Mecca and Medina was, as we have seen, no longer quite so primitive as that of the desert. To this may be added that the military expeditions brought those Arabs who spoke the classical language into contact with tribes from out-of-the-way districts, such as Ōmān, Bahānā (Bahāin), and particularly the north of Yemen. The fact that numbers of foreigners, on passing over to Islam, became rapidly Arabized was also little calculated to preserve the unity of the language. Finally, the violent internal and external commotions which were produced by the great events of that time, and stirred the whole nation, probably accelerated linguistic change. In any case, we know from good tradition that even in the 1st century of the Flight the distinction between correct and incorrect speech was quite perceptible. About the end of the 2d century the system of Arabic grammar was constructed, and never underwent any essential modification in later times. The theory as to how one should express oneself was now definitely fixed. The majority of those Arabs who lived beyond the limits of Arabia already diverged far from this standard, and in particular the final vowels which serve to indicate cases and moods were no longer pronounced. This change, by which Arabic lost one of its principal advantages, was no doubt hastened by the fact that even in the classical style such terminations were omitted whenever the word stood at the end of a sentence (in pause), and in the living language of the Arabs this dividing of sentences is very frequent. Hence people were already quite accustomed to forms without grammatical terminations.

Through the industry of Arabic philologists we are able to make ourselves intimately acquainted with this system, and still more with the vocabulary of the language, although they have not always performed their task in a critical manner. We should be all the more disposed to admire the richness of the ancient Arabic vocabulary when we remember how simple are the conditions of life amongst the Arabs, how painfully monotonous their country, and consequently how limited the range of their ideas must be. Within this range, however, the slightest modification is expressed by a particular word. It must be confessed that the Arabic lexicon has been greatly augmented by the habit of citing as words by themselves such rhetorical phrases as an individual poet has used to describe an object: for example, if one poet calls the lion the "roarer" and another calls him the "mangler," each of these terms is explained by the lexicographers as equivalent to "lion." One branch of literature in particular, namely, lampoons and satirical poems, which for the most part have perished, no doubt introduced into the lexicon many expressions coined in an arbitrary and sometimes in a very strange manner. Moreover, Arabic philologists have greatly underrated the number of words which, though they occur now and then in poems, were never in general use except amongst particular tribes. But in spite of these qualifications it must be admitted that the vocabulary is surprisingly rich, and the Arabic dictionary will always remain the principal resource for the elucidation of obscure expressions in all the other Semitic tongues. This method, if pursued with the necessary caution, is a perfectly legitimate one.

Poems seldom enable us to form a clear idea of the language of ordinary life, and Arabic poetry happens to have been distinguished from the very beginning by a certain tendency to artificiality and mannerism. Still less does the Koran exhibit the language in its spoken form. This office is performed by the prose of the ancient traditions (Hadith). The genuine accounts of the deeds of the Prophet and of his companions, and not less the stories concerning the battles and adventures of the Bedouins in the heathen period and in the earlier days of Islam, are

Dialect

excellent models of a prose style, although in some cases their redaction dates from a later time.

Gram-
metrical
forms
and rules

Classical Arabic is rich not only in words but in grammatical forms. The wonderful development of the broken plurals, and sometimes of the verbal nouns must be regarded as an excess of wealth. The sparing use of the ancient terminations which mark the plural has somewhat obscured the distinction between plurals, collectives, abstract nouns, and feminines in general. In its manner of employing the verbal tenses genuine Arabic still exhibits traces of that poetical freedom which we see in Hebrew, this characteristic disappears in the later literary language. In connecting sentences Arabic can go much further than Hebrew, but the simple parataxis is by far the most usual construction. Arabic has, however, this great advantage, that it scarcely ever leaves us in doubt as to where the apodosis begins. The attempts to define the tenses more clearly by the addition of adverbs and auxiliary verbs lead to no very positive result (as is the case in other Semitic languages also), since they are not carried out in a systematic manner. The arrangement of words in a sentence is governed by very strict rules. As the subject and object, at least in ordinary cases, occupy fixed positions, and as the genitive is invariably placed after the noun that governs it, the use of case-endings loses much of its significance.

Arabic of
the
middle
century

This language of the Bedouins had now, as we have seen, become that of religion, courts, and polished society. In the streets of the towns the language already diverged considerably from this, but the upper classes took pains to speak "Arabic." The poets and the *beaux esprits* never ventured to employ any but the classical language, and the "Atticists," with pedantic seriousness, convicted the most celebrated among the later poets (for instance Motanabbî) of occasional deviations from the standard of correct speech. At the same time, however, classical Arabic was the language of business and of science, and at the present day still holds this position. There are, of course, many gradations between the pedantry of the purists and the use of what is simply a vulgar dialect. Sensible writers employ a kind of *kowf*, which does not aim at being strictly correct, and calls modern things by modern names, but which, nevertheless, avoids coarse vulgarisms, aiming principally at making itself intelligible to all educated men. The reader may pronounce or omit the ancient terminations as he chooses. This language lived on, in a sense, through the whole of the Middle Ages, owing chiefly to the fact that it was intended for educated persons in general and not only for the learned, whereas the poetical schools strove to make use of the long extinct language of the Bedouins. As might be expected, this *kowf*, like the *kowf* of the Greeks, has a comparatively limited vocabulary, since its principle is to retain only those expressions from the ancient language which were generally understood, and it does not borrow much new material from the vulgar dialects.

It is entirely a mistake to suppose that Arabic is unsuited for the treatment of abstract subjects. On the contrary, scarcely any language is so well adapted to be the organ of scholasticism in all its branches. Even the tongue of the ancient Bedouins had a strong preference for the use of abstract verbal nouns (in striking contrast to the Latin, for example), thus they often said "Needful is this thing" than "It is needful that thou shouldst sit." This tendency was very advantageous to philosophical phraseology. The strict rules as to the order of words, though very unfavourable to the development of a truly eloquent style, render it all the easier to express ideas in a rigidly scientific form.

In the meantime Arabic, like every other widely spread language, necessarily began to undergo modification and to split up into

dialects. The Arabs are mistaken in attributing this development Minor to the influence of those foreign languages with which Arabic came into contact. Such influences can have had but little to do with dialects the matter, for even if otherwise the language of the interior of Arabia must have remained unchanged, yet even in this region the inhabitants are very far from speaking as they did a thousand years back. A person who in Arabia or elsewhere should trust to his knowledge of classical Arabic only would resemble those travellers from the north who endeavour to make themselves understood by Italian waders through the medium of a kind of Latin. The written language has, it is true, greatly retarded the development of the dialects. Every good Moslem repeats at least a few short *suras* several times a day in his prayers, besides being minutely acquainted with the sacred book, and this must have had a powerful influence upon the speech of the people at large. But nevertheless dialects have formed themselves and have diverged considerably from one another. Of these there are indeed but few with which we are tolerably well acquainted, that of Egypt alone is known with real accuracy.¹ Although the French have occupied Algiers for about fifty years, we still possess but imperfect information with respect to the language of that country. It is closely connected with that of Morocco on the one hand and with that of Tunis on the other. Arabic has long been banished from Spain; but we possess a few literary works written in Spanish Arabic, and just before it became too late Pélou de Alcala composed a grammar and a lexicon of that dialect.² We have also a few ancient specimens of the Arabic which was once spoken in Sicily. To the western group of dialects belongs the language of Malta, which, cut off as it is from other Arabic dialects, has developed a peculiarness of Italian, has developed itself in a very strange manner; in it a considerable number of words have already been pointed, but with Latin characters. The dialects of Arabia, Syria, and the other Eastern provinces, in spite of many valuable works, are not yet sufficiently well known to admit of being definitely classified.

There can be no doubt that the development of these dialects is in part the result of older dialectal variations which were already in existence in the time of the Prophet. The histories of dialects which differ completely from one another often pursue an analogous course. In general, the Arabic dialects still resemble one another more than we might expect when we take into consideration the great extent of country over which they are spoken and the very considerable geographical obstacles that stand in the way of communication. But we must not suppose that people, far as, for instance, from Mecca, Morocco, Syria, and the interior of Arabia, would be able to understand one another without difficulty. It is a total error to regard the difference between the Arabic dialects and the ancient language as a trifling one, or to represent the development of these dialects as something wholly unlike the development of the Romance languages. No living Arabic dialect diverges from classical Arabic so much as French or Roman from Latin; but, on the other hand, no Arabic dialect resembles the classical language so closely as the *Loggion* dialect, which is still spoken in Sicily, resembles its parent speech, and yet the lapse of time is very much greater in the case of the latter.

Sabean—Long before Mohammed, a peculiar and highly developed form of civilization had flourished in the table-^{inscriptions} land to the south-west of Arabia. The more we become acquainted with the country of the ancient Sabaeans and with its colossal edifices, and the better we are able to decipher its inscriptions, which are being discovered in ever-increasing numbers, the easier it is for us to account for the haze of mythical glory wherewith the Sabaeans were once invested. The Sabean inscriptions (which till lately were more often called by the less correct name of "Himyaritic") begin long before our era and continue till about the 4th century. The somewhat stiff character is always very distinct, and the habit of regularly dividing the words from one another renders decipherment easier, which, however, has not yet been performed in a very satisfactory manner, owing in part to the fact that the vast majority of the documents in question consist of religious votive tablets with peculiar sacerdotal expressions, or of architectural notices abounding in technical terms. These inscriptions fall into two classes, distinguished partly by grammatical peculiarities and partly by peculiarities of phraseology. One dialect, which forms the causative with *ha*, like Hebrew and others, and employs, like nearly

¹ W. Spitta-Bey, *Grammatik des arabischen Vulgärdialects von Aegypten* (Leipzig, 1880).

² They were published in 1505, reprinted by Lagarde (*Petrie Hesperia de Lingua Arabica Libri duo*, Göttingen, 1838).

all the Semitic languages, the termination *h* (*hā*) as the suffix of the third person singular, is the Sabaean properly speaking. The other, which expresses the causative by *sa* (corresponding to the Shaphel of the Arameans and others), and for the suffix uses *s* (like the Assyrian *sh*), is the Minaic. To this latter branch belong the numerous South Arabic inscriptions recently found in the north of the Hijaḡ, near Hēṭ, where the Minaeans must have had a commercial settlement. The difference between the two classes of inscriptions is no doubt ultimately based upon a real divergence of dialect. But the singular manner in which districts containing Sabaean inscriptions and those containing Minaic alternate with one another seems to point in part to a mere hieratic practice of clinging to ancient modes of expression. Indeed it is very probably due to conscious literary conservatism that the language of the inscriptions remains almost entirely unchanged through many centuries. A few inscriptions from districts rather more to the east exhibit certain linguistic peculiarities, which, however, may perhaps be explained by the supposition that the writers did not, as a rule, speak this dialect, and therefore were but imperfectly acquainted with it.

matical
forms.

As the Sabaean writing seldom indicates the vowels, our knowledge of the language is necessarily very incomplete, and the unvarying style of the inscriptions excludes a great number of the commonest grammatical forms. Not a single occurrence of the first or second person has yet been detected, with the possible exception of one proper name, in which "our god" apparently occurs. But the knowledge which we already possess amply suffices to prove that Sabaean is closely related to Arabic as we are acquainted with it. The former language possesses the same phonetic elements as the latter, except that it has at least one additional sibilant, which appears to have been lost in Arabic. It possesses the broken plural, a dual form resembling that used in Arabic, &c. It is especially important to notice that Sabaean expresses the idea of indefiniteness by means of an appended *m*, just as Arabic expresses it by means of an *n*, which in all probability is a modification of the former sound. Both in this point and in some others Sabaean appears more primitive than Arabic, as might be expected from the earlier date of its monuments. The article is formed by appending an *n*. In its vocabulary also Sabaean bears a great resemblance to Arabic, although, on the other hand, it often approaches more nearly to the northern Semitic languages in this respect, and it possesses much that is peculiar to itself.¹

Soon after the Christian era Sabaean civilization began to decline, and completely perished in the wars with the Abyssinians, who several times occupied the country, and in the 6th century remained in possession of it for a considerable period. In that age the language of central Arabia was already penetrating into the Sabaean domain. It is further possible that many tribes which dwelt not far to the north of the civilized districts had always spoken dialects resembling central Arabic rather than Sabaean. About the year 600 "Arabic" was the language of all Yemen, with the exception perhaps of a few isolated districts, and this process of assimilation continued in later times. Several centuries after Mohammed learned Yemenites were acquainted with the characters of the inscriptions which abounded in their country; they were also able to decipher the proper names and a small number of Sabaean words the meaning of which was still known to them, but they could no longer understand the inscriptions as a

whole. Being zealous local patriots, they discovered in those inscriptions which they imagined themselves to be capable of deciphering many fabulous stories respecting the glory of the ancient Yemenites.

Farther to the east, in the sea-coast districts of Shihir and Mahira, Dialects up to the borders of the barren desert of the interior, and also, we learn to no told, in the island of Socotra, dialects very unlike Arabic are Sabaean still spoken. Allusions to this fact are found in Arabic writers of the 10th century. These dialects depart widely from the ancient Semitic type, but bear some resemblance to the Sabaean, although they cannot be regarded as actually descended from the latter. One feature which they have in common with Sabaean is the habit of appending an *n* to the imperfect. Like the Ethiopic, and probably also the Sabaean, they use *k* (instead of *f*) in the terminations of the first person singular and the second person singular and plural of the perfect tense. In the suffixes of the third person there appears, at least in the feminine, an *s*, as in the Minaic. Unfortunately the information which we have hitherto possessed respecting these dialects is meagre and inexact, in part very incorrect.² It is much to be wished that soon they may all be investigated as carefully as possible, the more so as there is danger in delay, for Arabic is gradually supplanting them.

Ethiopic.—In Abyssinia, too, and in the neighbouring Gees, or countries we find languages which bear a certain resemblance to Arabic. The Gees or Ethiopic³ proper, the language of the ancient kingdom of Aksum, was reduced to writing at an early date. To judge by the few passages communicated by Salt, the back of the inscription of Anzanas, king of Aksum about 350, exhibits writing in the Sabaean language, which appears to prove that the development of the Gees character out of the Sabaean, and the elevation of Gees to the rank of a literary language, must have taken place after the year 350. The oldest monuments of this language which are known with certainty are the two great inscriptions of Tāzēnā, a heathen king of Aksum, dating from about 500. Hitherto our acquaintance with these inscriptions has been derived from very imperfect drawings⁴, but they amply suffice to show that we have here the same language as that in which the Ethiopic Bible is written, with the very same exact indication of the vowels,—a point in which Ethiopic has an advantage over all other Semitic characters. Who introduced this vocalization is unknown. When the above-mentioned inscriptions were made the Bible had probably been already translated into Gees from the Greek, perhaps in part by Jews, for Jews and Christians were at that time actively competing with one another, both in Arabia and in Abyssinia; nor were the former unsuccessful in making proselytes. The missionaries who gave the Bible to the Abyssinians must, at least in some cases, have spoken Aramaic as their mother-tongue, for thus alone can explain the fact that in the Ethiopic Bible certain religious conceptions are expressed by Aramaic words. During the following centuries various works were produced by the Abyssinians in this language, they were all, so far as we are able to judge, of a more or less theological character, almost invariably translations from the Greek. We cannot say with certainty when Gees ceased to be the language of the people, but it was probably about a thousand years ago. From the time when the Abyssinian kingdom was reconstituted, towards the end of the 13th century, by the so-called Solomonian dynasty (which was of southern origin), the language of the court and of the Government was Amharic; but Gees remained the ecclesiastical and literary language, and Gees literature even showed a certain

¹ See especially Maltzan, in *SDAAG*, vols. xxv. and xxvii.

² This name is due to the fact that the Abyssinians, under the influence of false erudition, applied the name *Akhorita* to their own kingdom.

³ The authorities of the Library of Frankfurt have kindly enabled the present writer to consult Rippell's copies, which are more accurate than the lithographs in his book. The English in 1688 did not seize the opportunity to examine thoroughly the antiquities of Aksum, and since then no traveller has taken the trouble to procure accurate copies of these extremely important monuments.

⁴ The literature relating to these inscriptions is widely scattered before the *Parasani Corpus* supplies us with the collected materials, we may hope to see the Sabaean grammar of D H Müller, who, with Halévy, has lately rendered the greatest services in this department.

activity in numerous translations from those Arabic and Coptic works which were in use amongst the Christians of Egypt, besides these a few original writings were composed, namely, lives of saints, hymns, &c. This literary condition lasted till modern times. The language, which had long become extinct, was by no means invariably written in a pure form, indeed even in manuscripts of more ancient works we find many linguistic corruptions, which have crept in partly through mere carelessness and ignorance, partly through the influence of the later dialects. On points of detail we are still sometimes left in doubt, as we possess no manuscripts belonging to the older period. This renders it all the more important that the ancient and authentic inscriptions upon the monuments of Aksum should be accurately published.

Characteristics of Geez

Geez is more nearly related to Sabæan than to Arabic, though scarcely to such a degree as we might expect. The historical intercourse between the Sabæans and the people of Aksum does not, however, prove that those who spoke Geez were simply a colony from Sabæa, the language may be descended from an extinct cognate dialect of south Arabia, or may have arisen from a mingling of several such dialects. And this colonization in Africa probably began much sooner than is usually supposed. In certain respects Geez represents a more modern stage of development than Arabic, we may cite as instances the loss of some inflexional terminations and of the ancient passive, the change of the aspirated dentals into sibilants, &c. In the manuscripts, especially those of later date, many letters are confounded, namely, *h*, *k*, and *kh*, *s* and *sh*, *ç* and *d*; this, however, is no doubt due only to the influence of the modern dialects. To this same influence, and indirectly perhaps to that of the Hamitic languages, we may ascribe the very hard sound now given to certain letters, *h*, *k*, *ç*, and *d*, in the reading of Geez. The last two are at present pronounced something like *ts* and *ts* (the German *s*). A peculiar advantage possessed by Geez and by all Ethiopic languages is the sharp distinction between the imperfect and the subjunctive: in the former a vowel is inserted after the first radical,—a formation of which there seem to be traces in the dialect of Mahra, and which is also believed to have existed in Assyrian. Geez has no definite article, but is very rich in particles. In the ease with which it joins sentences together and in its freedom as to the order of words it resembles Aramaic. The vocabulary is but imperfectly known, as the theological literature, which is for the most part very old, supplies us with comparatively few expressions that do not occur in the Bible, whereas the more modern works borrow their phraseology in part from the spoken dialects, particularly Amharic. With regard to the vocabulary, Geez has much in common with the other Semitic tongues, but at the same time possesses many words peculiar to itself; of these a considerable proportion may be of Hamitic origin. Even some grammatical phenomena seem to indicate Hamitic influence, for instance, the very frequent use of the gerundive, a feature which has become still more prominent in the modern dialects, placed as they are in yet closer contact with the Hamitic. We must not suppose that the ancient inhabitants of Aksum were of pure Semitic blood. The immigration of the Semites from Arabia was in all probability a slow process, and under such circumstances there is every reason to assume that they largely intermingled with the aborigines. This opinion seems to be confirmed by anthropological facts.

Tigrina and Tigrina

Not only in what is properly the territory of Aksum (namely, Tigré, north-eastern Abyssinia), but also in the countries bordering upon it to the north, including the islands of Dahlak, dialects are still spoken which are but more modern forms of the linguistic type clearly exhibited in Geez. The two principal of these are that spoken in Tigré proper and that of the neighbouring countries

In reality, the name of Tigré belongs to both, and it would be desirable to distinguish them from one another as Northern and Southern Tigré. But it is the custom to call the northern dialect Tigré simply, whilst that spoken in Tigré itself bears the name of Tigrina, with an Amharic termination. It is generally assumed that Tigré bears a closer resemblance to Geez than does Tigrina, although the latter is spoken in the country where Geez was first used, and this may very possibly be the case, for Tigrina has during several centuries been very strongly influenced by Amharic, which has not been the case with Tigré, which is spoken partly by nomads. Of Tigré, which appears to be divided into numerous dialects, we have several glossaries, but of its grammar we as yet know but little. Written specimens of this language are almost entirely wanting. With Tigrina we are somewhat better acquainted, but only as it is spoken in the centre of the country, near the site of the ancient Aksum, where Amharic happens to be particularly strong,—above all, amongst the more educated classes. In Tigrina the older grammatical forms are often subjected to violent alterations, foreign elements creep in, but the kernel remains Semitic.

Very different is the case with Amharic, a language of Amharic which the domain extends from the left bank of the Takakzé into regions far to the south. Although by no means the only language spoken in these countries, it always tends to displace those foreign tongues which surround it and with which it is interspersed. We here refer especially to the Agaw dialects. Although Amharic has been driven back by the invasions of the Galla tribes, it has already compensated itself to some extent for this loss, as the Yedju and Wollo Gallas, who penetrated into eastern Abyssinia, have adopted it as their language. With the exception, of course, of Arabic, no Semitic tongue is spoken by so large a number of human beings as Amharic. The very fact that the Agaw languages are being gradually, and, as it were, before our own eyes, absorbed by Amharic² makes it appear probable that this language must be spoken chiefly by people who are not of Semitic race. This supposition is confirmed by a study of the language itself. Amharic has diverged from the ancient Semitic type to a far greater extent than any of the dialects which we have hitherto enumerated. Many of the old formations preserved in Geez are completely modified in Amharic. Of the feminine forms there remain but a few traces; and that is the case also with the ancient plural of the noun. The strangest innovations occur in the personal pronouns. And certainly not more than half the vocabulary can without improbability be made to correspond with that of the other Semitic languages. In this, as also in the grammar, we must leave out of account all that is borrowed from Geez, which, as being the ecclesiastical tongue, exercises a great influence everywhere in Abyssinia. On the other hand, we must make allowance for the fact that in this language the very considerable phonetic modifications often produce a total change of form, so that many words which at first have a thoroughly foreign appearance prove on further examination to be but the regular development of words with which we are already acquainted.³ But the most striking deviations occur in the syntax. Things which we are accustomed to regard as usual or even universal in the Semitic languages, such as the placing of the verb before the subject, of the governing noun before the genitive, and of the attributive relative clause after its substantive, are here totally reversed. Words which are marked as genitives by the prefixing of the relative particle, and even whole relative clauses, are treated as one word, and are capable of having the objective suffix added to them. It is scarcely going too far to say that a person

¹ Franz Praetorius, *Grammatik der Tigrinischsprache*, Halle, 1872. The present writer was also permitted to use the manuscript grammar of a Belgian missionary, who spent a long time in the country.

² Only an advanced guard of the Agaw languages, the Bilin or dialect of the Bogos, is being similarly absorbed by the Tigré.

³ Praetorius, however, in his very valuable grammar, *Die amharische Sprache* (Halle, 1879), has gone much too far in his attempts to connect Amharic words and grammatical phenomena with those that occur in Geez.

who has learnt no Semitic language would have less difficulty in mastering the Amharic construction than one to whom the Semitic syntax is familiar. What here appears contrary to Semitic analogy is sometimes the rule in Agaw. Hence it is probable that in this case tribes originally Hamitic retained their former modes of thought and expression after they had adopted a Semitic speech, and that they modified their new language accordingly. And it is not certain that the partial Semitization of the southern districts of Abyssinia (which had scarcely any connexion with the civilization of Aksum during its best period) was entirely or even principally due to influences from the north.

In spite of its dominant position, Amharic did not for several centuries show any signs of becoming a literary language. The oldest documents which we possess are a few songs of the 15th and 16th centuries, which were not, however, written down till a later time, and are very difficult to interpret. There are also a few Geez-Amharic glossaries, which may be tolerably old. Since the 17th century various attempts have been made, sometimes by European missionaries, to write in Amharic, and in modern times this language has to a considerable extent been employed for literary purposes, nor is this to be ascribed exclusively to foreign influence. A literary language, fixed in a sufficient measure, has thus been formed. Books belonging to a somewhat earlier period contain tolerably clear proofs of dialectal differences. Scattered notices by travellers seem

to indicate that in some districts the language diverges in a very much greater degree from the recognized type.

The Abyssinian chronicles have for centuries been written in Geez, largely intermingled with Amharic elements. This "language of the chronicles," in itself a dreary chaos, often enables us to discover what were the older forms of Amharic words. A similar mixture of Geez and Amharic is exemplified in various other books, especially such as refer to the affairs of the Government and of the court.

The languages spoken still farther to the south, that of Guigugé Guragú (south of Shoa) and that of Haari, are perhaps more fully described and as languages akin to Amharic than as Amharic dialects. (Cf. Havari. 1876.) We possess more precise information respecting them, and in general respecting the linguistic and ethnographical condition of these countries, it would not be safe to hazard even a conjecture as to the origin of these languages, which, corrupt as they may be, and surrounded by tongues of a wholly different class, must still be regarded as Semitic. It is enough to repeat that the immigration of the Semites into these parts of Africa was probably no one single act, that it may have taken place at different times, that the immigrants perhaps belonged to different tribes and to different districts of Asia, and that very heterogeneous peoples and languages appear to have been variously mingled together in these regions.

The clever and brilliant work of Renan, *Histoire générale des langues Semitiques* (1st ed., Paris, 1855), could not fail to produce much effect at the time, as a study of its one-sided character and the author's method shows that it contains. Even at the present day a scholar may read it with great interest and profit, but as a whole it has been superseded by the discoveries of the last twenty or thirty years. The journals of Ewald, in the introduction to his Hebrew grammar, upon the mutual relationship of the Semitic languages are still worthy of perusal, much as they provoke contradiction. A work upon the subject which reflects for the present state of science what Renan undertook to achieve for his own time unfortunately does not exist. (Cf. N.)

SEMLER, JOHANN SALOMO (1725-1791), ecclesiastical historian and critic, sometimes called "the father of German rationalism" (see RATIONALISM), was born at Sealfeld in Thuringia on 18th December 1725. He was the son of a clergyman in poor circumstances, and had to fight his way in the world solely by his own talents. He grew up amidst Pietistic surroundings, which powerfully influenced him in his life though, though he was never spiritually or intellectually a Pietist. As a boy he showed the omnivorous appetite for books which was characteristic of his later life. In his seventeenth year he entered the university of Halle, where he became the disciple, afterwards the assistant, and at last the literary executor of the orthodox rationalistic Professor Baumgarten. In 1749 he accepted the position of editor, with the title of professor, of the Coburg official *Gazette*, with leave to pursue historical and scientific studies. But the next year he was invited to Altdorf as professor of philology and history, and six months later became a professor of theology in Halle. After the death of Baumgarten (1757) Semler became the head of the theological faculty of his university, and the fierce opposition which his writings and lectures provoked only helped to increase his fame as a professor. His popularity continued undiminished for more than twenty years, until 1779. In that year he came forward with a reply to the *Wolffianische Fragmente* (see RATIONALISM) and to Bahrdt's confession of faith, a step which was interpreted by the extreme rationalists as a revocation of his own rationalistic position. Even the Prussian Government, which favoured Bahrdt, made Semler painfully feel its displeasure at this new but really not inconsistent aspect of his position. But, though Semler was really not inconsistent with himself in attacking the views of Roumaus and Bahrdt, as a comparison of his works prior and subsequent to 1779 with those in question shows, his popularity began from that year to decline, and towards the end of his life he felt painfully the necessity of emphasizing the apologetic and conservative value of true historical inquiry. With more justification, perhaps, might his defence of the notorious edict of Wöllner (1785), the cultus minister, be cited as a sign of the decline of his powers and of an unfaithfulness to his principles. He died at Halle on 14th

March 1791, worn out by his prodigious labours, embittered by his desolation, and disappointed at the issue of his work.

Semler's importance in the history of theology and the human mind is that of a critic of Biblical and ecclesiastical documents and of the history of dogmas. He was not a philosophical thinker or theologian, though he insisted, more or less cordially, and yet with an energy and persistence before unknown, on certain distinctions of great importance when properly worked out and applied, e.g., the distinction between religion and theology, that between private personal beliefs and public historical creeds, and that between the local and temporal and the permanent elements of historical religion. His great work was that of the critic. He was the first to reject with sufficient proof the equal value of the Old and the New Testaments, the uniform authority of all parts of the Bible, the divine authority of the traditional canon of Scripture, the inspiration and supposed correctness of the text of the Old and New Testaments, and, generally, the identification of revelation with Scripture. Though to some extent anticipated by the English deist Thomas Morgan, Semler was the first to take due note of and use for critical purposes the opposition between the Judean and anti-Judean parties of the early church. He led the way in the task of discovering the origin of the Gospels, the Epistles, the Acts of the Apostles, and the Apocalypse. He removed previous doubts as to the direct Pauline origin of the Epistle to the Hebrews, called in question Peter's authorship of the first epistle, and referred the second epistle to the end of the 2d century. He wished to remove the Apocalypse altogether from the canon. In textual criticism Semler pushed further the principle of classifying MSS. in families, adopted by R. Simon and Bengel. Though he lacked almost every qualification of the true church historian, Semler did the work of a pioneer in many periods and in several departments of ecclesiastical history. Tholuck pronounced him "the father of the history of doctrines," and Baur "the first to deal with that history from the true critical standpoint." At the same time, it is admitted by all that he was nowhere more than a pioneer. Baur's description of his work in one department of ecclesiastical history is true of his work generally. "His writings on the history of dogma resemble a fallow-field waiting to be cultivated or a building-site on which the skeleton of a new edifice and ruins lie the materials in chaotic confusion for a new edifice. The consequence was that as he was always engaged in preliminary labours, he brought nothing to even partial completion; and, though his general critical standpoint was correct, in its application to details his criticism could only be regarded as extremely bold and arbitrary."

Tholuck gives 171 as the number of Semler's works, of which only two reached a second edition, and none is now new for its own sake. Amongst the chief are—*De demonstris* (Halle, 1760, 4th ed. 1779), *Selecta capita historiarum ecclesiasticarum* (3 vols., Halle, 1767-69), *Von freier Untersuchung des Kanons* (Halle, 1773-72), *Apparatus ad liberalem N. T. interpretationem* (1767, ad V. T. 1778), *Institutio ad doctrinam Christi liberalliter discernendam* (Halle,

1774), *Ueber historisch, gesellschaftliche, und moralische Religion der Christen* (1786), and his autobiography, *Semler's Lebensbeschreibung, von ihm selbst abgefaßt* (Halle, 1781-82).

For estimates of Semler's labours, see Giese, *Geschichte des dogmatischen* (Berlin, 1834-37), Dörner, *Geschichte der protestantischen Theologie* (1867), Tholuck, *art in Herzog's Real-Encyclopädie*, Hilgenfeldt, *Einleitung in das Neue Testament* (Leipzig, 1873), Bau, *Epochen der kirchlichen Geschichtsschreibung* (1870), and Ritschl, *Geschichte des Protestantismus* (Bonn, 1880-84).

SEMLIN (Hung *Zimonyi*, Serbian, *Semun*), a town of Austria-Hungary, the easternmost in the Military Frontier district, stands on the south bank of the Danube, on a tongue of land between that river and the Save. It is the see of a Greek archbishop, has a real school of lower grade, five Roman Catholic and two Greek churches, a synagogue, a theatre, and a custom-house. The population (10,046) consists mostly of Serbians, with a few Germans, Greeks, Illyrians, Croats, Gipsies, and Jews. Semlin has recently undergone improvement in its streets and buildings, but its suburb Franzenthal near the Danube consists mostly of mud huts thatched with reeds. The town is surrounded by a stockade. On the top of Zageunerberg are the remains of the castle of John Hunyadi, who died here in 1456. Semlin has a considerable trade, sending woollen cloth, porcelain, and glass to Turkey, and obtaining in return yarn, leather, skins, honey, and meerschaum pipes. It is a principal quarantine station for travellers from Turkey. Steam ferry boats cross to Belgrade several times a day, and larger vessels run up the Save as far as to Sissek.

SEMPER, GOTTFRIED (1803-1879), German architect and writer on art, was born at Altona on 29th November 1803. His father intended him for the law, but irresistible impulse carried him over to art. His early mastery of classical literature led him to the study of classic monuments in classic lands, while his equally conspicuous talent for mathematics gave him the laws of form and proportion in architectural design. While a student of law at the university of Göttingen he fell under the influence of K. O. Müller, and in after years followed closely in his footsteps. Semper's architectural education was carried out successively in Hamburg, Berlin, Dresden, in Paris under Gau, and in Munich under Gartner; afterwards he visited Italy and Greece. In 1834 he was appointed professor of architecture in Dresden, and during fifteen years received many important commissions from the Saxon court. He built the opera-house, which made his fame, the new museum and picture gallery, likewise a synagogue. In 1848 his turbulent spirit led him to side with the revolution against his royal patron, he furnished the rebels with military plans, and was eventually driven into exile. Semper came to London at the time of the Great Exhibition of 1851, and the prince consort found him an able ally in carrying out his plans. He was appointed teacher of the principles of decoration; and his lectures in manuscript, preserved in the art library, South Kensington, deserve to be better known. He was also employed by the prince consort to prepare a design for the Kensington Museum; he likewise made the drawings for the Wellington funeral car. In 1853 Semper left London for Zurich on his appointment as professor of architecture, and with a commission to build in that town the polytechnic school, the hospital, &c. In 1870 he was called to Vienna to assist in the great architectural projects since carried out round the Ring. A year later, after an exile of over twenty years, he received a summons to Dresden, on the rebuilding of the first opera-house, which had been destroyed by fire in 1869; his second design was a modification of the first. The closing years of his life were passed in comparative tranquillity between Vienna and Rome, and in the latter city he died on 15th May 1879.

Semper's style was a growth from the classic orders through the Italian Cinque Cento. He forsook the base and rococo forms he found rooted in Germany, and, reverting to the best historic ex-

amples, fashioned a pure Renaissance. He stands as a leader in the practice of polychromy, since widely diffused, and by his writings and example did much to reunite the ancient union between architecture, sculpture, and painting. Among his numerous literary works are *Ueber Polychromie in ihrer Anwendung* (1851), *Die Anwendung des Putzes in der Architektur* (1851), *Die Kunst des Bauens in den technischen und technischen Künsten* (1860-68), *His Notes of Lectures on Practical Art in Metals and Hard Materials*, *its Technology, History, and Style*, remains in MS. His teachings, at times encumbered by speculations reaching far beyond the domain of his art.

SENAAR (SENNAAAR, properly SENNAR), a country of east Central Africa, commonly identified with the "Island of Meioe" of the ancients, and included in the central division of Egyptian (Easten) Súdán, as reorganized in the year 1882. By European writers the term is often applied to the whole region lying between the Abárá (Takazze) and the White Nile, but by native usage is restricted to the district confined between the latter river and the Bah-el-Azrak (Blue Nile), and its eastern tributaries, the Rahad and the Dender. It is bordered north and north-east by Upper Nubia, east by Abyssinia, west by the White Nile (Bah-el-Azrak), separating it from Kordofán, and stretches from the confluence of the two Niles at Khartúm southwards, in the direction of the Berta highlands in the east and the Búrín and Dmka plains in the west. As thus defined, Sennár extends across five degrees of latitude (16° to 11° N.), with a total length of about 350 miles, a mean breadth of 120 miles, an area of 40,000 square miles, and an approximate population of 300,000. It comprises two physically distinct tracts, the densely wooded and well-watered Jezirát el-Jesrír ("Isle of Isles") between the Rahad and the Blue Nile, and the "island" of Sennár proper, a nearly level steppe land confined between the two main streams. This western and much larger division, which has a mean elevation of under 2000 feet above sea-level, consists mainly of alluvial and sandy matter, resting on a bed of granite and porphyritic granite, which first crops out some ten days' journey south of Khartúm, in the Jebel es-Segati and the Jebel el-Aloya, near the town of Sennár on the Bah-el-Azrak. Between these two groups the plain is dotted over with isolated slate hills containing iron and silver ores. But beyond Sennár the boundless steppe, either under a tall coarse grass, or overgrown with mimosa scrub, or else absolutely waste, again stretches uninterruptedly for another ten or eleven days' journey to the Rosáres (Rosaires) district, where the isolated Okelmí and Kedus Hills, containing quartz with copper ore, rise 1000 feet above the right bank of the Blue Nile and 3000 above the sea. Here the plain is furrowed by deep gullies flushed during the rainy season; and farther south the land, hitherto gently sloping towards the north-west, begins to rise rapidly, breaking into hills and ridges 4000 feet high in the Fazogí district, and farther on merging in the Berta highlands with an extreme altitude of 9000 to 10,000 feet. In these metalliferous uplands, recently explored by Marmó and Schuwer, rises the Tumát, which is washed for gold, and which after a northerly course of nearly 100 miles joins the left bank of the Blue Nile near Fazogí and Famaka. South of and parallel with the Tumát flows the still unexplored Jabus (Yabus), on which stands Fadasi, southernmost of the now abandoned Egyptian stations in the Bah-el-Azrak basin. This point also marks the present limit of geographical exploration in the direction of the conterminous Galla country, Schuwer being the only European traveller who has hitherto succeeded in penetrating to any distance south of the Jabus.

Sennár lies within the northern limits of the tropical rains, which reach to Khartúm, and fall between June and September. In this part of its course the Blue Nile rises from May to August, when the northern and western winds prevail, nearly coinciding with the cool and healthy season. But they are followed by the hot khamsín from the south or the samúm (simoom) from the north-west charged

with fine sand from the Libyan Desert. Still more deadly are the miasmatic exhalations caused by the glowing sun playing on stagnant waters after the floods and giving rise to the "Sennar fever," which drives the natives themselves from the plains to the southern uplands. The temperature, which rises at times to over 120° Fahr., is also very changeable, often sinking from 100° Fahr. during the day to under 60° Fahr. at night.

The soil, mainly alluvial, is naturally fertile, and wherever water and hands are available yields bounteous crops of maize, pulse, cotton, tobacco, sesame, and especially durra, of which as many as twenty varieties are said to be cultivated. The forest vegetation, mainly confined to the "islo of isles" and the southern uplands, includes the *Adansonia* (baobab), which in the Fozzigi district attains gigantic proportions, the tamarind, of which bread is made, the date palm, several valuable gum trees (whence the term Sennar often applied in Egypt to gum arabic), some dyewoods, ebony, iron-wood, and many varieties of acacia. These forests are haunted by the two-horned rhinoceros, the elephant, lion, panther, numerous apes and antelopes, while the crocodile and hippopotamus frequent all the rivers. The chief domestic animals are the camel, horse, ass, ox, buffalo (used both as a beast of burden and for riding), sheep with a short silky fleece, the goat, cat, dog, and pig, which last here reaches its southernmost limit. The tsetse fly appears to be absent, but is replaced in some districts by a species of wasp, whose sting is said to be fatal to the camel in the rainy season.

The "African Mesopotamia" is occupied by a partly settled partly still nomad population of an extremely mixed character, including representatives of nearly all the chief ethnical divisions of the continent. The great plain of Sennar is mainly occupied by Hassaneh Arabs in the north, by Abu-Bel (Rufayeh) Hamites of Beta stock (Robert Hartmann) in the east as far as Fazog, and elsewhere by the Funj (Funj, Fungheh), traditionally from beyond the White Nile, and affiliated by some to the Kollofan Nubas, by others more probably to the Nilotie Negro Shilluks. These Funj, who have been the dominant race since the 15th century, have become almost everywhere assimilated in speech, religion, and habits to the Arabs. Negro tribes on their sacred Mount Guleh the traveller Prynasser found them still performing pagan rites, while according to Marno the Bithina, the southernmost branch of the race between the Beta highlanders and the Nilotie Denkas, are addicted to cannibalism. The Beta highlanders themselves (Jebellu, as the Arabs collectively call them) are of more or less pure Negro stock and number about 80,000, grouped in several semi-independent principalities. The two most important stretching north of Dar-Beta and east of the Tunnet valley is also occupied by distinct nationalities, such as the Kadalos in the extreme north, the Siennetos and Gumis in the east, here bordering on the Abyssinian Agawa, the Jabus and Gains in the south. Most of these appear to be of Negro or Negroid stock; but the Siennetos, said to be a surviving remnant of the primitive population of the whole country, are doubtless akin to the Siennetos of Dunnet and Gopam in Abyssinia. They are certainly not blacks, and have a yellow or fair complexion, lighter than that of southern Europeans.

The Sennar people cultivate a few industries, such as cotton-weaving, pottery, gold, silver, and iron work, matting, and leather work (camel saddles, sandals, &c.), noted throughout Suddän. But their chief pursuits are stock-breeding, agriculture, and trade—exporting to Egypt and Abyssinia gold, hides, durra, sesame, gums, ivory, horses, and slaves. The chief centres of population, all on the Bahir el-Azrak, are Fozzigi (Fazogke), now replaced by Fankaka, at the Tunnet confluence; Rossees, formerly capital of an independent state, Sannä, also an old capital, which gives its name to the whole region; Wod-Medineh at the Rahad confluence, and Khatim, just above the junction of the two Niles. A few miles above Khatim are the extensive ruins of Soba, former capital of the Funj empire, which at one time stretched from Wady Halfa to Dar-Berta and from Suakin to beyond Kollofan, but which was overthrown by Ismail Pasha in the year 1822. (A. H. K.)

SÉNANCOUR, ÉTIENNE PIVRET DE (1770-1846), French man-of-letters, was born at Paris in November 1770. His family was noble and not poor, but its fortunes were ruined by the Revolution. Before that event, however, Sénancour had met with mishap. He was a sickly youth and was destined for the church, but ran away from home and established himself in Switzerland. Here he married and spent some years; his wife died, and he returned to Paris about the end of the century. In 1804 he published the singular book entitled *Obernann*, which has continued to be in a fashion popular to the present day, and the next year a treatise *De l'Amour*, which had even more vogue at first, but is now little read. *Obernann*, which is to a great extent inspired by Rousseau, which attracted the admiration of George Sand, and which had

a considerable influence over the last generation in France and England, is a series of letters supposed to be written by a solitary and melancholy person, whose headquarters were in a valley of the Jura, but who writes also from divers other places. The style is meretricious, the descriptive power very considerable, the thought sometimes original, and the expression of a certain form of the *mélancolie du siècle* effective and striking. But, viewed from the strictly critical point of view, there is perhaps a certain unreality about the book. Its idiosyncrasy in the large class of Wertherian-Byronic literature has justly enough been said to be that the hero, instead of feeling the vanity of things, recognizes his own inability to be and do what he wishes. Sénancour is tinged to some extent with the older *philosophie* form of freethinking, and expresses less revolt from the 18th century than Chateaubriand. Having no resources but his pen, Sénancour during the half-century which elapsed between his return to France and his death at St Cloud in February 1846 was driven to literary hack work, and even his more independent productions have none of the attraction of *Obernann*. When George Sand and Sainte-Beuve revived interest in this latter, Thiers and Villemain successively obtained for the author from Louis Philippe pensions which enabled him to pass his last days in comfort. He committed the usual mistake of writing late in life a continuation to *Obernann*, entitled *Isabelle* (1833), but it has been wisely forgotten.

SENEBIER, JEAN (1742-1809), a Swiss pastor and voluminous writer on vegetable physiology, was born at Geneva on 6th May 1742. He is remembered on account of his contributions to our knowledge of the influence of light on vegetation. Though Malpighi and Hales had shown that a great part of the substance of plants must be obtained from the atmosphere, no progress was made until more than a century later, when Bonnet observed on leaves plunged in aerated water bubbles of gas, which Priestley recognized as oxygen. Ingenhousz proved the contemporaneous disappearance of carbonic acid; but it was Senebier who clearly showed that this activity was confined to the green parts, and to those only in sunlight, and first gave a connected view of the whole process of vegetable nutrition in strictly chemical terms, so preparing the way for the quantitative researches of N. T. de Saussure. Senebier died at Geneva on 22d July 1809.

See Sachs, *Geschichte d. Botanik*, and *Arbeiten*, vol. II.

SENECA, LUCIUS ANNEAUS (c. 3 B.C.-65 A.D.), the most brilliant figure of his time, was the second son of the rhetorician Marcus Annæus Seneca, and, like him, a native of Corduba in Hispania. From his infancy of a delicate constitution, he devoted himself with intense ardour to rhetorical and philosophical studies and early won a reputation at the bar. Caligula threatened his life, and under Claudius his political career received a sudden check, for the influence of Messalina having effected the ruin of Julia, the youngest daughter of Germanicus, Seneca, who was compromised by her downfall, was banished to Corsica, 41 A.D. There eight weary years of waiting were relieved by study and authorship, with occasional attempts to procure his return by such gross flattery of Claudius as is found in the work *Ad Polybium de Consolatione* or the panegyric on Messalina which he afterwards suppressed. At length the tide turned; the next empress, Agrippina, had him recalled, appointed pretor, and entrusted with the education of her son Nero, then (48) eleven years old. Seneca became in fact Agrippina's confidential adviser; and his pupil's accession increased his power. He was consul in 57, and during the first bright years of the new reign, the incompatible *quinguentennium Neronis*, he shared the actual administration of affairs with the worthy Burrus, the praetorian prefect. The government in the hands of these men of remarkable

SENEGAL, a river of western Africa, which falls into the Atlantic about 16° N lat., 9 or 10 miles below St Louis. It is formed at Bafulabé¹ (13° 50' N lat and 10° 50' W long) by the junction of the Ba-fing or Black River and the Ba-khoy or White River. The Ba-fing, which has a width at the confluence of 1475 feet, descends from the highlands of Futa-Jallon by a northward course of about 350 miles, during which it passes by a series of rapids from the altitude of 2450 feet, at which it takes its rise, to that of 360 feet, and receives from the right the Nunkolo and the Funkumah (with its tributary the Boku). The Ba-khoy, 800 feet wide at the confluence, has been previously flowing from east to west and gives that general direction to the Senegal, but its source is away in the south-east behind the country of Buré. That of its principal tributary, the Ba-ule (Red River), is more to the east and lies within a few miles of the course of the Niger in the Mandingo plateau. Below Bafulabé the Senegal, flowing north-west, passes a succession of falls—those of Guina (160 feet) and of Felu (50 or 60)—and arrives at Médina, after having accomplished 440 of its total course of 1000 miles. It receives only two important affluents,—from the right the “marigot” of Kulu, which comes from Kunakhary, draining the slopes of the Kaarta plateau, and from the left the Falemé, which rises in the Futa-Jallon between Labé and Timbo and flows north-west in a permanent stream. Below Médina the Senegal presents a series of great reaches, which become more and more navigable as they approach the sea.

From the 1st of August to the 1st of October it is open as far as Médina to vessels not drawing more than 8 feet. Between Médina and Bakel (85 miles) there are twenty-seven “narrows,” of which several, such as that at Kayes, are difficult, it is on this account that a railway has been projected between Kayes and the Niger. At Bakel below the confluence of the Falemé the river is navigable till the 1st of December, from Bakel to Saldé between the 15th of July and the 15th of December, and lastly from Mafa to the sea for a distance of 215 miles it is navigable all the year round. Outside the limits indicated navigation between Mafa and Médina is often precarious even for barges drawing little over a foot, and above Médina, though some reaches are deep enough, troublesome transshipments are necessary between reach and reach. Between Mafa and Saldé the Senegal changes its direction from north-west to west, and shortly before reaching the sea to south-west. The bar at the mouth can usually be crossed by vessels not drawing more than 10 feet, or at high tides a little more. Below Bakel the river becomes tortuous and encloses the great island of Morfil, 110 miles long, and a series of other islands, of which one is occupied by St Louis. At this point the right branch of the river is only 500 feet from the sea, but the dunes along the coast turn it south for other 9 miles. The scantiness of its sources, the steepness of its upper course, and the rapid evaporation which takes place after the short rainy season would soon dry up the river-system of the Senegal, especially in the upper regions, but natural dams cross the channel at intervals and the water accumulates behind them in deep reaches, which thus act as reservoirs. In the rainy season the barriers are submerged in succession, beginning with the farthest up, the reaches are filled, and the plains of the lower Senegal are changed into immense marshes. Like Lake Moors in antiquity on the Nile and the lake of Canabou at the present time on the Me-kong, Lake Cayor on the right side of the lower Senegal and Lake Pangoul on the left constitute reservoir basins, receiving the surplus waters of the river during flood and restoring them in the dry season. For months together the latter forms the only drinking pond for the wild beasts of the surrounding country,—lions, elephants, leopards, panthers, ounces, cheetahs, hyenas, lynxes, gazelles, antelopes, gazelles, monkeys, jackals visiting it in crowds. In the upper part of the river the reservoirs are successively emptied to the level of the dams and reserve no more water except from the permanent springs, but they are partially protected by curtains of verdure from the effects of the evaporation which makes itself so severely felt on the treeless seaboard. Owing to these natural “locks,” similar to those of an artificial canal, the Senegal river never discharges less than 1700 or 1800 cubic feet per second. The lower Senegal forms the boundary between the dry and herbar Sahara and the rich and productive region of the western Sudan; the line of its inundations is an ethnographic march between the nomadic Moor and the settled Negro.

SENEGAL,² a French colony of western Africa, composed of lines of fortified posts and a loose agglomeration of states and territories in various degrees of subjugation. The forts extend (a) from St Louis at the mouth of the Senegal to Bammako on the Niger,³ (b) along the coast of the Atlantic between St Louis and the mouth of the Salum to the south of Cape Verd, and (c) along the so-called rivers of the south which fall into the ocean between the Gambia and SIERRA LEONE (q v). French influence is fully dominant along those lines either in the form of actual territorial possession or of a recognized protectorate.⁴

The colony is ruled by a governor, sends a deputy to the French legislature, and elects a general council of sixteen members, ten for the electoral district of St Louis, four for that of Gorée-Dakar, and two for that of Rufisque. The three communes just named have each its municipal council. The population of these French possessions was in 1884 197,644,—46,854 urban, 143,200 rural, 8980 “floating.” In the whole number there were only 1474 Europeans, of whom 1461 were French. The population of the protected countries cannot be ascertained. The most important places in the colony are St Louis (18,924 inhabitants in 1883), Dagone (5875), Rufisque (4244), Médina (8000), Kaolack (2650), and Banjul (2000). The colony has only a single trade port, that of Dakar, to the east of the peninsula of Cape Verd, since 1855 connected with St Louis by a railroad, 163 miles long, and visited by Atlantic steamers on their way from France to South America. Rufisque and Gorée have open roadsteads, where vessels anchor at some distance from the shore. The port of St Louis in the Senegal is difficult of access owing to the bar, but it is the only place where vessels can be without serious damage. The principal commercial centres are St Louis (imports and exports), Gorée (exports), and Rufisque (exports). The upper Senegal sends ground-nuts (known as Galam nuts), gum, millet, leather, and receives in exchange lake calico (gunné) from India, England, and Belgium, various other cotton stuffs, cotton yarn, guns and ammunition, tobacco, crushed rice, sugar (raw and refined), molasses, biscuits, tinsmiths’ wares, &c. The colony also imports from the interior of Africa, and is supplied by the native blacksmiths into agricultural implements, knives, daggers, and spears. Cayor sells its ground-nuts for money. The rivers of the south district export ground nuts, palm kernels, maha-rubber, leather, coffee, in return for English and Belgian lake calico, Hamburg brandy, English gunpowder, English and Belgian guns, and American tobacco. An English firm has twenty-three factories on the Rio Xhine, and others on the Rio Pongo and the Malinke. The total value of the principal imports of the colony was £1,325,711 in 1879, £1,771,039 in 1880, and £1,858,657 in 1883, the imports slightly preponderating over the exports. The value of the ground-nuts exported in 1883 was £700,000, that of the gums only £120,000, and the ground-nut trade is still rapidly developing. The imports comprise French

¹ For the physical geography, &c., see SENIGAMMA.

² Along this line lie Richat Toll, Dagone (founded in 1821), Podor (1743 and 1851), Saldé (1850), Matam (1867), Bakel (1820), Kayes, Médina (1855), and Bafulabé (1878) on the Senegal, and between this river and the Niger the forts of Baoulé and Talcola on the Ba-khoy, Kita (1891), Komin (1893), Niagassola (1884-85), and lastly Bammako (1853) or Bammakou, on the Niger.

³ ARRONDISSEMENT I.—On the circle of *Dakel* depend the prov. of Matam, the protected countries of Danga (1850), Gney, Kinnere, Guindimakha, Bouda, and Bammak; on the circle of *Médina*, Kakaou, Logo, and Natanga; on the circle of *Banjalou*, Banrita, Mukalaga, Beladoug, Farimbula, Baling; on the circle of *Kita*, the province of Kita and Fulainga; on the circle of *Bammako*, Birgo and Fiallo Beladoug. This arrondissement is under the command of a superior officer resident at Kayes. ARRONDISSEMENTS II., III.—These are formed by Leo and Toro (1863), protected countries attached to the circle of *Saldé*; the circle of *Podor*, which comprises the French portion of Toro and a fragment of Dman; the circle of *Dagone*, on which depend the other portion of Dman and a portion of Walo; the suburban district of St Louis, including the other portion of Walo, Rose, Mermaghe, the cantons of Ganthulu, M’yal, Khatté, Gouin, Dandakar, Ndanga, and Taldé; N’bambou and Mame N’gure, sovereign territory of Cayor placed under French protection, as well as the kingdoms of Cayor and Baul; the suburb of Dakar with the island of Gorée, the cantons of Rufisque and the circles of *M’bimé*, *Thos*, *Portudal*, and *Jol*. ARRONDISSEMENT IV.—The Rivers of the South district constitutes the fourth arrondissement under a lieutenant-governor, and comprises the circle of *Kadiakou* or *Saldem*; those of *Gerecane* and *Sekou* on the Casamance, with the protected countries of Baka, Bana, Bama, Yacou, Fialla, the circle of *Fila Afoles* formed by the Nalus and Landman tribes; the circle of the *Rio Pongo* with the country of the Surus; the circle of *Mollucou* with the protected countries of Samo, Kalack, Kalita, Kalum, Tabussu, Manesh, Corzera, and the island of Tombo.

¹ Bafulabé is a native word for “confluence.”

goods £360,000, goods passing as French £200,000, foreign goods £440,000, of which £240,000 represent English, £200,000 Belgian, £120,000 German, £30,000 American articles. In 1882 946 vessels entered and 960 cleared. The budget for the colony in 1884 was £100,320, for the communal expenses £14,560, and for the expenses of the capital £250,000.

History—The navigators of Dieppe are said to have discovered the Senegal about 1480. The Portuguese had some establishments on its banks in the 15th century, and the first French settlements were probably formed in the latter part of the 16th or beginning of the 17th century. Between 1664, when these French settlements were assigned to Colbert's West India Company, and 1763, when the colony was seized by the English, Senegal had passed under the administration of no fewer than seven different companies, none of which attained any great success, though from 1694 to 1724 affairs were conducted by a really able governor, André Brue. In 1777 the French captured from the Dutch Rufisque, Portudal, Joal, and Goébe, and they were confirmed in possession of these places by the treaty of Nimuegen (1778). In 1717 they acquired Fort-Louis and in 1724 Aiguon on the coast of the Sahara, which still belong to the colony. Goébe and the district of Cape Verd were surrendered by the English to the French in 1763, and by the treaty of peace in 1763 the whole of the Senegal was also restored, but the English again captured the colony in the wars of the first empire (Goébe 1800, St. Louis 1805), and, though the treaty of Paris authorized a complete restitution, the French authorities did not enter into possession till 1817. Between that date and 1854 little was effected by the thirty-seven governors who succeeded each other at St. Louis, but in this year the appointment of General Faidherbe proved the turning-point in the history of Senegal. He at once set about subduing the Moorish (Berber) tribes of the Fulas, Bambaras, and Danas, whose "kings," especially the king of the Fulas, had subjected the French settlers and traders to the most grievous and arbitrary exactions, and he bound them by treaty to confine their authority to the north bank of the Senegal. In 1855 he annexed the country of Walo and erected the fort of Médine in the country of Khasse. This last was a bold stroke and the purpose of securing the advancing tide of Moslem invasions, which under Omar el-Hadi (Alagu) threatened the safety of the colony. In 1857 Médine was brilliantly defended by the mulatto Paul Holle against Omar, who with his army of 20,000 men had to retire before the advance of General Faidherbe and turn his attention to the conquest of the native states of the Sudan. By treaty of 1860 Omar recognized the French claim to half of Bambaruk, half of Khasse, Bondi, Kameia, Guay, Goulamaska, Danga, Futa-Toro, Dumar, &c. Since then conquests and provocations have followed in rapid succession under the provisions of Faramba, Foulbe, and Bure de l'Isle. It is sufficient to mention the treaties of 1881 and 1885 by which the confederation of Futa-Jallon and Bure respectively recognized a French protectorate.

SENEGAMBIA, a country in the west of equatorial Africa, comprising, as the name indicates, the regions watered by the Senegal and the Gambia. It lies between 9° and 17° N. lat. and 6° and 17° 30' W. long., being bounded on the N. by the Sahara, W. by the Atlantic, S. by Sierra Leone, and E. by the Joliba or upper Niger. The area is estimated at about 400,000 square miles. Accepting the course of the Senegal and its right hand affluent the Baule as the boundary towards the Sahara, the Joliba as the frontier towards Segu and Upper Guinea, and the watershed between the Mellacorée (Mellacoury) and the Great Scarcees as that between Senegambia and Sierra Leone, we have only for short distances to fall back on a mere conventional delimitation,—in the north between Sidan on the Baule and Sansanding on the Niger *via* Murda, in the south-east, from Sansanding to a point above Nyamina, and finally between the Joliba and the sources of the Great Scarcees. The Senegambian coast extends south-south-west almost in a straight line from the N'diader or Mosquito lagoon (Marigot des Mangroûnes), formerly the northern mouth of the Senegal, to Cape Verd, the most western point of the African continent; then it bends south as far as Cape Roxo; and

afterwards south-east as far as the Mellacorée. With the exception of the two great capes just mentioned, the only headlands of any importance are Cape St. Mary, forming the south side of the estuary of the Gambia, Cape Vergé, between Rio Nuñez and Rio Pongo; and Konary Point, opposite the Los (or Idolois) Islands. The only gulf on the whole coast is that which lies to the south of Cape Verd and contains the island of Gorée (*g v*), the other islets, such as the bay of Sangareah, are mere estuaries or river mouths. Apart from the island in the Senegal on which St. Louis is built and those formed by the deltas of the rivers, the only islands along the coast are Gorée, the Bissagos (or Bijug) Archipelago, the Los Islands, and the

Map of Senegambia

little island of Matakong. The coast in the northern part has the same appearance as that of the Sahara,—low, arid, desolate, and dune-skirted, its monotony relieved only here and there by cliffs and plateaus. Farther south it becomes low, marshy, and clothed with luxuriant vegetation. Behind the low flat seaboard the country rises into a vast Interior plateau terminating eastwards in a mountainous region. Though of no great height, these mountains cover a large area and have numerous ramifications. Farther to the east they sink abruptly towards the Niger valley, while southwards they are prolonged towards Sierra Leone and the interior of Upper Guinea, perhaps forming those Kong Mountains which are said to exist between the ocean and the Niger basin. Under the name of Mounts Badet, Yandi, Maté, Kissi (of which the first form the "Alps" of Futa-Jallon) they descend on the west by a series of terraces to the plains of Senegambia, and on the north they extend to the left bank of the Senegal and even throw out some spurs into the desert beyond. The mountain region is cut by numerous erosion valleys. As to the general altitude nothing is accurately known, but the following points have been determined—Mount Daro, 4068 feet, Kuruwo, 3668, Warnani, 3799, Yenkina, 3560; Bogoma, 3524; Pampaya, 3290. The principal rivers are the Senegal, the Salum, the Yombas, the Gambia, the Casamance, the Cacheo, the Geba, the Rio Grande, the

Boundaries

Coast.

Cassini, the Company, the Rio Nuñez, the Rio Pongo, the Dubraka or Konaky, the Forecarée, and the Mellacore. They all rise in the mountains of the interior or at the foot of the highlands and fall into the Atlantic. Their general direction is from east to west with a south-west deflexion, which becomes always more pronounced as we advance southwards. Unlike these rivers, the Joliba or NIGER (*g*), flowing north and north-east, soon passes beyond Senegambia. Lagoons and backwaters are common, but there are no true lakes of any importance.

Geology

The geological constitution of the country is as yet very imperfectly known, especially in the interior. The low region of the seaboard has a very uniform character. It consists of sandstones or clay rocks and loose beds of reddish soil containing marine shells. At certain points, such as Cape Verd and Cape Roxo, the sandstones crop out, it is the red colour of the sandstone in fact which has given Cape Roxo or Cap Rouge its name. Clay slates also occur, and at intervals these sedimentary strata are interrupted by basaltic basins and volcanic rocks. For instance, the island of Gorée is basaltic, the Bissagos (Bissos) Islands are composed of scoria and other volcanic products, and a great part of the coast to the north of Rio Nuñez consists of basaltic and amygdaloid rocks. The base of the mountains is found in certain places of clay slate, but more generally of granite, porphyry, syenite, or tachyite. In these districts igneous schists and iron ores occur. Iron and gold are found in the mountains and the alluvial deposits. The streams also carry down gold dust. Many of the valleys are covered with fertile soils and there is generally a fertile belt along the river sides, but the rest of the country is rather arid and sterile.

Climate

The climate is far from being so unhealthy as is frequently asserted. Except when yellow fever is raging, Europeans may live there as satisfactorily as at home. There are two seasons, the dry season and the rainy season or winter, the latter contemporaneous with our summer. Along the seaboard the dry season is cool and agreeable, in the interior it is mild only for the first few months which correspond to our winter, and then it becomes a time of intolerable heat. The annual temperature increases as we advance south and more rapidly as we advance east into the interior, except, of course, where an ascent is made to higher altitudes. To the south of Cape Verd the changes of temperature become less and less marked, Bissao has a more equable climate than Gorée. Eastwards the monthly range of the thermometer becomes more extensive. The maximum temperature, which is exceptional at St. Louis, becomes almost the rule at Bakel on the upper Senegal, and at MacCarthy on the Gambia. In the north, on the banks of the Senegal, the north-east trade-winds blow for eight months of the year, the daily land and sea breezes which cool the atmosphere along the seaboard not being felt far inland. During the other four months there prevails a gentle south-west monsoon accompanied with frequent calms, storms, tornadoes, and rain. Southwards along the coast the trade-winds gradually decrease in both strength and duration, while the south-west monsoon becomes more powerful and persistent. The rainy season begins at Gorée between 27th June and 18th July, on the Gambia about 20th June, on the Casamance about the end of May, at the Bissagos Archipelago about the middle of May, and on the Rio Nuñez at the end of April. During the season Senegambia, drenched by heavy rains brought from the coast, everywhere has a uniform appearance. The mean temperature is throughout very close on 81° Fahr. and the range of the thermometer is extremely limited. The rivers overflow and flood the lowlands. Storms or frequent vegetation displays its fullest energy. The fever exhalations are unfortunately also at their worst. At St. Louis, Gorée, Dagana, and all along the Senegal there are 35 days of rain, a slight increase being apparent in the upper part of the river. At St. Mary's, Bathurst, there are 48 days of rain, at Sédina 84, at Bissao 111, at Bakel 137. As we advance as we approach the equator. The number of storms follows almost the same ratio of increase, and showers which last two or three hours at St. Louis give place to whole days of rain on the Casamance and the Rio Nuñez.

Flora

The king of the Senegambian trees is the baobab (*Adansonia digitata*), which sometimes at the height of 24 feet has a diameter of 34 feet and a circumference of 104. A species are very numerous, one species, *A. digitata*, being indeed the commonest of all Senegambian trees and valuable for its ship-timber. Among the palm-trees the *royan* deserves to be mentioned, as the wood resists moisture and the attacks of insects, in some places, as in Cayor, it forms magnificent forests. The wood of the calocalla (*Khaya senegalensis*), a tall tree, is used in joiner's work and ivory, and its bark furnishes a better tone. The mangroves grow sometimes 100 feet high, its branches beginning only at a height of about 25 feet. The tree yielding the famous kola-nut grows on the banks

of the southern streams. It is almost needless to mention the m'bulor, the gonat, the mimosa, fig-trees, orange-trees, cocoa-palms, mango-trees, pomegranates, sycamores, and so on. The dumb, the neten, the tamanno, the dambignon, the gologne, the n'abo yield edible fruits. The cultivated plants are millet, rice, tobacco, bananas, ground-nuts, indigo (wild indigo is also abundant), cotton (also found wild), maize, sugar-cane, and the butter-tree or karité.

The Senegambian lion is quite different from the Barbary lion. Fauna its colour is a deeper and brighter yellow, and its mane is neither so thick nor so long. Other beasts of prey are the leopard, the wild cat, the cheetah, the civet, and the hyena. The wild boar is commoner than the European variety. Antelopes and gazelles occur in large herds all through upper Senegambia, the gazelle is common in the region of the upper Senegal, the elephant is rare, the hippopotamus is gradually disappearing. Crocodiles swarm both in the upper Senegal and the upper Niger. Monkeys and apes of different species (the chimpanzee, the colobus, the cynopithecus, &c.) the squirrel, rat, and mouse abound. The hedgehog, marmot, porcupine, hare, rabbit, &c., are also met with. Among the more noteworthy birds are the ostrich, which migrates to the Sahel, the bustard, occurring in desert and uncultivated districts, the marabout, a kind of stork, with its black bill in the middle and red at the point, which frequents the moist meadow-lands and the lagoons, the brown partridge, the rock partridge, and the quail in the plains and on the mountain sides, and the guinea-fowl in the thickets and brushwood. Along the coast are caught the sperm whale, the manatee, and the cod-fish. Most aquatic animals are the horse, sea, ox, sheep, goat, dog, and camel.

The population of Senegambia cannot be ascertained with any Popula approach to accuracy, but it may be roughly stated at from ten to twelve millions. It comprises three distinct races,—the Moor, the Negro, and the European. The Moors, or rather Berbers (Tanzas, Biskans, and Danush), belong strictly to the right bank of the Senegal and appear in Senegambia only exceptionally. The Negroes form the bulk of the population. They are divided into the Fulas (Fulbe, Fulah, or Follat), Toucouleurs, Mandingoes, Sarrakolés, Wolofs, Sereres, Diolas, Bambaras, Balantes, Balaies, Pepels, Nalms, Landumans, Bagas, and Susus. The Fulas inhabit Futa, Dama, Bondi, and Futa-Jallon; they have a reddish complexion and almost straight hair, their body fairly stout, but their limbs slim. They are gentle and hospitable, but addicted to theft. The Toucouleurs, Fula and half-bred, belonging originally to Futa-Jallon, are similar to the Negro people, they are taciturnous, warlike, fond of plunder, and fanatical in their Mohammedanism. The Mandingoes or Malinkés inhabit the banks of the upper Niger and the upper Senegal and the western slope of the mountains of Futa-Jallon. They comprise the Mandingo proper, occupying Manding, and the Malinké and Soninké, scattered about Bambar, Buri, and Faidinga. The name of Walo or Wangara. They are also found in all the immense tract which extends to the north of the Kong Mountains. They are tall of stature and of great muscular strength. The Sarrakolés are one of the branches of the Bambara race produced by crossing with the Fulas. Their character is mild and pacific. Scattered about in Gony, Kament, and Guidimaka, they are fond of trade and engage in it with activity. The Wolofs and the Sereres inhabit the seaboard from St. Louis to Cape Verd and the left bank of the Senegal from its mouth to Richard Toll and Dagana. They are tall and robust, with black and glossy skin. Most of them are fetishists. The Diolas have flat noses, thick lips, harsh features, and a prominent belly; the body is tattooed. The Bambaras, who have invaded Karta and Khasso, have a coppery black complexion and fuzzy hair, their cheeks are marked with deep scars. The Balantes inhabit the left bank of the Casamance; they are as cruel and as fond of pillage as the Mandingoes, but are very generous towards the vanquished. The Buriates live on the banks of the Rio Grande and the Papels in the valley of the Cahoe and the Gela. The Nalms and the Landumans are tributary to the French ports of the Rio Nuñez and the Rio Pongo. Islam is gradually detaching them from fetishism. The Bagas occupy the coast between the Rio Nuñez and the Rio Pongo. The Susus formerly dwelt on the upper Niger, but they were expelled by the invasion of the Mohammedans and are at the present time settled in the villages of the Rio Pongo. The principal languages of Senegambia are Wolof, Fula, Serere, Mandingo, and Arabic. Wolof is spoken in a large part of Senegambia, in Wolof, Walo, Cayor, Dakar, Baol, Sine, Salum, and in the towns of St. Louis and Gorée. The river Senegal marks the line of separation between Wolof and Arabic. Fula is the language of the Fulas and the Toucouleurs, Mandingoes comprise several dialects,—Malinké, Soninké, Bambara. The few Europeans are mainly civil and military officials, and traders. White planters are rare. The native of Senegambia are generally divided into two quite distinct classes,—freemen and slaves. The groves are a kind of birds or crocodiles who live at the expense of those whose plagues they slug. Polygamy is generally practised. Circumcision of the adults of both sexes is a rite accompanied with superstitious

¹ A very complete account of this nut will be found in Nachtigal, *Sahara und Sudan*.

observances. Every canton, every village in independent Senegambia is governed either by a chief ("king") or by an "almamy" elected by a group of villagers.

History Senegambia is divided into French Senegambia (with the territories placed under French protection), English Senegambia, Portuguese Senegambia, an independent Senegambia, comprising the native states not under the protection of a European power. French Senegambia is called the colony of SENEGAL (*q.v.*). English Senegambia comprises the establishments of the GAMBIA (*q.v.*) and the islands of Los. Portuguese Senegambia consisted till quite recently of Bissagos Archipelago and the "factories" of Ziguinchor on the Casamance, Cacheo and Faum on the Rio Cacheo, and Geba on the Geba. By an agreement effected in 1886 Portugal ceded Ziguinchor to France in exchange for Massabé on the Loungo coast, Germany, which seemed at one time disposed to place various territories of Dubetka, Koba, and Kabita under its protection, has formally abandoned the plan. The independent states are not very numerous, but for the most part they are more extensive than the protected countries. They were quite recently—Jolof, lying between the Senegal and the Gambia in one direction and between the Falemé and the ocean in the other, Buté in the Manding region, a territory abounding in gold, Gudimaka in Gambia, on the right bank of the Senegal. There still remain among the more important Kaarta, the country of Segu, and Futa-Jallon.

Communication Several lines of English, French, and German packets call at the Senegambian ports, and small steamers ascend the navigable portions of the rivers. A railway unites St. Louis and Dakar, and another line is being constructed from Kayes to Bafoulabé (on the upper Senegal), with a projected extension to Bamako. There is telegraphic communication between Dakar and St. Louis, and a second line puts all the ports of the upper Niger and the left bank of the Senegal into connexion with St. Louis, which has touch of Europe by means of a submarine cable passing by way of the Canary Islands to Cadix. The foreign trade of Senegambia consists in the exportation of gums, ground-nuts, sesame, oil, india-rubber, birds' feathers, hides, wax, and ivory, coffee from the Rio Nuñez, and rice from the Casamance, and the importation of iron, alcoholic liquors, firearms, ammunition, coral, beads, tobacco, preserved foods, and lime calico (gumbe).

(D. K*)

SENIOR, NASSAU WILLIAM (1790-1864), English political economist, was born at Compton, Berks, on 28th September 1790, the eldest son of the Rev J. R. Senior, vicar of Durnford, Wilts. He was educated at Eton and Magdalen College, Oxford, at the university he was a private pupil of Richard Whately, afterwards archbishop of Dublin, with whom he remained connected by ties of lifelong friendship. He took the degree of B.A. in 1811, was called to the bar in 1819, and in 1836, during the chancellorship of Lord Cottenham, was appointed a master in chancery. On the foundation of the professorship of political economy at Oxford in 1835, Senior was elected to fill the chair, which he occupied till 1830, and again from 1847 to 1852. In 1830 he was requested by Lord Melbourne to inquire into the state of combinations and strikes, to report on the state of the law, and to suggest improvements in it. He was a member of the Poor Law Inquiry Commission of 1832, and of the Handloom Weavers Commission of 1837, the report of the latter, published in 1841, was drawn up by him, and he embodied in it the substance of the report he had prepared some years before on combinations and strikes. He was also one of the commissioners appointed in 1861 to inquire into popular education in England. In the later years of his life, during his visits to foreign countries, he studied with much care the political and social phenomena they exhibited. Several volumes of his journals have been published, which contain much interesting matter on these topics, though the author probably rated too highly the value of this sort of social study. Senior was for many years a frequent contributor to the *Edinburgh Quarterly*, *London*, and *North British Reviews*, dealing in their pages with literary as well as with economic and political subjects. He died at Kensington on 4th June 1864.

His writings on economic theory consisted of an article in the *Encyclopædia Metropolitana*, afterwards separately published as *An Outline of the Science of Political Economy* (1836, 3d ed. 1854), and his lectures delivered at Oxford. Of the latter the following were printed—*An Introductory Lecture* (1827, 3d ed. 1881), *Two Lec-*

tures on Population, with a correspondence between the author and Malthus (1831); *Three Lectures on the Transmission of the Precious Metals from Country to Country*, and *The Mercantile Theory of Wealth* (1828), *Three Lectures on the Cost of obtaining Money and on some Effects of Private and Government Paper Money* (1830), *Three Lectures on Wages and on the Effects of Absenteeism, Slavery, and War*, with a *Preface on the Causes and Remedies of the Present Disturbances* (1830, 2d ed. 1831), *A Lecture on the Production of Wealth* (1847), and *Four Introductory Lectures on Political Economy* (1852). Several of his lectures were translated into French by M. Auvibrène under the title of *Principes Fondamentaux d'Economie Politique* (1835). Senior also wrote on administrative and social questions—*A Letter to Lord John Russell on a Letter from the Irish Poor, Communication of Taxes, and a Provision for the Irish Roman Catholic Clergy* (1831, 8d ed. 1832, with a preface containing suggestions as to the measures to be adopted in the "present emergency"), *Statement of the Provision for the Poor and of the Condition of the Labouring Classes in a considerable portion of America and Europe, being the Preface to the Foreign Communications in the Appendix to the Poor Law Report* (1835), *On National Property*, *On the Progress of the Present Administration*, *On the Successors* (anon., 1835), *Lectures on the Factory Act, as it affects the Cotton Manufacture* (1837), *Suggestions on Popular Education* (1861), *American Slavery* (in part a reprint from the *Edinburgh Review*, 1862), *An Address on Education delivered to the Social Science Association* (1863). His contributions to the reviews were collected in volumes entitled *Essays on Fiction* (1864), *Bibliographical Notices* (1865, chiefly of the *Edinburgh Review*), and *Philosophical Essays* (1865). In 1859 appeared his *Journal kept in Turkey and Greece in the Autumn of 1857 and the Beginning of 1858*, and the following were edited after his death by his daughter—*Journals, Conversations, and Essays relating to Ireland* (1868), *Journals kept in France and Italy from 1843 to 1863, with a Sketch of the Revolution of 1848* (1871), *Conversations with Thiers, Guizot, and other Distinguished Persons during the Second Empire* (1878), *Conversations with Distinguished Persons during the Second Empire, from 1830 to 1836* (1880), *Conversations and Journals in Egypt and Malta* (1889), also in 1872 *Correspondence and Conversations with Alexis de Tocqueville from 1834 to 1859*.

Senior's literary criticisms do not seem to have even won the favour of the public; they are, indeed, somewhat formal and academic in spirit. The author, while he had both good sense and right feeling, appears to have wanted the deeper insight into the genuineness, and the ethical test, which are necessary to make a critic of a high order, especially in the field he chose,—that, namely, of imaginative literature. His tracts on practical politics, though the theses they supported were sometimes questionable, were ably written and are still worth reading, but cannot be said to be of much permanent interest. But his name will continue to hold an honourable, though secondary, place in the history of political economy. Senior regards political economy as a purely deductive science, all the truths of which are inferences from four elementary propositions. It is, in his opinion, wrongly supposed by J. S. Mill and others to be a hypothetical science,—founded, that is to say, on postulates not corresponding with social realities. The premises from which it sets out are, according to him, not assumptions but facts. It concerns itself, however, with wealth only, and can therefore give no practical counsel as to political action. It can only suggest considerations which the politician should take into account in the study of the questions with which he has to deal. The conception of economics as altogether deductive is certainly erroneous, and puts the science from the outset on a false path. But deduction has a real, though limited, sphere within it. Hence, though the chief difficulties of the subject are not of a logical kind, yet accurate nomenclature, strict definition, and rigorous reasoning are of great importance. To these Senior has given especial attention, and, notwithstanding occasional pedantries, with very useful results. He has in several instances improved the forms in which accepted doctrines were habitually stated. He has also done excellent service by pointing out the arbitrary novelties and frequent inconsistencies of terminology which deface Ricardo's principal work,—as, for example, his use of "value" in the sense of "cost of production," and of "high" and "low" wages in the sense of a certain proportion of the product as distinguished from an absolute amount, and his peculiar employment of the epithets "fixed" and "circulating" as applied to capital. He shows, too, that in numerous instances the premises assumed by Ricardo are false. Thus he cites the assertions that rent depends on the difference of fertility of the different portions of land in cultivation, that the labourer always receives precisely the necessities, or what custom leads him to consider the necessities, of life, that, as wealth and population advance, agricultural labour becomes less and more profitably productive, and that therefore the share of the produce taken by the landlord and the labourer must constantly increase, whilst that taken by the capitalist must constantly diminish, and he demes the truth of all these propositions. Besides adopting some terms, such as that of "natural agents," from Say, Senior

introduced the word "abstinence"—which, though obviously not free from objection, is for some purposes useful—to express the conduct of the capitalist which is remunerated by interest, but in defining "cost of production" as the sum of labour and abstinence necessary to production he does not seem to see that an amount of labour and an amount of abstinence are dissipated, and do not admit of reduction to a common quantitative standard. He has added some important considerations to what had been said by Smith on the division of labour. He distinguishes usefully between the rate of wages and the price of labour. But in seeking to determine the law of wages he falls into the error of assuming a determinate wage-fund, and states as an economic truth what is only an identical proposition in arithmetic. Whilst entertaining such an exaggerated estimate of the services of Malthus, that he not vaguely pronounces him "as a benefactor of mankind on a level with Adam Smith," yet yet shows that he modified his opinions on population considerably in the course of his career, regards his statements of the doctrine with which his name is associated as vague and ambiguous, and asserts that, "in the absence of disturbing causes, subsistence may be expected to increase in a greater ratio than population." It is urged by Pénin, and must, we think, be admitted, that by his isolation of economics from morals, and his assumption of the desire of wealth as the sole motive-force in the economic domain, Senoi has, in common with most of the other followers of Smith, tended to set up egotism as the legitimate rule and guide of practical life. It is no sufficient answer to this charge that he makes formal reserve in favour of higher ends. From the scientific side, Cliffe Leslie has abundantly proved the unsatisfactory nature of the abstraction involved in the phrase "desire of wealth," and the inadequacy of such a principle for the explanation of economic phenomena. (J K I)

SENILIS, a town of France, in the department of Oise, lies on the right side of the Nonette, a left-hand affluent of the Oise, 34 miles north-north-east of Paris by the Northern Railway on the branch line (Chantilly-Crépy) connecting the Paris-Creil and Paris-Soussons lines. In 1881 it had only 6870 inhabitants, but its antiquity, its historical monuments, and its situation in a beautiful valley, in the midst of the three great forests of Hallatte, Chantilly, and Eimmonville, render it interesting. Its Gallo-Roman walls, 23 feet high and 13 feet thick, are, with those of St Lizier (Ariège) and Bouges, the most perfect in France. They enclose an oval area 1024 feet long from east to west and 794 feet wide from north to south. At each of the angles formed by the broken lines of which the circuit of 2756 feet is composed stands or stood a tower, numbering originally twenty-eight, and now only sixteen, they are semicircular in plan, and up to the height of the wall are unperched. The Roman city had only two gates, the present number is five. The site of the praetorium was afterwards occupied by a castle occasionally inhabited by the kings of France from Clovis to Henry IV and still represented by ruins dating from the 11th, 13th, and 16th centuries. In the neighbourhood of Senlis the foundations of a Roman amphitheatre, 138 feet by 105, have also been discovered. The old cathedral of Notre Dame (12th, 13th, and 16th centuries) was begun in 1155 on a vast scale, but owing to the limited resources of the diocese progress was slow and the transept was finished only under Francis I. The total length is 269 feet, but the nave (98 feet high) is shorter than the choir. At the west front there are three doors and two bell towers. The right-hand tower (256 feet high) is very striking: it consists, above the belfry stage, of a very slender octagonal drum with open-work turrets and a spire with eight domed windows. The left-hand tower, altered in the 16th century, is crowned by a balustrade and a sharp roof. In the side portals, especially in the southern, the flamboyant Gothic is displayed in all its decay. Externally the choir is extremely simple. In the interior the sacristy pillars with capitals of the 10th century are noteworthy. The episcopal palace, now an archaeological museum, dates from the 13th century; the old collegiate church of St Frambourg was rebuilt in the 12th century in the style which became characteristic of the "saintes chapelles" of the 13th and 14th centuries, St Pierre, though enclosed by cavalry barracks, has preserved

its two towers. The ecclesiastical college of St Vincent, occupying the old abbey of this name, has a very elegant church, the date of which has been greatly disputed by archaeologists, who sometimes wrongly refer it to Queen Anne of Russia. The town-house and several private houses are also of architectural interest.

Senlis can be traced back to the Gallo-Roman township of the Silvaneches which afterwards became Augustomagus. Christianity was introduced by St Iknel at the close of the 3d century. During the first two dynasties of France Senlis was a royal residence. After the dismemberment of the Carolingian empire it belonged to the counts of Vermandois and then to the royal domain, and obtained a communal charter in 1173. Its bishop, Guein, elected in 1214, signalled himself at the battle of Bouvines. The burgesses took part in the Jacques of the 14th century, then sided with the Burgundians and the English, whom, however, they afterwards expelled. The League was there beaten by the duke of Longueville and La Nöe. In the time of Henry IV the local manufactures employed 200 masters and 4000 men, but all industrial activity has now disappeared. The bishopric was suppressed at the Revolution, and this suppression was confirmed by the Concordat.

SENNA (Arab *sand*), a popular purgative, consisting of the leaves of two species of *Cassia*, viz. *C. acutifolia*, Del. and *C. angustifolia*, Vahl. *C. acutifolia* is a native of many districts of Nubia, e.g., Dongola, Berber, Kordofan, and Senaar, but is grown also in Timbuctoo and Sokoto. The leaflets are collected twice a year by the natives, the principal crop being gathered in September after the rainy season and a smaller quantity in April. The leaves are dried in the simplest manner by cutting down the shrubs and exposing them on the rocks to the burning sun until quite dry. The leaflets then readily fall off and are packed in large bags made of palm leaves, and holding about a quintal each. These packages are conveyed by camels to Assouan and Daraa and thence to Cairo and Alexandria, or by ship by way of Massowah and Suakim. The leaflets form the Alexandrian senna of commerce. Formerly this variety of senna was much adulterated with the leaves of *Solenostemma Aegypti*, Hayne, which, however, are readily distinguishable by their minutely wrinkled surface. Of late years Alexandrian senna has been shipped of much better quality. Occasionally a few leaves of *C. obovata*, Coll., may be found mixed with it. *C. angustifolia* affords the Bombay, East Indian, Arabian, or Mecca senna of commerce. This plant grows wild in the neighbourhood of Yemen and Hadramaut in the south of Arabia, in Somali Land, and in Sind and the Punjab in India. The leaves are chiefly shipped from Mocho, Aden, Jeddah, and other Red Sea ports to Bombay and thence to Europe, the average imports into Bombay amounting to about 250 tons annually, of which one-half is re-exported. Bombay senna is very inferior in appearance to the Alexandrian, as it frequently contains many brown and decayed leaflets and is mixed with leaf-stalks, &c. *C. angustifolia* is also cultivated in the extreme south of India, and there affords larger leaves, which are known in commerce as Timnevelly senna. This variety is carefully collected, and consists almost exclusively of leaves of a fine green colour, without any admixture of stalks. It is exported from Tuticorin.

Senna appears to have been introduced into Europe about the 9th century by Arabian physicians, by whom, however, the pods seem to have been preferred to the leaves. The medicinal activity of senna leaves appears to be due to a very unstable colloid glucoside to which the name of cathartic acid has been given. It is readily decomposed by a temperature much below 100° Fahr. (*Pharm. Jour. Trans.*, [3], xv. p. 704), and hence cold preparations of senna are the most active. In the free state it is soluble in dilute alcohol and in water, forming a brown solution, but is almost insoluble in strong alcohol and entirely so in ether and chloroform. Combined with ammonia it forms an active purgative. Two bitter principles named *sennaridin* and *senna-pyridin* have been extracted from senna by Ludwig; the former is soluble and the latter insoluble in ether. A yellow colouring matter has also been obtained from senna, but it appears probable that it is only a decomposition product of cathartic acid. Senna must be included among the irritant purgatives, since cathartic acid has no aperient effect when injected into the

blood. Owing to its colloid character, it is absorbed with difficulty, and its action is thus exerted throughout the greater part of the intestinal canal.

SENNACHERIB See **BABYLONIA**, vol III p 187, and **ISRAEL**, vol XIII p 413 sq.

SENNAR See **SENAAR**.

SENS, a town of France, chef-lieu of an arrondissement in the department of Yonne, lies on the right side of the Yonne near its confluence with the Vanne, and on the railway from Paris to Lyons, 70 miles south-east of the former city at the intersection of the line from Orleans to Troyes. It derives its importance from its antiquity and its archiepiscopal see. The cathedral of St Etienne occupies the site of an ancient temple on which St Savinian is said to have built, at the close of the 3d century, a little church consecrated to the Virgin. The present Gothic cathedral, erected between 1123 and 1168, subsequently underwent alteration in the 13th century and again under Louis XII. The west front measures 154 feet in breadth, the middle portal has good sculptures, representing the parable of the virgins and the story of St Stephen. The right-hand portal contains twenty-two remarkable statuettes of the prophets, which have suffered considerable injuries. Above this portal rises the stone tower, decorated with armorial bearings and with statues representing the principal benefactors of the church. The bells in the campanula, by which the tower is surmounted, enjoyed immense reputation in the Middle Ages, the two which still remain, La Savinienne and La Potentienne, weigh respectively 15 tons 7 cwt and 13 tons 13 cwt. The left portal is adorned with two bas-reliefs, Liberality and Avarice, as well as with the story of John the Baptist. The portal on the north side of the cathedral is one of the finest examples of French 16th-century sculpture. Glass windows of the 12th to the 16th century are preserved, some of them representing the legend of St Thomas of Canterbury. Among the interior adornments are an altarpiece finely carved in stone, the tomb of the dauphin (son of Louis XV) and his consort, Marie Joseph of Saxony, one of the masterpieces of Coustou, and bas-reliefs from the mausoleum of Cardinal Duprat. The treasury contains a fragment of the true cross presented by Charlemagne, and the vestments of St Thomas of Canterbury. It was in the cathedral of Sens that St Louis, in 1234, married Marguerite of Provence, and five years later deposited the crown of thorns. The official buildings of the cathedral, dating from the 13th century, have been restored by Viollet-le-Duc. The old judgment-hall and the dungeons had remained intact, in the first story is the synod hall, vaulted with stone and lighted by beautiful grisaille windows. A Renaissance structure connects the buildings with the archiepiscopal palace, which also dates from that period. The oldest of the other churches of Sens is St Savinian, the foundation of which dates from the 3d century, while the crypt is of the early part of the 11th, and the upper portions of the bell-tower of the first years of the 13th. The contents of the museum of sculptured stones have been mainly derived from the old fortifications, which were themselves constructed during barbarian invasion from the ruins of public monuments. The only town gate still preserved is that known as the dauphin's (1777). In the public library are a number of MSS and a famous missal with ivory covers. The chemist Thénard has his statue in the town. The population in 1881 numbered 13,440.

Sens, when the capital of the Senones, one of the most powerful peoples of Gaul, bore the name of Agneticum. It was not finally subdued by the Romans till after the defeat of Vercingetorix. On the division of Gaul into seventeen provinces under the emperor Valens, Agneticum became the metropolis of the 4th Lugdunensis Tertia, dioceses, amphitheatres, triumphal arches, and aqueducts were all built in the town by the Romans. It was the meeting point of six great highways. The inhabitants, converted to Chris-

tianity by the martyr Savinian and Potentian, held out against the Alemanni and the Franks in 356, against the Saracens in 781 or 788, and finally against the Normans in 886,—the last having besieged the town for six months. At the commencement of the feudal period Sens was governed by counts, who had become hereditary towards the middle of the 10th century, and the contests of these counts with the archbishops or with their feudal superiors often led to much bloodshed and disaster. Several councils were held at Sens, notably that at which St Bernard and Abelard met. The burghers in the middle of the 12th century formed a defensive association which carried on war against the clergy, and Philip Augustus revoked the commune. In the adon of its Catholicism Sens massacred the Protestants in 1593, and it was one of the first towns to join the League. Henry IV did not effect his entrance till 1594, and he then deprived the town of its privileges. In 1622 Paris, hitherto suffragan to Sens, was made an archbishopric, and the bishoprics of Châlons, Orleans, and Meaux were transferred to the new jurisdiction. In 1791 the archbishopric was reduced to a bishopric of the department of Yonne. Suppressed in 1801, the see was restored in 1807 with the rank of archbishopric. The town was occupied by the invaders in 1814 and 1870-71.

SENSITIVE PLANT See **MIMOSA**, comp **PHYSIOLOGY**, vol XIX p 62.

SEONI or **SEONEE**, a British district of India, in the Central Provinces, lying between 21° 36' and 22° 58' N lat and 79° 14' and 80° 19' E long, with an area of 3247 square miles, is bounded on the N by Jabalpur, on the E by Mandla and Balighat, on the S by Nagpur and Bhambhara, and on the W by Narsimhapur and Chhindwara. Seoni is a portion of the upland tract formed by the Satpura Hills which extend along the south bank of the Nerbadda (Nerbudda) from the plains of Bhoach on the west to the Maikal range in the east, and it is remarkable for the beauty of its scenery and the fertility of its valleys. The northern and western portions of the district include the plateaus of Lakhnadon and Seoni, the eastern section consists of the watershed and elevated basin of the Wanganga; and in the south-west is a narrow strip of rocky land known as Dongartal. The plateaus of Seoni and Lakhnadon vary in height from 1800 to 2000 feet, they are well cultivated, clear of jungle, and their temperature is always moderate and healthy. Geologically the north part of Seoni consists of trap hills and the south of crystalline rock. The soil of the plateaus is the rich black cotton soil formed by disintegrated trap, of which about two-thirds of the district are said to consist, but towards the south, where cliffs of gneiss and other primitive formations occur, the soil is silicious and contains a large proportion of clay. Seoni is hilly throughout, the hills for the most part being clothed with small stunted trees, but in the valleys and on the plateaus forest trees are very thinly scattered and are seldom of large size. The chief river of the district is the Wanganga, with its affluents the Hiri, Sagar, Theil, Byna, and Thanwar; other streams are the Tinar and the Sher, affluents of the Nerbadda. The average annual rainfall is about 50 inches.

The census of 1881 returned the population of Seoni district at 334,733 (males 167,925, females 166,808), of these 179,705 were Hindus, 13,442 Mohammedans, 69 Christians, and 139,441 aboriginals. Seoni (q.v.) is the only town with a population exceeding 10,000. Of the total district area of 3247 square miles only 1008 are cultivated, and of the portion lying waste 618 are returned as cultivable. Wheat forms the staple crop, rice and other food-grains are also extensively grown, and among miscellaneous products are cotton, fibres, and sugar-cane. In 1883-84 the gross revenue of Seoni amounted to £35,419, of which the land-tax yielded £15,379. Trade is chiefly carried on by means of markets in the towns. Manufactures consist of coarse cloth and some pottery of superior quality made at Kailhwara. At Kailhwara, in the midst of the forest, leather is beautifully tanned. The only means of communication is by road, the aggregate length of which is estimated at 90 miles. Seoni came under British rule early in the 19th century, on the downfall of the Nagpur power, and it was formed into a separate district in 1861.

SEONI, principal town and administrative headquarters of the above district, is situated in 22° 5' 30" N lat and 79° 35' E long, midway between Nagpur and Jabalpur.

It was founded in 1774 by Mohammed Awn Khán, and contains large public gardens, a fine market-place, and a handsome tank. In 1881 the population was 10,203.

SEPIA is a valuable and much used deep brown pigment obtained from the ink-sacs of various species of CUTTLE-FISH (*q.v.*), that from which it is principally obtained is *Sepia officinalis*, a native of the Mediterranean, and especially abundant in the upper parts of the Adriatic, where it is a prized article of food. To obtain sepia the ink-sac is, immediately on the capture of the animal, extracted from the body and speedily dried to prevent putrefaction. The contents are subsequently powdered, dissolved in caustic alkali, and precipitated from the solution by neutralizing with acid. The precipitate after washing with water is ready to make up into any form required for use.

Sepia-bone or *cuttle-bone* consists of the internal "shell" or skeleton of *Sepia officinalis* and other allied species. It is an oblong convex structure from 4 to 10 inches in length and 1 to 3 inches in greatest width, consisting internally of a highly porous cellular mass of carbonate of lime with some animal matter covered by a hard thin glassy layer. It is used principally as a polishing material and for tooth powder, and also as a moulding material for fine castings in precious metals.

SEPOY, the usual English spelling of *sipáh*, the Persian and Urdu term for a soldier of any kind. The word *sipáh*, "army," from which *sipáh*, "soldier," is derived, corresponds to the Zend *spáda*, Old Persian *spáda*, and has also found a home in the Turkish, Kurdish, and Pashto (Pushtu) languages (see Justi, *Handbuch der Zendsprache*, p. 303, 6), while its derivative is used in all Indian vernaculars, including Tamil and Burmese, to denote a native soldier, in contradistinction to *gorá*, "a fair-complexioned (European) soldier." Towards the middle of the 18th century efforts were made by the East India Company to train natives of good caste, both Hindus and Mohammedans, for military service under the company. Though they were made to use the musket, they remained for some time chiefly armed in the fashion of the country, with sword and target, they wore the Indian dress—the turban, vest, and long drawers—and were provided with native officers under English superior command. Under their European leaders they were found to do good service and to face danger with constancy and firmness. In the progress of time a considerable change took place, and natives of every description were enrolled in the service. Though some corps that were almost entirely formed of the lowest classes achieved considerable reputation for valour in the field, it was not considered safe to encourage the system, and the company reverted to their practice of recruiting from none but the most respectable classes of native society. It is on record that a corps of 100 sepoys from Bombay and 400 from Tellicherry joined the army at Madras in 1747, that the regular sepoys at Madras were employed in the defence of Arcot (1761), and that a company of Bombay sepoys were present at the victory of Plassey.

For instances of the early occurrence of the word see Bunnell and Yale's *Glossary of Anglo-Indian Terms*, &c. On the history of the sepoys compare Captain Williams's *Historical Account of the Rise and Progress of the Bengal Infantry* (London, 1817), Captain Bloom's *History of the Rise and Progress of the Bengal Army* (Calcutta, 1850), Colonel Wilson's *History of the Madras Army* (London, 1832-55, in 3 volumes); No. xxxvi. of the *Quarterly Review*; and the military histories of India generally.

SEPTEMBER, the seventh month of the old Roman year, had thirty days assigned to it. By the Julian arrangement, while retaining its former name and number of days, it became the ninth month. The Ludi Romani (Ludi Romani) in honour of Jupiter, Juno, and Minerva began on the 4th of September. The principal ecclesiastical feasts falling within the month are—the Nativity of the Blessed Virgin on the 8th, the Exaltation of the Holy Cross on the 14th, St Matthew the Apostle on the 21st, and St Michael the Archangel on the 29th. September

was called "harvest month" in Charlemagne's calendar, and it corresponds partly to the Fructidor and partly to the Vendémiaire of the first French republic.

SEPTICÆMIA. After a wound, whether the result of accident or of operation by the surgeon, blood-poisoning may occur. Sepsis or putrefaction in the wound is the most evident local condition which has been associated by clinical observers with blood-poisoning, and hence the term "septicæmia." Within recent years the relation of micro-organisms to the different forms of blood-poisoning has come prominently into notice, putrefaction is now known to be only one of the fermentative changes due to the presence of certain micro-organisms in a wound, and it is admitted that there are many organisms which, when they enter a wound, may give rise to fermentative changes that are non-putrefactive. (See SCHIZOMYCETES.)

Organisms have recently been divided into two great groups,—those which can only grow in dead or decaying matter and those which can grow in the living tissues and in the blood, which in this relation must be looked upon as a tissue. The first group has been termed "saprophytic." The second group may be termed "pathogenic," to distinguish them from the saprophytic variety. But no distinct line of demarcation can yet be drawn between these two groups, and as a matter of fact some pathogenic organisms may equally with the saprophytic find a habitation in dead and decaying matter. Yet there can be no doubt that the more common varieties of septic organisms or saprophytes can only grow in dead or decaying matter, and that the living tissues, more especially when their power of vitality is great, are able to resist and destroy the saprophytes. There are also some organisms which, as far as is known at present, may be innocuous and give rise to no symptoms, local or general, when they are implanted in the human body. When an organism finds in the tissues a fit habitation for its growth and development, the elements in the tissue are broken up, and the products are termed a "ptomaine" (πρωίμα). This ptomaine may irritate the wound and prevent healing, it may also be absorbed into the blood and poison it, hence the term "ptomaine poisoning." Both the saprophytic and the pathogenic organism may form a ptomaine in the wound. When the wound is due to a saprophyte the absorption of the ptomaine has been termed "sajnamia", the ptomaine of the saprophyte has been called "sepsin." No special name has yet been given to the ptomaine formed in the wound by the pathogenic organism, nor has any name been given to the condition due to the absorption of the ptomaine formed by the pathogenic organism. Our knowledge is not yet sufficient to enable us to separate these two varieties of ptomaine poisoning. There can, however, be little doubt that they do exist as separate conditions, and also that there can be little doubt that in some instances both forms of poisoning may be present at one and the same time.

The pathogenic organism, however, has another power which gives rise to an entirely separate condition. Not only may it form its ptomaine in the wound, but the organism itself can enter into and be carried by the blood-stream and lymph-stream to distant parts. It can live in the blood or lymph-stream and can grow there. It may be arrested in the capillaries of the blood-vessels, or in the lymphatic glands of the lymph-vessels, and in these situations may form, so to speak, a colony of organisms which develop and form ptomaines; and the ptomaines, passing into the blood, may still further poison the patient. This power of the pathogenic organism is infective, and the term "infection" has been applied to the process. These colonies or secondary foci of infection often go on to suppuration, hence the term "secondary" applied to the

abscesses which have long been observed in some forms of blood-poisoning. It was at one time thought that the pus-cells in the original wound passed into the blood, and, being caught in the capillaries, were the cause of the abscess-formation in the parts distant from the wound, hence the term "pyæmia" or pus in the blood. The pus-cells may enter the blood-stream, it is not, however, the cellular element that is the essence of the condition, but the organism which the cellular element may carry along with it. The hectic condition observed in a case of long-continued suppuration is in all probability a chronic form of blood-poisoning. In very acute cases, in which the poison is either concentrated, virulent, or in large quantity, death may occur within a very few hours. In other cases the condition may become chronic, and if the strength of the patient can be kept up by stimulants recovery often takes place. The chances of recovery are much greater when the condition is not truly an infective one. When the manufacture of the ptomaine is only in the wound, the organism may be there destroyed by the use of powerful antiseptics or antifermentatives. The primary cause being removed, the patient may then be saved. When, however, the pathogenic organism gets into the blood-stream and distant foci of infection are formed, the chances of ultimate recovery are greatly diminished. Various unsuccessful attempts have been made by the internal administration of antifermentatives so to alter the blood that the micro-organism cannot find in it or the tissues a fit nidus. The point to attend to is to prevent organismal fermentation in wounds by careful antiseptic or rather antifermentative precautions. Just as the word "septicæmia" has a more general application than can now be strictly allowed if we look to the derivation of the word and the present state of our knowledge, so the word "antiseptic" is applied to all substances which prevent organismal fermentation, although many of these organisms are undoubtedly non-septic in their character.

SEPTUAGINT. The Septuagint (*oi 6, LXX*) or Alexandrian version of the Old Testament seems to be named from the legend of its composition by seventy, or more exactly seventy-two, translators. In the *Letter of Aristeas* (Aristeus)¹ this legend is recounted as follows. Demetrius Phalereus, keeper of the Alexandrian library, proposed to King Ptolemy II. Philadelphus to have a Greek translation of the Jewish law made for the library. The king consented and sent an embassy, of which the author of the letter was a member, to the high priest Eleazar at Jerusalem asking him to send six ancient, worthy, and learned men from each of the twelve tribes to translate the law for him at Alexandria. Eleazar readily consented and sent the seventy-two men with a precious roll of the law. They were most honourably received at the court of Alexandria and conducted to the island (Pharos), that they might work undisturbed and isolated. When they had come to an agreement upon a section Demetrius wrote down their version; the whole translation was finished in seventy-two days. The Jewish community of Alexandria was allowed to have a copy, and accepted the version officially,—indeed a curse was laid upon the introduction of any changes in it.

There is no question that this *Letter* is spurious.² Aristeas is represented as a heathen, but the real writer must have been a Jew and no heathen. Aristeas is represented as himself a member of the embassy to Eleazar, but the author of the *Letter* cannot have been a contemporary of the events he records, else he would have known

that Demetrius fell out of favour at the very beginning of the reign of Philadelphus, being said to have intrigued against his succession to the throne.³ Nor could a genuine honest witness have fallen into the absurd mistake of making delegates from Jerusalem the authors of the Alexandrian version. The forgery, however, is a very early one. "There is not a court-title, an institution, a law, a magistracy, an office, a technical term, a formula, a peculiar phrase in this letter which is not found on papyri or inscriptions and confirmed by them."⁴ That in itself would not necessarily imply a very early date for the piece; but what is decisive is that the author limits canonicity to the law and knows of no other holy book already translated into Greek. Further, what he tells about Judæa and Jerusalem is throughout applicable to the period when the Ptolemies bore sway there and gives not the slightest suggestion of the immense changes that followed the conquest of Palestine by the Seleucids.⁵ Thus, too, it is probable that the Jewish philosopher Aristobolus, who lived under Ptolemy Philometor (180-145), derived his account of the origin of the LXX from this *Letter*, with which it corresponds.⁶

If now the *Letter* is so old, it is incredible that it should contain no elements derived from actual tradition as to the origin of the LXX, and we must try to separate those from the merely fabulous. To this end we must consider what is the main aim and object of the forgery. The chief thing in the *Letter* is the description of a seven days' symposium of the seventy translators at the Alexandrian court, during which each of them has a question to answer, and raises the admiration of the king for the wisdom produced among the Jews by their knowledge of the law. Further, very great weight is laid on the point that the LXX is the official and authoritative Bible of the Hellenistic Jews, having been not only formally accepted by the synagogue at Alexandria but authorized by the high priest at Jerusalem and the seventy elders who are in fact its authors. Other matters receive no special emphasis, and the presumption is that what is said about them is not deliberate fiction and in part at least is true. Thus it has always been taken as a fact that the version originated at Alexandria, that the law was translated first, and that this took place in the time of Ptolemy II. On the other hand, it has been thought difficult to believe that the scholarly tastes of the Alexandrians, personified in Demetrius Phalereus as the presiding genius of the Alexandrian library, could have furnished the stimulus to reduce the translation to writing. One can hardly call this intrinsically improbable in view of the miscellaneous literary tastes of the court of the Ptolemies. But it has been thought much more likely that the Septuagint was written down to satisfy the religious needs of the Jews by a translated Torah, since in fact the version is fitted for Jews and could have been intelligible only to them, and indeed never came to be circulated and known outside of their circles. Here, however, we must distinguish between written and oral interpretation. If interpretation was needed in the synagogue service, it was an oral interpretation that was given. It was not a natural thing for the Jews to write the translation,—indeed they had religious scruples against such a course. Only "Scripture" was to be written, and to put the contents of Scripture in writing in any other than the old holy form was deemed almost a profanation,—a feeling of which there is evidence in the *Letter* itself.⁷ It is well

known how in Palestine the Targum was handed down orally for centuries before it was at last reduced to writing, and, it, on the contrary, at Alexandria a written version came into existence so early, it is far from improbable that this was due to some influence from without. That the work is purely Jewish in character is only what was inevitable in any case. The translators were necessarily Jews and were necessarily and entirely guided by the living tradition which had its focus in the synagogal lessons. And hence it is easily understood that the version was ignored by the Greeks, who must have found it barbarous and unintelligible, but obtained speedy acceptance with the Jews, first in private use and at length also in the synagogue service.

The next direct evidence which we have as to the origin of the LXX is the prologue to Ecclesiasticus, from which it appears that about 130 B.C. not only the law but "the prophets and the other books" were extant in Greek. With this it agrees that the most ancient relics of Jewish-Greek literature, preserved in the extracts made by Alexander Polyhistor (Eus., *Præp. Ev.*, ix.), all show acquaintance with the LXX. These later translations too were not made to meet the needs of the synagogue, but express a literary movement among the Hellenistic Jews, stimulated by the favourable reception given to the Greek Pentateuch, which enabled the translators to count on finding an interested public. If a translation was well received by reading circles amongst the Jews, it gradually acquired public acknowledgment and was finally used also in the synagogue, so far as lessons from other books than the Pentateuch were used at all. But originally the translations were mere private enterprises, as appears from the prologue to Ecclesiasticus and the colophon to Esther. It appears also that it was long before the whole Septuagint was finished and treated as a complete work.

As the work of translation went on so gradually and new books were always added to the collection the compass of the Greek Bible came to be somewhat indefinite. The law always maintained its pre-eminence as the basis of the canon; but the prophetic collection changed its aspect by having various Hagiographa incorporated with it according to an arbitrary arrangement by subjects. The distinction made in Palestine between Hagiographa and Apocrypha was never properly established among the Hellenists. In some books the translators took the liberty to make considerable additions to the original, and these additions—e.g., those to Daniel—became a part of the Septuagint. Nevertheless learned Hellenists were quite well aware of the limits of the canon and respected them. Philo can be shown to have known the Apocrypha, but he never cites them, much less allegorizes them or uses them in proof of his tenets. And in some measure the widening of the Old Testament canon in the Septuagint must be laid to the account of Christians. As regards the character of the version, it is a first attempt, and so is memorable and worthy of respect, but at the same time displays all the weaknesses of a first attempt. Though the influence of contemporary ideas is sometimes perceptible, the Septuagint is no paraphrase, but in general closely follows the Hebrew,—so closely indeed that we can hardly understand it without a process of retroversion, and that a true Greek could not have found any satisfaction in it. The same Greek word is forced to assume the whole range of senses which belongs in Semitic speech to the derivatives of a single root, a Hebrew expression which has various Greek equivalents according to the context is constantly rendered in one way, the aorist, like the Hebrew perfect, is employed as an inchoative with a much wider range of application than is tolerated in classical Greek. At the same time, many passages are freely rendered and turned where there is no

particular need to do so, and that even in books like the *Prophetae Pseudei*, in which the rendering is generally quite stiff. The literalness of the version is therefore due not to scrupulousness but to want of skill, and probably in part also to accommodation to a kind of Jewish Greek jargon which had already developed in the mouths of the people and was really Hebrew or Aramaic in disguise. This Jewish dialect in turn found its standard in the Septuagint.

As the version is the work of many hands, it is naturally not of uniform character throughout all its parts,—indeed considerable varieties of character sometimes appear in one and the same book. The older constituents of the canon have an unmistakable family likeness as contrasted with the later books, this one may see by comparing Kings with Chronicles or Isaiah and Jeremiah with Daniel. The Pentateuch is considered to be particularly well done and Isaiah to be particularly unhappy. Some of the Hagiographa (Ecclesiastes, Canticles, Chronicles) are reproduced with verbal closeness, others, on the contrary (Job, Esther, Daniel), are marked by a very free treatment of the text, or even by considerable additions. It is not, however, always easy to tell whether a Septuagint addition is entirely due to the translator or belongs to the original text, which lay before him in a recension divergent from the Massoretic. The chief impulse in recent times to thorough investigation of the character of the several parts of the Septuagint was given by Lagarde in his *Anmerkungen zur griechischen Uebersetzung der Propheten*, Leipzig, 1863.

The Septuagint came into general use with the Grecian Jews even in the synagogue. Philo and Josephus use it, and so do the New Testament writers. But very early small corrections seem to have been introduced, especially by such Palestinian as had occasion to use the LXX, in consequence partly of divergent interpretation, partly of differences of text or of pronunciation (particularly of proper names). The Old Testament passages cited by authors of the first century of the Christian era, especially those in the Apocalypse, show many such variations from the Septuagint, and, curiously enough, these often correspond with the later versions (particularly with Theodotion), so that the latter seem to rest on a fixed tradition. Corrections in the pronunciation of proper names so as to come closer to the Massoretic pronunciation are especially frequent in Josephus. Finally a reaction against the use of the Septuagint set in among the Jews after the destruction of the temple,—a movement which was connected with the strict definition of the canon and the fixing of an authoritative text by the rabbins of Palestine. But long usage had made it impossible for the Jews to do without a Greek Bible, and to meet this want a new version was prepared corresponding accurately with the canon and text of the Pharisees. This was the version of Aquila, which took the place of the Septuagint in the synagogues, and long continued in use there.¹ A little later other translations were made by Jews or Jewish Christians, which also followed the official Jewish canon and text, but were not such slavish reproductions as Aquila's version; two of those were Greek (Theodotion, Symmachus) and one Syriac (Peshito).

Meantime the Greek and Latin Christians kept to the old version, which now became the official Bible of the catholic church. Yet here also, in process of time, a certain distrust of the Septuagint began to be felt, as its divergence from the Jewish text was observed through comparison of the younger versions based on that text, or came into notice through the frequent discussions between Jews and Christians as to the Messianic prophecies.

¹ *Corpus Juris Civ.*, Nov. cxlii.

On the whole the Christians were disposed to charge the Jews with falsifying their Scriptures out of hatred to Christianity,—a charge which has left its echoes even in the Koran. But some less prejudiced scholars did not share this current view, and went so far in the other direction as simply to identify the Jewish text with the authentic original. Thus they fell into the mistake of holding that the later Jewish text was that from which the Septuagint translators worked, and by which their work was to be tested and measured. On these critical principles Origen prepared his famous *Hexapla*, in which he placed alongside of the Septuagint, in six parallel columns, the three younger versions and the Hebrew text in Hebrew and in Greek characters. The Septuagint text he corrected after the younger versions, making the additions of the LXX with a prefixed obelus (—), as a sign that they should be deleted, and supplying omissions, generally from Theodotion, with a prefixed asterisk (*) The end of the passage to which the obelus or asterisk applied was marked with a metobelus (<) The same signs were used for various readings, the reading of the LXX being obelized, and the variant, from another version corresponding to the Hebrew text, following it with an asterisk. It was only in simpler cases, however, that this plan could be carried through without making the text quite unreadable; the more complicated variations were either tacitly corrected or left untouched, the reader being left to judge of them by comparing the parallel columns. Origen made most change in the proper names, which he amended in conformity with the Jewish pronunciation of the period, and in the order of the text, which, to preserve the parallelism in the columns, he made to follow the Hebrew.¹

Origen's critical labours had a very great influence in shaping the text of the Septuagint, though in quite another direction than he designed. Even before his time the Septuagint was largely contaminated by admixture from the other versions, but such alterations now began to be made systematically. Thus he intensified a mischief which to be sure had begun before him, and even before the labours of Aquila, Theodotion, and Symmachus. The most significant evidence of this contamination of the text lies in the conflated readings, where the same Hebrew words are translated twice, or sometimes even thrice, or where two Hebrew readings of the same passage are represented, sometimes by simple juxtaposition of renderings that differ but slightly, at other times by a complicated interlacing of very different forms of the Greek. These conflated readings, however, in which the true reading survives along with the false, are the least fatal corruptions, in many cases the genuine text has disappeared altogether before the correction, as can be seen by comparing different MSS. A faithful picture of the corruption of the text of the Septuagint as it has come down to us is given in the apparatus to the great Oxford edition of Holmes and Parsons (5 vols., Oxford, 1798-1827).

Not long after Origen there arose almost contemporaneously three recensions of the Septuagint, which became established in three regions of the Greek Church. "Alexandria et Ægyptus in Septuaginta suis Hesiychum laudant auctorem, Constantinopolis usque Antiochiam Lucianum martyris exemplaria probat, medius inter has provincie Palestine codices legunt, quos ab Origene elaboratos Eusebius et Pamphilus vulgaverunt, totiusque orbis hac inter se trifaria variate compungat," says Jerome in the *Præf. in Paralip. ad Chromatum*. According to this the text of Eusebius is that of Origen, i.e., a separate edition of the fifth column of the *Hexapla*, which contained the

Septuagint with asterisks and obel. The text of Hesiychus has not yet been identified with certainty², that of Lucian is, according to Field and Lagarde, most probably given in *Codd. Holmes*, 19, 82, 93, 108, and another series of MSS for the prophets. It is by no means the case, however, that all our MSS can be arranged in three families, many belong to none of the three recensions, and among these are such important codices as the Alexandrian (A) and the Vatican (B).

The divergences of the LXX from the Hebrew are particularly great in the books of Samuel and Kings, also in the prophets, especially in Ezekiel, and still more in Jeremiah, and finally also in Job and Proverbs. In Jeremiah the differences extend to the order of the chapters in the second half of the book, and therefore have always attracted special attention. In Proverbs too the individual proverbs are differently arranged in the LXX, and similar differences can be traced in the versions of Ecclesiasticus. In the Pentateuch there are considerable variations only in the last part of Exodus. The text of the genuine Septuagint is generally shorter than the Massoretic text.

The chief editions of the Septuagint are—(1) the Complutensis, 1514-17, (2) the Aldine, 1618, (3) the Sixtine, 1587, (4) the first Oxford edition by Græbe, 1707-20, (5) the second Oxford edition by Holmes and Parsons, 1798-1827, (6) Lagarde's edition of Lucian, vol. 1, Göttingen, 1888.

The LXX is of great importance in more than one respect. It is probably the oldest translation of considerable extent that ever was written, and at any rate it is the starting-point for the history of Jewish interpretation and the Jewish view of Scripture. And from this its importance as a document of exegetical tradition, especially in lexical matters, may be easily understood. It was in great part composed before the close of the canon—may, before some of the Hagiographa were written—and in it alone are preserved a number of important ancient Jewish books that were not admitted into the canon. As the book which created or at least codified the dialect of Biblical Greek, it is also the key to the New Testament and all the literature connected with it. But its chief value lies in the fact that it is the only independent witness for the text of the Old Testament which we have to compare with the Massoretic text. Now it may seem that the critical value of the LXX is greatly impaired, if not entirely cancelled, by the corrupt state of the text. If we have not the version itself in authentic form we cannot reconstruct with certainty the Hebrew text from which it was made, and so cannot get at various readings which can be confidently confronted with the Massoretic text, and it may be a long time before we possess a satisfactory edition of the genuine Septuagint. But fortunately in this case sound results in detail must precede and not follow the establishment of a text sound throughout. The value of a Septuagint reading must be separately determined in each particular case, and the proof that a reading is good is simply that it necessarily carries us back to a Hebrew variant, and cannot be explained by looseness of translation. It is therefore our business to collect as many Greek passages as possible which point to a various

² See, however, Ceram's note on the recensions of LXX in the *Readings of the B. Instituto Lombardo* for 18th February 1886, where it is shown that the *Codex rescriptus Diobitensis*, Holmes, viii, edited at Dublin, 1880, and other MSS written in Egypt, which Ceram had already cited in his *Monumenta* (vol. iii p. xx) present many features of correspondence with the Coptic versions and with the readings of Cyril of Alexandria. "All these documents at any rate present the character of the Hesiychian recension, being all Egyptian testimonies contemporary with or little later than Jerome." Most of their characteristic readings appear also in MS Holmes, 106, to which MSS 26, 83, 86, 97, 193, 206 are also akin. For an attempt to determine the MSS containing or akin to the Hesiychian recension in Ezekiel, see Cornall, *Das Buch Ezechiel*, Leipzig, 1886, p. 66 sq.

¹ The best collection of the fragments of the *Hexapla* is that of Field, *Origenis Hexaplorum quæ supersunt*, Oxford, 1876.

reading in the Hebrew text of the translators as compared with the Massoretic text. And for this we must not confine ourselves to one recension but use all recensions that our MSS offer. For, though one recension may be better than another, none of them has been exempt from the influences under which the genuine Septuagint was brought into conformity with the received Hebrew text, and those influenced have affected each recension in a different way, and even differently in the different books. In this process, as indeed in all textual criticism, much of course must be dependent on individual judgment. But that it should be so appears to have been the design of providence, which has permitted the Old Testament text to reach us in a form that is often so corrupt as to sin against both the laws of logic and of grammar—of rhetorical and poetical form (J WE)

SEPULCHRE, CANONS REGULAR OF THE HOLY, an order founded in 1114 by Arnold, patriarch of Jerusalem (or according to another account in 1099 by Godfrey of Bouillon), on the rule of St Augustine. It admitted women as well as men and soon spread rapidly over Europe. In the 17th century it received a new rule from Urban VIII. Shortly after this the canons became extinct, but the canonesses are still to be found in Fiance, Baden, and the Netherlands. They live a strictly monastic life and devote themselves mainly to the work of education.

SEPULCHRE, KNIGHTS OF THE HOLY, an English military order which was said to date from the 12th century and which became extinct at the Reformation. A similar order, founded in Fiance, lasted from the end of the 15th century till the time of the Revolution; it was resuscitated by Louis XVIII in 1814, but again became extinct in 1830.

SEPULCHRE, THE HOLY, the rock-cut tomb in which, after His crucifixion, the body of our Lord was placed. Few questions of topography have been debated with greater persistence or, in many cases, with greater bitterness than that of the site of this tomb. Only a brief sketch of the leading features of the controversy can be given here.

The only information on the subject to be gained from the New Testament is that the tomb was in a garden "in the place where Christ was crucified" (John xix 41), which again was "near the city" (John xix. 20) and "without the gate" (Heb. xii. 12), and that the watch, proceeding from the sepulchre to the chief priests, "came into the city" (Matt xxvii 11). The first requisite, therefore, of any locality professing to be that of the Sepulchre is that it should, at the date of the crucifixion, have been *without* the walls of Jerusalem.¹

The existing church of the Holy Sepulchre, which is admitted on all hands to have occupied the same site for the last 800 years, is in the heart of the present town, 300 yards from the nearest point of the existing wall and in the immediate vicinity of the bazzars. Saewulf,² writing in 1102, Hildebrand of Oldenburg³ in 1211, and Jacobus de Vitriaco⁴ in 1220, assert that up to the time of Hadrian the site was still without the circuit of the walls. Brocardus⁵ in 1230 states that the modern walls included more in breadth than they did at the time of

Christ, and that there were even some who refused to believe that the present site was the true one. Oedericus⁶ in 1320 and William de Baldensel⁷ in 1336 corroborated Saewulf, but Baldensel adds that the sepulchre then shown was no longer the one in which the body of Christ had been laid, for that had been cut out of the solid rock, while the other was formed out of stones cemented together. Gretser⁸ in 1598 and Quaresimus⁹ in 1616-25 refer to the objections started in their time by some whom the latter calls "misty Western heretics," and the difficulty was broadly enunciated by Monconys¹⁰ in 1647. It was not, however, until 1741 that the site was openly declared to be false by Korte.¹¹ The attack of the latter writer was followed up in greater detail by Plessing¹² in 1789, and in England by Dr Edward Clarke¹³ in 1810, but until the appearance of the *Biblical Researches* of Dr Robinson of New York in 1841¹⁴ the attention of inquirers in England and America can hardly be said to have been seriously drawn to the subject. This elaborate work called forth energetic replies from Cardinal Newman¹⁵ and Williams,¹⁶ the latter of whom subsequently republished his work in two large volumes in 1849, which, to the upholders of tradition, may be said to occupy the same position as those of the American author to its opponents. Since that date the writers on both sides have been numerous; among them may be specially noted, as impugning the accuracy of tradition, Fergusson, Tobler, the author of an elaborate essay in the *Museum of Classical Antiquities* for 1853, Barclay, Bonar, Schwartz, Sandie, and Conder, and on the other side Lord Nugent, Schutz, Kraft, Schaffter, De Sauley, Abbé Michon, Thunp, Du Vogué, Lewin, Pionotti, Caspari, and Sir Charles Warren.

The main question on which the dispute has turned is the circuit of the walls at the time of Christ. The city at that date was surrounded by two walls. The first or oldest began, according to Josephus, "in the north, at the tower called Hippicus, and extended to what was termed the Xystus; it then formed a junction with the council house, and terminated at the western colonnade of the temple."¹⁷ By almost all the writers on either side this northern portion of the first wall is traced along the southern side of the depression, which extends from the central valley eastwards to the Jaffa gate.¹⁸ From some point in that northern line of wall the second wall took its departure, and of it all we are told by Josephus is that "it had its beginning at the gate called Gennath, belonging to the first wall, and reached to the Antonia, encircling only the western quarter of the city." If this Gennath gate was near Hippicus, the line of the second wall, in order to exclude the present site, must be drawn along a route curiously unsuited, from the slope of the hill, for defensive purposes, and that it was near Hippicus seems

¹² Fergusson and Sandie place Hippicus at the north-western angle of the modern wall, and thus include the existing church of the sepulchre within the first wall itself, but they have overlooked the assertion of the Jewish historian, that from the ravine which surrounded the latter it was almost impregnable. Bonar, while placing Hippicus somewhere near the same spot, does not define the locality, and Schwartz seeks to identify it with "a high rocky hill north of the so-called Grotto of Jeremiah" and far beyond the northern limits of the modern city.

¹ The revised text of John xix. 20 reads *ἐν ἑγγύῃ τῇ τῆς πόλεως ὁ τόπος* *ὅπου ἐσταυρώθη ὁ Ἰησοῦς*, but the best accredited reading is *ἐν ἑγγύῃ τῇ πόλεως*. Mr Buckton, in *Notes and Queries* (2d series, ii. 97), argues that according to the latter reading Calvary must have been within the city. He would explain Heb. xii. 12 as spoken "for the allegorical purpose of the writers" of the temple, but offers no explanation of Matt. xxvii. 11.

demonstrable from the declaration of Josephus that the city in his time was "fortified by three walls except where it was encompassed by impassable ravines", from the absence of any record of an attack on the first wall till the second had been taken, from a variety of incidental references in the siege by Titus, from the apparent necessity of including within its circuit the pool Amygdalon, now known as Hezekiah's Pool or Birket Hamman el-Batrak², and from the remarkably small area which would otherwise be included by it.

Writers on both sides have pressed into their service the remains of ancient buildings found in the districts traversed by the second wall according to their respective theories. It seemed doubtful, till quite recently, if any sound argument could be based on these, the ruins being too fragmentary and occurring in too many different quarters to warrant any positive identification with a line of fortification as distinguished from other edifices.³ But in the summer of 1888 a stretch of ancient wall 40 or 50 yards in length was discovered, running northwards from the open space within the Jaffa gate to the west of Hezekiah's pool, which certainly, as figured in the January number of the *Quarterly Reports of the Palestine Exploration Fund*, seems to go a long way to settle the question against the genuineness of the existing site.

Considerable stress has been laid by some writers on the existence of ancient Jewish sepulchres, of a date apparently anterior to the Christian era, in the rock on which the present church is built, as proving that that rock could not have been within the circuit of the walls, inasmuch as it is alleged "the Jews never buried within their towns."⁴ There is, however, no trace in the historical books of the Bible of any aversion on the part of the Jews to intramural interment. Whatever width of interpretation may be given to the recorded burial of eleven of the kings of Judah "in the city of David," the phrase can hardly be held to prove that such burial-place was *without* the walls, while 2 Chron xxvii 27 and xxxii 20 seem to point very strongly in the opposite direction. Joab also, we are told, was buried "in his own house in the wilderness,"⁵ and Samuel "in his house at Ramah."⁶ But the most striking case of all is Hebron, where in the midst of the city are found the jealously guarded walls which enclose the cave of Machpelah. If, then, these tombs are older than the time of Christ, there seems little difficulty in crediting that they might have been included within the second wall. We know for a certainty that they were within the third. The curious point rather is that their existence in the rock may be used as a strong argument against the site, for, speaking of the disinterment of the rock of the sepulchre from the accumulated soil heaped over it by the Romans, Eusebius⁷ impresses on us the fact

that there was "only one cave within it, lest, had there been many, the miracle of Him who overthrew death should have been obscured."

One argument remained which, at least up to 1847, it seemed difficult for the impugners of the orthodox site to meet, namely,—Was it at all probable that Constantine should have been deceived, either by erroneous inference or by wilful misrepresentation, when in 325 he erected a monumental church over what was then believed to be the holy tomb? Apart from the consideration that of all localities this seemed to be the least likely to pass from the memory of the Christian church,⁸ its exact position had been in a manner identified by the existence on the rock of Golgotha of a temple or statue of Venus, and on the site of the resurrection of a statue of Jupiter erected by Hadrian in the 2d century, and the fact remains that on the superincumbent rubbish being cleared away by the orders of Constantine a cave was discovered, which it seems difficult, even were we willing with Taylor⁹ to impute deliberate fraud to the existing bishop of Jerusalem, to believe could have been previously prepared beneath a heathen shrine, and in the midst of a population of pagans and of Jews.¹⁰

In 1847 Feiguisson, in his *Essay on the Ancient Topography of Jerusalem*, attempted to show that Constantine had built his memorial church on another site altogether, and that it was still existing under another name. On the eastern hill of the city, in the sacred Mohammedan enclosure of the Harâm-es-Sherif, and on a spot generally considered to have formed part of the temple area, stands the magnificent octagonal building called the Dome of the Rock, usually but erroneously believed to have been erected by the caliph 'Omar, and so popularly known as the mosque of 'Omar. The jealousy of the Moslems had, with rare exceptions, prevented up to quite recent times the intrusion of Christians within its sacred precincts, but it was known to have been erected over a large mass of native rock rising above the surface of the ground and having a cave within it. A section of the building, very roughly executed, was given in the *Travels of Ali Bey*, published in 1816 (vol. ii p. 74), but in 1833 Mr. Cutcherwood, under the pretext of being a civil engineer in the employment of Mehemet Ali, and of examining into the structural condition of the building with a view to its repair, spent three weeks in examining it and its surroundings, of which he made elaborate drawings and sections. A general account of his investigations and their results, published in W. H. Bartlett's *Walks about the City and Environs of Jerusalem* (p. 148), led to Feiguisson's getting access to those drawings, which confirmed him in the belief he had already begun to entertain from other sources, that the Dome of the Rock was originally a Christian edifice, and in the essay referred to he argued at great length and with much vigour on both architectural and historical grounds that it and the Golden Gateway—a walled-up entrance to the Harâm from the east—were built in the time of Constantine, that the former was the church of the Anastasis, erected by that emperor over the tomb of our Lord, and the latter the entrance to the atrium of the great basilica described by Eusebius¹¹ as

¹ *Bell. Jud.*, v. 4, 1.

² It is of course quite possible to draw a line, as Lewin does, which, while it includes this pool, will yet exclude the existing church, but all probability seems opposed to such a route.

³ Pierotti gives a detailed plan of the whole district in which the remains which he seeks to identify with the second wall occur (*Jerusalem Explored*, pl. xxx). But from this it would seem extremely doubtful whether any of those ruins can be identified with a city wall, or should not merely be regarded as portions of detached buildings, the walls of which project, now to the east, now to the west, of the imagined line.

⁴ Lord Nugent, *Lands Classical and Sacred*, London, 1845, ii. 47. These tombs have been described by Heyworth Dixon, in *Gentleman's Magazine*, March 1877, and more fully by Clermont-Ganneau in *Quarterly Report of the Palestine Exploration Fund*, 1877, p. 76. In 1885 two additional sepulchral chambers were discovered in the same rock a little to the south-east of the present church, of which a plan and notices are given by Schick in *Zeitschrift des deutschen Palästina-Vereins*, 1884, vol. viii p. 171.

¹⁰ Finley (*Greece under the Romans*, p. 561) has argued that exact identification would be easy from the minute registration of property which prevailed in the Roman empire and extended to the provinces, by which the position of Golgotha and the property of Joseph of Arimathea might easily have been traced. But he seems to miss his point too far (see Fallmerayer, *Golgotha und das heilige Grab*, 4to, Munich, 1852, p. 8).

¹¹ *Vita Const.*, in 39.

immediately adjoining; and that the transference of the site from the eastern to the western hill took place somewhere about the commencement of the 11th century, when, in consequence of the invasion of the Turks, the Christians were driven from the former hill for a time. This work was followed up by his article "Jerusalem" in Smith's *Dictionary of the Bible* and by several minor publications,¹ and the whole question was, with some modifications, re-argued by him at great length in *The Temples of the Jews and the other Buildings in the Haram Area at Jerusalem* in 1878.

Though at first Fergusson's essay seemed to fall dead, it inaugurated a discussion which has within the last twenty years been carried on with much keenness. His views have been supported on architectural grounds by Unger,² and on general grounds by Sande,³ Smith,⁴ and Langlois,⁵ while among the multitude of his opponents may be specially noted Williams,⁶ Lewin,⁷ the Abbé Michon,⁸ De Vogüé,⁹ Pierotti,¹⁰ Sir Charles Warren,¹¹ and Captain Couder.¹²

The architectural arguments in favour of Fergusson's theory have forced Lewin, one of his most strenuous opponents, to argue that the Dome of the Rock may have been a temple to Jupiter erected by Hadrian, which he imagines may have been restored or rebuilt by Maximian Daza, the successor of Diocletian.¹³ But they must be studied in Fergusson's own works or in that of Unger above referred to. The topographical objections are mainly founded on the necessity of reconstructing the Jewish temple to the south-eastern corner of the Haram, the site, however, assigned to it by Lewin himself and Thirupp,¹⁴ and on the difficulty of supposing a place of interment so near the sacred building. But Josephus, at the time of the siege, speaks of "the monuments of King Alexander," whatever that may mean, existing just over against or in front of the north colonnade of the temple.¹⁵

As regards the historical argument, it would certainly appear that up to the close of the 8th century the balance of evidence is in favour of the eastern site. The narrative of the Pilgrim of Bordeaux¹⁶ may perhaps be read as supporting either view. But Antoninus Martyr¹⁷ and Theodosius¹⁸ can hardly be reconciled with the existing location; in two manuscripts of the latter¹⁹ the writer believed that the same hill witnessed in succession the offering of Isaac, the vision of the angel at Aaron's threshing-floor, the building of the temple, and the death and resurrection of

our Lord. Many more passages might be quoted from writers of this period testifying to the belief that the hill that witnessed the offering of Isaac witnessed also the resurrection of Christ, and many others identifying the scene of the offering of Isaac with the hill on which the temple was built. Perhaps the strongest point in this connexion against Fergusson is that so striking a fact as the identity of the hill of the Passion with that on part of which the temple stood should only be discreetly spoken to by a single writer. After the 9th century the historical evidence becomes more difficult to interpret. Fergusson would date the transference of the site about 1000, but it seems clear from Istakhri (978)²⁰ and Mokaddasi (987),²¹ both of whom were unknown to him, that before their days the Dome of the Rock was a Mohammedan place of worship, and the latter expressly states that it was suggested by a great Christian church.²² The natural date to assign for such a transference would be about 614, when the city was captured by the Persians, and to quote the carefully guarded narrative of Gibbon, "the sepulchre of Christ and the stately churches of Helena and Constantine were consumed, or at least damaged, by the flames." The buildings were repaired or rebuilt by Modestus a few years later, and their praises are sung by Sophronius, his successor in the patriarchate, but in terms which give little topographical information. Sophronius lived to see the capture of the city by 'Omar in 636, the earliest records of whose domes, as yet available are the brief one of Theophanes (818) and the more lengthened one of Eutychius (937). From both of these it seems clear that the caliph confirmed the Christians in the possession of the sites (whatever these might be) which he found in their hands. In or about 670 the French bishop Arculph visited Jerusalem, and under the hand of Adamnanus we have a detailed account taken down from his lips,²³ and a plan of the church of the Resurrection as he saw it, which strikingly corresponds to the Dome of the Rock,—as, however, it necessarily would correspond with any church which had been erected in close imitation of that building.²⁴ There are passages, however, in Arculph descriptive of the city very difficult to understand unless on the assumption that the transference of Zion, which had hitherto (see JERUSALEM) been identified with the eastern hill, had already in his time taken place. The next pilgrim who has left us a record is Willibald,²⁵ who visited the city early in the 8th century, and whose description applies on the whole better to the western than the eastern site,

¹⁵ *Bel. Jud.*, v. 5 § 3. Sande's attempt (*Israel and Jerusalem*, p. 259) to minimize this difficulty by supposing a rocky valley to have run up from the valley of Jehoshaphat westwards at this point, and so to have divided the temple from the tomb, seems inadmissible. Modern investigation shows that such a valley, or rather depression, did exist, but north, not south, of the Dome of the Rock.

²⁴ The view that at the time when Arculph wrote the Dome of the Rock was in the hands of the Mohammedans seems strengthened by the well-known Coptic inscription which still runs round the colonnade of that building, and a complete translation of which by the late Professor Palmer will be found in the *Quarterly Report of the Palestine Exploration Fund* (1871, p. 164) and Fergusson's *Temples of the Jews* (p. 269). In it the construction of the dome of the building is dated 73 A.D. (691), but the name of the builder, which clearly was Abd-el-Melek in the original, has been erased and that of Abdallah al-Mamin (168 A.D., 818) fraudulently substituted, "the short-sighted forger," as Palmer calls him, having omitted to change the date as well as the name. In this inscription there is very special mention made of our Saviour, and in a way which seems impossible unless the building on which it was inscribed had been, in the mind of the writer, associated in some important respects with the history of Jesus. And the tradition that it was so continued long after; for we find Theodorus so late as 1178 writing of it, "Toc templum, quod nunc vultus, ad honorem Domini nostri Jesu Christi quaque jam generibus ab Helece regina et eius filio, imperatore Constantino, constructum est" (ed. Tobler, Reg. lat. 1865, p. 46). Fergusson believes this inscription to have been written in the 12th century, but is obliged to admit that the scribe employed is identical with that found on the cone of Abd-el-Melek (*Temples of the Jews*, p. 24). A fragment of the sentence containing the date and the forger will be found in the Rev. Isaac Taylor's *The Alphabet* (London, 1883, i. p. 322).

²⁵ *Itin. Lat.* (Soc. de l'O. Lat.), 1879, i. pp. 214-207.

but, on the other hand, that of Bernard,¹ who travelled about 870, applies better to the eastern than to the western. If the transference can be supposed to have taken place at the time of the Persian invasion, one of the main difficulties in the adoption of Ferguson's theory will be greatly lessened, for the intervening period of more than 450 years would go far to explain how the crusaders, on gaining possession of the city in 1099, failed to make it their first business to revert to the original site. On the whole, the question is one which can hardly be satisfactorily determined until the Arabic authorities on the subject have been duly scrutinized, and as yet we have practically access to none earlier than the two above referred to.²

Within the last few years a third locality has been suggested. In 1878 Captain Conde, in his *Tent Work in Palestine* (i pp 372-376), expressed a strong conviction that the real site was to be found on a rocky knoll outside the northern wall, and close to the cave known as "Jeremiah's Grotto." He argued that not only did this locality meet the requirements of the Gospel narratives, being outside the city and near one of the great roads leading from the country, but that in this direction lay "the great cemetery of Jewish times" as testified by "the sepulchre of Simon the Just preserved by Jewish tradition," and the monument of Helena "fitted with a rolling stone such as closed the mouth of the Holy Sepulchre." Here also by early Christian tradition had been the scene of the martyrdom of Stephen, which doubtless occurred at the place of public execution, and to this day, according to Dr Chaplin, the Jews designate the knoll "by the name Beth has-Sekilah, 'the place of stoning' (domus lapidationis), and state it to be the ancient place of public execution mentioned in the Mishnah." The hill itself appears to present a striking resemblance to a human skull, and so to associate itself with the word "Golgotha." The adoption of this site by Dr Chaplin, the Rev S Merrill, Schuck, and perhaps especially the late General Gordon,³ has aided in giving it a considerable popularity. It is, however, a purely conjectural location, and involves the assumption that all the Christian writers from the 4th century downwards, as well as the mother of Constantine, were in error as to the real site. (A. B. M'G.)

SEQUESTRATION. See BANKRUPTCY.

SEQUOIA, a genus of conifers, allied to *Taxodium* and *Cryptomeria*, forming one of several surviving links between the firs and the cypresses. The two species usually placed in this group are evergreen trees of large size, indigenous to the west coast of North America. Both bear their round or ovoid male catkins at the ends of the slender terminal branchlets, the ovoid cones, either terminal or on short lateral twigs, have thick woody scales dilated at the extremity, with a broad disk depressed in the centre and usually furnished with a short spine, at the base of the scales are from three to seven ovules, which become reversed or partially so by compression, ripening into small angular seeds with a narrow wing-like expansion.

The redwood of the Californian woodsmen, *S. sempervirens*, which may be regarded as the typical form, abounds on the Coast Range from the southern borders of the State northwards into Oregon, and, according to De Candolle, as far as Nootka Sound. It grows to a gigantic size: a trunk

has been recorded 270 feet in length, and a greater height is said to be occasionally reached, while a diameter of from 12 to 15 feet is sometimes attained at the base. In old

Sequoia sempervirens—a, green cones and catkins, b, section of cone, c, scale of cone

age the huge columnar trunk rises to a great height bare of boughs, while on the upper part the branches are short and irregular. The bark is red, like that of the Scotch fir, deeply furrowed, with the ridges often much curved and twisted. When young the tree is one of the most graceful of the conifers: the stem rises straight and tapering, with somewhat irregular whorls of drooping branches, the lower ones sweeping the ground,—giving an elegant conical outline. The twigs are densely clothed with flat spreading linear leaves of a fine glossy green above and glaucous beneath, in the old trees they become shorter and more rigid and partly lose their distichous habit. The globular brown catkins appear early in June, the cones, from 1 to 2 inches long, are at first of a bluish green colour, but when mature change to a reddish brown, the scales are very small at the base, dilating into a broad thick head, with a short curved spine below the deep transverse depression. The redwood forms woods of large extent on the seaward slope of the Coast Range and occurs in isolated groups farther inland. From the great size of the trunk and the even grain of the red cedar-like wood it is a valuable tree to the farmer and carpenter: it splits readily and evenly, and planes and polishes well, cut radially, the medullary plates give the wood a fine satiny lustre, it is strong and durable, but not so elastic as many of the western pines and firs. In England the tree grows well in warm situations, but suffers much in severe winters,—its graceful form rendering it ornamental in the park or garden, where it sometimes grows 30 or 40 feet in height, its success as a timber tree would be doubtful. In the eastern parts of the United States it does not flourish. Discovered by Menzies in the end of the 18th century, it has long been known in British nurseries under the name of *Taxodium sempervirens*.

The only other member of the genus is the giant tree of the Sierra Nevada, *S. gigantea*, the largest of known conifers; it is confined to the western portion of the great Californian range, occurring chiefly in detached groups

¹ *Itin Lat* (See de l'Or Lat.), 1879, i pp. 809-820

² Palmer, in the chapter contributed by him (mainly from Arabic sources) to *Jerusalem, the City of Herod and Saladin* (by W. Besant and E. H. Palmer, London, 1871), has failed to give, with rare exceptions, any clue to the date of the writers whose statements he embodied.

³ *Reflections in Palestine*, London, 1884, pp. 1-3. See also *Quarterly Report of Palestine Exploration Fund* for 1883, p. 69, and Sir J. W. Dawson's *Egypt and Syria, their Physical Features in Relation to Bible History*, London, 1885, pp. 85-95, where two illustrations of the hill are given.

locally called "groves," at an altitude of from 4000 to 5000 feet above the sea. The leaves of this species are awl-shaped, short and rigid, with pointed apex, closely adpressed, they completely cover the branchlets. The male catkins are small, solitary, and are borne at the ends of the twigs, the cones are from 1½ to 3 inches long, ovoid, with scales thicker at the base than those of the redwood, and bearing below the depression a slender pickle. The young tree is more formal and rigid in growth than *S. seniperuviana*, but when old the outline of the head becomes cylindrical, with short branches sparsely clad with foliage sprays. The bark, of nearly the same tint as that of the redwood, is extremely thick and is channelled towards the base with vertical furrows, at the root the ridges often stand out in buttress-like projections. Some of these vast vegetable columns are upwards of 30 feet in diameter and a few have attained a height of 400 feet or more.

The famous group known as the Mammoth Grove of Calaveras in California, containing about ninety large trees, stands in 38° N lat, about 4370 feet above the sea, between the San Antonio and Stanislaus rivers. According to Yreka, it was discovered by a hunter in pursuit of a bear, in 1852, but had apparently been visited before, as the date 1850 is cut on one of the trees. The bark of one of the finest trunks was foolishly stripped off to the height of 116 feet, and exhibited in New York and London, it now stands in the Crystal Palace, Sydenham. The tree, known as the "mother of the forest," soon died at the base it measured 90 feet in girth, and the dead tree was 321 feet high, a postulate trunk in the neighbourhood is 18 feet in diameter 300 feet from the base. Some trees in the Mariposa grove rival these in size one measures 101 feet round the root, and a cut stump is 31 feet in diameter. Gigantic as these trees are and imposing from their vast columnar trunks, they have little beauty, owing to the scanty foliage of the short rounded boughs, some of the trees stand very close together, they are said to be over 400 in number. Some are of vast age, perhaps 3000 years or more; they appear to be the remains of extensive woods belonging to a past epoch, and probably have been in distant time much injured by forest fires. The growth of the "mammoth tree" is fast when young, but old trees increase with extreme slowness. The timber is not of great value, but the heartwood is dense and of deeper color than that of *S. seniperuviana*, varying from brownish red to very deep brown, oil and varnish, it is best used in cabinet work. *S. gigantea* was brought to England by Lobb in 1853, and received from Dr. Lindley the name of *Wellingtonia*, by which it is still popularly known, though its affinity to the redwood is too marked to admit of generic distinction. In America it is sometimes called *Washingtonia*. In the Atlantic States it does not succeed, and, though nearly hardy in Great Britain, it is planted only as an ornament of the lawn or park-wood. It is never likely to acquire any economic importance in Europe. (C. P. J.)

SERALEVO See BOSNA SERAI.

SERAING, a town of Belgium, stretching nearly a mile along the right bank of the Meuse, across which a suspension bridge connects it with Jeneffe, 3 miles southwest of Liège. It has one of the largest manufactories of machinery on the Continent, founded by John Cockerill, an Englishman, in 1817, on the site of the former palace of the prince-bishops of Liège. Including offices, the works extend over 370 acres, employ 11,000 hands, and the annual value of their products is more than 45,000,000 francs. Down to 1882 they had turned out 52,600 engines or pieces of machinery, including the first locomotive engine built on the Continent (1835). After Cockerill's death in 1840, the works were purchased by "La John Cockerill Société." A monument was erected to his memory in 1871. The population, which numbered but 2326 in 1827, amounted to 24,315 in 1877, and is now (1886) estimated at about 27,500.

SERAMPUR, a town of British India, in Hugli (Hooghly) district, Bengal, situated on the right bank of the Hugli river, 13 miles by rail north of Calcutta, in 22° 45' 26" N. lat. and 88° 23' 10" E. long. It was formerly a Danish settlement, and remained so until 1845, when all the Danish possessions in India were ceded by treaty to the East India Company. Serampur is famed as the

residence of a body of Protestant Baptist missionaries, who made it the centre of their Christianizing efforts. At the census of 1881 the population of the town was 25,559 (13,187 males and 12,422 females).

SERAPHIM. In the vision of Isaiah vi the throne of God is surrounded by seraphim,—figures apparently human (ver. 6), but with six wings, which constantly proclaim the *trisagion*. The seraphim are not again mentioned in the Bible, but in later Jewish theology they are taken to be a class of angels. As the whole vision of Isaiah is symbolical, the seraphim also are in this connexion symbolical figures, aiding the delineation of Jehovah's awful holiness. But the imagery is probably borrowed from some popular conception analogous to that of the *CHERUBIM* (q. v.). The name is sometimes explained to mean "lofty ones," after the Arabic *sharifa* (Gesenius), but if it has a Hebrew etymology it must signify "burning ones" ("consuming," not "fiery"), so that in Isaiah's vision the seraphim will mean the same thing as the "devouring fire" of God's holiness (Isa. xxxiii. 14). But this, again, is a spiritual interpretation of the old Hebrew conception that Jehovah appears in the thunderstorm (Judges v. 4, Ps. xviii. xxxix.) escorted by thunderbolts (*seraphim*, Hab. iii. 5). Among the Phœnicians Resheph is a god (*C. I. S.*, i. 38), probably identical with the Arabian divine archer Kozah, who shoots lightnings. In prophetic monotheism such mythological conceptions could only survive as personifications of the natural phenomena attending a theophany.

In Num. xxi. 6 *seraphim* is used of a kind of serpents, not "fiery serpents" (A. V.) but burning, i. e. poisonous ones (comp. *hehah*, "glowing heat," "venom"). In Isa. xlv. 20 and xlv. 6 the singular *seraph* occurs with the epithet "flying," and from the second passage we see that such flying serpents were supposed to inhabit the desert between Palestine and Egypt; comp. Herod. ii. 75 and the white flying serpents in an Arabian legend (*Adh.* x. 136, 30).

SERAPIS, or SARAPIS, in the Leyden papyrus *Ὀσραιδης, i. e.*, Osmis-Apis, apparently meaning the dead Apis worshipped as Osmis (see ARIS), and so as lord of the underworld, was the name under which the Egyptian priests consulted by Ptolemy Soter incorporated with the old religion the Greek worship of Hades. The statue with the attributes of Hades which they professed to identify as Serapis (a name which had till then played no prominent part in Egyptian religion) was brought by the king from Sinope to Alexandria in consequence, it was given out, of a revelation granted to him in a dream (Plut., *Is. et Os.*, 28).

The real object of Ptolemy was to provide a mixed Greek and Egyptian religion for his mixed subjects, especially in Alexandria; the true Egyptians disliked the innovation, and no Serapeum or Sciapis temple was admitted within the walls of Egyptian cities (Macrobi., i. 7, 14). Thus the great Serapeum at Memphis lay outside the town (Strabo, xvi. 1, 32), where its ruins were laid bare by Mariette in 1850. From papyri found on the spot it is known that a sort of monastery was connected with this and other Serapea. The so-called Egyptian Serapeum or series of Apis graves excavated in the rock near the Greek Serapeum is distinct and belongs to the old religion, though the old Osmis worship was gradually transferred to Serapis. The cult of Serapis also spread largely in the Græco-Roman world. Egyptian monasticism seems to have borrowed something from the monks of Serapis, and the Egyptian Christians were accused of worshipping Serapis as well as Christ (*Vita Saturnini*, 8), perhaps because they identified the god who is represented bearing a corn-measure on his head with the Biblical Joseph; see Firmicus Maternus, c. 13, and Suidas, s. v. *Σάραπης*.

SERENA, a city of Chili, capital of the province of Coquimbo, is situated on an elevated plain on the south side of the river Coquimbo, about 5 miles from the sea, in 29° 54' S. lat. and 71° 13' W. long. The original town

was founded by Juan Bohon in 1544, on the opposite side of the river, and called by him Serena, after the town of that name in Spanish Estremadura, the birthplace of his chief, Pedro de Valdivia. Being shortly after destroyed by the Indians, it was rebuilt on its present site by Francisco de Aguirre in 1549. Serena is the seat of a bishopric embracing the whole of Chih to the north, and of a court of appeal the jurisdiction of which extends to the province of Atacama. The town is well supplied with water. The principal edifice is the cathedral (1844-60), built of a light porous stone, 216 feet long and 66 broad. The town contains eight other churches, an excellent lyceum, a theatre, an episcopal palace, and several convents and charitable institutions. It is connected by rail with its port 9 miles to the south-west, and with the Tamaya copper-mines. A narrow-gauge line up the Elqui valley was opened in 1883. Biewing has recently become an important industry. The population of Serena was 12,293 in 1875, or, including the suburbs of the Pampa (Alta and Baja), 14,403.

SERENUS or ANTISSE, an ancient Greek geometer, the author of two treatises—*De Sectione Cylindri et Coni, libri duo*—which Halley has published in Greek and Latin along with his edition of the *Conus* of Apollonius of Perge. Great difference of opinion has existed as to his date. Halley says in his preface to the *Conus*, "We know nothing of Serenus except that he was born at Antissa, a town in the island of Lesbos, and that, besides his book *On the Section of the Cylinder*, and another *On the Section of the Cone*, he wrote commentaries on Apollonius, and that he lived before Marinus—the pupil of Proclus—as appears from the preface of Marinus to the *Data* of Euclid." Montucla says vaguely that Serenus lived within the first four centuries of the Christian era. Chasles places him about the same time as Pappus. Bretschneider pointed out that Antissa was completely destroyed by the Romans in 187 B.C., and inferred thence that Serenus lived c. 220-180 B.C. To this inference it has been fairly objected by Cantor, after F. Blass, that the name Serenus is Latin and that Antissa had been rebuilt at the time of Strabo. The statement of Halley that "he lived before Marinus" has been since repeated by many writers, but Heiberg has pointed out (*Rev. Crit. d'Hist. et de Litt.*, 1881, p. 381) that the passage referred to in support of this statement is faulty, and that the name of Serenus is certainly not to be found in it. Th. H. Martin, in his edition of the *Astronomy* of Theon of Smyrna (Paris, 1849), has published a fragment which in the MS. follows the text of Theon and is headed *Πρόν τῶν Λεμμάτων τοῦ Φιλοσόφου Σερένου*. This is unquestionably the same as Serenus of Antissa, to whom this appellation "philosopher" is given in the titles of the two treatises edited by Halley. No conclusion, however, can be drawn from this as to the date of Serenus, for the extract is not given by Theon but by an anonymous scholiast. M. Paul Tannery in an elaborate paper (*Bull. des Sc. Math. et Astron.*, 2d series, vii, 1883) has shown from the character of Serenus's writings that he lived long after the brilliant period of Greek mathematics, and that he must be placed chronologically between Pappus and Hypatia, consequently in the 4th century. This determination of the date of Serenus is accepted by Cantor (*Zeitschrift für Math. und Phys.*, August 1885, p. 124).

In the treatise *On the Section of the Cone*, which is the less important of the two books, Serenus, as he tells us in the preface, was the first to take up the particular branch of that subject with which he deals. In it he treats of the area of a triangle formed by cutting a cone, right or scalene, on a circular base by a plane through the vertex. He shows how "to cut a right cone whose axis is not less than the semi-diameter of the base by a plane through the vertex so that the triangle thus formed shall be equal to a given triangle" (Prop. 8), or "a maximum" (Prop. 13). He then considers the case of the scalene cone, solves the problem "to cut a given scalene cone by a plane through the vertex so as

to form an isosceles triangle" (Prop. 21), and shows that, "of the triangles which are formed by cutting a scalene cone through the axis, the greatest is the isosceles, the least that which is at right angles to the base of the cone, of the rest, however, that which is nearest the greatest is greater than one more remote" (Prop. 22). The general questions for a scalene cone, corresponding to the problems for the right cone (Props. 8 and 13), and which depend on solid loci for their solution, are not attempted. These have been solved by Halley in his edition of Serenus, p. 68 g.

In his preface to the treatise *On the Section of the Cylinder*, Serenus tells us that many geometers of his time supposed that the transverse sections of a cylinder were different from the elliptic sections of a cone, that he thought it right to refute this error and to prove that these sections were of the same kind. He has established this in a series of theorems ending with Prop. 18, he shows in Prop. 19 that "it is possible to exhibit a cone and a cylinder cutting one another in one and the same ellipse." He then solves problems such as—"given a cone (cylinder) and an ellipse on it, to find the cylinder (cone) which is cut in the same ellipse as the cone (cylinder)" (Props. 20, 21), "given a cone (cylinder), to find a cylinder (cone), and to cut both by one and the same plane so that the sections thus formed shall be similar ellipses" (Props. 22, 23), "given a cylinder cut in an ellipse, to construct a cone having the same base and altitude as the cylinder, so that the section of it by the same plane is an ellipse similar to the ellipse of the cylinder" (Prop. 25). In Props. 26-29 he shows how to cut a scalene cylinder or cone in an infinite number of ways by two planes—which are not parallel—so as to form similar ellipses (subtending sectors). He then gives some theorems—"all the straight lines drawn from the same point to touch a cylindrical surface, on both sides, have their points of contact on the sides of a single parallelogram" (Prop. 31), "all the straight lines drawn from the same point to touch a conical surface, on both sides, have their points of contact on the sides of a single triangle" (Prop. 34). This last is proved by means of Prop. 33, where we find, indirectly stated, the property of an harmonic pencil.

SERES, SERRES, or SIROS, a town of Turkey in Europe, now at the head of a sanjak in the vilayet of Salonika, is situated in the valley of the Stymon (Kaeasu), in a district so fertile as to bear among the Turks the name of Altın Ovası or Golden Plain, and so thickly studded with villages as to have, when seen from the heights of Rhodope, the appearance of a great city with extensive gardens. The principal buildings are the Greek archiepiscopal palace, the Greek cathedral, restored since the great fire of 1879, by which it was robbed of its magnificent mosaics and woodwork, the Greek gymnasium and hospital (the former built of marble), the richly endowed Eski Jami, and the ruins of the once no less flourishing Ahmed Pasha or Aghia Sophia mosque, whose revenues used to be derived from the Crimea. On a hill above the town are the ruins of a fortress described in a Greek inscription as a "tower built by Helen in the mountainous region." Cloth-factories and tanneries are the chief industrial establishments and lignite mines are worked in the neighbourhood with some success. The population is 30,000.

Seres is the ancient Sais, Siris, or Sirhus, mentioned by Herodotus in connexion with Xerxes's retreat, and by Livy as the place where Æmilius Paulus received a deputation from Persius. In the 14th century, when Stephen Dushan of Servia assumed the title emperor of Servia, &c., he chose Sirhus as his capital, and it remained in the hands of the Servians till its capture by Sultan Murad. In 1596 Bayazid summoned his Christian vassals to his camp at Sirhus.

SERFDOM. See SLAVERY.

SERGHIEVSKIY POSAD, or TROITZE-SERGHIEVSK, a town of Russia, in the government of Moscow, which has grown up round the monastery of Troitse-Sergheievskaya Lavra, 44 miles by rail to the north-east of Moscow. It is situated in a beautiful country, intersected by pleasant little valleys and varied with woods, the buildings extending partly over the hill occupied by the monastery and partly over the valley below. Including the extensive Kukevsk suburbs, it had in 1884 31,400 inhabitants. There are several lower-grade schools, an infirmary for old women, and a school for girls. Numerous inns and hotels, some maintained by the monastery and others a rich source of revenue to it, accommodate the numerous pilgrims.

Sergievsk has long been renowned for its manufactures of holy pictures (painted and carved), spoons, and a variety of other articles carved in wood, especially toys, sold to pilgrims. Within the last twenty years this industry has greatly developed; separate parts of certain toys are made elsewhere and brought to Sergievsk, where no fewer than 330 workshops, employing 1055 hands, with an annual production valued at more than £30,000, supply the finished article. Several other petty industries are carried on both in the town and in the neighbouring villages.

The Troitsk monastery is the most sacred place in middle Russia, the Great Russians regarding it with more veneration than even the cathedrals and relics of the Kremlin of Moscow. It occupies a picturesque site on the top of a hill, protected on two sides by deep ravines and steep slopes. The walls, 25 to 50 feet in height, are fortified by nine towers, one of which, the Pyatitsk, has been for some time a prison for both civil and ecclesiastical offenders. Eleven churches, including the Troitskiy (Trinity) and Uspenskiy cathedrals, a lofty bell-tower, a theological academy, various buildings for monks and pilgrims, and a hospital stand within the precincts, which are nearly two-thirds of a mile in circuit. A small wooden church, erected by the monk Sergius, and afterwards burned by the Tatars, stood on the site now occupied by the cathedral of the Trinity, which was built in 1432, and contains the relics of Sergius, as well as a holy picture which has frequently been brought into requisition in Russian campaigns. The Uspenskiy cathedral was erected in 1585; close beside it are the graves of Boris Godunoff and his family. In the southern part of the monastery is the church of Sergius, beneath which are spacious rooms where 200,000 dinners are distributed gratis every year to the pilgrims. The bell-tower, 290 feet high, has a bell weighing 137½ tons. Several monasteries of less importance occur in the neighbourhood. The site now occupied by the Troitsk monastery was in the 14th century covered with impenetrable forests. In 1837 two brothers, Bartholomew and Stefan, sons of a Rostoff boiar, erected a church on the spot. The elder (born in 1814) took monastic orders under the name of Sergius, erected bells for the church, and became widely famous among the peasants around. The Moscow princes also showed great respect for the chief of the new monastery. Dmitri Joannovich Donskoi received the benediction of Sergius before setting out on the Tatar expedition which terminated in the victory of Kulikovo, and afterwards accepted the advice and help of the monk in his dealings with the prince of Ryazan. Sergius lived a life of diligence and simplicity, and declined to accept the office of metropolitan of Moscow. His monastery acquired great fame and became the wealthiest in middle Russia. Ivan the Terrible in 1561 made it the centre of the ecclesiastical province of Moscow. During the Polish invasion at the beginning of the 17th century it organized the national resistance, and supplied the combatants with money and food. In 1608-9 it withstood a sixteen months' siege by the Poles; at a later date the monks took a lively part in the organization of the army which crushed the outbreak of the peasants. In 1683 and 1689 Peter I. took refuge here from the revolted *strelitz*. The theological seminary, founded in 1744 and transformed in 1814 into an academy, reckons Platon and Philarete among its pupils.

SERGIUS I., pope from 687 to 701, came of an Antiochene family which had settled at Palermo, and owed his election as Canon's successor to skilful intrigues against Paschalis and Theodorus, the other candidates. In the second year of his pontificate he baptized King Ceadwalla of Wessex at Rome. For rejecting certain canons of the Trullan (Quinisext) council of 692, Justinian II. commanded his arrest and transportation to Constantinople, but the militia of Ravenna and the Pentapolis forced the imperial protopatriarchus to abandon the attempt to carry out his orders. Sergius was followed by John VI. as pope.

SERGIUS II., pope from 844 to 847, a Roman of noble birth, elected by the clergy and people to succeed Gregory IV., was forthwith consecrated without waiting for the sanction of the emperor Lothair, who accordingly sent his son Louis with an army to punish the breach of faith. A pacific arrangement was ultimately made, and Louis was crowned king of Lombardy by Sergius. In this pontificate Rome was ravaged, and the churches of St Peter and St Paul robbed, by Saracens (August 846). Sergius was succeeded by Leo IV.

SERGIUS III. succeeded Pope Christopher in 904, and reigned till 911. His pontificate, so far as is known, was

remarkable for nothing but the rise of the "pornocracy" of Theodora and her daughters. Sergius restored the Lateran palace, which had been shattered by an earthquake. After him Anastasius III. sat on the pontifical throne.

SERGIUS IV., pope from 1009 to 1012, originally bore the name of Peter, and is said to have been the first to change his name on accession to the pontificate. He was a mere tool in the hands of the feudal nobility of the city (see ROME); he was succeeded by Benedict VIII.

SERGIUS, Sr. The Eastern and Western Churches celebrate the martyrs Sergius and Bacchus, Roman officers who suffered under Maximian, on 7th October. Both were martyred in Syria, Sergius at Rosáfa (Rasíftá, Rosáfát Hishám) near Rakka. Sergius was a very famous saint in Syria and Christian Arabia (comp. what is related of Chosroes II. in vol. xviii. p. 614); and Rosáfa, which became a bishop's see (Le Quien, *Or. Chr.*, ii. 951), took the name of Sergiopolis, and preserved his relics in a fortified basilica. The church was adorned and the place further strengthened by Justinian (Procopius, *Ad.*, ii. 9).

SERILEMA, or CARIAMA,¹ a South-American bird, sufficiently well described and figured in Marcgrave's work (*Hist. Rer. Nat. Brasilie*, p. 203), posthumously published by De Laet in 1648, to be recognized by succeeding ornithologists, among whom Brisson in 1760 acknowledged it as forming a distinct genus *Cariama*, while Linnaeus regarded it as a second species of *Palmæda* (see SCREAMER, vol. xxi. p. 552), under the name of *P. cristata*, Englished by Latham in 1785 (*Synopsis*, v. p. 20) the "Crested Screamer,"—an appellation, as already observed, since transferred to a wholly different bird. Nothing more seems to have been known of it in Europe till 1803, when Azara published at Madrid his observations on the birds

Serica.

of Paraguay (*Apuntamientos*, No. 340), wherein he gave an account of it under the name of "Saria," which it bore among the Guaranis,—that of "Cariama" being applied to it by the Portuguese settlers, and both expressive of its ordinary cry.² It was not, however, until 1809 that this very remarkable form came to be autotypically described scientifically. This was done by the elder Geoffroy St-

¹ In this word the initial C, as is usual in Portuguese, is pronounced soft, and the accent laid upon the first syllable.

² Yet Forbes states (*Ibid.*, 1831, p. 353) that *Serica* comes from *Siri*, "a diminutive of Indian extraction," and *Ena*, the Portuguese name for the Rheas (comp. EMU, vol. viii. p. 171), the whole thus meaning "Little Rheas."

Hilare (*Ann du Muséum*, xiii pp. 362-370, pl. 26), who had seen a specimen in the Lisbon museum, and, though knowing it had already been received into scientific nomenclature, he called it anew *Microlutulus nigrigran*. In 1811 Illiger, without having seen an example, renamed the genus *Dicolophus*—a term which, as before stated (ORNITHOLOGY, vol. xviii p. 46, note 1), has since been frequently applied to it—placing it in the curious congeries of forms having little affinity which he called *Aleotides*. In the course of his travels in Brazil (1815-17), Ponce Max of Wied met with this bird, and in 1823 there appeared from his pen (*Nat Acad L-C Nat Curiosorum*, xi pt. 2, pp. 341-350, tab. xiv) a very good contribution to its history, embellished by a faithful life-sized figure of its head. The same year Temminck figured it in the *Planches Colorées* (No. 237). It is not easy to say when any example of the bird first came under the eyes of British ornithologists, but in the Zoological Proceedings for 1836 (pp. 29-32) Mathin described the visceral and osteological anatomy of one which had been received alive the preceding year.¹

The Serema, owing to its long legs and neck, stands some two feet or more in height, and in menageries beats itself with a stately deportment. Its bright red back, the base greenish blue skin surrounding its large yellow eyes, and the tufts of elongated feathers springing vertically from its loins, give it a pleasing and animated expression, but its plumage generally is of an inconspicuous ochraceous grey above and dull white beneath,—the feathers of the upper parts, which on the neck and throat are long and loose, being banded by fine zigzag markings of dark brown, while those of the lower parts are more or less striped. The wing-quills are brownish black, banded with mottled white, and those of the tail, except the middle pair, which are wholly greyish brown, are banded with mottled white at the base and the tip, but dark brown for the rest of their length. The legs are red. The Serema inhabits the campos or elevated open parts of Brazil, from the neighbourhood of Pernambuco to the Rio de la Plata, extending inland as far as Matto Grosso (long 60°), and occurring also, though sparsely, in Paraguay. It lives in the high grass, running away in a stooping posture to avoid discovery or being approached, and taking flight only at the utmost need. Yet it builds its nest in thick bushes or trees at about a man's height from the ground, therein laying two eggs, which Prof. Burmeister likens to those of the Land-Rail in colour.² The young are hatched fully covered with grey down, relieved by brown, and remain for some time in the nest. The food of the adult is almost exclusively animal,—insects, especially large ants, snails, lizards, and snakes, but it also eats certain large red beetles.

Until 1860 the Serema was believed to be without any near relative in the living world of birds,³ but in the Zoological Proceedings for that year (pp. 334-338) Dr Hartlaub described an allied species discovered by Prof. Burmeister in the territory of the Argentine Republic.⁴ This bird, which has since been regarded as entitled to generic division under the name of *Chingua burmeisteri* (*P Z S*, 1870, p. 466, pl. xxv), and seems to be known in its native country as the "Chunim," differs from the Serema by frequenting forest or at least bushy districts. It is also darker in colour, has less of the frontal crest, shorter legs, a longer tail, and the markings beneath take the form of bars rather than stripes. In other respects the difference between the two birds seems to be immaterial.

There are few birds which have more exercised the taxonomer than this, and the reason seems to be plain. The Serema must be regarded as the not greatly modified heir of some very old type, such as one may fairly imagine to have lived before many of the existing groups of birds had

become differentiated. Looking at it in this light, we may be prepared to deal gently with the systematists who, having only the present before their eyes, have relegated it positively to this, that, or the other Order, Family, or other group of birds. There can be no doubt that some of its habits point to an alliance with the BUSTARD (vol. iv p. 578) or perhaps certain Plovers (see PLOVER, vol. xix p. 237), while its digestive organs are essentially, if not absolutely, those of the HERON (vol. xi p. 760). Its general appearance recalls that of the SECRETARY-BIRD (*supra*, p. 617); but this, it must be admitted, may be merely an analogy and may indicate no affinity whatever. On the one hand we have authorities, starting from bases so opposed as Prof. Parker (*P Z S*, 1863, p. 516) and Sundevall, placing it among the *Accipitres*,⁵ while on the other we have Nitzsch, Prof. Burmeister,⁶ Mathin (*ut supra*), and Dr Gadow (*Journ. f. Ornithologie*, 1876, pp. 445, 446) declaring in effect that this view of its affinities cannot be taken. Prof. Huxley has expressed himself more cautiously, and, while remarking (*P Z S*, 1867, p. 456) that in its skull "the internasal septum is ossified to a very slight extent, and the maxillo-palatine processes may meet in the middle line, in both of which respects it approaches the birds of prey," adds that "the ossified part of the nasal septum does not unite below with the maxillo-palatines," and that in this respect it is unlike the *Accipiter*,⁷ finally he declares (p. 457) that, as *Otus* connects the *Geranomorpha* with the *Charadriomorpha*, so *Curama* connects the former with the *Aetonomorpha*, "but it is a question whether these two genera may be better included in the *Geranomorpha*, or made types of separate groups" (A X).

SERIES. A series is a set of terms considered as arranged in order. Usually the terms are or represent numerical magnitudes, and we are concerned with the sum of the series. The number of terms may be limited or without limit, and we have thus the two theories, finite series and infinite series. The notions of conveyancy and divergency present themselves only in the latter theory.

Finite Series.

1. Taking the terms to be numerical magnitudes, or say numbers, if there be a definite number of terms, then the sum of the series is nothing else than the number obtained by the addition of the terms, e.g., $4 + 8 + 10 = 23$, $1 + 2 + 4 + 8 = 15$. In the first example there is no apparent law for the successive terms, in the second example there is an apparent law. But it is important to notice that in neither case is there a determinate law—we can in an infinity of ways form series beginning with the apparently irregular succession of terms 4, 9, 10, or with the apparently regular succession of terms 1, 2, 4, 8. For instance, in the latter case we may have a series with the general term 2^n , when for $n = 0, 1, 2, 3, 4, 5$ the series will be 1, 2, 4, 8, 16, 32, . . . ; or a series with the general

⁵ The author of vol. 1. of the British Museum *Catalogue of Birds* even refers it to the Family *Falconidae* and sub-Family *Polyborinae*, though he regards the *OSPREY* (vol. xviii p. 56) as the type of a distinct sub-Order, thereby showing a want of penetration which it is difficult to excuse. Here it needs only to be said that, whereas in a few points *Pendion* differs from the normal *Falconidae*, *Curama* diverges in characters too numerous to mention. The suggestion that the Order *Accipitres* might be justifiably enlarged so as to include the Serema has before (ORNITHOLOGY, vol. xviii pp. 45, 46) met with conditional approval, but that this remarkable and peculiar form should be treated in the way just described indicates an amount of neglect of evidence hardly to be expected at the present day.

⁶ Nitzsch, as Prof. Burmeister states in his masterly contribution to the natural history of this bird (*Abhandl. naturf. Gesellsch. Halle*, pp. 1-48, pls. 1, 2), in 1834 saw a defective skeleton sent to Munich by the Brazilian travellers Spix and Martius. His description of it was not, however, published until 1853. To it is appended a description by Dr Cephin of some *Entolona* found in the Serema, but this unfortunately seems to give no help as to the systematic position of the bird.

¹ The skeleton has been briefly described and figured by Eytton (*Ornith. Annum*, p. 190, pls. 3, K, and 23 bis, fig. 1).

² This distinguished author twice cites the figure given by Thene-mann (*Fortschrittsgesch. gesamm. Vogel*, pl. lxxii fig. 14) as though taken from a genuine specimen, but little that can be called Ralline in character is observable therein. The same is to be said of an egg laid in captivity at Paris, but a specimen in Mr Walter's possession undeniably shows it (*cf. Proc. Zool. Society*, 1881, p. 2).

³ A supposed fossil *Curama* from the caves of Brazil, mentioned by Bonaparte (*C. R.*, xiii p. 779) and others, has since been shown by Reichenow (*Ibis*, 1882, pp. 321-332) to rest upon the misinterpretation of certain bones, which the latter considers to have been those of a *Ictha*.

⁴ Near Tucuman and Catamarca (Burmeister, *Reise durch die La Plata Staaten*, ii p. 508).

term $\frac{1}{6}(n^3 + 5n + 6)$, where for the same values of n the series will be 1, 2, 4, 8, 15, 26. The series may contain negative terms, and in forming the sum each term is of course to be taken with the proper sign.

2 But we may have a given law, such as either of those just mentioned, and the question then arises, to find the sum of an indefinite number of terms, or say of n terms (n standing for any positive integer number at pleasure) of the series. The expression for the sum cannot in this case be obtained by actual addition, the formation by addition of the sum of two terms, of three terms, &c., will, it may be, suggest (but it cannot do more than suggest) the expression for the sum of n terms of the series. For instance, for the series of odd numbers $1 + 3 + 5 + 7 + \dots$, we have $1 = 1$, $1 + 3 = 4$, $1 + 3 + 5 = 9$, &c. These results at once suggest the law, $1 + 3 + 5 + \dots + (2n - 1) = n^2$, which is in fact the true expression for the sum of n terms of the series; and this general expression, once obtained, can afterwards be verified.

3 We have here the theory of finite series the general problem is, u_n being a given function of the positive integer n , to determine as a function of n the sum $u_0 + u_1 + u_2 + \dots + u_n$, or, in order to have n instead of $n + 1$ terms, say the sum $u_0 + u_1 + u_2 + \dots + u_{n-1}$.

Simple cases are the three which follow

(i) The arithmetic series,

$$a + (a + b) + (a + 2b) + \dots + (a + (n-1)b),$$

writing here the terms in the reverse order, it at once appears that twice the sum is $= 2a + n - 1b$ taken n times that is, the sum $= na + \frac{1}{2}n(n-1)b$. In particular we have

an expression for the sum of the natural numbers

$$1 + 2 + 3 + \dots + n = \frac{1}{2}n(n+1),$$

and an expression for the sum of the odd numbers

$$1 + 3 + 5 + \dots + (2n-1) = n^2$$

(ii) The geometric series,

$$a + ar + ar^2 + \dots + ar^{n-1},$$

here the difference between the sum and r times the sum is at once seen to be $a - ar^n$, and the sum is thus $= a \frac{1-r^n}{1-r}$; in particular the sum of the series

$$1 + r + r^2 + \dots + r^{n-1} = \frac{1-r^n}{1-r}$$

(iii) But the harmonic series,

$$\frac{1}{a} + \frac{1}{a+b} + \frac{1}{a+2b} + \dots + \frac{1}{a+(n-1)b}$$

or say $\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots + \frac{1}{n}$, does not admit of summation, there is no algebraical function of n which is equal to the sum of the series.

4. If the general term be a given function u_n , and we can find v_n a function of n such that $v_{n+1} - v_n = u_n$, then we have $u_0 = v_1 - v_0$, $u_1 = v_2 - v_1$, $u_2 = v_3 - v_2$, \dots , $u_n = v_{n+1} - v_n$; and hence $u_0 + u_1 + u_2 + \dots + u_n = v_{n+1} - v_0$ —an expression for the required sum. This is in fact an application of the Calculus of Finite Differences. In the notation of this calculus $v_{n+1} - v_n$ is written Δv_n ; and the general inverse problem, or problem of integration, is from the equation of differences $\Delta v_n = u_n$ (where u_n is a given function of n) to find v_n . The general solution contains an arbitrary constant, $v_n = V_n + C$; but this disappears in the difference $v_{n+1} - v_0$. As an example consider the series

$$u_0 + u_1 + \dots + u_n = 0 + 1 + 3 + \dots + \frac{1}{2}n(n+1),$$

here, observing that

$$n(n+1)(n+2) - (n-1)n(n+1) = n(n+1)(n+2 - n - 1) = 3n(n+1),$$

we have

$$v_{n+1} - v_0 = \frac{1}{6}n(n+1)(n+2),$$

and hence $1 + 3 + 6 + \dots + \frac{1}{2}n(n+1) = \frac{1}{6}n(n+1)(n+2)$,

as may be at once verified for any particular value of n . Similarly, when the general term is a factorial of the order r , we have

$$1 + \frac{r+1}{1} + \frac{n(n+1)}{1 \cdot 2} + \frac{(n+1)(n-1)}{2} = \frac{n(n+1)}{1 \cdot 2} + \frac{(n+2)}{(r+1)}$$

5 If the general term u_n be any rational and integral function of n , we have

$$u_n = u_0 + \frac{1}{1 \cdot 2} \Delta u_0 + \frac{n(n-1)}{1 \cdot 2} \Delta^2 u_0 + \frac{(n-1)(n-2)}{1 \cdot 2} \Delta^3 u_0 + \dots$$

where the series is continued only up to the term depending on p , the degree of the function u_n , for all the subsequent terms vanish. The series is thus decomposed into a set of series which have each a factorial for the general term, and which can be summed by the last formula, thus we obtain

$$u_0 + u_1 + \dots + u_n = (n+1)u_0 + \frac{(n+1)n}{1 \cdot 2} \Delta u_0 + \frac{(n+1)n(n-1)}{1 \cdot 2 \cdot 3} \Delta^2 u_0 + \dots + \frac{(n+1)n(n-1)(n-2)\dots(n-p+1)}{(p+1)!} \Delta^p u_0,$$

which is a function of the degree $p+1$.

Thus for the before-mentioned series $1 + 2 + 4 + 8 + \dots$, if it be assumed that the general term u_n is a cubic function of n , and writing down the given terms and forming the differences, 1, 2, 4, 8, 1, 2, 4, 1, 2, 1, we have

$$u_n = 1 + \frac{n}{1} + \frac{n(n-1)}{1 \cdot 2} + \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3} \left\{ = \frac{1}{6}(n^3 + 3n^2 + 6n + 6), \text{ as above } \right\},$$

and the sum $u_0 + u_1 + \dots + u_n$

$$= n + 1 + \frac{(n+1)n}{1 \cdot 2} + \frac{(n+1)n(n-1)}{1 \cdot 2 \cdot 3} + \frac{(n+1)n(n-1)(n-2)}{1 \cdot 2 \cdot 3 \cdot 4} + \dots = \frac{1}{24}(n^4 + 2n^3 + 11n^2 + 34n + 24)$$

As particular cases we have expressions for the sums of the powers of the natural numbers—

$$1^2 + 2^2 + \dots + n^2 = \frac{1}{6}n(n+1)(2n+1); 1^3 + 2^3 + \dots + n^3 = \frac{1}{24}n^2(n+1)^2$$

(observe that this $= (1 + 2 + \dots + n)^2$); and so on.

6 We may, from the expression for the sum of the geometric series, obtain by differentiation other results.

thus $1 + r + r^2 + \dots + r^{n-1} = \frac{1-r^n}{1-r}$ gives

$$1 + 2r + 3r^2 + \dots + (n-1)r^{n-2} = \frac{d}{dr} \frac{1-r^n}{1-r} = \frac{1-nr^{n-1} + (n-1)r^{n-1}}{(1-r)^2};$$

and we might in this way find the sum $u_0 + u_1 + \dots + u_n$, where u_n is any rational and integral function of n .

7. The expression for the sum $u_0 + u_1 + \dots + u_n$ of an indefinite number of terms will in many cases lead to the sum of the infinite series $u_0 + u_1 + \dots$; but the theory of infinite series requires to be considered separately. Often in dealing apparently with an infinite series $u_0 + u_1 + \dots$ we consider rather an indefinite than an infinite series, and are not in any wise really concerned with the sum of the series or the question of its convergence; thus the equation

$$\left(1 + nx + \frac{n(n-1)}{1 \cdot 2} x^2 + \dots\right) \left(1 + nx + \frac{n(n-1)}{1 \cdot 2} x^2 + \dots\right) = 1 + (m+n)x + \frac{(m+n)(m+n-1)}{1 \cdot 2} x^2 + \dots$$

really means the series of identities

$$\begin{aligned} (m+n) &= m+n \\ \frac{(m+n)(m+n-1)}{1 \cdot 2} &= \frac{m(m-1)}{1 \cdot 2} + 2 \frac{m}{1} + \frac{n(n-1)}{1 \cdot 2}, \text{ &c.}, \end{aligned}$$

obtained by multiplying together the two series of the left-hand side. Again, in the method of generating functions we are concerned with an equation $\phi(t) = A_0 + A_1 t + \dots + A_n t^n + \dots$, where the function $\phi(t)$ is used only to express the law of formation of the successive coefficients.

It is an obvious remark that, although according to the original definition of a series the terms are considered as arranged in a determinate order, yet in a finite series

definitely small, by taking m sufficiently large the sum $u_{m+1} + u_{m+2} + \dots + u_{m+r}$ (where r is any number however large) can be made as small as we please, or, as this may also be stated, the sum of the infinite series $u_{m+1} + u_{m+2} + \dots$ can be made as small as we please. If the terms are all positive (but not otherwise), we may take, instead of the entire series $u_{m+1} + u_{m+2} + \dots$, any set of terms (not of necessity consecutive terms) subsequent to u_m , that is, for a convergent series of positive terms the sum of any set of terms subsequent to u_m can, by taking m sufficiently large, be made as small as we please.

13. It follows that in a convergent series of positive terms the terms may be grouped together in any manner so as to form a finite number of partial series which will be each of them convergent, and such that the sum of their sums will be the sum of the given series. For instance, if the given series be $u_0 + u_1 + u_2 + \dots$, then the two series $u_0 + u_2 + u_4 + \dots$ and $u_1 + u_3 + \dots$ will each be convergent and the sum of their sums will be the sum of the original series.

14. Obviously the conclusion does not hold good in general for series of positive and negative terms, for instance, the series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ is convergent, but the two series $1 + \frac{1}{3} + \frac{1}{5} + \dots$ and $-\frac{1}{2} - \frac{1}{4} - \dots$ are each divergent, and thus without a sum. In order that the conclusion may be applicable to a series of positive and negative terms the series must be "absolutely convergent," that is, it must be convergent when all the terms are made positive. This implies that the positive terms taken by themselves are a convergent series, and also that the negative terms taken by themselves are a convergent series. It is hardly necessary to remark that a convergent series of positive terms is absolutely convergent. The question of the convergency or divergency of a series of positive and negative terms is of less importance than the question whether it is or is not absolutely convergent. But in this latter question we regard the terms as all positive, and the question in effect relates to series containing positive terms only.

15. Consider, then, a series of positive terms $u_0 + u_1 + u_2 + \dots$; if they are increasing—that is, if in the limit u_{n+1}/u_n be greater than 1—the series is divergent, but if less than 1 the series is convergent. This may be called a first criterion, but there is the doubtful case where the limit = 1. A second criterion was given by Cauchy and Raabe, but there is here again a doubtful case when the limit considered = 1. A succession of criteria was established by De Morgan, which it seems proper to give in the original form, but the equivalent criteria established by Bertrand are somewhat more convenient. In what follows \log is for shortness written to denote the logarithm of x , no matter to what base. De Morgan's form is as follows:—

Writing $u_n = \frac{1}{\phi(n)}$, put $p_0 = \frac{x\phi'(x)}{\phi(x)}$; if for $x = \infty$ the limit a_0 of p_0 be greater than 1 the series is convergent, but if less than 1 it is divergent. If the limit $a_0 = 1$, seek for the limit of $p_1 = (p_0 - 1)\log x$, if this limit a_1 be greater than 1 the series is convergent, but if less than 1 it is divergent. If the limit $a_1 = 1$, seek for the limit $p_2 = (p_1 - 1)\log x$, if this limit a_2 be greater than 1 the series is convergent, but if less than 1 it is divergent. And so on indefinitely.

16. Bertrand's form is:—If, in the limit for $n = \infty$, $\frac{1}{u_n} \log n$ be negative or less than 1 the series is divergent, but if greater than 1 it is convergent. If it = 1, then if $\frac{1}{u_n n} \log n$ be negative or less than 1 the series is divergent, but if

greater than 1 it is convergent. If it = 1, then if $\frac{1}{u_n n \log n} \log n$ be negative or less than 1 the series is divergent, but if greater than 1 it is convergent. And so on indefinitely.

The last-mentioned criteria follow at once from the theorem that the several series having the general terms $\frac{1}{n^a}, \frac{1}{n \log n}, \frac{1}{n \log n \log n}, \frac{1}{n \log n \log n \log n}, \dots$ respectively are each of them convergent if a be greater than 1, but divergent if a be negative or less than 1 or = 1. In the simplest case, series with the general term $\frac{1}{n^a}$, the theorem may be

proved nearly in the manner in which it is shown above (cf § 9) that the harmonic series is divergent.

17. Two or more absolutely convergent series may be added together, $\{u_0 + u_1 + u_2 + \dots\} + \{v_0 + v_1 + v_2 + \dots\} = \{u_0 + v_0 + u_1 + v_1 + \dots\}$; that is, the resulting series is absolutely convergent and has for its sum the sum of the two sums. And similarly two or more absolutely convergent series may be multiplied together $\{u_0 + u_1 + u_2 + \dots\} \times \{v_0 + v_1 + v_2 + \dots\} = \{u_0 v_0 + (u_1 v_0 + u_0 v_1) + (u_2 v_0 + u_1 v_1 + u_0 v_2) + \dots\}$, that is, the resulting series is absolutely convergent and has for its sum the product of the two sums. But more properly the multiplication gives rise to a doubly infinite series—

$$\begin{matrix} u_0 v_0 & u_0 v_1 & u_0 v_2 & \dots \\ u_1 v_0 & u_1 v_1 & u_1 v_2 & \dots \\ u_2 v_0 & u_2 v_1 & u_2 v_2 & \dots \end{matrix}$$

—which is a kind of series which will be presently considered.

18. But it is in the first instance proper to consider a single series extending backwards and forwards to infinity, or say a back-and-forwards infinite series. $\dots u_{-2} + u_{-1} + u_0 + u_1 + u_2 + \dots$, such a series may be absolutely convergent, and the sum is then independent of the order of the terms, and in fact equal to the sum of the sums of the two series $u_0 + u_1 + u_2 + \dots$ and $u_{-2} + u_{-1} + u_{-3} + \dots$ respectively. But, if not absolutely convergent, the expression has no definite meaning until it is explained in what manner the terms are intended to be grouped together, for instance, the expression may be used to denote the foregoing sum of two series, or to denote the series $u_0 + (u_1 + u_{-1}) + (u_2 + u_{-2}) + \dots$ and the sum may have different values, or there may be no sum, accordingly. Thus, if the series be $\dots -\frac{1}{2} - \frac{1}{4} + 0 + \frac{1}{2} + \frac{1}{4} + \dots$, in the former meaning the two series $0 + \frac{1}{2} + \frac{1}{4} + \dots$ and $-\frac{1}{2} - \frac{1}{4} - \dots$ are each divergent, and there is not any sum. But in the latter meaning the series is $0 + 0 + 0 + \dots$, which has a sum = 0. So, if the series be taken to denote the limit of $(u_0 + u_1 + u_2 + \dots + u_m) + (u_{-1} + u_{-2} + \dots + u_{-m})$, where m , m' are each of them ultimately infinite, there may be a sum depending on the ratio $m:m'$, which sum consequently acquires a determinate value only when this ratio is given.

19. In a singly infinite series we have a general term u_m , where n is an integer positive in the case of an ordinary series, and positive or negative in the case of a back-and-forwards series. Similarly for a doubly infinite series we have a general term $u_{m,n}$, where m, n are integers which may be each of them positive, and the form of the series is then

$$\begin{matrix} u_{0,0} & u_{1,1} & u_{2,2} & \dots \\ u_{-1,0} & u_{0,1} & u_{1,2} & \dots \\ u_{-2,0} & u_{-1,1} & u_{0,2} & \dots \end{matrix}$$

or they may be each of them positive or negative. The latter is the more general supposition, and includes the former, since $u_{m,n}$ may = 0 for m or n each or either of them negative. To put a definite meaning on the notion of a sum, we may regard m, n as the rectangular coordinates of a point in a plane; that is, if m, n are each of

them positive we attend only to the positive quadrant of the plane, but otherwise to the whole plane; and we have thus a doubly infinite system or lattice-work of points. We may imagine a boundary depending on a parameter T which for $T = \infty$ is at every point thereof at an infinite distance from the origin, for instance, the boundary may be the circle $x^2 + y^2 = T$, or the four sides of a rectangle, $x = \pm aT$, $y = \pm \beta T$. Suppose the form is given and the value of T , and let the sum $\Sigma u_{m,n}$ be understood to denote the sum of those terms $u_{m,n}$ which correspond to points within the boundary, then, if as T increases without limit the sum in question continually approaches a determinate limit (dependent, it may be, on the form of the boundary), for such form of boundary the series is said to be convergent, and the sum of the doubly infinite series is the aforesaid limit of the sum $\Sigma u_{m,n}$. The condition of convergency may be otherwise stated, it must be possible to take T so large that the sum $\Sigma u_{m,n}$ for all terms $u_{m,n}$ which correspond to points outside the boundary shall be as small as we please.

It is easy to see that, if the terms $u_{m,n}$ be all of them positive, and the series be convergent for any particular form of boundary, it will be convergent for any other form of boundary, and the sum will be the same in each case. Thus, let the boundary be in the first instance the circle $x^2 + y^2 = T$, by taking T sufficiently large the sum $\Sigma u_{m,n}$ for points outside the circle may be made as small as we please. Consider any other form of boundary—for instance, an ellipse of given excentricity,—and let such an ellipse be drawn including within it the circle $x^2 + y^2 = T$. Then the sum $\Sigma u_{m,n}$ for terms $u_{m,n}$ corresponding to points outside the ellipse will be smaller than the sum for points outside the circle, and the difference of the two sums—that is, the sum for points outside the circle and inside the ellipse—will also be less than that for points outside the circle, and can thus be made as small as we please. Hence finally the sum $\Sigma u_{m,n}$, whether restricted to terms $u_{m,n}$ corresponding to points inside the circle or to terms corresponding to points inside the ellipse, will have the same value, or the sum of the series is independent of the form of the boundary. Such a series, viz., a doubly infinite convergent series of positive terms, is said to be absolutely convergent, and similarly a doubly infinite series of positive and negative terms which is convergent when the terms are all taken as positive is absolutely convergent.

20 We have in the preceding theory the foundation of the theorem (§ 17) as to the product of two absolutely convergent series. The product is in the first instance expressed as a doubly infinite series; and, if we sum this for the boundary $x = y = T$, this is in effect a summation of the series $u_0 v_0 + (u_0 v_1 + u_1 v_0) + \dots$, which is the product of the two series. It may be further remarked that, stating with the doubly infinite series and summing for the rectangular boundary $x = aT$, $y = \beta T$, we obtain the sum as the product of the sums of the two single series. For series not absolutely convergent the theorem is not true. A striking instance is given by Cauchy: the series $1 - \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{8}} - \frac{1}{\sqrt{4}} + \dots$ is convergent and has a calculable sum, but it can be shown without difficulty that its square, viz., the series $1 - \frac{2}{\sqrt{2}} + \left(\frac{2}{\sqrt{8}} + \frac{1}{2}\right) - \dots$, is divergent.

21 The case where the terms of a series are imaginary comes under that where they are real. Suppose the general term is $p_n + iq_n$, then the series will have a sum, or will be convergent, if and only if the series having for its general term p_n and the series having for its general term q_n be each convergent, then the sum = sum of first series + i into sum of second series. The notion of absolute conver-

gence will of course apply to each of the series separately, further, if the series having for its general term the modulus $\sqrt{p_n^2 + q_n^2}$ be convergent (that is, absolutely convergent, since the terms are all positive), each of the component series will be absolutely convergent, but the condition is not necessary for the convergence, or the absolute convergence, of the two component series respectively.

22 In the series thus far considered the terms are actual numbers, or are at least regarded as constant; but we may have a series $u_0 + u_1 + u_2 + \dots$ where the successive terms are functions of a parameter z , in particular we may have a series $a_0 + a_1 z + a_2 z^2 + \dots$ arranged in powers of z . It is in view of a complete theory necessary to consider z as having the imaginary value $x + iy = r(\cos \phi + i \sin \phi)$. The two component series will then have the general terms $a_n r^n \cos n\phi$ and $a_n r^n \sin n\phi$ respectively; accordingly each of these series will be absolutely convergent for any value whatever of ϕ , provided the series with the general term $a_n r^n$ be absolutely convergent. Moreover, the series, if thus absolutely convergent for any particular value R of r , will be absolutely convergent for any smaller value of r , that is, for any value of $x + iy$ having a modulus not exceeding R , or, representing as usual $x + iy$ by the point whose rectangular coordinates are x, y , the series will be absolutely convergent for any point whatever inside or on the circumference of the circle having the origin for centre and its radius = R . The origin is of course an arbitrary point. Or, what is the same thing, instead of a series in powers of z , we may consider a series in powers of $z - c$ (where c is a given imaginary value = $\alpha + i\beta$). Starting from the series, we may within the aforesaid limit of absolute convergency consider the series as the definition of a function of the variable z , in particular the series may be absolutely convergent for every finite value of the modulus, and we have then a function defined for every finite value whatever $x + iy$ of the variable. Conversely, starting from a given function of the variable, we may inquire under what conditions it admits of expansion in a series of powers of z (or $z - c$), and seek to determine the expansion of the function in a series of this form. But in all this, however, we are travelling out of the theory of series into the general theory of functions.

23 Considering the modulus r as a given quantity and the several powers of r as included in the coefficients, the component series are of the forms $a_0 + a_1 \cos \phi + a_2 \cos 2\phi + \dots$ and $a_1 \sin \phi + a_2 \sin 2\phi + \dots$ respectively. The theory of these trigonometrical or multiple sine and cosine series, and of the development, under proper conditions, of an arbitrary function in series of these forms, constitutes an important and interesting branch of analysis.

24. In the case of a real variable z , we may have a series $a_0 + a_1 z + a_2 z^2 + \dots$, where the series $a_0 + a_1 + a_2 + \dots$ is a divergent series of decreasing positive terms (or as a limiting case where this series is $1 + 1 + 1 + \dots$). For a value of z inferior but indefinitely near to ± 1 , say $z = \pm(1 - \epsilon)$, where ϵ is indefinitely small and positive, the series will be convergent and have a determinate sum $\phi(z)$, and we may write $\phi(\pm 1)$ to denote the limit of $\phi(\pm(1 - \epsilon))$ as ϵ diminishes to zero, but unless the series be convergent for the value $z = \pm 1$ it cannot for this value have a sum, nor consequently a sum = $\phi(\pm 1)$. For instance, let the series be $z + \frac{z^2}{2} + \frac{z^3}{3} + \dots$, which for values of z between the limits ± 1 (both limits excluded) = $-\log(1 - z)$. For $z = +1$ the series is divergent and has no sum, but for $z = 1 - \epsilon$ as ϵ diminishes to zero we have $-\log \epsilon$ and $(1 - \epsilon) + \frac{1}{2}(1 - \epsilon)^2 + \dots$, each positive and increasing without limit; for $z = -1$ the series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ is convergent, and we have at

the limit $\log 2 = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} \dots$. As a second example, consider the series $1 + z + z^2 \dots$, which for values of z between the limits ± 1 (both limits excluded) $= \frac{1}{1-z}$. For $z = +1$, the series is divergent and has no sum, but for $z = 1 - \epsilon$ as ϵ diminishes to zero we have $\frac{1}{\epsilon} + 1 + (1 - \epsilon) + (1 - \epsilon)^2 \dots$, each positive and increasing without limit, for $z = -1$ the series is divergent and has no sum, the equation $\frac{1}{2 - \epsilon} = 1 - (1 - \epsilon) + (1 - \epsilon)^2 \dots$ is true for any positive value of ϵ however small, but not for the value $\epsilon = 0$.

SERINGAPATAM, formerly the capital of Mysore, India, is situated on an island of the same name in the Kaveri (Cauvery) river in 12° 25' 33" N lat and 76° 43' 8" E. long. It is chiefly noted for its fortress, which figured so prominently in Indian history at the close of the 18th century. This formidable stronghold of Tipu Sultan thrice sustained a siege from the British, but it was finally stormed in 1799, and after its capture the island was ceded to the British. The island of Seringapatam is about 3 miles in length from east to west and 1 in breadth, and yields valuable crops of rice and sugar-cane. The fort occupies the western side of the island, immediately overhanging the river. Seringapatam is said to have been founded in 1454 by a descendant of one of the local officers appointed by Rāmānuja, the Vishnuite apostle, who named it the city of Sri Ranga, or Vishnu. At the eastern or lower end of the island is the Lal Bagh or "red garden," containing the mausoleum built by Tipu Sultan for his father Hyder Ali, in which Tipu himself also lies. In 1881 the population of the town of Seringapatam was 11,734 (males 5579, females 6155).

SERJEANT-AT-LAW is the name given to one who holds an ancient and honourable rank at the English or Irish bar. The word is a corruption of *sermons ad legem*, as distinguished from *apprenticus ad legem*, or utter barrister, who probably originally obtained his knowledge of law by serving a kind of apprenticeship to a serjeant. When the order of serjeants was instituted is unknown, but it certainly dates from a very remote period. The authority of serjeant counsellors or counsellors (i.e., pleaders, those who frame counts in pleading) is treated in the *Mirror of Justices*, and they are named in 3 Edw I. c. 29. They may possibly have been the representatives of the *conteurs* mentioned in the great customary of Normandy. The position of the serjeant had become assured when Chaucer wrote *One of the chaunciers in the Canterbury Tales* 15.

"A serjeant of the law, way and wise,
That often had y-been at the parvis,"¹

Serjeants (except king's serjeants) were created by writ of summons under the great seal, and wore a special and distinctive dress, the chief feature of which was the coif, a white lawn or silk skull-cap, now represented by a round piece of black silk at the top of the wig. They enjoyed a social precedence after knights bachelors and before companions of the Bath and other orders. In this they differed from queen's counsel, who have simply professional as distinguished from social rank. Socially the serjeant had precedence, professionally the queen's counsel, unless indeed, as was often the case, a patent of precedence was granted to the former. Till past the middle of the 19th century, a limited number of the serjeants were called "king's (queen's) serjeants." They were appointed by patent and summoned to parliament. Until 1814 the two senior king's serjeants had precedence of even the attorney-general and solicitor-general. It was the custom for serjeants on their appointment to give gold rings with mottoes to their colleagues. Down to 1845 the order enjoyed a very valuable monopoly of practice. The serjeants had the right of exclusive audience as leading counsel in the Court of Common Pleas. In 1834 a royal mandate of William IV attempted to abolish this privilege, but in 1840 the judicial committee of the privy council declared the mandate informal and invalid. The monopoly was finally abolished in 1845 by Act of Parliament (9 and 10 Vict. c. 54). For at least 600 years the judges of the superior courts of common law were always serjeants. If a judge was appointed who was not a serjeant at the time of his appointment, he was formally created one immediately before his elevation to the bench. By the Judicature Act, 1873, sect 8, no person appointed a judge of the High Court of Justice or the Court of Appeal is required to take or have taken the degree of serjeant-at-law. The serjeants had their own inn of court down to a very recent date. Serjeants' Inn was formerly in two divisions, one in Fleet Street and one in Chancery Lane. In 1758 the members of the former joined the latter. In 1877 the latter was dissolved, the inn sold to one of the members, and the proceeds divided among the existing serjeants. The extinction of the order is now only a question of time, no serjeant having been created since 1868. It is, however, still within the discretion of the crown to create fresh serjeants if ever it should be deemed advisable to do so. In Ireland the order still exists. The three serjeants at the Irish bar have precedence next after the law officers of the crown. See *Sermons ad Legem*, by Mr Serjeant Manning, *The Order of the Coif*, by Mr Serjeant Pulling.

SERJEANTY, a form of tenure. See REAL ESTATE.

SERPENT, a musical instrument. See OPTICFLUTE.

vol xvn p 778

SERPENTINE, a compact crypto-crystalline or fibrous mineral substance, occurring in rock-masses which commonly present dark green colours, variously mottled and fancifully compared to the markings on certain serpents, whence the name "serpentine." For a like reason it is sometimes called "ophite," while Italian sculptors have termed it "anocchia," in allusion to its resemblance to the skin of a frog. In consequence of its variegated tints, the stone is frequently cut and polished for ornamental purposes, and is hence popularly called a marble. From true marble, however, it differs in chemical composition, being essentially a hydrated silicate of magnesium, usually associated with certain metallic oxides (such as those of iron, nickel, and chromium) which confer upon the stone its characteristic tints. In some localities serpentine is found in

¹ The parvis was the porch of old St Paul's, where each serjeant had his particular pillar at which he held interviews with his clients.

masses which are evidently intrusive among other rocks, while elsewhere it occurs interbedded, usually in lenticular masses, associated with gneiss and crystalline schists. It is noteworthy that the serpentine is frequently crushed and brecciated, exhibiting polished slip-faces which are sometimes striated. The surface of an exposed mass of serpentine is generally barren, whence bosses of the rock are known in the Alps as "monts morts." The origin of serpentine has been a subject of much dispute. It was pointed out by Sandberger and Tschermak that the alteration of olivine may give rise to this product, and pseudomorphs of serpentine after chrysolite are well known to mineralogists. Professor Bonney and many other geologists regard serpentine as being generally an altered eruptive rock, due to the hydration of peridotites, such as lherzolite, probably it may also result from the decomposition of olivine-gabbro and other rocks rich in magnesian silicates. Augite and hornblende may become altered to serpentine. On the contrary, Dr Sterry Hunt and certain other chemical geologists believe that serpentine has generally been formed as an aqueous sediment, probably precipitated by the reaction of sulphate or chloride of magnesium upon the silicate of lime or alkaline silicates derived from the disintegration of crystalline rocks and found in solution in many natural waters. Serpentine is a rock of rather limited occurrence. Its principal localities in England are Cornwall, especially in the Lizard district, where it occupies a considerable area. The famous scenery of Kynance Cove owes much of its beauty to the vivid colours and brilliant surface of the serpentine. The rock is worked into vases, columns, mantelpieces, &c., and of late years has been used to a limited extent for the decoration of shop-fronts in London. The beauty of the Lizard rock is heightened by the white veins of steatite which traverse it, and in some cases by disseminated crystals of bastite, which glisten with metallic lustre. Much of the Lizard serpentine is of rich red and brown colour. Green serpentine is found near Holyhead in Anglesea. A singularly beautiful variety of mottled red and green tints, with veins of steatite, occurs near Portsoy in Banffshire, Scotland. It is also found with chrome iron ore in the Shetland Islands. The green serpentine of Galway occurs in intimate association with crystalline limestone, forming the rock known as "ophicalcite" or "serpentine marble." Such an association is by no means uncommon; but, though the beauty of the serpentine may thus be enhanced, its durability seems to be impaired. On exposure to the weather the carbonate of calcium decomposes more readily than the silicate of magnesium, and hence the stone soon presents a rough eroded surface. The Galway rock comes into the market under the name of "Irish green" or "Connemara marble." Ophicalcites also occur in Ayrshire, Scotland, and in various parts of the Scottish Highlands; and the green pebbles found in Iona belong to this type of rock.

On the Continent serpentine is largely worked at Zoblit, at Waldheim in Saxony. The famous rock of Zoblit, mentioned by Agricola, is known to have been wrought for between three and four centuries, and is still extensively explored by open quarries and by subterranean galleries. The rock usually presents various shades of green and brown, red being very rare, but its most interesting feature is the frequent presence of pyrope, or Bohemian garnet, which occurs scattered through the rock in dark red grains, that decompose on weathering to a green chloritic product. Very little of the Zoblit serpentine comes to England, but it is common throughout Germany, and a good deal is sent to Russia and even to the United States. It has been used in the construction of the mausoleum of Prince Albert at Frogmore, and for Abraham Lincoln's monument at Springfield, Illinois. The best known

of the Italian serpentine is the "verde Prato," which has been quarried for centuries at Monteferrato, near Prato in Tuscany. According to Capacci this serpentine is probably of Eocene age. It has been largely used as a decorative stone in ecclesiastical architecture in Prato, Pistoia, and Florence. A good deal of serpentine is found near Genoa and Levanto. The "verde di Pegh" is obtained from Pegh, not far from Genoa, while the "verde di Genova" is a brecciated serpentinous limestone from Pietra Lavezzara. Serpentine also occurs at various other points of the Apennines, in Elba, and in Corsica. The term "ophiolite" has been vaguely used to include not only serpentine but many of the rocks associated with the Italian serpentine. In like manner the term "gabbro," derived from a locality near Leghorn, was at one time used as a general name for serpentine and its associates, though now usually restricted to a rock composed essentially of plagioclase and diabase. It is notable that this true gabbro is often found in company with serpentine.

Serpentine is found in numerous localities in the Alps and in France. An elegant variety is quarried at Epinal in the Vosges, and a beautiful ophicalcite is worked at St Vétan and Maurins, in the department of Hautes-Alpes. The serpentine of the Ronda Mountains in Spain has been described by Mr J Macpherson. In North America serpentine is so extensively distributed that only a few localities can be mentioned. It is found at Syracuse in New York, on Manhattan and Staten Islands, at Hoboken in New Jersey, at Newport, Rhode Island, at Newburyport, Massachusetts, at Westchester, Chester county, and at Texas, Lancaster county, in Pennsylvania. It also occurs between Clear Lake and New Idria in California. A fine ophicalcite has been obtained from near Milford and New Haven in Connecticut, and a beautiful variety has been worked at Port Henry, Essex county, New York (Dana). The Canadian eczoen occurs in a serpentinous limestone.

See GEOLOGY, vol. v. pp. 228, 232, MARBLE, vol. xv. p. 528, and MINERALOGY, vol. xvi. p. 414. The literature of the Italian and Saxon serpentine is rather voluminous. Of recent English writings on serpentine reference may be made to Bonney, in *Quart. Journ. Geol. Soc.*, London, xxxiii. p. 884, xxxiv. p. 788, xxxv. p. 40, xxxix. p. 21, and in *Geol. Mag.*, [2] vi. p. 362, [3] i. p. 406, and to Collins, *Quart. Journ. Geol. Soc.*, xl. p. 458, and *Geol. Mag.*, [3] i. p. 298. Sterry Hunt has written an elaborate paper in *Proc. Roy. Soc. Canada*, 1883, sect. iv. pp. 165-215. See also Teall, *British Petrography*, 1886, and Becker, in *Amer. Journ. of Science*, May 1886. (F. W. R.)

SERPENTS. See SNAKES.

SERPUKHOFF, a district town of Russia, in the government of Moscow, 61 miles south of the city of Moscow, with which it is connected by rail. Built on high cliffs on both banks of the river Nais, 3 miles above its junction with the Oka, Serpukhoff has of late become an important manufacturing and commercial town. The aggregate production of its manufactures (cotton and woollen stuffs, paper, leather), which employ about 4000 hands, in 1880 was valued at about £300,000. The surrounding district has several large cotton and woollen factories, with a yearly output worth about £1,000,000. Petty trades are also much developed in the neighbourhood,—textile fabrics, furniture, and earthenware and porcelain being produced by the peasantry. The manufactured goods of Serpukhoff are sent—mostly by rail—to the fairs of Nijni-Novgorod and the Ukraine, while large amounts of grain, hemp, and timber, brought from the east on the Oka, are discharged at Serpukhoff and sent on to Moscow and St Petersburg. The goods traffic by rail and river showed in 1880 an aggregate of 5,400,000 cwts (exclusive of timber floated down the Oka). Notwithstanding its recent prosperity and the sums bequeathed to the municipality by wealthy merchants, Serpukhoff improves but slowly. The cathedral (1380) was rebuilt in the 18th century, of

the old fortress, situated on a promontory formed by a bend of the Nara, a few heaps of stones are the only remains. The population in 1884 was 22,420

Seupukhoff is one of the oldest towns of the principality of Moscow, it is mentioned in the will of Ivan Dautsch (1528), at which time it was a nearly independent principality under the protection of Moscow. Its fortress, protecting Moscow on the south, was often attacked by the Tatars, Toktamish plundered it in 1382, and the Lithuanian prince Svjatoslav in 1410. In 1556 the town was strongly fortified, so that fifteen years later it was able to resist the Mongol invasion. Its commercial importance dates from the 18th century.

SERTORIUS, QUINTUS. The life and career of the Roman Sertorius, a man of remarkable genius both as a general and as a statesman, may be said to be comprised between the years 105 and 72 B.C., a period of civil war and revolution in the Roman world, when every man of any mark had to be an adherent either of Sulla or of Marius. Sertorius, who came from a little Sabine village under the Apennines and was a self-made man, attached himself to the party of the latter, and served under him in 102 B.C. at the great battle of Aquæ Sextiæ (Aix), in which the Teutones were decisively defeated. Three years before he had witnessed the rout of a Roman army by the Cimbri on the Rhone. In 97 he was serving in Spain and thus had a good opportunity of making himself acquainted with the country with which his fame is chiefly associated. In 91 he was quaestor in Cisalpine Gaul, and on his return to Rome he met with such a hearty welcome that he would have been elected to the tribuneship but for the decided opposition of Sulla. He now declared himself for Marius and the democratic party, though of Marius himself as a man he had the worst opinion. He must have been a consenting party to those heinous massacres of Marius and Cinna in 87, though he seems to have done what he could to mitigate their horrors by putting a stop to the outrages perpetrated by the scum of Marius's soldiery. On Sulla's return from the East and the war with Mithradates in 83, Sertorius left Rome for Spain, where he represented the Marian or democratic party, but it would appear, without receiving any definite commission or appointment. Here he passed the remainder of his life, with the exception of some cruises in the Mediterranean in conjunction with Cilician pirates, and of a campaign in Mauretania, in which he defeated one of Sulla's generals and captured Tingis (Tangier). This success recommended him to the Spaniards, more particularly to the Lusitanian tribes in the west, whom Roman generals and governors of Sulla's party had plundered and oppressed. Brave and kindly and gifted with a rough telling eloquence, Sertorius was just the man to impress Spaniards favourably, and the native militia, which he organized, spoke of him as the "new Hannibal." Many Roman refugees and deserters joined him, and with these and his Spanish volunteers he completely defeated one of Sulla's generals and drove Metellus, who had been specially sent against him from Rome, out of Lusitania, or further Spain as the Romans called it. Sertorius owed much of his success to his statesmanlike ability, and it seems that he aspired to be in Spain what the great Agricola afterwards was in Britain. His object was to build up a stable government in the country with the consent and co-operation of the people, whom he wished to civilize after the Latin model. He established a senate of 300 members, drawn from Roman emigrants, with probably a sprinkling of the best Spaniards. For the children of the chief native families he provided a school at Osca (Huesca), where they received a Roman education and even adopted the dress of Roman youths. Strict and severe as he was with his soldiers, he was particularly considerate to the people generally and made their burdens as light as possible. It seems clear that he had a peculiar gift for evoking the

enthusiasm of rude tribes, and we can well understand how the famous white fawn, which was his constant companion, may have promoted his popularity. For six years he may be said to have really ruled Spain. In 77 he was joined by Perpenna, one of the officers of Lepidus, from Rome, with a following of Roman nobles, and in the same year the great Pompey, then quite a young man and merely a knight, was sent by the senate to take the command in Spain and with Metellus to crush Sertorius. The war was waged with varying success, but on the whole Sertorius proved himself more than a match for his adversaries, utterly defeating their united forces on one occasion near Saguntum. Pompey wrote to Rome for reinforcements, without which, he said, he and Metellus would be driven out of Spain. Rome's position was very critical, the more so as Sertorius was in league with the pirates in the Mediterranean, was negotiating with the formidable Mithradates, and was in communication with the insurgent slaves in Italy. But owing to jealousies among the Roman officers who served under him and the Spaniards of higher rank he could not maintain his position, and his influence over the native tribes slipped away from him, though he won victories to the last. In 72 he was assassinated at a banquet, Perpenna, it seems, being the chief instigator of the deed.

What we know of Sertorius is mainly drawn from Plutarch's *Lives*, from Appian, and from the fragments of Sallust. There is a good life of him by G. Long in Smith's *Classical Diet.*

SERVAT See MASTER and SERVANT

SERVETUS, MICHAEL, or MIGUEL SERVETO (1511-1553), physician and polemic, was born in 1511¹ at Tudela in Navarre (according to his Vienne deposition), his father being Hernando Villanueva, a notary of good family in Aragon. His surname is given by himself as Serveto in his earliest works, "per Michaelen Sereto, alias Reues." Later he latinized it into Servetus, and even when writing in French (1553) he signs "Michel Sermetus."² It is not certain that he was related to his contemporary Andrieu Serveto of Anillon, the Bologna jurist, but it is probable that he was of the same family as the Spanish ecclesiastic Marco Antonio Serveto de Reves (d. 1598), born at Villanueva de Sigüenza in the diocese of Huesca (Latassa, *Biblioteca Nueva*, 1798, i. 609). Servetus, who at Geneva makes "Villeneuve" his birthplace, fixes it in the adjoining diocese of Lenda, in which there are three villages named Vilanova. Having apparently had his early training at the university of Saragossa, he was sent by his father to study law at Toulouse, where he first became acquainted with the Bible (1528). From 1529 he had found a patron in Juan de Quintañia (d. 1534), a Franciscan promoted in 1530 to be confessor to Charles V. In the train of Quintañia he witnessed at Bologna the coronation of Charles in February 1530, visited Augsburg, and perhaps saw Luther at Colberg. The spectacle of the adoration of the pope at Bologna had strongly impressed his mind in an anti-papal direction. He left Quintañia, and, after visiting Lyons and Geneva, repaired to Ecclampadius at Basel, whence he pushed on to Bucer and Capito at Strasburg. A crude, but very original and earnest, theological essay, *De Trinitatis Erroribus*, printed at Hagenau in 1531, attracted considerable attention; Melancthon writes "Servetum multum lego." It was followed in 1532 by a revised presentation of its argument. We next find Servetus at Lyons, in 1535, as an editor of scientific works for the printing firm of Trechsel, under the name of Michel de Villeneuve or Michael Villanovanus, which he used without interruption till the year

¹ This date rests upon his own testimony as to his age (both at Vienne and Geneva) and that of Calvin. An isolated passage of his Geneva testimony may be adduced in support of 1509.

² The form "Servet" first appears in a letter of Ecclampadius to the senate of Basel (1531), and is never used by himself. "Servete" is an imaginary form.

of his death. Here he found a friend in Dr Symphorien Champier (Campegius) (1472-1539), whose profession he resolved to follow. Accordingly he went (1536) to Paris, where he studied medicine under Johann Gunther, Jacques Dubois, and Jean Fernel. It was in 1536, when Calvin was on a hurried and final visit to France, that he first met Servetus at Paris, and, as he himself says, proposed to set him right in theological matters.¹ As assistant to Gunther, Servetus succeeded the famous anatomist Vesalius, Gunther, who pays the highest tribute to his general culture, describes him as specially skilled in dissection and "vix uli secundus" in knowledge of Galen. He graduated in arts and asserts that he also graduated in medicine, published a set of lectures on syrups (the most popular of his works), lectured on geometry and astrology, and defended by counsel a suit brought against him (March 1538) by the medical faculty on the ground of his astrological lectures. In June 1538 we find him at the university of Louvain (where he was inscribed on the roll of students as Michael Villanova on 14th December 1537), studying theology and Hebrew, explaining to his father (then resident at San Gil) his removal from Paris, early in September 1537, as a consequence of the death (8th August) of his master (el señor mi maestro), and proposing to return to Paris as soon as peace was proclaimed. After this he practised medicine for a short time at Avignon, and for a longer period at Châtelain (where he contemplated marriage, but was deterred by a physical impediment). In September 1540 he entered himself for further study in the medical school at Montpellier. In 1541 he resumed editorial work for the Lyons booksellers, to whose neighbourhood he had returned.

Among the attendants upon his Paris lectures had been a distinguished ecclesiastic, Pierre Paulmier, since 1528 archbishop of Vienna. Paulmier invited Servetus to Vienna as his confidential physician. He acted in this capacity for twelve years (1541-53), and made money. Outwardly he conformed to Roman Catholic worship, in private he pursued his theological speculations. It is probable that in 1541 he had been rebaptized. He opened a correspondence with Calvin, and late in 1545, or very early in 1546, he forwarded to Calvin the manuscript of a revised and enlarged edition of his theological tracts, and expressed a wish to visit him at Geneva. Calvin replied on 23d February 1546, in a letter which is lost, but in which, he says, he expressed himself "plus durement que ma costume ne porte". On the same day he wrote to Guillaume Farel, "si veniet, modo valeat mea auctoritas, vivum exire nunquam patiar," and to Pierre Viret in the same terms. Servetus had fair warning that if he went to Geneva it was at his peril. In his letter to Abel Pouppin (in or about 1547), after stating that he had failed to recover his manuscript from Calvin, he says, "mihi ob eam rem moriendum esse certo scio." The volume of theological tracts, again recast, was declined by a Basel publisher in April 1552, but an edition of 1000 copies was secretly printed at Vienna. It was finished on 3d January 1553; the bulk of the impression was privately consigned to Lyons and Frankfurt, for the Easter market. But on 26th February a letter, enclosing a sheet of the printed book, and revealing the secret of its authorship, was written from Geneva by Guillaume H. C. de Trey, formerly *schömm* of Lyons, to his cousin Antoine Arneys in that city. This letter bears no sign of dictation by Calvin, the history of De Trey shows that it may have been instigated in part by personal ill-feeling towards the Lyons booksellers. But Calvin furnished (reluctantly, according to De Trey) the samples of Servetus's handwriting enclosed in a subsequent letter, for the express purpose of securing his conviction.

¹ Beza incorrectly makes Servetus the challenger and the date 1534.

The inquisitor-general at Lyons, Matthæus Ory, set to work on 12th March, Servetus was interrogated on 16th March and arrested on 4th April. Under examination his defence was that, in correspondence with Calvin, he had assumed the character of Servetus for purposes of discussion. At 4 A.M. on 7th April he escaped from his prison, evidently by connivance. He took the road for Spain, but turned back in fear of arrest. How he spent the next four months is not known, Calvin believed he was wandering in Italy, the idea that he lay concealed in Geneva was first started by Spon. On Saturday 12th August he rode into Louyet, a village on the French side of Geneva. Next morning he walked into Geneva, and ordered a boat, to take him towards Zurich on his way for Naples. He was recognized that day at church and immediately arrested. The process against him lasted from 14th August to 26th October, when sentence "estie bruslé tout vif" was passed, and carried out next day at Champel (27th October 1553). Calvin would have had him beheaded. Meanwhile the civil tribunal at Vienna had ordered (17th June) that he be fined and banished alive; the sentence of the ecclesiastical tribunal at Vienna was delayed till 23d December. Jacques Chamier, a priest in Servetus's confidence, was condemned to three years' imprisonment at Vienna. The life of Servetus is full of puzzles, his writings give the impression not only of quick genius but also of transparent sincerity, they throw, however, little light on the mysterious parts of his story. Don Pedro Gonzalez de Velasco (see his *Miguel Servet*, 1880) has placed a statue of Servetus in the porch of the Instituto Antropológico at Madrid.

The opinions of Servetus, marked by strong individuality, are not easily described in the terms of any current system. His anaphanism, with his denial of the personality of the Godhead and of the deity of the Son, made his views alien not to Catholics and Protestants alike, while his intense Biblicism, his passionate devotion to the person of Christ, and the essentially Christocentric character of his view of the universe gave him an almost unique place in the history of religious thought. He is sometimes classed with the Arians, but he endorses in his own way the homoousian formula, and speaks contemptuously of Arian as "Christi gloria neperissimus." He has had many critics, some apologetic (e.g., Fostel and Lencuere), and few followers. The fifteen polemical classes, introducing the sentence of Servetus at Geneva, set forth in detail that he had been found guilty of heresies, expressed in blasphemous language, against the true foundation of the Christian religion. It is curious that one instance of his injurious language is his employment of the term "humilitas" to denote "ceux qui croient en la Trinité." No law, current in Geneva, has ever been adduced as enacting the capital sentence. Claude Rigot, the inquisitor-general, examined Servetus with a view to show that his legal education must have familiarized him with the provisions of the code of Justinian to this effect, but in 1535 all the old laws on the subject of religion had been set aside at Geneva, the only civil penalty for religion, retained by the edicts of 1543, was banishment. The Swiss churches, while agreeing to condemn Servetus, gave no hint of capital punishment in their letters of advice. The actual law seems to have been arbitrarily revived for the occasion. A valuable controversy followed, on the question of executing heretics, in which Beza (for), Mino Cela (against), and several caustic anonymous writers took part.

The works of Servetus are not so rare as is often supposed, but the most common are his earliest, in which he approaches nearer to the position afterwards taken by F. Socinus than he does in his more matured publications. The following is an enumeration of them in the order of their appearance: (1) *De trinitatis Erroribus Libri Septem*, 1531, 16mo. (2) *Dialogus von de Trinitatis Libri Duo*, 1532, 16mo. Four chapters are added on justification and kindred topics. These two books have been twice reprinted and manuscript copies are common; a Dutch version, by Keymer Telle, was published in 1820. (3) *Claudio Ptolomæi Alexandrini Geographice Emendatioris Libri Octo. ex Bibliothecâ Prædikehermi translatione, sed ad Græcæ et Græcæ exemplaria a Michæle Vallanovano jam primum recognita. Aldina in typis ab eodem schola*, &c., Lyons, (Melchior & Caspar Trechsel), 1536, fol.; 2d ed., Lyons (Hugo à Porta), 1541, &c., 1542; printed by Caspar Trechsel at Vienna, fol., on this work Tollin founds his high estimate of Servetus as a comparative geographer; the passage incriminated on his trial as attacking the authority of Moses is an extract from Lorenz Fries.

Geology The geological structure of Servia is varied. In the south and west the sedimentary rocks most largely developed are of ancient, pre-Carboniferous date, interrupted by considerable patches of granite, serpentine, and other crystalline rocks. Beyond this belt there appear in the north-west Mesozoic limestones, such as occupy so extensive an area in the north-west of the Balkan peninsula generally, and the valleys opening in that quarter to the Drina have the same desolate aspect as belongs to these rocks in the rest of that region. In the extreme north-east the crystalline schists of the Carpathians extend to the south side of the Danube, and stretch parallel to the Morava in a band along its right bank. Elsewhere east of the Morava the prevailing rocks belong to the Cretaceous series, which enters Servia from Bulgaria. The heart of the country—the Shumadia, as it is called—is mainly occupied by rocks of Tertiary age, with intervening patches of older strata, and the Rudnik Mountains are traversed by metallic veins of syenite. The mineral wealth of Servia is considerable and varied, though far from being adequately developed. Gold, silver, iron, and lead are said to have been worked in the time of the Romans. Heaps of ancient slag from lead mines still exist in the neighbourhood of Belgrade, and other old lead mines occur in the valley of the Toplitza. Gold dust is washed down by heavy rains in the valley of the Timok, where it is gathered by the peasants. In the syenite veins of the Rudnik Mountains ores of lead, zinc, copper, sulphur, and arsenic are present, but are not worked, and from the mines of Krupani in the north-west argenteous lead, antimony, and other ores have been obtained. The principal mining centre east of the Morava is Maidanpek in the north, where there is a large iron-smelting establishment in the hands of an English company. Coal or lignite is met with in many places, including a number of points on the Servian railway. The largest deposit lies round Trupina, and measures about 19 miles in length by 7½ in breadth. All the minerals belong to the state, but permission to work them can be obtained on payment of a moderate royalty.

Minerals

Climate The climate of Servia is on the whole mild, though subject to the extremes characteristic of inland Eastern countries. In summer the temperature may rise as high as 106° Fahr, while in winter it often sinks to 13° or even sometimes 20° below zero. The high-lying valleys in the south are colder than the rest of the country, not only on account of their greater elevation but also because of their being exposed to the cold winds from the north and north-east. Accordingly, the chief products of the soil are such as thrive under a warm summer and are unaffected by a cold winter. Both maize and wine are grown, but the olive is excluded by the severity of the cold season.

Products. Maize is the principal object of agriculture, the average annual crop being estimated at upwards of 5,000,000 bushels, wheat coming next with an average crop of less than 4,000,000 bushels. Besides cereals, flax, hemp, and tobacco are grown, but the attempts made to cultivate cotton have proved unsuccessful. The chief wine-growing locality is in the north-east round Negotin. Inefficient as are the implements and backward the methods of agriculture, grain makes up a considerable portion of the exports, owing to the scantiness of the population and the deficiency of other industries, and it is expected that this export will be greatly increased on the completion of the railway system to the southern seaports. The grain chiefly exported is wheat,—maize supplying, as among all the Slavs of the Balkan peninsula, the chief food of the people. Hitherto live-stock has formed the largest item in the exports, sometimes amounting to over one-half. Among these, which are fed in immense numbers on the meads of the forests, take the first place. Of late years their number has greatly declined, largely in consequence of American competition, but relatively to population Servia still maintains a much greater number than any other country of Europe; and the same is true of sheep, which are here relatively more than twice as numerous

as in Spain. Cattle also are numerous, but are reared solely as beasts of draught and for export. Bees are very generally kept,—the honey being consumed in the country, the wax exported. The rearing of silkworms is spreading, especially since cocoons and eggs have begun to be exported to Italy. Oldenils are very extensive, and all kinds of fruit belonging to central Europe are grown in abundance,—above all, the plum, from which is distilled the favourite national spirit, *slivovitz*. The average annual value of the exports is a little over £1 per head of population. After live animals and grain come hides and furs. Among the imports the chief items are sugar, salt (wholly absent in Servia), cotton goods, and other textiles. Import duties being high, a considerable amount must always be allowed for smuggling goods. Though the great bulk of the imports enter the country by the Austrian frontier, an increasingly large proportion comes originally from beyond Austria-Hungary. Thus in 1878, of the total quantity of imports across the Austrian frontier, 76 per cent were of Austriian-Hungarian origin, in 1880 73 per cent, in 1881 63 per cent, leaving 24, 27, and 36 per cent respectively for countries beyond. Among the latter Germany comes next after Austria-Hungary and then England. Colonial wares (sugar, coffee, &c.) are now imported cheaper by way of Hamburg than by way of Trieste.

The natural increase of population in Servia is pretty rapid, the Population birth-rate being among the highest in Europe, while the latest death-rate, though high, is exceeded in several other countries. During the years 1878-84 the average annual number of births was 76,962, of deaths 47,181, the excess of births over deaths 29,781, which figures compared with a total population of 3,000,000, show that at the end of 1874 and that at the end of 1884 gave a birth-rate of upwards of 43 per thousand, a death-rate of less than 27 per thousand, and an annual excess of births over deaths of nearly 17 per thousand. The average proportion of male to female births is 106:100. The people are mainly Serbs, though the proportions have been modified by the measure of territory under the treaty of Berlin. This territory, at one time occupied by Servians, had been to a large extent deserted by them in consequence of the oppressive Turkish yoke, and their place had been taken by Mohammedan Albanians west of the Morava and by Bulgarians in the valley of the Nishava. Most of the Albanians, however, quitted their homes at the time of annexation, and Servians are now returning to their former seats. Previous to the treaty of Berlin the principal element of the population west of the Servians consisted of Romanians, of whom there were about 130,000. The Servian Church is a branch of the Oriental Greek Church, and is under independent administration. The highest ecclesiastical authority is exercised by the national synod. Elementary education is in a very backward state, but recently a law has been passed to remedy this defect, by making education obligatory on all children between six and fifteen and laying the duty of providing accommodation, books, and teachers upon school districts. At Belgrade there is a high school on a par with faculties of philosophy, law, and medicine.

The agricultural population is scattered among a great number of villages, most of which consist of single isolated homesteads. Each homestead is occupied by a group of families connected by blood and acknowledging one head, the *stareshtina*, who is usually the patriarch of the community, but is often chosen by the rest of the members on account of his prudence and ability. He regulates the work and distributes the proceeds of the labour of the entire homestead, and his ruling is followed by all. The land is cultivated by a family or group of families as always their own property. The buildings belonging to the homesteads are enclosed within an immense palisade, inside which a large expanse of fields is mostly planted with plum, damson, and other fruit-trees, surrounding the houses of the occupants. In the midst of these is the house of the *stareshtina*, which contains the common kitchen, eating hall, and family hall of the entire homestead. In this last all the members assemble in the evening for conversation and amusement, the women spinning, while the children play. The people take delight in listening to the recitation of the poetical rhapsodies in which the Servian literature is remarkably rich. The houses are mostly very small wooden structures, serving for little else but sleeping places. But that of the *stareshtina* is out of brick, and is invariably of better construction than the rest.

Since 6th March 1858 the government has been a constitutional Government. The legislative body is called the *skupstina*, and in March 1884 consisted of 77 members, three-fourths of whom are elected by the people, the remainder being nominated by the king. A new *skupstina* is elected every three years. For the settlement of special questions of great moment an extraordinary *skupstina* or great national assembly is elected, in which there are four times as many members, all elected, as in the ordinary *skupstina*. There is also a permanent council of state of 16 members, who have the task of drawing up proposals for legislation, hearing complaints regarding the decisions of ministers, and performing other functions. For administrative purposes the kingdom is divided into twenty-two circles, beside the city of Belgrade. In the budget for 1888-84 the revenue and expenditure were each estimated at nearly

Exports and imports

£1,500,000, and for 1884-85 at about £1,840,000. The national debt at the end of 1884 was about £7,000,000. An additional debt of about £1,000,000 was contracted during the Servo-Bulgarian war of 1885-86.

Army.

The Serbian army is divided into three classes. The first class, embracing men between 25 and 30 years of age, constitutes the standing army, which numbers 18,000 on a peace footing and about 100,000 on a war footing. The first two years are served with the colours and the remainder of the term in the reserve. The second class contains men between 30 and 37 who have served in the standing army. The third class, which is only called out in extraordinary emergencies, is composed of men between 37 and 50. The total military strength of Serbia in case of emergency is estimated to be about 210,000 men.

The capital of Serbia is Belgrade, at the junction of the Danube and the Save. It is the only town with more than 15,000 inhabitants. Next in size is Nish, in the territory added by the treaty of Berlin, where the valley of the Kishava opens into that of the Bulgarian Morava. The other chief towns are Kraguevatz in the centre of the Slumadja, the former capital of the country, Shabatz on the Save, Semendria on the Danube, Krashevatz, Alczanz (the centre of the flax and hemp growing district), Ushitz, Posharevatz, Vianja, and Leskovatz.

History.

The original home of the Croats and Serbs, who are identical in race and language, was the country adjoining the Carpathian range. Their speech shows them to belong to the eastern division of the Slavonic family (see Slavs). The generally accepted derivation of the name *Chakri*, *Chori*, is from the original designation of the Carpathians, *Chrikt*, "a ridge," an opinion supported by Schafarik and Professor Ljubic, author of a Croatian history. This view is rejected by Pavulic and by Tonka, but apparently on insufficient grounds. The last-named connects the word with the same root as that from which "Slav" is derived (*slav*, *slav*, *slav*) and makes it signify the "vassals," those who follow a chief. The derivation suggested by Schafarik for "Serb" is the root *ser*, "to produce"; thus the name would come to mean the people, just as *deutsch* is from *diot*, "people." He considers it to have been the original appellation of all the Slavs. This must be accepted as the best explanation here we give, though not altogether satisfactory. We find the name *Slavo* in Ptolemy and *Serbi* in Pliny.

Settlement of Serbs in Balkan peninsula.

The Serbs and Croats have no history till the year 638 A.D., at which period they left their original settlements and migrated into the ancient Illyricum and part of Moesia. Whether any of this people had previously taken up their abode in the Balkan peninsula is by no means clear, and very different opinions have been held on the subject. The most probable account is that small Slavonic colonies were settled here and there as early as the 2d and 3d centuries, consisting mainly of prisoners taken in war, and we hear of two tribes, the Karpis and the Kostoboci, who are claimed by Schafarik with good reason as Slavs. Jucak considers that for two hundred years before the Slavs are heard of in history south of the Danube they were scattered as colonists in Moesia, Thracia, Dardania, and Macedonia. Professor Dinoff finds mention of Slavonic colonies in Thrace in the *Itinerarium Antonini*, and, even if we do not give a complete adhesion to his views, there are many names of towns in Proconnes (in the first half of the 6th century) which are undoubtedly Slavonic. The traces of the original inhabitants have disappeared, except in so far as the Albanians represent these peoples. It is generally believed that the word *metopoli* or *metropolis*, signifying a slave, found in the *Zakonik* of Dushan, refers to the Norpans, an old Thracian tribe.

Our authority for the Serbian migration in the middle of the 7th century is the emperor Constantine Porphyrogenitus. According to the story, five Croatian princes, the brothers Glavas, Lobelus, Cosentius, Mucilo, and Chiolatus, and two sisters, Tuga and Buga (i.e., Calamity and Prosperity), came at this period from northern or Bado-Croatia, as it was called, the original home of the Croats in the Carpathian mountains. The descendants of their people who remained in the territory are lost among the surrounding population. The services of these Croats were made use of by the emperor, Heraclius, and they became a barrier against the Avars, whom they drove out of the country in which they settled. The territory which they occupied was divided by them into eleven *župani* or *guberni*. The people who inhabited the western portion kept the name of Croats; those in the eastern were called Serbs. We must now leave the Croats, as in this article we have only to do with the Serbs properly so called. The Croatian branch of the family, after being ruled by petty *banes* (a word said to be of Avar origin), was annexed to the kingdom of Hungary, and after the 16th century followed the fortunes of the house of Hapsburg.

¹ *Archiv für slavische Philologie*, vii. 361.

² *Origines Arcaïques*, p. 236, Vienna, 1888.

For five centuries after their arrival in their new territories we Early hear nothing of the Serbs save an occasional very brief mention in contests the Byzantine chronicles. The native annals do not begin earlier with than the 12th century. As in Croatia so among the Slavs, the Greek smaller families gradually became merged into the of three great ones. The head *župan* of Serbia, who resided in Desnya, was called by Constantine Desnina, was at first the suzerain of all the other Serbian *župans*, with the exception of the Pagani, concerning whose Latin name the emperor Constantine makes the very strange remark—*ad ipse Havelar karu ripu riu Sclavos ybascos adparatos episcopo*. After the land was hunted by the Bulgarians we find the great *župan* of Dioclea (Diocle) supreme, he assumed the title of king, and received his insignia from the pope. Prince Nemanja, the descendant of a *župan* family of Dioclea, founded a new dynasty in Rassa (mod. Novibazar), and united Serbia and Bosnia into one strong empire. The names of the earlier princes, who are insignificant and do not help us to follow the line of Serbian history, need not be mentioned. We find them sometimes tributary to the Greek emperors and sometimes independent. They appear, moreover, to have been engaged in constant wars with the Bulgarians. About 1015 Vladimir was reigning, but he was assassinated by the Bulgarian czar John, who got possession of Serbia, but died two years afterwards on an expedition against the Greeks. Together with Bulgaria, Serbia fell under the power of the emperor, and its affairs were managed by a Greek governor. Stephen Vojislav made an insurrection in 1040, expelled the governor, and Theophilus, Emperor, and defeated the Greeks in 1043. His son and successor, Michael (1050-80), at first lived in peace with the pope. Byzantium, but afterwards entered into diplomatic relations with the West, took the title of king (*car*), and received his insignia from the pope (1078). He conquered Durazzo (Draç) in 1079, and reigned thirty years. His son, Constantine Bodin, subjugated the *župans* of Bosna and Rassa. About 1122 Onufo, surnamed Bela, *župan* of Rassa, assumed the throne. From this time dated the power of Serbia. His wife Anna was a German princess. Omitting these insignificant rulers, we come to the famous Stephen Nemanja (1169-95), whose life has been written by his son Sava. He reigned thirty-six years, and was many times successful against the Greeks, but was not able to take Ragusa. He abandoned the government to his son Stephen in 1196 and became a monk under the name of Simeon, dying in 1200 in the monastery of Chilandar on Mount Athos. Stephen was crowned by his youngest brother Sava, first abbot of the country, with a crown, and became consecrated by the pope, hence his title *Protopsaltes*, "the divinely crowned,"—that is to say of the new dynasty, for the *župans* of Serbia were already kings. He died in 1224 and was followed by his sons Radoslav and Vladislav in succession. The latter made an offensive and defensive alliance with Ragusa. He employed Germans to work the Serbian mines, and we find them repeatedly mentioned in Serbian documents under the name of Saxons, especially in the *Zakonik* of Stephen Dushan. No traces, however, can be found of them at the present day. Vladislav's court is said to have been very luxurious. He died childless about 1237 and was succeeded by his brother Stephen Urosh, whose territories were devastated in 1241 by the Mongols. He was afterwards driven from his throne by his son Dragutin and died in 1272. The latter, however, stung by conscience, abandoned the crown to his brother Milutin and contented himself with Symrna, where he died in 1317. The reign of Milutin was chiefly occupied with struggles against the Greeks, he was generally successful in his campaigns. But his domestic life was unhappy. He divorced three wives and caused his only son Stephen to be blinded from suspicion of his treachery. The operation, however, was imperfectly performed, and the youth recovered his sight. In 1314 Milutin fought on the side of the emperor Ambrosius against the Turks, and in the same year the Ragusians to pay him tribute. After his brother Dragutin's death he saved his kingdom from ruin, and, establishing his son Stephen, whom he had banished to Constantinople, gave him Dioclea. In 1319 the Hungarians deprived him of Bosnia, two years later he died. His son Stephen was engaged in perpetual wars. In 1330 he defeated the Bulgarians at the brook Kamenuha near Veluždoh, when the Bulgarian czar Michael was slain. It was on this occasion that his son called Stephen Dushan first Stephen distinguished himself. In spite of the king's successes against the Greeks, he was destined to close his reign in the most lamentable manner, he was imprisoned and strangled by order of his own son at Zvechan in 1356. It is from this time that Dushan gained his surname (*duhshits*, "to suffocate"). Concerning this prince, we are told by the ancient chronicles that he was gigantic in stature and terrible in appearance. He conducted thirteen campaigns against the Greeks. In 1357 he took Strumitsa and subjugated all Macedonia and Albania to Thessalonica, Koston, and Janina, threatened Byzantium, and concluded a peace with the emperor Andronicus, and

³ The following rules for the pronunciation of the Croatian letters will be found useful:—*pa*, *pa*, *pa* as between *ts* and *ch*, something like *tsch* in the English word "distant"; *ch*, *ch* as in "church"; *y*, *y* as in "young"; *sh*, *sh* as in "shin"; *zh*, *zh* as in "zhizn."

Contests
with
Turks

who was shut up in Thessalonica. He now divided his kingdom into eight districts and arranged everything on the Byzantine model. He conquered the whole of Macedonia, and caused himself to be crowned emperor of Serbia, his son Urosh as king (*tsar*, *zar*), and the archbishop of the city as patriarch. In 1664, at a council he published his celebrated *Zakonik* or "Book of Laws" (see below). In 1656 he began a new campaign against the Greeks, his object being to seize Constantinople, to place the Greek crown upon his head, and drive the Turks out of Europe, but in the midst of his schemes he died at Danubius in Albania on 18th December 1656. His son Urosh was then but nineteen years of age, and, being sickly and weak in mind, he was unable to struggle against the revolted governors of his provinces, some of whom wished to make themselves independent. He was killed in a conflict with one of them in 1667, who ascended the throne under the name of Vukashin. This monarch was at first successful against the Turks, now already masters of considerable portions of the Byzantine empire, but he lost the deserts bordering of Tamasus, and with it his life, in 1671. According to the chronicles, the Serbs were surprised and many slain while sleeping. Many also were drowned in the waters of the Maritsa, "and these their bones lay and were never buried." The fate of Vukashin and of his brother Gorko was uncertain. The empire of Dushan now began to fall to pieces and Serbia was again without a ruler. Marco, the son of Vukashin, declared himself the successor of his father, but the line was unpopular with the Serbs, and at a diet at Topli (Ipek) in 1676, they elected a young noble, Lazar Groblanovich, son of the old princely house. He did not, however, take the title of either emperor or king, but only of *knez* or prince. Bosnia was separated from Serbia and fell under the rule of a noble named Travtso. Sultan Murad had already conquered the Bulgarian sovereign Shishman and now marched against Serbia. On the 15th of June 1689 the Serbs were completely defeated at Petz, the battle of which has been celebrated in the national songs of this. Many are the lays which tell of the treachery of Vuk Brankovich and the glorious self-immolation of Milosh Obilich, who stabbed the conqueror on the battlefield. The sultan shroud, embroidered with gold, with which his wife Mihlava covered the body of her husband is still preserved in the monastery of Vidnik in Symia, and a tree which she planted as a trophy at Travtso. According to legend, the conqueror was killed in the battle, according to others he was taken prisoner and executed before the eyes of the dying Murad. The bones of Lazar now rest at Ravantza on the Fruška Gora in Symia. We hear no more of independent

Turkey

Serb princes, the country was now tributary to Turkey, and its rulers were styled despots. Stephen, the son of Lazar, was confined in this title by Bajazet, the despot of Hungary. Murad died in a convent in 1480. His son, who died in 1497 childless, was succeeded by George Brankovich, a man thirty years of age, whose reign was a troubled one. In 1497 he was compelled to fly to Hungary to avoid the wrath of Murad II., and did not recover his territory till Hunyadi and Sanderberg drove back the Turks in 1444. George fell, in the ninety-first year of his age, in battle with a Hungarian magnate named Michael Salgany on 24th December 1457. His youngest son Lazar succeeded him after committing many crimes, but only survived his father five weeks. His widow, Helena Palaeologus, gave the country to the pope in order to secure his assistance against the Turks. Upon this the sultan ravaged Serbia in the most pitiless manner, burnt the churches and monasteries, and carried off 200,000 persons into captivity. Serbia became in all respects a Turkish province, although we occasionally find the empty title of "despot" borne by some of the descendants of its princes. Great numbers of the Serbs subsequently migrated to Hungary. In 1689 some thousands under the command of the despot George Brankovich entered the imperial (German) army. In 1691 the Serbian patriarch, Arsenius Chernoyevich, led about 36,000 families to settle in various parts of Hungary, chiefly in Symia and Slavonia. These *zadrugas*, as they are called, are not families in our sense of the word, consisting of parents and children, but communities of kindred according to the custom still found among the Croats of the Military Frontier. The number of the emigrants at that time would probably amount to 400,000 or 500,000 persons. Others followed them in 1738 and 1738. These Serbs have kept their religion and language in spite of the desperate efforts of the Government to Magyarize them. The last despot of Serbia was George Brankovich, who died in captivity in Austria in 1711.

In consequence of the splendid victories of Prince Eugene, Austria acquired the greater part of Serbia by the treaty of Passarowitz in 1718, but the Turks regained it by the peace of Belgrade in 1739. For upwards of four centuries the Serbs groaned under the Turkish yoke, until, in 1804, unable to endure the oppression of the Turkish *dahis*, they broke out into rebellion under George Petrovich, surnamed *Zrnka*, or "Bird" (George "in Turkish *Kara*"). Kara George was born at Topli (Czuplia) in 1767; at first he merely aimed at conquering the *dahis*, but afterwards he attempted to drive the Turks out of Serbia. This he succeeded in doing after many failures.

In 1813, however, they reconquered the country, and George with his adherents was compelled to fly to Austria. He returned in 1817, but was treacherously murdered by order of Milosh Obrenovich, who had now become the Serbian *tsar*. We have no space here to struggle with the struggle of Milosh to secure the independence of Serbia for himself. He was himself of peasant origin and in his youth had been a swine-peddler. The Turks had continued to kill or drive out of the country once all the Serbian aristocracy, leaving only peasants to till the ground, feed swine (one of the great industries of the country), and pay the *harach*. Milosh was declared prince by the national assembly, and in 1830 secured the consent of the Porte to his enjoyment of the throne with the stipulation that the succession should pass to his family. Turkey allowed Serbia a quasi-independence, but held and garrisoned several fortresses. Milosh had so little forgotten his Turkish training that he made himself obnoxious to his subjects by his despotic acts. He was a man of simple, even coarse habits, as many of the anecdotes told of him testify. He was compelled to abdicate in 1839 in favour of his son Milan, who, however, was of too feeble constitution to direct the government, and, dying soon afterwards, was succeeded by his young brother Michael. He also abdicated in 1842 and the Serbs then elected Alexander, the son of Tami George, or, to give him his Serbian patronymic, Karaageorgievich. His title lasted seventeen years, he was compelled to resign in 1859, and, now very old, was invited to come from Bucharest. He lived, however, only one year, dying in 1859, and left the throne to his son Michael, then aged forty, who, in 1860, was elected prince of Serbia. Michael was a man of refinement and had learned much during his exile. The condition of the country improved during his reign, and in 1862 he succeeded in getting the Turkish garrisons removed from Belgrade. The Moslem inhabitants have gradually withdrawn from the country, so that they are now represented by a very few families. Of the two mosques still remaining in Belgrade one is devoted to their use, the other having been turned into a gas-works. While walking in his park, called Koshutniak or Topshidra, near Belgrade, Michael was assassinated by the emissaries of Alexander Karaageorgievich on 10th June 1868. He was succeeded by his second cousin, Milan, grandson of Yephrem, a brother of Milosh. Milan was born in 1854, he became prince of Serbia in 1872. In 1875 he married a Russian lady, Maria de Keckio. In 1878 he was proclaimed king of Serbia, but his aims were unsuccessful, and the country was occupied by the intervention of Russia. By the treaty of Berlin, July 1878, the country received a large accession of territory, and the prince caused himself to be proclaimed king. Peace continued till the year 1885, and during this period the Serbs seemed to make considerable progress as a nation, in spite of the bitterness of political faction. In 1885, however, Serbia made an ill-judged and selfish attack upon Bulgaria, which was ignominiously beaten off.

LITERATURE

For some account of the Serbian language, see SLAVS.

Under Serbian literature the Dalmanian and Croatian in the limited sense of the term must be included. The latter, however, is somewhat meagre. This literature is divided into three periods:—(1) from the earliest times to the fall of Serbian independence at the battle of Kosovo, 1389; (2) from the rise of the importance of Ragusa in the 15th century till its decay towards the end of the 17th; (3) from the time of Dostan Obradovich to the present day.

First Period.—The earliest composition which has come down to early use in the Serbian or Illyrian language, to use a term in which we chronically may include the Dalmanian Slavs, who are practically the same class, is the production of an unknown priest of Dubrava (Dobruva), now Duklja, a heap of ruins, but formerly a city of considerable importance on the river Momtza. His title in Latin is "Anonymus Presbyter Dioclesius," or in Slavonic "Foy Dukhann." He must have lived about the middle of the 12th century, as the chronicle compiled by him extends to the year 1161. It is a tedious production, and possesses only antiquarian interest; it is printed by Eukimovich in his *Serbsche Leseköny* (Pesth, 1859). We have only space to mention the more important productions. (1) *The Life of St. Symeon* by his son St. Sabas or Sava, the first archbishop of Serbia, was written about 1210. The only manuscripts have been lost and the oldest copy known only dates from the 17th century. Besides this work, Sava also compiled a *typik* or collection of statutes for the monastery of Studenitz, of which he was hegumen or abbot. He was the founder of the celebrated Chilandar monastery. (2) *The History of St. Symeon and St. Sava* by a Dominican monk compiled in 1364, and is preserved in a manuscript of the 14th century.

1 In citing the names of those members of the Serbo-Croatian race who use Latin letters the original orthography is preserved.

There is a good edition by Damshult, to whom we are indebted for a valuable lexicon of Old Seravian. (3) *The Dodoslof* on Lives of Serbian kings and archbishops, compiled by Archbishop Daniel (died 1388), contains the lives of Kings Radoslaw, Vukashaf, Urosh, Dragutin, Jovan Helen, Milutin, &c. After his death, the work was continued by an anonymous writer. The style of these productions is dry and tasteless. They are written in Paleo-Slavonic mixed with Sclavisms. Hilferding has commented with great severity on their bombastic and pangeyrical style,—the most complimentary epithets being applied to many sovereigns whose careers were stained with crimes. (4) *The Life of Stephen*, surnamed "Dečanski," from the monastery Dečani which he founded, written by Gregory Tumbak, hegumen of the same monastery. (5) In 1369 we have the Code of Laws (*Zakonik*) of Stephen Dushan, which has been previously mentioned, it is the earliest specimen of Serbian legislation, and has come down in several manuscripts, being first published by Reich in his *History* at the close of the 18th century. Since that time other editions have appeared, the two most important being those of Miklosch and Novakovich.

Second Period.—To this epoch, which may be said to commence with the 15th century, belong some of the Serbian chronicles, the *Zyeloys Koprivnicko* and others—dry and tedious compilations; the 15th century saw also the outburst of the literature of Ragusa (see below). The Serbian ballads have obtained a European celebrity, and must have existed from very early times. Nicephorus Gregoras, who in 1325-26 came to Stephen Urosh IV. as ambassador from the Byzantine emperor Andronicus, noticed that some Serbs attached to his suite sang the celebrating of great exploits of their national heroes. At St. Pimen's remarks in his *History of Slavonic Literature*, this shows the existence of a national epic among the Serbs before the battle of Kosovo. In the description of an embassy sent from Vienna to Constantinople in 1551 a certain Kurpeshnich, by birth a Slavonic, speaks of hearing songs sung in honor of Milosh who slew Sultan Murad. The first attempt at collecting them was made by the Franciscan monk Andrew Kakač-Mušić, a Dalmatian, who died in 1785. His work was published at Venice in 1756 under the title of *Zagorov Upodoba Narodna Slovesnoga* (Recreations of the Slavonic People). Some of the pieces included in this volume were written by Musić himself, and he made many alterations in the old ones. This, however, was quite in the spirit of the age in which he lived. We find extracts from Serbian ballads in some of the Dalmatian works of the 16th century. In 1774 they were collected by the *Prosveta* of the abbé Berce, and were finally collected by Vuk Stephanovich Karadjich and published at Leipzig in 1824 under the title *Narodne Srpske Pjesme* (Popular Serbian Songs). Some of them were afterwards translated into German by Thessa von Jacob and into English by Bowring and Lord Lytton. The versions of the last two possess but little merit. It would be impossible in a short notice like the present to discuss the contents of these popular ballads. To the majority of readers, the cycle which treats of Kosač and his fate at the battle of Kosovo will prove the most interesting. Besides historical persons introduced in the ballads, there is the half-mythical hero Marco Kraljević, who, like the Russian Ilya Murometz, has many of the characteristics of a supernatural being. His victories, chiefly over Turks and Magyars, are narrated in the most bombastic phraseology. At last he dies in battle; but the belief prevails that he remains concealed till he shall appear on some future occasion to rescue his people from their oppressors. Almost as mysterious as the hero himself is his horse Sharatz, who was presented to him by a *aida* or fairy. After the death of Vuk Stephanovich (1864) a supplementary volume was published by his widow, which her husband had left prepared for the press *Srpske Narodne Pjesme u Ilerogovinu* (Popular Serbian Songs from Herzegovina, Vienna, 1866). A good collection of the Slavonic Slavonic (Bulgarian) was collected at Leipzig in 1857 by Mulitrowitz. There has also appeared a little volume of Serbian national songs from Bosnia, collected by Bogoljub Petanovich in 1867. Since then volumes of Serbian popular poetry by Rayachewich and Raschich have appeared.

During this period Slavonic literature reached a high pitch of culture in the little city of Ragusa, called in Slavonic Dubrovnik. During the 16th, 16th, and 17th centuries this city, now in a state of decay, was a sort of Slavonic Athens, and the influence of Italian literature was added the culture introduced by the schools of learned Greeks—Chalcondylas, Lascares, and others—who found refuge within its walls after the fall of Constantinople. Lynes and the lyric drama seem to have been the general productions of the more noteworthy authors. The influence of Italian is perceptible throughout. The first writer of eminence was Humislj Licić, a very popular poet in his day, author of love-songs, a drama, *Zelazna* (The Female Slave), and translations published first by his son Anthony at Venice in 1556, and reprinted by Dr Gay at Agium in 1847. A very interesting poem by this author is his *Eklogy* of the city of Dubrovnik (Ragusa). Another writer of considerable reputation was Nicholas Vetrinac-Ostović (1482-1470), who afterwards became a monk and lived as a hermit on one of the islands on the Dalmatian coast. He has left several

plays and, besides translating the *Heinrich* of Euripides, wrote several mysteries, in the style of the religious plays once so popular throughout Europe, of these the *Savijes of Abraham* is the best. His poem entitled *Italy* is remarkable for the warm affection it expresses for the country of his education. Peter Hektorović (1488-1572) was a rich proprietor of the island of Zara, and is worth mentioning as having shown a taste for the national poetry of his country. He has introduced some songs in his *Ribnjave i Zlatoslovo Pripovijest* (Fishing and a Dialogue of Fishermen). Very celebrated in its time was the *Jagupka* or Gypsy of Andrew Chubunović (1500-1559), who was originally a silver-smith. His poem of the *Gypsy* is said to have been evolved in the following manner: Chubun was on one occasion following a young lady and urging his suit when she turned round and said scornfully to him to get her attendant, in the hearing of the poet, "Che vuole da me questo Zingaro?" ("What does this Gypsy want with me?") The despondent lover took up the word of reproach and wrote a poem in which he introduced a Gypsy prophesying to a company of ladies their various fortunes and concluding with an expostulation to the hard-hearted beauty for her obduracy. Schafarik speaks of this piece with great enthusiasm and calls it "a truly splendid flower in the garden of the Illyrian Muses." The Russian poet Pjipin supposes, with great probability, that the poem was written as a sort of masquerade for the carnival. It enjoyed considerable popularity and was frequently imitated. A similar story is said to have suggested the *Derwisch* (Derwisch) of Stejko Gučević, in which the author represents himself as a Turkish derwisch. These two pieces are elegant productions in the Italian manner.

Nicholas Nalajković (1510-1587) was a native of Ragusa and author of several pastoral plays in the style then so much in vogue throughout Europe. Of the same description are the productions of Maimo Držić (1520-1580), of whom his contemporaries praised "il puro, vago, e dolce canto." Mention may also be made of Đurko Ravnina and Maimo Orbin (d. 1514). Another celebrated poet was Đorđe Baničević (1556-1620), who, besides translating the *Alcibiades* of Sophocles, produced a version of the *Assunto* of Tasso and has left several minor pieces. The chief of the Ragusan poets, however, was Ivan Gundulić (sometimes called by his Italian name of Gondola). Very few facts are known of his life, but he died in 1633 aged fifty, having discharged several important public offices. His death, says Schafarik, was not too early for his fame but too early for literature and the glorious prosperity of his country. Gundulić published but little, and much of his writings perished in the earthquake in 1667, after which Ragusa never regained her former prosperity. The so-called Petarchian school of Illyrian poetry languished after this and wasted its energy on elegant trifles. Dalmatian poets of the 18th and 19th centuries have not made any considerable figure. The *Osmen* of Gundulić, on which his fame rests, is an epic in twelve books, and was written to celebrate the victory of the Poles under Chodkiewicz over the Turks and Tatars in 1623 at Chocim (Khotin). Schafarik praises Gundulić for the richness of his imagination, the lofty tone of his verse, and its perfectly constructed rhythm. We are willing to allow that *Osmen* possesses considerable spirit and that the versification is melodious, but on the whole it seems a tedious poem. The short quatrains in which it is written lack the true epic dignity. Leaving the Dalmatians, the only writer worthy of mention among the Serbs is George Brankovich (1648-1711), the last despot, who compiled a *History of Serbia till the end of the 17th Century*, which has been edited by Obedinski Mijatovich, ambassador from the court of Serbia to St James's (1836). From this period till the close of the 18th century there is no Serbian literature: the spirit of the people seems to have been crushed out of them by Austrian persecutions on the one hand and by Turkish on the other. Till the reign of Milosh Obrenovich in the 19th century hardly a Serbian printed book was to be seen. The works of Vuk Karadjich, who was a Serb, wrote in Russian, are mentioned under Russia (p. 105).

Third Period (from 1750).—The spark of nationality was still burning among the Serbs, in spite of their degradation, and men were found to fan it. Such a man was Rasch (1720-1801), a Raich, though patriot. He was born in Slavonia, a province of Austria inhabited by Serbs, the son of poor parents, but he had all the enthusiasm for learning that animated the Russian Lomonosoff, whom he very much resembled. Thus we find him making his way on foot from his native town to Kiel, where he was located into the ecclesiastical seminary and devoted himself to theology. After spending three years at Kiel, he took himself to Moscow. Meeting, on his return to his native country, with a cold reception from those whom he had expected to foster his studies, he went back to Russia, and while at Kiel resolved to write the history of the Servians. Knowing that the Slavonic monuments in European Turkey contained many unpublished manuscripts (numbers of which have since perished in the wars which have devastated the country or have been destroyed by the Greeks), he visited Constantinople and many other parts of that empire in order to collect materials. On his return to Austria he took up his abode at Nenzatz on the Danube (also long the headquarters of Schafarik),

Orn-
dovich

and worked at his history, which he finished in 1768, but it was not published till upwards of twenty years later. In 1772 he became a monk, and he died in 1801. The work of Raich, though interesting as a monument of learned industry, does not now possess much critical value. The style is harsh and a great deal of the ethnology (a science then in its infancy) unsound. Thus, among other strange statements, he holds the Bulgarians on the Volga to have been Slavs. After Raich we come upon two indefatigable Serbian workers, Dositej Obadovich (1789-1811) and Vuk Stephanovich (1787-1864). The life of the former has been written by himself. He was a man of varied learning, and his career was marked by many curious adventures. After having visited nearly every part of Europe (including England, where he was received with great hospitality),¹ Obadovich returned to Serbia and became tutor to the children of Tsern George. He was a man sprung from the people, and an indefatigable and successful labourer for national education. The list of his compilations and translations is considerable. Acting on the wise principle that the language as it is spoken should be cultivated and not a jargon overloaded with archaisms and supposed classical forms, he did good by destroying the influence of the Paleoslavism among his countrymen. Before his death his services to his country were recognized by his appointment as member of the senate and superintendent of national education. The man, however, who was destined to bring the Serbian language into the greatest prominence was Vuk (Wolf) Stephanovich Karajich, whose collection of songs was mentioned above. Vuk was an indefatigable scholar and patriot till his time. The Serbian language has been, in fact, as far as foreignness was concerned, simply a *serbo-*independent* model*. He wrote a good grammar, which has formed the basis of all published ones, and to this Jacob Grimm furnished a preface. To him also we owe a Serbian dictionary and a collection of tales and proverbs. His supposed innovations in the Serbian language with regard to the rejection of archaisms and the introduction of a new system of orthography roused up a host of enemies against him, so that not only was he forbidden to enter Serbia but his books were excluded from the country. He died at the beginning of 1864, but permission to make use of his innovations was not given till four years afterwards.

Vuk

ovichMinor
writers

A complete enumeration of the Serbian and Croatian authors of the 19th century far exceeds the limits of this article. But Matthias Antuhor Relković (1792-1798) deserves mention, because he wrote in a dialect both little cultivated, viz. the Slavonian in the restricted sense, as applied to the Slavonian province. His first work, he published in 1817, a little satirical satire entitled *Satir sili Dvoj* (*Satire on the Clever Man*), at Dresden. A few names, each of which makes a definite feat in the literature, must suffice. Lucian Muzitski (1777-1851), an archimandrite, afterwards bishop of Galitzin, was highly esteemed by his countrymen as a poet. His ode in aid of patriotic feeling, *Yvan Hadechik* (1789-1870) wrote under the name of *plume* of Klishi Stretch. For some time he was an authority in Serbian literature, but ultimately his influence waned. Simson Milutinovich, a noted writer, whose life was full of strange adventures, composed an epic poem entitled *Serbianica*, which describes the chief incidents of the Serbian war in 1812. It was published at Leipzig in 1826. We have previously alluded to his collection of Montenegrin songs. He is also the author of a tragedy on Miloš Obilić, who slew Sultan Murad. Milutinovich, who was a Bosnian, died in poverty in 1847. Yovan Popovich (1806-1866), a native of Belgrade, was a rich, cultured, and meritorious man, and gained a considerable reputation by his plays, the subjects of which were taken from Serbian history and were put upon the stage with considerable effect. Without being a great dramatic writer, he had the art of constructing pieces to which people would listen—something like Sheridan Knowles. To this end he belongs also Yura Malchich, author of *Spomenik Lukomir Muzitskom* (A Memorial to Lucian Muzitski), and also the *Apocryphs of Kara George*. In 1847 the well-known journal *Glasnik* (The Messenger) was founded, which has continued to the present time and contains many valuable papers on Serbian history and literature. Schafarik had previously founded at Neussatz (Novi Sad) the *Matica Srpska*, an excellent society for printing Serbian books.

Croatian
litera-
ture.

The Croats have also been active in modern times. The remarkable poem, *Death of the Agia Ismaili Cemid*, by Ivan Mataram (born in 1818), is said to be so popular among the Serbs, as stimulating their hatred of the Turks, that it has been called "The Eyes of Hail." Ismail was the descendant of an old Bosnian family who had turned Mussulmans to keep their estates when the country was first invaded. These recollections, as might be expected, are more fanatical than the Turks themselves. His exploits were chiefly directed against the Ustoks and the Montenegrins. The poem is composed in the same metre as that of the Serbian ballads collected by Vuk. It is spirited, but has a savage air about it, engendered by the scenes described, the fierce border wars of long hereditary

hated. The account of the cruelties committed by the Turks while collecting the *harach* and the conclusion, where the body of the slain Agia is brought to the hermit, are dramatically conceived.

The four most celebrated Serbo-Croatian poets are Stanko Vraz, Servo-Pravoslav, Yovanovich, and Radichovich. Stanko Vraz (1816, Croatian 1851) was by birth a Slovene, he joined, however, the Illyrian poetry movement under Igudert Gay and used the Serbo-Croatian language. The attempt of Gay to form a common literary language under the name of Illyrian by fusing the Serbo-Croat and the Slovenish languages was not successful. Perhaps the only result, if it had been persevered in, would have been that the Slovenes would have become completely Germanized, as a pelagic literary language would not have been understood by the peasants. Besides many graceful lyrics, Vraz also published collections of national songs. Some of his shorter pieces are very elegant and have a rich Oriental colouring. Peter Preradovich (1818-1872), a native of the Military Frontier and a general in the Austrian army, is the author of many graceful lyrics, widely known throughout all Serbo-speaking regions. A complete edition of his works appeared in 1873. Peter Yovanovich (born in 1801) is the author of many popular poems. But no one of the later generation of Serbian authors has gained such a reputation as Branko Radichovich, who was born in the Austrian Banat in 1824, and ended his short life in Vienna in 1853. His popularity rests upon the patriotism shown in his writings and their spirited tone. Nor have the Serbo-Croats lacked important voices in the fields of history and philology. Among these must be mentioned Dyro Danichich (1825-1882), who was educated partly in Vienna and partly at Vienna, and was one of the pupils of Miklosich. He first made himself conspicuous by exposing the cause of Vuk Stephanovich Karajich in the disputes about Serbian orthography. Besides contributing valuable papers to the *Glasnik*, he was the author of an Old Serbian dictionary of great service to students. He edited, as previously mentioned, the memoirs of Old Serbian literature. At the time of his death he was engaged upon a great Serbo-Croatian dictionary, a work which, it is to be hoped, will be continued by some of his pupils. Janderic Gay (1809-1872), who has already been mentioned, was a Croat and laboured to bring about a national unity. His services were invaluable as an editor of the Old Dalmatian classics. Asim Pavic (still living) has written a good history of the Dalmatian dialects (*Istoriya Dalmatskikh Dialekta*, Agam, 1871). Stoyan Novakovich (born 1842), at one time minister of public instruction, besides contributing many valuable articles in the *Glasnik*, has edited and translated the history of the Serbian language and an edition of the *Radonik* of Stephen Dushan. Another worker in the same field was Chedemil Miratovich, previously mentioned. One of the most indefatigable and patriotic of modern Croatian scholars is Ivan Kukuljevic Sakcinski, who has edited, besides many early Croatian and Serbian works, an admirable *Atlas na Povijestnu Jugoslavensku* (Collection of Documents for South Slavonic History), of which several volumes have appeared,—a valuable storehouse of Slavonic philology, and literature. He has found an excellent coadjutor in Dr Francis Rački (born 1829), among whose works may be mentioned *Pismo Slovensko* (Slavonic Writing, Agam, 1861), *Glasnik Srpskego prava* (*History of the Serbs*), and many excellent historical articles in the journals *Povar* (The Observer) and *Rad* (Labour).

Dr Miklosich, the most indefatigable worker in the field of Slavonic literature now living, is the Croat Jure Vatroslav Jaglic Ilienski (born 1836), formerly a professor at Berlin, who now occupies the true chair of Slavonic philology at St Petersburg, in the place of Gerasimov. He has published many valuable works on Slavonic philology, such as (in 1867) a *History of Serbo-Croatian Literature*, also a leading-book with specimens of early Glagolitic and Cyrillic works (*Priručnik Staroslovenske Jazike*). He has also edited two of the oldest Slavonic codices, *Manuscripts and Zographisms*, a foreboding in 1876 he founded the well-known *Archiev za slovensku Philologiju*, which he still edits with the co-operation of many Slavists. Sime Igubich is another worker in the field of Slavonic history and literature. To the excellent literary journals already mentioned may be added the *Starina*, published at Agam. Valuable works have been written by Balharzar Bogovic in the home-communities of the southern Slavs and south Slavonic law generally. His labours have been made use of by Sir Henry Murray. One of the most celebrated of living Serbian poets is Matthea Ban, the author of several poems and plays, which have been very favourably received.

A few words may be added here on Montenegrin history and Montenegro, the details of which are but scanty. On the death of negro Stephen Dushan, a certain prince Balscha became independent ruler of Zeta. Many fugitives betook themselves to the little retreat after the battle of Kosovo. Ivan Chernoyevich settled in Tzeminje (Cettigne) in 1485 and built a church and a monastery. In 1510 his son and successor retired to Vrnoski, and Montenegro was governed by a national assembly and a vladika (prince bishop). The country was ruled by vladikas of various families till 1697. In that year the office became hereditary in the family of Petrovich of Negosh. Originally the ecclesiastical and civil functions were combined in

¹ To show the opinion entertained of him in Britain it is only necessary to cite the inscription in a book presented to him by Dr Porphyry, an eminent London physician, in 1792. "Dositheo Obadovich, Serbiano, viri linguis variis erudit, sanctissimis moribus notus," &c.

the person of the *vladika*, but they were separated on the death of Peter II in 1351. This latter was the author of some poems in the Servian language, the most celebrated being *Louča Mikoškova* (The Light of the Microcosm), which appeared at Belgrade in 1845. He was succeeded by his son Daniel, first prince of Montenegro, who, dying in 1860, was followed by his nephew Nicholas, the most memorable events of whose reign have been the war with Turkey and the increase of his territory by the treaty of Berlin. (W R M)

SERVITES (*Servi Beate Marie Virginis*) This religious order owes its origin to Bonfiglio Monaldi, a Florentine, who in 1233 withdrew along with six of his comrades to the Campo Marzio near the city for prayer and ascetic exercises in honour of the Virgin. Three years afterwards they removed to Monte Senario, where their numbers were considerably increased. The order at a very early period received from Bishop Ardingus of Florence the rule of St Augustine, but did not obtain papal sanction until 1255. It rapidly spread into France, Germany, the Low Countries, Poland, and Hungary, and from Martin V it received in 1424 the privileges of the mendicant orders. The Servite Tertiaries were founded about the same time by Giuliano Falconieri. Under Bernardino di Riccioini arose the Hermit Servites (1593). The members of the order (Observants and Conventuals) are now found chiefly in Italy, Hungary, Austria, and Bavaria.

SERVIVS, the commentator on Virgil, is all but unknown to us, so far as personal information goes. From notices in the *Saturalia* of Macrobius, where he appears as an interlocutor, we may infer that in or about 380, though still quite young, he was already distinguished as a "grammaticus," that is, as an expert in the criticism, explanation, and teaching of the classical literature of Rome. Servius therefore belongs to the latter half of the 4th and the earlier years of the 5th century, to the age of Symmachus and Claudian, of Jerome and Augustine. The allusions of Macrobius and a short letter from Symmachus to Servius leave no doubt that the grammarian formed one of that band of cultivated men, led by Symmachus, whose eyes were turned towards the pagan past and away from the Christian future, and who breathed into pagan culture its last transient sparks of life and vigour. The race of "grammatici" to which Servius belonged, and which had now run at Rome a course of some 500 years, had done much evil to literature, had helped to corrupt, falsify, encumber, and even in some instances by abbreviations upon abbreviations to kill out the texts on which they worked, but on the whole they had done more good. They had helped to save what could be saved of education, culture, and history, and so had in the main contributed to the preservation of the ancient literature that has come down to us. Of all the "grammatici" none bears on his front more of the virtues and fewer of the vices of the race than Servius. But it must be noted that much which passes under the name of Servius in modern editions, and in modern quotations, most certainly did not proceed from his hand. The comments on Virgil to which his name has been attached come from three different sources. One class of MSS. contains a comparatively short commentary, definitely attributed to Servius. A second class (all going back to the 10th or 11th century) presents a much expanded commentary, in which the first is embedded; but these MSS. differ very much in the amount and character of the additions they make to the original, and none of them bear the name of Servius. The added matter is undoubtedly ancient, dating from a time but little removed from that of Servius, and is founded to a large extent on historical and antiquarian literature which is now lost. The third class of MSS., written for the most part in Italy and of late date, repeats the text of the first class, with numerous interpolated scholia of quite recent origin and little or no value.

The real Servian commentary (for so we must designate the text that we find in the first class of MSS.) practically gives the only complete extant edition of a classic author written before the destruction of the empire. It is constructed very much on the principle of a modern edition, but with very different ideas both as to the relative and the absolute value of the matters treated. Owing to the delicacy and originality of his veiled style, to the innumerable threads of ancient history, mythology, and antiquities shot through the texture of his poems, owing above all to the firm hold he early gained upon the Latin schools, Virgil had a continuous line of expounders stretching almost from his death to the destruction of the Roman government of the West. Servius built his edition in part on the extensive Virgilian literature of preceding times, much of which is known only from the fragments and facts he has preserved. The notices of Virgil's text, though seldom or never authoritative in face of the existing MSS., which go back to, or even beyond, the times of Servius, yet supply valuable information concerning the ancient recensions and textual criticism of Virgil. In the grammatical interpretation of his author's language, Servius does not rise above the stiff and overwrought subtleties of that day, while his etymologies, as is natural, violate every law of sound and sense. As a literary critic the shortcomings of Servius are great, if we judge him by a modern standard, but he shines if compared with his contemporaries. In particular, he deserves credit for setting his face against the prevalent allegorical methods of exposition. But the abiding value of his work lies in his preservation of facts in Roman history, religion, antiquities, and language which but for him might have perished. Not a little of the laborious erudition of Varro and other ancient scholars, to whom time has proved unkind, has survived in Servius's pages. The older MSS. sometimes add to the name Servius that of Magister (given to other distinguished grammarians at different times); the later Italian MSS. in some cases give his name as Maturus Servius Honoratus. Besides the Virgilian commentary, we have other works of Servius, a collection of notes on the grammar (*Arts*) of Donatus, a treatise on metrical endings; the tract *De Centum Metris* or *Centumeter*.

The most noted editions of the Virgilian commentary are by Fabricius (1551), P. Daniel, who first published the enlarged commentary (1606), and by Thilo and Hagen (Leipzig, 1878-84). The *Essays on Servius* by R. Thomas (Paris, 1880) is an elaborate and valuable examination of all matters connected with Servius; many points are treated also by Ribbeck in his "Prolegomena" to Virgil, and by Thilo and Hagen as above. The smaller works of Servius are printed in Keil's *Grammatici Latini*.

SERVIVS TULLIVS, the sixth king of Rome, described in one account as originally a slave, is said to have married a daughter of Tarquin, and to have gained the throne by the contrivance of Tanaquil, his mother-in-law. Another legend represented him as a soldier of fortune originally named Mastarna, from Etruria, who attached himself to Caelus Vibenna, the founder of an Etruscan city on the Caelian Hill. Servius included within one circuit the five separately fortified hills which were then inhabited and added two more, thus completing the "Septimontium"; the space thus inclosed he divided into four "regiones," the Suburana, Esquilina, Collina, and Palatina (see *ROME*, vol. xx. p. 813). For his contributions to Roman law see *ROMAN LAW*, vol. xx. p. 689 *sq.*, and for his reforms of the constitution see *ROME*, vol. xx. pp. 734-735. His legislation was extremely distasteful to the patrician order, and his reign of forty-four years was brought to a close by a conspiracy headed by his son-in-law Tarquinius Superbus. The street in which Tullia drove her car over her father's body ever after bore the name of the "Vicus Sceleratus."

SESAME, the most important plant of the genus *Sesamum* (nat. ord. *Pedaliaceae*), is that which is used throughout India and other tropical countries for the sake of the oil expressed from its seeds. *S. indicum* is an herb 2 to 4 feet high, with the lower leaves on long stalks, broad, coarsely toothed or lobed. The upper leaves are opposite, lanceolate, and bear in their axils curved, tubular, two-lipped flowers, each about $\frac{1}{2}$ inch long, and pinkish or yellowish in colour. The four stamens are of unequal length, with a trace of a fifth stamen, and the two-celled ovary ripens into a two-valved pod with numerous seeds. The plant has been cultivated in the tropics from time immemorial, and is supposed on philological grounds to have been disseminated from the islands of the Indian Archipelago, but at present it is not known with certainty in a wild state. The plant varies in the colour of the flower, and especially in that of the seeds, which range from light yellow or whitish to black. Sesame oil, otherwise known as gingelly or til (not to be confounded with that derived from *Guisotia oleifera*, known under the same vernacular name), is very largely used for the same purposes as olive oil, and, although less widely known by name, is commercially a much more important oil, thus, apart from the almost universal use of the oil in India, from 50 to 80 millions of kilograms of the seed are stated to have been introduced annually into France in 1870-1872. The seed is also largely exported from Zanzibar and Formosa. The seeds and leaves also are used by the natives as demulcents and for other medicinal purposes. The soot obtained in burning the oil is said to constitute one of the ingredients in India or Chinese ink. The plant might be cultivated with advantage in almost all the tropical and semi-tropical colonies of Britain, but will not succeed in any part of Europe.

SESOSTRIS (*Σεσωστρίς*, so Herodotus; Diodorus writes *Sesostis*, other forms are *Sesonchois*, *Sesosis*, *Sesothas*, &c.) is according to Greek historians the name of a king of Egypt who conquered the whole world, even Scythia, the lands of the Ganges, and Ethiopia, which were not subject to any of the later great empires. The conqueror in whose exploits these extravagant legends took their rise was Ramses II. (see EGYPT, vol. vii. p. 739), but the Greek accounts unite in his person all the greatest deeds of the ancient Pharaohs, and add much that is purely imaginary. In Manetho's lists Sesostris is identified with a much older king, Useratesen II., perhaps because authentic tradition made him the conqueror of Ethiopia (see vol. vii. p. 734). When Herodotus says that he himself saw monuments of Sesostris in Palestine, he has been thought to refer to the figures of Ramses II. hewn in the rocks of Nahr-al-Kalb, near Beirút, but they do not agree well with his description (Hdt., i. 102-106), which seems to point rather to Astarte pillars (*Asêrim*). The monuments in Ionia of which he speaks still exist in the Karabel Pass. They are not Egyptian but so-called "Hittite," i.e., probably Cappadocian. See Wright, *Empire of the Hittites*, last plate.

SESSA, a town of the kingdom of Italy, province of Terra di Lavoro, situated among hills on the site of the ancient *Suessa Aurunca*, on a small affluent of the Gargiano, is 17 miles east of Gaeta and half a mile from Sant'Agata. The hill on which Sessa is situated is a mass of volcanic tufa, in which have been discovered painted chambers erroneously supposed to have belonged to a city covered by a volcanic eruption. The town contains many ancient remains, particularly the ruins of Ponte Aurunca and of an amphitheatre. It is the see of a bishop, has an interesting basilica with three naves, a gymnasium, a technical school, and a seminary. The cathedral contains inscriptions, a mosaic pavement, and a good ambo decorated with mosaics resting on columns. In the principal street

are memorial stones with inscriptions in honour of Charles V., surmounted by an old crucifix with a mosaic cross. Exclusive of the environs, the town has a population of 6130. The hills of Sessa are celebrated for their vines, the "Ager Falernus" of the Romans.

SESSION, COURT OF. See SCOTLAND, p. 535 *supra*.
SETTLE, EKANAH (1648-1723), a minor poet and playwright of the Restoration period, immortalized by the ridicule of Dryden and Pope, was born at Dunstable in 1648. He is the "Doeg" of the second part of *Abolam* and *Achutophil*, and is treated by the satirist with somewhat more good-humoured contempt than his companion in the pillory—Shadwell.

Doeg, though without knowing how or why,
Made still a blinding kind of melody,
Spurr'd boldly on, and dash'd through thick and thin,
Through sense and nonsense, never out nor in.

Dryden treats him as a sort of harmless fool, who "rhymed and rattled" along in perfect satisfaction with himself. For some time also he was taken by the public at his own valuation. At college he seems to have been regarded as a prodigy, and his juvenile verse was preferred to Dryden's. Coming to London, he began to produce tragedies. His *Empress of Morocco* (acted in 1673, when the author was twenty-five) was a signal success on the stage, and is said by Dennis to have been "the first play that was ever sold in England for two shillings, and the first that was ever printed with cuts." Puffed up by this success, Settle made haughty allusions in his preface, which excited the ire of his contemporaries, and Dryden co-operated with Crowne and Shadwell in writing sarcastic notes on *The Empress*. Settle's next collision with Dryden was also provoked by himself. He attempted a counterblast to Dryden's great satire in *Abolam Senior*, and was contemptuously demolished in return. Settle was then comparatively a young man, his age being thirty-five, but he had touched the height of his fame, and the remaining forty years of his life were not so successful. Dryden mockingly said of him that his ambition was to be "the master of a puppet-show," alluding to his duties in the office of city poet, in which he was one of the successors of Lodge, Middleton, Jonson, and Quarles; and to this he was literally reduced in his old age, keeping a booth at Bartholomew Fair, where he is said to have played the part of the dragon in green leather. He died in the Charterhouse in 1723.

SETTLEMENT, in law, is a mutual arrangement between living persons for regulating the present or future enjoyment of property. It also denotes the instrument by which such enjoyment is regulated. The prevailing notion of a settlement is the dealing with property in a manner different from that in which the law would have dealt with it apart from the settlement. Definitions of settlement for the purposes of the Acts are contained in the Acts of 1856, 1877, and 1882 (see below). They are, however, scarcely sufficient for a general definition. On the one hand they are too extensive, and include wills; on the other they are not comprehensive enough, as they apply only to real estate. They also include only cases of successive limitations, but the idea of succession does not in itself seem a necessary part of the conception of settlement, although no doubt most settlements contemplate successive enjoyment. Settlements may be either for valuable consideration or not, the latter are usually called voluntary, and are in law to some extent in the same position as revocable gifts; the former are really contracts, and in general their validity depends upon the law of contract. They may accordingly contain any provisions not contrary to law or public policy.¹

¹ In this English law allows greater freedom than French. By § 791 of the Code Napoléon, in a contract of marriage the succession to a living person cannot be renounced.

The elements of the modern settlement are to be found in Roman law. The *vulgaris, pupillaris, or exemplaris substitutio* (consisting in the appointment of successive heirs in case of the death, incapacity, or refusal of the heir first nominated) may have suggested the modern mode of giving enjoyment of property in succession. Such a *substitutio* could, however, only have been made by will, while the settlement of English law is, in the general acceptance of the term, exclusively an instrument *inter vivos*. The *dos* or *donatio propter nuptias* corresponds to a considerable extent with the marriage settlement, the instrument itself being represented by the *dotal instrumentum* or *pacta dotalia*. In the earliest period of Roman law no provision for the wife was required, for she passed under *manus* of her husband, and became in law his daughter, entitled as such to a share of his property at his death. In course of time the plebeian form of marriage by *usus*, according to which the wife did not become subject to *manus*, gradually superseded the older form, and it became necessary to make a provision for the wife by contract. Such provision from the wife's side was made by the *dos*, the property contributed by the wife or some one on her behalf towards the expenses of the new household. *Dos* might be given before or after marriage, or might be increased after marriage. It was a duty enforced by legislation to provide *dos* where the father possessed a sufficient fortune. *Dos* was of three kinds:—*profecticia*, contributed by the father or other ascendant on the male side, *adventitia*, by the wife herself or any person other than those who contributed *dos profecticia*, *recepticia*, by any person who contributed *dos adventitia*, subject to the stipulation that the property was to be returned to the person advancing it on dissolution of the marriage. The position of the husband gradually changed for the worse. From being owner, subject to an obligation to return the *dos* if the wife predeceased him, he became a trustee of the *corpus* of the property for the wife's family, retaining only the enjoyment of the income as long as the marriage continued. The contribution by the husband was called *donatio propter nuptias*.¹ The most striking point of difference between the Roman and the English law is that under the former the children took no interest in the contributions made by the parents. Other modes of settling property in Roman law were the life interest or *usus*, the *fideicommissum*, and the prohibition of alienation of a *legatum*.

The oldest form of settlement in England was perhaps the gift in frankmarriage to the donees in frankmarriage, and the heirs between them two begotten (Littleton, § 17). This was simply a form of gift in special tail, which became up to the reign of Queen Elizabeth the most usual kind of settlement. The time at which the modern form of settlement of real estate came into use seems to be doubtful. There does not appear to be any trace of a limitation of an estate to an unborn child prior to 1556. In an instrument of that year such a limitation was effected by means of a feoffment to uses. The plan of granting the freehold to trustees to preserve contingent remainders² is said to have been invented by Lord Keeper Bridgman in the 17th century, the object being to preserve the estate from forfeiture for treason during the Commonwealth.³ The settlement of chattels is no doubt of considerably later origin, and the principles were adopted by courts of equity from the corresponding law as to real estate.

At the present time the settlement in England is, so far as regards real estate, used for two inconsistent purposes,—to “make an eldest son,” as it is called, and to avoid the results of the right of succession to real property of the eldest son by making provision for the younger children. The first result is generally obtained by a strict settlement, the latter by a marriage settlement, which is for valuable consideration if ante-nuptial, voluntary if post-nuptial. At the same time it should be remembered that these two kinds of settlement are not mutually exclusive: a marriage settlement may often take the form of a strict settlement and be in substance a resettlement of the family estate.

There are three possible varieties of the marriage settlement—(1) the dotal system (*regime dotal*), under which the husband generally has the usufruct but not the property in the *dos*, this is the system generally followed in countries where the Roman law prevails, (2) the system of community of goods (*communauté de biens*), by which the wife becomes a kind of partner of the husband; this system, said to have been originally the custom of ancient Germany, is in vogue in France and Louisiana, (3) the system of separate property, by which (subject to contract) the wife's property is free from the control of her husband, this system prevails in the United Kingdom and the United States. An ordinary English marriage settlement of personality is a deed to which the parties are the intended husband and wife, and trustees nominated on their behalf. It generally contains the following clauses—a power to vary the investments of the settled property within limits, trusts of the income for the benefit of the husband and wife during their lives, trusts for the issue, usually according to the appointment of the husband and wife or the survivor, and in default for sons attaining twenty-one and for daughters attaining that age or marrying, equally, subject to a “hoistpot” clause, charging the children with the amount of any pecuniary appointments, a power of advancement of the portions of children in anticipation, a trust for the maintenance of infant children after the death of the parents, with a direction for the accumulation of surplus income, ultimate trusts fixing the destination of the settled property in default of issue. The receipt and trustee clauses, at one time usual, have been rendered unnecessary by recent legislation. The Conveyancing Act, 1881, (section 1), Lord St Leonards's Act of 1859 and Lord Cairns's Act of 1860, gives power to appoint new trustees, and makes a trustee's receipt a sufficient discharge. Trustees were formerly much restricted in their investments, but various Acts of Parliament have now increased their powers of choice of investment (see *TRUSTS*). The settlement of real estate is still a matter of greater difficulty than that of personality, though it has been considerably simplified by recent legislation. A short statutory form of settlement of real estate is provided by the Conveyancing Act, 1881 (Fourth Schedule, Form iv). The Act further enacts that a covenant by the settlor for further assurance is to be implied. This takes the place of those covenants usually inserted in settlements before the Act, which were the ordinary covenants for title. (See *REAL ESTATE*.) The Settled Land Act, 1882, gives statutory authority to certain provisions generally inserted by conveyancers. The clauses must, however, still vary infinitely according to the circumstances of particular cases. Where the settlement is of copyholds, the usual course is to surrender them to the use of trustees as joint tenants in fee upon such trusts as will effect the desired devolution of the property.

A strict settlement of real estate usually takes place on the coming of age or marriage of the eldest son; if it be the intention of the settlor that the estate should continue in settlement, the consideration for the settlement in the first case is usually an immediate allowance made to the son, in the second the marriage itself, a valuable consideration. It will appear on referring to the articles *ENTAIL* and *REAL ESTATE* that an estate cannot be entailed for a period exceeding a fixed number of existing lives and an additional term of twenty-one years, but that if it be sought to bar the entail within that period the consent of the protector of the settlement must be obtained. The doctrine of resettlement is thus described by Lord St Leonards:—“Where there are younger children, the father is always anxious to have the estate resettled on them and their issue, in case of failure of issue of the first son. This he cannot accomplish without the concurrence of the son; and, as the son, upon his establishment in life in his father's lifetime, requires an immediate provision, the father generally secures to him a provision during their joint lives as a consideration for the resettlement of the estate in remainder upon the younger sons.” The settlement usually takes the form of a life estate for the father, followed by a life estate for the son, with remainder in tail to the unborn child of the son, the continuance of the estate in the family being further secured by a series of cross-remainders. There is often a name and arms clause, under which, by means of a

¹ See Hunter, *Roman Law*, p. 150, v. Maine, *Early History of Institutions*, lect. vii.

² The appointment of such trustees has been rendered unnecessary by 8 and 9 Vict. c. 106 and 41 Vict. c. 33.

³ This sketch of the history of settlement is abridged from a paper by the late Mr Joshua Williams, *Papers of the Juridical Society*, vol. i. p. 45.

shifting use (see TRUST), every person succeeding to the settled estate as tenant in tail is forced to assume the name and arms of the settlor under penalty of forfeiture of his estate. Certain parts of the personality of the settlor are often settled upon trusts to devolve with the real estate. In order to attain this end, the chattels are not simply subjected to the same limitations as the real estate. If so subjected, they would vest absolutely in the first tenant in succession, as no estate can be limited in personality (see PERSONAL ESTATE). A declaration is added that they shall not vest absolutely in any tenant until he shall attain twenty-one, and in case he should die under that age that they shall devolve as nearly as possible in the same way as life. By means of strict settlement the actual possessor of a settled estate at any given time is in general only a tenant for life. It is a rule of law that in a settlement of this nature there should be a full and complete communication of all material circumstances by the one party to the other.

It is only within a comparatively recent period that any dissatisfaction at the system of settlement has been felt. In 1829 the Real Property Commissioners saw no reason to recommend any alteration of the law as it then existed. To set the words of the First Report, p. 6, "Settlements bestow upon the present possessor of an estate the benefits of ownership, and secure the property to his posterity. The existing rule respecting perpetuities has happily hit the medium between the strict entails which prevail in the northern part of the island, and by which the property entailed is for ever abstracted from commerce," and the total prohibition of substitutions, which the ancient restrictions of the power of devising established in some countries on the Continent of Europe. In England families are preserved, and purchases always find a supply of land in the market." This optimistic view, it is scarcely necessary to say, is not the one generally accepted at present. The inconveniences inseparable in an economical point of view from the settlement of land have been proposed to be met in two ways:—(1) by a total prohibition of the creation of the estate (see LARSEN), and (2) by an extension of the powers of the limited owner. The latter is the one which has hitherto commended itself to the legislature of the United Kingdom.

Up to thirty years ago a settled estate in England or Ireland could be sold or leased only under the authority of a private Act of Parliament. The dealings of the limited owner with his property were practically confined to certain powers of issuing money for draining conferred by 8 and 9 Geo. 4 c. 56 and the Fines and Recoveries Acts (now repealed). The first real improvement in the Law of Settled Estates Act, 1856, which proceeded on the principles generally followed in the private Acts. The Act allowed the tenant for life to demise the premises (except the principal mansion house) for various terms, and to sell with the approval of the court. Several amending Acts were passed, and finally the law was consolidated and amended by the Settled Estates Act, 1877 (40 and 41 Vict. c. 18), which provided for the improvement of land, and the Limited Owners' Residence Acts, 1870 and 1871, had been passed. The Act of 1864 allowed the owner of a settled estate to charge upon the land, by way of rent-charge, the expenses of certain improvements, such as drainage, irrigation, inclosing, reclamation, clearing, erection of labourers' cottages and farmhouse buildings, planting for shelter, construction of any buildings which will increase the value of the land, and the expenses of the purchase and construction of jetties or landing-places on the sea-coast or navigable rivers and lakes. This list of improvements has been since extended by the Settled Land Act, 1882. The Act of 1870 enabled the owners of settled estates to charge such estates with the expense of building mansions as residences. The building of such mansions is by the Act of 1871 an improvement within the meaning of the Act of 1864. The Settled Estates Act, 1877 (40 and 41 Vict. c. 18), allowed the tenant for life, or for a greater estate, of a settled estate, to demise settled land on an agricultural lease for a term not exceeding twenty-one years (in Ireland thirty-five years). The lease must not be without impeachment of waste. This is the only case in which the powers of the Act may be exercised without the leave of the court. The court may authorize leases of any settled estates or of any rights or privileges over or affecting any settled estates, subject to the conditions that—(1) the lease be made to take effect in possession at or within one year next after the making, and be for a term for an agricultural lease as above, for a mining lease not exceeding forty years, a repairing lease sixty years, a building lease ninety-nine years, with power for the court to grant

for a longer term if in accordance with the custom of the district and beneficial to the inheritance, (2) the best rent must be reserved, (3) in a mining lease three-fourths of the rent is to be reserved, (4) in a mining lease the limited owner is entitled to work the minerals for his own benefit, (5) the lease is not to authorize the felling of trees except for the purpose of clearing for building, (6) the lease is to be by deed, and is to contain a condition for re-entry on non-payment of rent for twenty-eight days. The court may also authorize sales of settled estates and of timber, and dedication for streets, roads, squares, gardens, sewers, and other works. The application to the court (which in England is the Chancery Division or the Chancery of Lancaster, and in Ireland the Chancery Division) is by petition in a summed-up bill, with the consent of the persons having any beneficial estate under the settlement, and all trustees having any estate on behalf of any unborn child. The court may dispense with consent under certain circumstances. No application is to be granted by the court where a similar application has been refused by parliament. Money received on sale under the Act is to be invested as the Act directs, for the benefit of the settled estate. In 1882 the powers of the limited owner were still further increased. In that year was passed the Settled Land Act, 1882 (45 and 46 Vict. c. 38), since amended by 47 and 48 Vict. c. 19. For this very valuable Act the statute book is indebted to the late Earl Cairns. It does not repeal the Act of 1877, but gives cumulative powers. The Act of 1877 must still be brought into action in certain cases to which the Act of 1882 does not apply. The local distinction between the two Acts is that the powers given by the Act of 1877 are based entirely, except in agricultural leases, on judicial proceedings, while those given by the Act of 1882 may be exercised by the tenant for life at his option, generally without the consent of trustees or the court. The powers are those usually inserted in settlements of real estate, and are conferred upon every tenant for life beneficially entitled to possession. This includes a tenant in tail by Act of Parliament (excepted from defeating an estate tail, but not a tenant in tail where the land in respect of which he is restrained was purchased with money provided by parliament), a tenant in fee simple subject to an executory limitation, a person entitled to a base fee, a tenant for years determinable on a life, a tenant *pro curia vie*, a tenant in tail after possibility of issue extinct, a tenant by the courtesy, &c. A married woman may exercise the powers given by the Act in spite of any restraint on anticipation contained in the settlement. The Act does not apply to money or to chattels or to the aggregate. The chief powers given by the Act are those of selling and leasing. A tenant for life may sell settled land or any part of it, or any easement, right, or privilege over it, or the sovereignty of a manor, and may make exchange or partition. A sale must be for the best price, and an exchange or partition for the best consideration, the sale may be in one lot or several, and by auction or private contract. A reservation as to use of mines and minerals may be imposed. Settled land in England may not be exchanged for land out of England. A lease is not to exceed for building ninety-nine years, mining sixty, any other kind twenty-one. The regulations as to leases are in general correspondence with those of the Act of 1877. The time for which non-payment of rent gives a right of re-entry is thirty instead of twenty-eight days, and there are additional regulations as to building and mining leases. While the tenant for life is impeachable for waste in respect of mines, three-fourths of the rent must be set aside as capital money, in other cases one-fourth. The tenant for life may surrender and regrant leases. The principal mansion house and the demesnes thereof, and other lands usually occupied therewith, cannot be sold or leased without the consent of the trustees of the settlement or the order of the court. The Act provides for three kinds of sale—(1) by the tenant for life *mere morte*, (2) by the tenant for life with the consent of trustees, (3) by the tenant for life as to the principal mansion house and of the application of money paid for a lease or reversion; (3) by order of the court, as in the case of the variation of a building or mining lease according to the circumstances of the district, of parliamentary opposition for the protection or recovery of settled land, and of the sale or purchase of chattels as heirlooms to devolve with land. Land acquired by purchase, exchange, or partition is to be settled as far as possible on the same trusts as the other settled property. Capital may be applied as the Act directs, generally for the benefit of the settled property. The tenant for life may enter into a contract for carrying into effect the purposes of the Act. A contract not to exercise the powers of the Act is void. As to procedure, an application to the Chancery Division is to be made by petition or summons. Jurisdiction is conferred upon county courts (in Ireland civil bill courts) in respect to land or personal chattels settled or to be settled, not exceeding in capital value £500 or in

¹ The law of Scotland was shortly afterwards altered by the Rutherford Act of 1848 (see ENTAIL).

² As by the Code Napoléon, § 896. By § 898 substitutions *voluntaires* are, however, practically allowed, and are distinguished with § 899 being avoided by the fact that these are not substitutions at all. In other countries the right of settlement or substitution has been much modified by legislation, mostly in the direction of limiting the authority of the settlor. Thus in Austria no family settlement (*Familiens-Fideicommissum*) can be created without the consent of the legislature, *Ord. Code*, § 618.

³ In France the proprietor may only devise half, a third, or a quarter of his estate, according to the number of his children.

⁴ That is to say, the Act would apply to the estates tail of the marquess of Abercromby or Viscount of Shrewsbury, but not to the estates tail of the duke of Devonshire, purchased with public money by the dukes of Malborough and Wellington (see EARLS).

⁵ This sense has quite recently been held to include an hereditary dignity, such as a baronetcy.

annual value £30. Rules of court have been framed for the purpose of carrying into effect the provisions of the Acts of 1877 and 1882. For more minute information than can be given in this place the Acts and rules themselves must be consulted.

The necessity for a settlement, as far as the wife's interests are concerned, has been diminished by the Married Women's Property Act, 1882 (45 and 46 Vict. c. 76). It is still, however, usual to have a settlement on marriage, especially where there is property of any considerable value. The Act contains a saving of existing settlements and a power to make future settlements with or without restriction against anticipation (not to be valid against a married woman's ante-nuptial debts). No settlement or agreement for a settlement is to have greater validity against a married woman's creditors than such settlement or agreement would have when made or entered into by a man. A future or reversionary interest in settled personality is specially excepted from the operation of Malins's Act (20 and 21 Vict. c. 5), under which a married woman may by deed acknowledged dispose of her future or reversionary interest in unsettled personality. The former law as to *equity to a settlement* seems to have been rendered obsolete by the Married Women's Property Act. The doctrine of equity formerly was in accordance with the maxim, "He who seeks the law must go to equity,"—that is, where a party is forced to obtain the assistance of a court of equity to reach property to which he was entitled in right of his wife, equity would only aid him on condition of his settling a certain portion on his wife. Now that a husband cannot succeed to any property in right of his wife during her lifetime, the reason for the doctrine of equity to a settlement has disappeared.

As a rule a settlement can only be made by a person not under disability—therefore apart from statute not by a lunatic, or a bankrupt, and generally not by an infant. But by the Infants' Settlement Act (18 and 19 Vict. c. 48) infant males of twenty or over or infant females of seventeen or over may with the approbation of the Chancery Division obtained by petition make a valid settlement or contract for a settlement of all or any part of their property. By the Acts of 1877 and 1882 the powers of the Acts may in certain cases be exercised by trustees of a settlement, trustees in bankruptcy, committees of lunatics, and guardians of infants.

Where the parties are not in a position to make an immediate settlement, articles for a settlement are sometimes entered into, but more rarely than formerly on account of the facilities offered by the Infants' Settlement Act. The court will enforce the execution of a settlement in accordance with the articles, and may reform one already made, not in accordance with them. The court will also enforce the specific performance of any contract on the faith of which a marriage has taken place, in spite of the provisions of § 4 of the Statute of Frauds (see *FRAUD*).¹ It should be noticed that marriage itself is not such a part performance of a contract as to give the court jurisdiction. An imperfect obligation arising from an informal ante-nuptial agreement can be made binding as between the parties by a post-nuptial settlement; but this will not protect such a settlement from being treated as a voluntary settlement against creditors.

A settlement or contract for settlement made in consideration of marriage or for other valuable consideration is as a rule irrevocable by the settlor and good against creditors. The only exception or apparent exception is the provision in the Bankruptcy Act, 1883 (46 and 47 Vict. c. 52, § 47 (2)), that any covenant or contract made in consideration of marriage for the future settlement on or for the settlor's wife or children of any money or property wherein he had not at the date of his marriage any estate or interest, and not being money or property of or in right of his wife, shall, on his becoming bankrupt before the property or money shall have been actually transferred or paid, be void against the trustee in bankruptcy. With regard to voluntary settlements, 13 Eliz. c. 5 avoids as against creditors conveyances of lands or chattels contracted to deliver, but not in the future, to the settlor, or others, with a proviso protecting estates or interests conveyed on good consideration and *bona fide* to persons not having notice of hand. 46 and 47 Vict. c. 52, § 47 (1), enacts that any settlement of property, not being a settlement made before and in consideration of marriage or made in favour of a purchaser or incumbrancer in good faith and for valuable consideration, or a settlement made on or for the wife or children of the settlor of property which was earned on or after marriage in right of his wife, shall, if the settlor becomes bankrupt within two years after the date of the settlement, be void against the trustee in the bankruptcy, and shall, if the settlor becomes bankrupt within ten years, be void against the trustee unless the parties claiming under the settlement can prove that the settlor was at the time of making the settlement able to pay all his debts without the aid of the settled property, and that

the interest of the settlor in such property had passed to the trustee of the settlement on the execution thereof. 27 Eliz. c. 4 was passed for the benefit of purchasers, as 13 Eliz. c. 5 was for that of creditors, but refers to real estate and chattels real only. It enacts that every conveyance of lands with intent to defraud purchasers shall be void as against such purchasers only, and that conveyances with power of revocation shall be void against subsequent purchasers. The Act has been construed to mean that a voluntary conveyance of real estate is void as against a subsequent purchaser, mortgagee, or lessee for value. With these exceptions a voluntary settlement is good as between the settlor and the objects of the settlement, and as between the settlor and third persons. So far as this the case that the settlor will not assist a settlor to destroy the effect of a voluntary settlement by compelling specific performance against a subsequent purchaser. On the other hand the court will not enforce specific performance of a voluntary settlement, in spite of its being a contract under seal. Such an instrument, however, creates a debt and will be admitted to proof in a creditors' suit.²

Scotland.—A disposition and settlement is a mode of providing for the devolution of property after death, and so corresponds rather to the English will than the English settlement. The English marriage settlement is represented in Scotland by the *contract of marriage*, which, like the English settlement, may be ante- or post-nuptial. The main difference between the ante- and the post-nuptial contract is the extent to which the property the subject of the contract may be withdrawn from creditors. In the former case a preference or *ius crediti* is according to circumstances conferred on the wife or children; in the latter case the wife or children cannot compete with the creditors. A post-nuptial contract is also liable to revocation by the husband or wife. The Married Women's Property Act, 1881, while it makes the wife complete mistress of her property, at the same time does not exclude or abridge the power of settlement by ante-nuptial contract of marriage.

A contract of marriage may be made with or without the creation of trustees, the latter being the more usual form. If the contract settles heritable property, it generally contains a narrative or inductive clause, containing the names of the parties with an obligation to celebrate the marriage, a disposition of the estate with its destination, provisions as to the wife and younger children, and a declaration that these provisions shall be in full of their legal claims, a conveyance by the wife of the whole means and estate to her husband, and the trustees, an appointment of trustees to secure implement of provisions to the wife and children, a registration clause, and a testing clause. If the contract settles moveables, it is, *mutatis mutandis*, in much the same form, with the addition of a clause excluding the *jus mariti* of a future husband of the wife (see *Juridical Styles*, vol. i p. 174, vol. ii p. 498). The Ruthfurd Act (11 and 12 Vict. c. 80) and the Entail Act, 1852 (16 and 46 Vict. c. 58), specially provide that settlements by marriage contract are not to be disappointed until the birth of a child, who by himself or his guardian consents to disclaim, or until the marriage is dissolved, unless with the consent of the trustees of the contract. Improvements by limited owners were allowed by law much earlier than in England. 10 Geo. III. c. 51 enabled heirs of entail to charge the entailed estates with the sums of money laid out by them in building mansions. This principle was expressly adopted for England, as the preamble of the Act shows, by the Limited Owners' Residence Act, 1870. The Ruthfurd Act and other Acts empowered heirs of entail to exclaim, to feoff, to lease, to charge by bond and disposition in security, to sell, to grant family provisions, and to erect labourers' cottages. The Settled Estates Act and Settled Land Act do not apply to Scotland. Substitution, as in Roman law, can only be made by testamentary or *mortis causa* disposition. The Ruthfurd Act and the Entail Amendment Act, 1868 (31 and 32 Vict. c. 84), more strict than the law of England against perpetuities, forbid the creation of a life-rent interest in hereditables or moveables except in favour of a party in life at the date of the deed creating such interest.

United States.—Marriage settlements are not in as common use as in England, no doubt owing to the fact that the principle of the Married Women's Property Act was the law of most of the States of the Union long before its adoption by England. In Louisiana, in the absence of statutes to the contrary, community of goods is the rule. Settlements other than marriage settlements are practically unknown in the United States. Property cannot, as a general rule, be tied up to anything like the extent still admissible in England. In those States where entail is allowed the entail may be barred by simple means of alienation. (J. W.)

SETTLEMENT, Act of. By this Act, 12 & 13 Will. III. c. 2, passed in 1701 (followed by the parliament of Scotland in the Act of Union, 1707, c. 7), the crown was

¹ At one time the ecclesiastical courts went further, and enforced specific performance of the ceremony of marriage itself. After a contract of marriage *per verba de presenti* or *per verba de futuro*, a celebration in *facie ecclesie* might have been demanded. This jurisdiction of the ecclesiastical courts was finally abolished by 4 Geo. IV. c. 76.

² See Williams, *The Settlement of Real Estates*; Davidson, *Presidents of Conveyances*; and H. W. Winstonehouse and Turner, *The Settled Land Act*; Middleton, *The Estates relating to Settled Estates*.

settled upon the Princess Sophia, electress and duchess dowager of Hanover, granddaughter of James I, and the heirs of her body, being Protestants. The Act contained in addition some important constitutional provisions. Those which are still law are as follows—(1) that whosoever shall hereafter come to the possession of this crown shall join in communion with the Church of England as by law established, (2) that in case the crown of this realm shall hereafter come to any person not being a native of this kingdom of England, this nation be not obliged to engage in any war for the defence of any dominions or territories which do not belong to the crown of England without the consent of parliament, (3) that after the limitation shall take effect no person born out of the kingdoms of England, Scotland, or Ireland, or the dominions thereunto belonging, although he be naturalized or made a denizen (except such as are born of English parents), shall be capable to be of the privy council or a member of either House of Parliament, or enjoy any office or place of trust, either civil or military, or to have any grant of lands, tenements, or hereditaments from the crown to himself, or to any other or others in trust for him,¹ (4) that after the limitation shall take effect judges' commissions be made *quandus se bene gesserint*,² and their salaries ascertained and established, but upon the address of both Houses of Parliament it may be lawful to remove them; (5) that no pardon under the great seal of England be pleadable to an impeachment by the Commons in parliament. The importance of the Act of Settlement appears from the fact that in all the Regency Acts it is specially mentioned as one of those Acts which the regent may not assent to repeal (see REGENT). To maintain or affirm the right of any person to the crown, contrary to the provisions of the Act of Settlement, is treason by 6th Anne, c. 7.

SETTLEMENT OF THE POOR. See POOR LAWS.

SETÚBAL, called by the English St Ubes, a port and commercial town in the province of Estremadura, Portugal, nearly 20 miles south-east of Lisbon, lying for about three-quarters of a mile the north shore of a harbour of the same name, 3 leagues long by half a league broad and inferior only to that of Lisbon, at the end of a fertile valley of 6 miles long from Palmella, where the Sabo river discharges into the Bay of Setúbal, and on the Portuguese railway (Lisbon-Barreiro-Setúbal). It is overtopped on the west by the great red treeless range of Arrabida. In the sandhills of a low-lying promontory in the bay, over against Setúbal, are the ruins of "Troia," uncovered in part by heavy rains in 1814, and again in 1850 by an antiquarian society. These ruins of "Troia," among which have been brought to view a beautiful Roman house and some 1600 Roman coins, refer, beyond almost all dispute, to Cetobriga, which flourished 300–400 A.D. In the neighbourhood, on a mountain 1700 feet high, is the cloister Arrabida, with stalactite cavern, whither pious pilgrimages are made. There are five forts for the defence of the harbour, and that of St Philip, built by Philip III., commands the town. Setúbal is an emporium of the Portuguese salt trade carried on principally with Scandinavian ports, the salt being deemed the finest for curing meat and fish. By reason of this advantage and the excellence of its oranges, the best in Portugal, and of its Muscatel grapes, it has much commercial importance, and is the fourth city in the kingdom. It also manufactures leather and does a considerable fishing trade. There are five churches, several convents, a theatre, a monument of the poet Bocage, who was born here,

and an arsenal. Among its other public buildings are the Stápal, the Bomfin, which has a handsome fountain, the Fonte Nova, and the Annunciata. Setúbal suffered severely, along with Lisbon, from the earthquake of 1755. The population was 14,798 in 1878.

SEVENOAKS, a market town of Kent, England, situated on high ground about a mile from the railway station, 25 miles south-east of London by the London, Chatham, and Dover Railway, and 20 by the South-Eastern Railway. It consists principally of two streets which converge at the south end, near which is the church of St Nicholas, of the 13th, 14th, and 15th centuries, restored in 1878, and containing monuments of the Amheist family and a tablet to William Lambard, the "Perambulator" of Kent (d. 1601), removed from the old parish church of Greenwich when that was demolished. At the grammar school founded in 1418 by Sir William Sevenoke, lord mayor of London, George Grote received his education. There is also a school founded by Lady Margaret Boswell, wife of Sir William Boswell, ambassador to Charles I at The Hague, and almshouses founded by Sir William Sevenoke in connexion with his school. The Walthamstow Hall for 100 children, daughters of Christian missionaries, erected at a cost of £22,000, was opened in 1882. Close to Sevenoaks is Knole Park, one of the finest old residences in England, which in the time of King John was possessed by the earl of Pembroke, and after passing to various owners was bought by Archbishop Bouchier (d. 1486), who rebuilt the house. He left the property to the see of Canterbury, and about the time of the dissolution it was given up by Crammer to Henry VIII. By Elizabeth it was conferred first on the earl of Leicester and afterwards on Thomas Sackville, earl of Dorset, by whom it was in great part rebuilt and fitted up in regard to decoration and furniture very much as it at present exists. In the time of Elizabeth county assizes were held in the town. Of late years Sevenoaks has very much increased by the addition of villa residences for persons having their business in London. The population of the urban sanitary district (area 2028 acres) in 1871 was 4118, and in 1881 it was 6296.

SEVEN SLEEPERS OF EPHEBUS, *TEB*, according to the most common form of an old legend of Syrian origin, first referred to in Western literature by Gregory of Tours (*De Glor. Mart.*, c. 95), were seven Christian youths of Ephesus, who, to escape the rage of Decius, lived for some time in concealment in a cave. The enemy at last, however, discovered their hiding place, and caused great stones to be rolled to its mouth that they might die of hunger. The martyrs fell asleep in a mutual embrace. The occurrence had long been forgotten, when it fell out, in the thirtieth year of Theodosius II., 196 years afterwards, that a certain inhabitant of Ephesus, seeking shelter for his cattle, rediscovered the cave on Mount Colian, and, letting in the light, awoke the inmates, who sent one of their number down to buy food. Cautiously approaching the city, the lad was greatly astonished to find the cross displayed over the gates, and on entering to hear the name of Christ openly pronounced. By tendering coin of the time of Decius at a baker's shop he roused suspicion, and in his confusion being unable to explain how he had come by the money he was taken before the authorities as a dishonest finder of hidden treasure. He was easily able to confirm the strange story he now had to tell by actually leading his accusers to the cavern where his six companions were found, youthful and rosy and beaming with a holy radiance. Theodosius, hearing what had happened, hastened to the spot in time to hear from their lips that God had wrought this wonder to confirm his faith in the resurrection of the dead. This message once delivered, they again fell asleep.

¹ This clause is virtually repealed by the Naturalization Act, 1870 (33 & 34 Vict. c. 14, § 7), as to persons obtaining a certificate of naturalization.

² Their commissions had previously been made *durante bene placito*.

Gregory says he had the legend from the interpretation of "a certain Syrian", in point of fact the story is very common in Syriac sources. It forms the subject of a homily of Jacob of Saug (ab 521 A.D.), which is given in the *Acta Saadorum*. Another Syriac version is printed in Lami's *Anecdota*, in 87 sq.; see also Barhebraeus, *Chron. Eccles.*, i. 142 sq., and comp. Assemani, *Bib. Or.*, i. 385 sq. Some forms of the legend give, eight sleepers, e.g., an ancient MS. of the 8th century now in the British Museum (*Oct. Syr. MSS.*, p. 1090). There are considerable variations as to their names. The legend rapidly attained a wide diffusion throughout Christendom, its currency in the East is testified by its acceptance by Mohammed (sur xviii), who calls them *Ashab al-Kahf*, "the men of the cave." According to Al-Biruni (*Chronology*, tr. by Sachau, p. 285) certain undecayed corpses of monks were shown in a cave as the sleepers of Ephesus in the 8th century. The seven sleepers are a favourite subject in early medieval art.

SEVERN, THE, next to the Thames in length among the rivers of England, rises at Maes Hafren on the eastern side of Plinlimmon, on the south-west-west borders of Montgomeryshire, and flows in a nearly semicircular course of about 200 miles to the sea, the direct distance from its source to its mouth in the Bristol Channel is about 80 miles. By the Britons it was called Halfrin, and its old Latin name was *Sabina*. Through Montgomeryshire its course is at first in a south-easterly direction, and for the first 15 miles it flows over a rough precipitous bed. At Llandidies, where the valley widens to a breadth of one or two miles and assumes a more fertile appearance, it bends towards the north-east, passing Newtown and Welshpool. On the borders of Shropshire it receives the Vyrnwy, and then turning in a south-easterly direction enters the broad rich plain of Shrewsbury, after which it bends southward past Ironbridge and Bridgnorth to Bewdley in Worcestershire. In Shropshire it receives a number of tributaries (see SHROPSHIRE). Still continuing its southerly course through Worcestershire it passes Stourport, where it receives the Stour (left), and Worcester, shortly after which it receives the Teme (right). It enters Gloucestershire at Tewkesbury, where it receives the Avon (left), after which, bending in a south-westerly direction, it passes the town of Gloucester, 18 miles below which the estuary widens out into the Bristol Channel, at the point where it receives from the left the Lower Avon or Bristol river, and from the right the Wyre.

From Newtown its fall is 405 feet, the average fall per mile being about 2 feet 8 inches, but from Ironbridge to Gloucester, a distance of about 70 miles, the fall is only about 106 feet. Between Stourport and Gloucester the breadth is 150 feet, but below that town the breadth rapidly increases and the banks become bolder and more picturesque. Owing to the gradual decrease in the width and depth of the Bristol Channel the tides enter with great force, forming a tidal wave or bore about 9 feet in height, which at certain times causes great destruction, among the more serious inundations being those of 1608, 1687, 1703, and 1833. The total area drained by the Severn is about 4500 square miles. Its navigation extends to about 150 miles above its mouth, barges can ascend as far as Stomport, and large vessels to Gloucester. Owing to the difficulties of the navigation the Gloucester and Berkeley Ship Canal, 18 miles in length, was constructed, admitting vessels of 350 tons to Gloucester, the river only admitting vessels of 150 tons. The only other important port is Bristol, but there are a few smaller ports and fishing towns, while by means of canals the Severn has connexion with some of the principal towns of England. With the Thames it is connected by the Strandwater and Thames and Severn Canals, by various canals it has communication with the Trent and the rivers of the north; and the Hereford and Gloucester Canal connects those two cities. The Severn is a good salmon river, and is especially famous for its lampreys.

SEVERN, JOSEPH (1793-1879), portrait and subject painter, was born in 1793. During his earlier years he practised portraiture as a miniaturist; and, having studied in the schools of the Royal Academy, he exhibited his first work in oil, *Hermia and Helena*, a subject from the *Midsummer Night's Dream*, in the Royal Academy Exhibition of 1819. In 1820 he gained the gold medal and a three years' travelling studentship for his *Una and the Red Cross Knight in the Cave of Despair*, a painting now

in the possession of the representatives of the late Lord Houghton. He accompanied his friend Keats the poet to Italy, and nursed him till his death in 1821. In 1861 he was appointed British consul at Rome, a post which he held till 1872, and during a great part of the time he also acted as Italian consul. His most remarkable work is the Spectre Ship from the *Ancient Mariner*. He painted Cordelia Watching by the Bed of Lear, the Roman Beggar, Ariel, the Fountain, and Rienzi, executed a large altarpiece for the church of St Paul at Rome, and produced many portraits, including one of Baron Bunsen and several of Keats. He died at Rome August 3, 1879.

SEVERUS, LUCIUS SEPTIMIUS, the twenty-first emperor of Rome, reigned from 193 to 211 A.D. He was born in 146 at Leptis Magna, an African coast town in the district of Syrtis, whose ancient prosperity is still attested by its extensive ruins. In this region of Africa, despite its long possession by the Romans, the Punic tongue was still spoken by the people in general. Severus had to acquire Latin as a foreign language, and is said to have spoken it to the end of his days with a strong African accent. After he had arrived at the throne he dismissed abruptly from Rome a sister who had come to visit him, because he felt shame at her abominable Latin. Yet Severus and his dynasty were almost the only emperors of provincial descent who frankly cherished the province of their origin, while the province showed true loyalty to the only Roman emperor ever born on African soil, and to the successors who derived their title from him.

Of the origin of the Severi nothing is known. It is a natural but very doubtful conjecture that the L. Septimius Severus, a native of Africa, addressed by the poet Statius, was an ancestor of the emperor who bore the same name. The father of Severus was a Roman citizen of equestrian rank, and it may safely be affirmed that the family held a poor position when he was born, but had risen in importance by the time he reached manhood. Two of his uncles attained to consular rank. Fulvius Pius, the maternal grandfather of Severus, is often identified with the man of that name who was governor of Africa, and, after being condemned for corruption by Pertinax, was highly honoured by Didius Julianus; but dates are strongly against the identification. Of the future emperor's education we learn nothing but its results. Spartianus declares him to have been "very learned in Latin and Greek literature," to have had a genuine zeal for study, and to have been fond of philosophy and rhetoric. But the learning of rulers is often seen through a magnifying medium, and we may better accept the statement of Dio Cassius that in the pursuit of education his eagerness was greater than his success, and that he was rather shrewd than facile. No doubt in his early years he acquired that love for jurisprudence which distinguished him as emperor. Of his youth we know only that it was entirely spent at Leptis. Beyond that there is merely one anecdotal fabrication giving an account of youthful wisdom.

The removal of Severus from Leptis to Rome is attributed by his biographer to the desire for higher education, but was also no doubt due in some degree to ambition. From the emperor Marcus Aurelius he early obtained, by intercession of a consular uncle, the distinction of the broad purple stampe. At twenty-six, that is, almost at the earliest age allowed by law, Severus attained the quaestorship and a seat in the senate, and proceeded as *quaestor militaris* to the senatorial province of Bætica, in the Peninsula. While Severus was temporarily absent in Africa in consequence of the death of his father, the province of Bætica, disordered by invasion and internal commotion, was taken over by the emperor, who gave the senate Sardinia in exchange. On this Severus became

military quaestor of Sardinia. His next office, probably in 174, was that of legate to the proconsul of Africa, and in the following year he was tribune of the plebs. This magistracy, though far different from what it had been in the days of the republic, was still one of dignity, and brought with it promotion to a higher grade in the senate. During the tribunate he married his first wife Marcia, whose name he passed over in his autobiography, though he erected statues of her after he became emperor. In 178 Severus became pretor, not by favour of the emperor, but by competition for the suffrages of the senators. Then, probably in the same year, he went to Spain as legate, after that (179) he commanded a legion in Syria. The death of Marcus Aurelius seems in some way to have interrupted his career, he was unemployed for several years, and devoted great part of his leisure to the study of literature, religion, and antiquities (so says Spartianus) at Athens. The year of Severus's first consulship cannot be determined with precision, but it falls within the space between 185 and 190. In this time also falls the marriage with Julia, afterwards famous as Julia Donna, whose acquaintance he had no doubt made when an officer in Syria. Her two sons Bassianus (known as Caracalla) and Geta were probably born in 188 and 189. Severus was governor in succession of Gallia Lugdunensis, Sicily, and Pannonia Superior. He was in command of three legions at Carnuntum, the capital of the province last named, when news reached him that Commodus had been murdered by his favourite concubine and his most trusted servants.

Up to this moment the career of Severus had been ordinary in its character. He had not raised himself above the usual official level. He had achieved no military distinction,—had indeed seen no warfare beyond the petty border frays of a frontier province. But the storm that now tried all official spirits found his alone powerful enough to brave it. Three imperial dynasties had now been ended by assassination. The Flavian line had enjoyed much shorter duration and much less prestige than the other two, and the circumstances of its fall had been peculiar in that it was probably planned in the interest of the senate and the senate certainly reaped the immediate fruits. But the crisis which arose on the death of Nero and the crisis which arose on the death of Commodus were strikingly alike. In both cases it was left to the army to determine by a struggle which of the divisional commanders should succeed to the command-in-chief, that is, to the imperial throne. In each case the contest began with an impulsion given to the commanders by the legiones themselves. The soldiers of the great commands competed keenly for the honour and the material advantages to be won by placing their general in the seat of empire. This officer who refused to lead would have been deemed a traitor to his troops, and would have suffered the punishment of his treason.

There is a widespread impression that the Prætorian guards at all times held the Roman empire in their hands, but its cironousness is demonstrated by the events of the year 193. For the first time in the course of imperial history the Prætorians presumed to nominate as emperor a man who had no legions at his back. This was Pertinax, who has been well styled the Galba of his time—upright and honourable to severity, and zealous for good government, but blindly optimistic about the possibilities of reform in a feeble and corrupt age. After a three months' rule he was destroyed by the power that lifted him up. According to the well-known story, true rather in its outline than in its details, the Prætorians sold the throne to Didius Julianus. But at the end of two months both the Prætorians and their nominee were swept away by the real disposers of Roman rule, the provincial legions. Four groups of legions at the time were strong enough to aspire

to determine the destiny of the empire,—those quartered in Britain, in Germany, in Pannonia, in Syria. Three of the groups actually took the decisive step, and Severus in Pannonia, Pescennius Niger in Syria, Clodius Albinus in Britain, received from their troops the title of Augustus. Severus far outdid his rivals in promptness and decision. By what means we do not know, he secured the aid of the legions in Germany and of those in Illyria. These, with the forces in Pannonia, made a combination sufficiently formidable to overawe Albinus for the moment. He probably deemed that his best chance lay in the exhaustion of his competitors by an internecine struggle. At all events he received with submission an offer made by Severus, no doubt well understood by both to be politic, insincere, and temporary. Severus sent a trusted officer, who confirmed Albinus in his power and bestowed upon him the title of Caesar, making him the nominal heir-apparent to the throne.

Before the action of Severus was known in Rome, the senate and people had shown signs of turning to Pescennius Niger, that he might deliver them from the poor puppet Didius Julianus and avenge on the Prætorians the murder of Pertinax. Having secured the co-operation or neutrality of all the forces in the western part of the empire, Severus hastened to Rome. To win the sympathy of the capital he posed as the avenger and successor of Pertinax, whose name he even added to his own, and used to the end of his reign. The feeble defences of Julianus were broken down and the Prætorians disarmed and disbanded, without a blow being struck. A new body of household troops was enrolled and organized on quite different principles from the old. In face of the senate, as Dio tells us, Severus acted for the moment like "one of the good emperors in the olden days." After a magnificent entry into the city he joined the senate in execrating the memory of Commodus, and in punishing the murderers of Pertinax, whom he honoured with the most splendid funeral rites. He also encouraged the senate to pass a decree directing that any emperor or subordinate of an emperor who should put a senator to death should be treated as a public enemy. But he ominously refrained from asking the senate to sanction his accession to the throne.

The rest of Severus's reign, as it is read in the ancient histories, is in the main occupied with wars, over which we shall rapidly pass. The power wielded by Pescennius Niger, who called himself emperor, and was supposed to control one half of the Roman world, proved to be more imposing than substantial. The magnificent promises of Oriental princes were falsified as usual in the hour of need. Niger himself, as described by Dio, was the very type of mediocrity, conspicuous for no faculties, good or bad. This very character had no doubt commended him to Commodus as suited for the important command in Syria, which might have proved a source of danger in able hands. The contest between Severus and Niger was practically decided after two or three engagements, fought by Severus's officers. The last battle, which took place at Issus, ended in the defeat and death of Niger (194). After this the emperor spent two years in successful attacks upon the peoples bordering on Syria, particularly in Adiabene and Osroene. Byzantium, the first of Niger's possessions to be attacked, was the last to fall, after a glorious defence.

Late in 196 Severus turned westward, to reckon with Albinus, who was well aware that the reckoning was inevitable. He was better born and better educated than Severus, but in capacity far inferior. As Severus was nearing Italy he received the news that Albinus had been declared emperor by his soldiers. The first counter-stroke

of Severus was to affiliate himself and his elder son to the Antonines by a sort of spurious and posthumous adoption. The prestige of the old name, even when gained in this illegitimate way, was probably with a good deal Bassianus, the elder son of Severus, thereafter known as Aurelius Antoninus, was named Caesar in place of Albinus, and was thus marked out as successor to his father. Without interrupting the march of his forces, Severus contrived to make an excursion to Rome. Here he availed himself with much subtlety of the sympathy many senators were known to have felt for Niger. Though he was so far faithful to the decree passed by his own advice that he put no senator to death, yet he banished and impoverished many whose presence or influence seemed dangerous or inconvenient to his prospects. Of the sufferers probably few had ever seen or communicated with Niger.

The collision between the forces of Severus and Albinus was the most violent that had taken place between Roman troops since the mighty contest at Philippi. The decisive engagement was fought in February of the year 197 on the plain between the Rhone and the Saône, to the north of Lyons. Dio tells us that 150,000 men fought on each side. The fortunes of Severus were, to all appearance, at one stage of the battle as hopeless as those of Julius Cæsar were for some hours during the battle of Munda. The tide was turned by the same means in both cases—by the personal conduct and bravery of the commander.

By this crowning victory Severus was released from all need for disguise, and "poured forth on the civil population all the wrath which he had been storing up for a long time" (Dio). He particularly frightened the senate by calling himself the son of Marcus and brother of Commodus, whom he had before insulted. And he read a speech in which he declared that the severity and cruelty of Sulla, Marius, and Augustus had proved to be safer policy than the clemency of Pompey and Julius Cæsar, which had wrought their ruin. He ended with an apology for Commodus and bitter reproaches against the senate for their sympathy with his assassins. Over sixty senators were arrested, on a charge of having adhered to Albinus, and half of them were put to death. In most instances the charge was merely a pretence to enable the emperor to crush out the forward and dangerous spirits in the senate. The murderers of Commodus were punished, Commodus himself was deified, and on the monuments from this time onward Severus figures as the brother of that reproduction of all the vice and cruelty of Nero with the refinement left out.

The next years (197-202) were devoted by Severus to one of the dominant ideas of the empire from its earliest days—war against the Parthians. The results to which Trajan and Verus had aspired were now fully attained, and Mesopotamia was definitely established as a Roman province. Part of the time was spent in the exploration of Egypt, in respect of which Dio takes opportunity to say that Severus was not the man to leave anything human or divine uninvestigated. The emperor returned to enjoy a well-earned triumph, commemorated to this day by the arch in Rome which bears his name. During the six years which followed (202-208) Severus resided at Rome and gave his attention to the organization of the empire. No doubt his vigorous influence was felt to its remotest corners, but our historians desert us at this point and leave us for the most part to the important but dim and defective conclusions to be drawn from the abundant monumental records of the reign. Only two or three events in the civil history of this period are fully narrated by the ancient writers. The first of these is the festival of the Decennalia, or rejoicings in the tenth year of the emperor's reign. Contemporaneous with this festival was the marriage of Aurelius Antoninus

(Caracalla) with Plautilla, the daughter of Plautianus, commander of the reorganized Prætorian guards. This officer holds a conspicuous position in the ancient accounts of the reign, yet it is all but impossible to believe a good deal that we are told concerning him. Nevertheless, without a clear view of the career of Plautianus, it is difficult to grasp definitely some important features in the character of Severus, or to appreciate exactly the nature of his government. According to Dio and Herodian, Plautianus was allowed for years to exercise and abuse the whole power of the emperor, so far as it did not relate to the actual conduct of war. He was cruel, arrogant, and corrupt, and the whole empire groaned under his exactions. Geta, the brother of Severus, tried to open the emperor's eyes, but the licence of Plautianus was merely restricted for a moment, to be bestowed again in full. Finally, in 203 this second Sejanus fell a victim to an intrigue set on foot by his own son-in-law Antoninus (Caracalla), the details of which were not clearly known even to contemporary writers. It is hard to see in what way we are to reconcile this history with the known facts of Severus's character and career, unless we assume that Plautianus was really the instrument of his master for the execution of his new policy towards the senate and the senatorial provinces. That Plautianus abused his authority and brought about his own fall is probable enough,—also that Severus had destined him at one time for the guardianship of his sons. Plautianus was succeeded in his office by two men, one of whom was the celebrated jurist Papinian.

Severus spent the last three years of his life (208-211) in Britain, amidst constant and not very successful warfare, which he is said to have provoked partly to strengthen the discipline and powers of the legions, partly to wear his sons from their evil courses by hard military service. He died at York in February of the year 211. There are vague traditions that his death was in some way hastened by Caracalla. This prince had been, since about 197, nominally joint emperor with his father, so that no ceremony was needed for his recognition as monarch.

The natural gifts of Severus were of no high or unusual order. He had a clear head, promptitude, resolution, tenacity, and great organizing power, but no touch of genius. That he was cruel cannot be questioned, but his cruelty was of the calculating kind, and always clearly directed to some end. He took the lead of Niger over the ramparts of Byzantium, but mainly as the best means of procuring a surrender of the stubbornly defended fortress. The head of Albinus he exhibited at Rome, but only as a warning to the capital to tamper no more with pretenders. The children of Niger were held as hostages and kindly treated so long as they might possibly afford a useful basis for negotiation with their father; when he was defeated they were killed, lost from among them should arise a claimant for the imperial power. Stern and barbarous punishment was always meted out by Severus to the conquered foe, but terror was deemed the best guarantee for peace. He felt no scruples of conscience or honour if he thought his interest at stake, but he was not wont to take an excited or exaggerated view of what his interest required. He used or destroyed men and institutions alike with cool judgment and a single eye to the main purpose of his life, the secure establishment of his dynasty. The few traces of aimless savagery which we find in the ancient narratives are probably the result of fear working on the imagination of the time.

As a soldier Severus was personally brave, but he can hardly be called a general, in spite of his successful campaigns. He was rather the organizer of victory than the actual author of it. The operations against Niger were carried out entirely by his officers. Dio even declares that the final battle with Albinus was the first at which Severus had ever been actually present. When a war was going on he was constantly travelling over the scene of it, planning it and instilling into the army his own pertinacious spirit, but the actual fighting was usually left to others. His treatment of the army is the most characteristic feature of his reign. He frankly broke with the decent conventions of the Augustan constitution, ignored the senate, and candidly based his rule upon force. The only title he ever laid to the throne was the *prænomen* of the legions, whose adherence to his cause he commemorated

even on the conage of the realm. The legions voted him the adopted son of Marcus Aemilius, the legions associated with him Casca in the government of the empire. Severus strove earnestly to wed the army as a whole to the support of his dynasty. He increased enormously the material gains and the honorary distinctions of the services, so that he was charged with corrupting the troops. Yet it cannot be denied that, all things considered, he left the army of the empire more efficient than he found it. He increased the strength of it by three legions, and turned the Praetorians, heretofore a flabby body without military experience or instinct, into a chosen corps of veterans. Their ranks were filled by promotion from all legions on service, whereas previously these had been supplied almost entirely with recruits from the two of the neighbouring provinces. It was hoped that these picked men would form a force on which an emperor could rely in an emergency. But to meet the possibility of a legionary revolt in the provinces, one of the fundamental principles of the Augustan empire was abrogated. Italy became a province, and troops of the regular army were quartered in it under the direct command of the emperor. Further to obviate the risk of revolution, the great commands in the provinces were broken up so that, excepting on the turbulent eastern frontier, it was not possible for a commander to dispose of troops numerous enough to render him dangerous to the government.

But, while the policy of Severus was primarily a family policy, he was by no means careless of the general security and welfare of the empire. Only in one instance, the destruction of Byzantium, did he weaken its defences against the east, and even in that case, which his successors paid dearly, when the Goths came to dominate the Buxine. The constantly troublesome Danubian regions received the special attention of the emperor, but all over the realm the status and privileges of communities and districts were recast in the way that seemed likely to conduce to their prosperity. The administration acquired more and more of a military character, in Italy as well as in the provinces. Retained military officers now filled many of the posts formerly reserved for civilians of equestrian rank. The prefect of the Praetorians received legal civil and judicial powers, so that the investment of Papinian with the office was less unnatural than it at first might seem. The alliance between Severus and the juriconsults had important consequences. While he gave them now importance in the body politic, and co-operated with them in the work of legal reform, they did him material service by working an absolute reform of the government and the texture of the Roman law. Of the legal changes of the reign, important as they were, we can only mention a few details. The emperor himself was a devoted and upright judge, but he struck a great blow at the purity of the law by transferring the exercise of imperial jurisdiction from the forum to the palace. He sharpened in many respects the law of treason, put an end to the time-honoured *quaestiones perpetuae*, altered largely that important section of the law which defined the rights of the family, and developed further the social policy which Augustus had embodied in the *lex Julia de adulteris* and the *lex Papia Poppaea*.

Severus boldly adopted as an official designation the autocratic title of *dominus*, which the better of his predecessors had renounced, and with which the worse had only toyed, as Domitian, whom Martial did not hesitate to call "his lord and his god." During Severus's reign the senate was absolutely powerless, he took all initiative into his hands. He broke down the distinction between the servants of the senate and the servants of the emperor. All nominations to office or function passed under his scrutiny. The estimation of the old consular and other republican titles was diminished. The growth of capacity in the senate was effectually checked by cutting off the tallest of the poppy-heads early in the reign. The senate became a mere registration office for the imperial designations, and its members, as has been well said, a choir for drawing conventional hymns of praise in honour of the monarch. Even the nominal restoration of the senate's power at the time of Alexander Severus, and the accession of so-called "senatorial emperors" later on, did not efface the work of Septimius Severus, which was resumed and carried to its fulfilment by Diocletian.

It only remains to say a few words of the emperor's attitude towards literature, art, and religion. The period in the history of Latin literature is so barren as the reign of Severus. Many later persons—the age of Sticho, for example—shine brilliantly by comparison. The only great Latin writers are the Christians Tertullian and Cyprian. The Greek literature of the period is richer, but not owing to any patronage of the emperor, except perhaps in the case of Dio Cassius, who, though no admirer of Severus, attributes to encouragement received from him the execution of the great historical work which has come down to our time. The numerous restorations of ancient buildings and the many new constructions carried out by Severus show that he was not insensible to the artistic glories of the past; and he is known to have paid much attention to works of art in foreign countries where his duties took him. But he was in no sense a patron or connoisseur of art. As to religion,

if we may trust Dio, one of the most superstitious of historians, Severus was one of the most superstitious of monarchs. But apart from that it is difficult to say what was his influence on the religious currents of the time. He probably did a good deal to strengthen and extend the official cult of the imperial family, which had been greatly developed during the prosperous times of the Antonines. But what he thought of Christianity, Judaism, or the Oriental mysticism to which his wife Julia Domna gave such an impulse in the succeeding reign, it is impossible to say. We may best conclude that his religious sympathies were wide, since tradition has not painted him as the patron of any one form of worship.

The energy and dominance of Severus's character and his capacity for men may be deemed, without fancifulness, to be traceable in the numerous representations of his features which have survived to our days.

The authorities for this emperor's reign are fairly full and satisfactory, considering the general scantiness of the imperial records. Severus himself wrote an autobiography which was regarded as candid and trustworthy on the whole. The events of the reign were recorded by several contemporaries. The first place among these must be given to Dio Cassius, who stands to the empire in much the same relation as Livy to the Republic. He became a senator in the year when Marcus Antonius died (30) and obtained the dignity for more than thirty years. He was well acquainted with Severus, and was near enough the centre of affairs to know the real nature of events, without being great enough to have any personal motive for winking at the bad. The fragments of his history no longer exist in its original form, we have copious extracts from it, made by Xiphilinus, an ecclesiastic of the 11th century. The faults which have impaired the results of Dio's great work in its earlier portions are more numerous. By his facility, his inexact knowledge of the earlier Roman institutions, his passion for signs from heaven—could he hurt injury to the narrative of an eye-witness, and his too hasty and unhesitant response to the attempts of his contemporaries to divert him from the common views of history—passion, prejudice, and inexactness. His Greek, too, stands in an agreeable contrast to the debased Latin of the "scriptores historici Augusti." The Greek writer Herodian, a contemporary of Severus, but the mere fact that we know nothing of his life is in itself enough to show that his opportunities were not so great as those of Dio. The opinionation of Herodian, which was used as the main authority for the times of Severus by Tillemont and Gibbon, has not been proof against the criticism of recent scholars. His faults are those of rhetoric and exaggeration. His narrative is probably in many places not independent of Dio. The writers known as the "scriptores historici Augusti" are also of considerable importance, particularly in the lives of Didius Julianus, Severus, Pescennius Niger, and Caracalla, attributed to Helius Spartianus, those of Gordianus Albinus and of Philip the Arab to Julius Capitolinus, those of Antoninus Didianus, Antoninus Hellogabalus, and Alexander Severus to Lampridius. The personal history of Severus and his family is known to us mainly from these writers. The principal author who was contemporary of L. Marcus Maximus, a young contemporary of Septimius Severus, who wrote, in continuation of the work of Suetonius, the lives of eleven emperors from Trajan to Hadrian, is unknown. He may have been a senator, as he is described by Antoninus Marcellinus, he was a kind of prose Juvenal, whose uniformly dark pigments can hardly have sufficed to paint a true picture even of his own times. The very numerous descriptions belonging to the age of Septimius Severus are of interest as contrasted with the attempts to suppress the literary records of his reign, particularly as regards the details of his administration. The judicial works of Justinian's epoch embody much that throws light on the government of Severus.

The principal modern works relating to this emperor, after Tillemont and Gibbon, are—J. Schilling, *Die Imperatoren L. Septimius Severus*, Münster, 1867; H. Hofmann, *Untersuchungen zur Geschichte des Kaisers L. Septimius Severus*, Gießen, 1875; *Untersuchungen zur römischen Kaisergeschichte*, ed. by H. Dübner, H. Schilling, *Geschichte der römischen Kaiserzeit*, Götting, 1889-93; Dr. Goulmeau, *Étude sur le Pe et le Règne de Sévère-Sépère*, Bruxelles, 1890; Réville, *La Religion à Rome sous les Sévères*, Paris, 1880. Controversy about the many disputed matters pertaining to Severus has been intentionally avoided in what has been said above.

SEVERUS, MARCUS AURELIUS ALEXANDER, Roman emperor from 222 to 235, was of Syrian parentage, and was born at Arca near the Syrian Tripolis (now Irka; Yaktit, iii. 553; cf. Gen. x. 17), probably in the year 205. His father Gessius Marcianus held office more than once as an imperial procurator; his mother Julia Mamaea was the daughter of Julia Messa, the scheming and ambitious lady of Emesa, who had succeeded in raising her grandson Elagabalus to the throne of the Caesars; see the genealogical table in HELIOGABALUS. His original name was Alexius Bassianus, but he changed it in 221, when Messa persuaded Elagabalus to adopt his cousin as successor and create him Caesar. In the next year Elagabalus was murdered, and Alexander was proclaimed by the Praetorians and accepted by the senate. He was then a mere lad, amiable, well-meaning, but somewhat weak, and entirely under the dominion of his mother; a woman of many virtues, who surrounded her son with wise counsellors, watched over the development of his character, and improved the tone of the administration, but on the other hand was inordinately jealous of her influence, and alienated the army by extreme parsimony, while neither she nor her son had a strong enough hand to keep tight the reins of military discipline. Mutinies became frequent in all parts of the empire: to one of them the life of the praetorian prefect Ulpius was sacrificed; another compelled

the retirement of Dion Cassius from his command (see DION). On the whole, however, the reign of Alexander Severus was prosperous till he was summoned to the East to face the new power of the Sásánians (see PERSIA, vol. xvii. p. 607). Of the war that followed we have very various accounts, Mommsen (vol. v. p. 420 sq.) leans to that which is least favourable to the Romans. At all events, though the Persians were checked for the time, the conduct of the Roman army showed an extraordinary lack of discipline. The emperor returned to Rome and celebrated a triumph (233), but next year he was called to face German invaders in Gaul, and there was slain with his mother in a mutiny which was probably led by Maximinus, and at any rate purchased him the throne. Whatever the personal virtues of Alexander were, and they have not lost by contrast with his successor's brutal tyranny, he was not of the stuff to rule a military empire.

SEVERUS, SUPREMACY (c. 365-c. 425), early Christian writer. A native of Aquitania, he was thoroughly imbued with the culture of his country and time. The seven southern provinces of Gaul, between the Alps and the Loire, had long been completely Romanized. The very name "Gaul" was repudiated by the inhabitants and confined to the natives of the rude northern districts. The lifetime of Severus exactly coincided with the period of greatest literary development in Aquitania, then the truest or only true home of Latin letters and learning—then last place of refuge, from which Severus saw them driven before he closed his eyes on the world. Almost all that we know of his life comes from a few allusions in his own writings, and some passages in the letters of his friend Paulinus, bishop of Nola. In his early days he was famous as a pleader in the courts, and his knowledge of Roman law is reflected in parts of his writings. He married a wealthy lady belonging to a consular family, who died young, leaving him no children. At this time Severus came under the powerful influence of St Martin, bishop of Tours, by whom he was led to devote his wealth to the Christian poor, and his own powers to a life of good works and meditation. To use the words of his friend Paulinus, he broke with his father, followed Christ, and set the teachings of the "fishermen" far above all his "Tulian learning." He rose to no higher rank in the church than that of presbyter. His time was passed chiefly in the neighbourhood of Toulouse, and such literary efforts as he permitted to himself were made in the interests of Christianity. In many respects no two men could be more unlike than Severus, the scholar and orator, well versed in the ways of the world, and Martin, the rough Pannonian bishop of Tours, ignorant of learning, suspicious of culture, the champion of the monastic life, the seer of visions, and the worker of miracles. Yet the spirit of the rugged saint subdued that of the polished scholar, and the works of Severus would have little importance now did they not reflect the ideas, influence, and aspirations of Martin, the foremost ecclesiastical of Gaul, and one of the most striking figures in the church of his day.

The chief work of Severus is the *Chronica*, a summary of sacred history from the beginning of the world to his own times, with the omission of the events recorded in the Gospels and the Acts, "lest the form of his brief work should detract from the honour due to these events." The book was in fact a text-book, and was actually used as such in the schools of Europe for about a century and a half after the *editio princeps* was published by Flaccus Illyricus in 1558. Severus nowhere clearly points to the class of readers for whom his book is designed. He disclaims the intention of making his work a substitute for the actual narrative contained in the Bible. "Worthily historians" had been used by him, he says, to make clear the dates and the connexion of events and for supplementing the sacred sources, and with the intent at one and the same time to instruct the unlearned and to "convince" the learned. Probably the "unlearned" are the mass of Christians and the learned are the cultivated Christians and

pagans alike, to whom the rude language of the sacred texts, whether in their Greek or their Latin form, would be distasteful. The literary structure of the narrative itself shows that Severus had in his mind principally readers on the same level of culture with himself. He was anxious to show that sacred history might be presented in a form which lovers of Sallust and Tacitus could appreciate and enjoy. The style is lucid and almost classical. Though phrases and even sentences from many classical authors are woven here and there, the narrative flows on easily, with no trace of the jolts and jerks which offend us in almost every line of a patchwork imitation of the classics like Sidenius. In order that his work might fully stand beside that of the old Latin writers, Severus boldly ignores the alleged deficiencies of the sacred history to which the heretics and the orthodox of the age were alike wedded. Possibly he was not unshaken in his adherence to the peculiar reading which nearly all men then gave to the maxim that "the letter killeth but the spirit maketh alive."

As an authority for times antecedent to his own, Severus is of little moment. At only a few points does he enable us to correct or supplement other records. He lays it down that he based his narrative of the destruction of Jerusalem by Titus on the account given by Tacitus in his "Histories," a portion of which has been lost. We are enabled thus to contrast Tacitus with Josephus, who warped his narrative to do honour to Titus. In his allusions to the Gentile rulers with whom the Jews came into contact from the time of the Maccabees onwards, Severus discloses some points which are not yet fully brought to light by the real interest of his work lies, first, in the incidental glimpses it affords all through of the history of his own time, next and more particularly, in the information he has preserved concerning the struggle over the Priscillianist heresy, which disorganized and degraded the churches of Spain and Gaul, and particularly affected Aquitania. The sympathies here betrayed by Severus are wholly those of St Martin. The stout bishop had withstood to his face Maximinus, who ruled for some years a large part of the western portion of the empire, though he never conquered Italy. He had repudiated him with attacking and overthrowing his predecessors on the throne, and for his dealings with the church. Severus loses no opportunity presented by his narrative for laying stress on the crimes and follies of rulers, and on their cruelty, though he once declares that, cruel as rulers could be, priests could be crueler still.

This last statement has reference to a huge part of the blood of Maximus to whom it had stained his hands with the blood of Priscillian and his followers. Martin, too, had denounced the worldliness and greed of the Gaulish bishops and clergy. Accordingly we find that Severus, in narrating the division of Canaan among the tribes, calls the special attention of ecclesiastics to the fact that no portion of the land was assigned to the tribe of Levi, lest they should be hindered in their service of God. "For the clergy seem," he says, "not merely forgetful of the Jewish precept of it, such a passion for possessions has in our days fastened like a pestilence on their souls. They are greedy of property, and tend their estates and hoard their gold, and buy and sell and give their minds to gain. Those of them who are reputed to be of better principles, who neither hold property nor larier, sit and wait for gifts, and pollute all the grace of their lives by taking fees, while they almost make market of their holiness, but I have digressed further than I intended, through vexation and weariness of the present age." We here catch an interesting glimpse of the circumstances which were winning over good men to monasticism in the West, though the evidence of an enthusiastic votary of the solitary life, such as Severus was, is probably not free from exaggeration. Severus also fully sympathized with the action of St Martin touching Priscillianism. This mysterious Western offshoot of Gnosticism had no single feature about it which could soften the long and arduous career, such as Martin's was, but he staunchly resisted the introduction of secular punishment for evil doctrine, and withdrew from communion with those bishops in Gaul, a large majority, who invoked the aid of Maximus against their erring brethren. In this connexion it is interesting to note the account given by Severus of the synod held at Rimini in 359, where the question arose whether the bishops attending the assembly might lawfully receive money from the secular treasury to recoup their travelling and other expenses. Severus evidently approves the action of the British and Gaulish bishops, who deemed it unbecoming that they should be under pecuniary obligation to the emperor. His ideal of the church required that it should stand clear of and above the state.

After the *Chronica* the chief work of Severus is his *Life of Martin*, a contribution to popular Christian literature which did much to establish the great reputation which that wonderful saint maintained throughout the Middle Ages. The book is not properly a biography, but a catalogue of miracles, told in all the simplicity of absolute belief. The power to work miraculous signs is assumed to be in direct proportion to holiness, and is by Severus valued merely as an evidence of holiness, which he is persuaded can only be attained through a life of isolation from the

world. In the first of his dialogues Severus puts into the mouth of an interlocutor a most pleasing description of the life of eremitics and solitaries in the deserts bordering on Egypt. The main evidence of the virtue attained by them lies in the voluntary subjection to them of the savage beasts among which they lived. But Severus was no indiscriminate adherent of monasticism. The same dialogue shows him to be alive to its dangers and defects. The second dialogue is a large appendix to the Life of Martin, and really supplies more information of his life as bishop and of his views than the work which bears the title *Vita S. Martini*. The two dialogues occasionally make interesting references to personages of the epoch. In Dial. I, cc. 6, 7, we have a vivid picture of the controversies which agitated Alexandria over the works of Origen. The judgment of Severus himself is no doubt that which he puts in the mouth of his interlocutor Postumianus: "I am astonished that one and the same man could have so far differed from himself that in the approved portion of his works he has no equal since the apostles, while in that portion for which he is justly blamed it is proved that no man has committed more unseemly errors." Three epistles complete the list of Severus's genuine works. He is said to have been led away in his old age by Pelagianism, but to have repented and inflicted long-enduring penance on himself.

The text of the *Chronica* rests on a single MS., one of the Palatine collection now in the Vatican, of the other works MSS. are abundant. Some spurious letters bear the name of Severus, also in a MS. at Madrid is a work falsely professing to be an epitome of the *Chronica* of Severus, and going down to 511. The chief editions of the complete works of Severus are those by De Plat (Vicenza, 1741) and by Halm (Leipzig, vol. 1 of the *Corpus Scriptorum Ecclesiasticorum Latinarum*, Vindob. 1866). There is a most admirable bibliography on the *Chronica* by Benary's (Leipzig, 1861). (J. S. R.)

SEVIGNÉ, MARIE DE RABUTIN-CHANTAL, MARQUISE DE (1626-1696), the most charming of all letter-writers in all languages, was born at Paris on February 6, 1626, and died at the chateau of Gignan (Drôme), on April 18, 1696. The family of Rabutin (if not so illustrious as Bussy, Madame de Sévigné's notorious cousin, affected to consider it) was one of great age and distinction in Burgundy. It was traceable in documents to the 12th century, and the castle which gave it name still existed, though in ruins, in Madame de Sévigné's time. The family had been "gens d'épée" for the most part, though François de Rabutin, the author of valuable memoirs on the sixth decade of the 16th century, undoubtedly belonged to it. It is said that Bussy's silly vanity led him to exclude this François from the genealogy of his house because he had not occupied any high position. Marie's father, Celse Bénigne de Rabutin, Baron de Chantal, was the son of the celebrated "Sainte" Chantal, friend and disciple of St. Francis of Sales, her mother was Marie de Coulanges. Celse de Rabutin shared to the full the mania for duelling which was the curse of the gentlemen of France during the first half of the 17th century, and was frequently in danger both directly from his adversaries and indirectly from the law. He died, however, in a more legitimate manner, being killed during the English descent on the Isle of Rhé in July 1627. His wife did not survive him many years, and Marie was left an orphan at the age of seven years and a few months. She then passed into the care of her grandparents on the mother's side, but they were both aged, and the survivor of them, Philippe de Coulanges, died in 1636, Marie being then ten years old. According to French custom a family council was held to select a guardian of the young heiress, for such she was to some extent. Her uncle Christophe de Coulanges, Abbé de Livry, was chosen. He was somewhat young for the guardianship of a girl, being only twenty-nine, but readers of his niece's letters know how well "Le Ben Bon"—for such is his name in Madame de Sévigné's little language—acquitted himself of the trust. He lived till within ten years of his ward's death, and long after his nominal functions were ended he was in all matters of business the good angel of the family, while for half a century his abbacy of Livry was the favourite residence, both of his niece and her daughter. Coulanges was much more of a man of business than of a man of letters, but either choice or the fashion of the time induced him to make of his niece a learned lady. Chapelain and Ménage are specially mentioned as her

tutors, and Ménage at least fell in love with her, in which point he resembled the rest of the world, and was constant to his own habits in regard to his pupils. Taillement des Réaux gives more than one instance of the cool and good-humoured raillery with which she received his passion, and the earliest letters of hers that we possess are addressed to Ménage. Another literary friend of her youth was the poet Saint-Pavin. Among her own sex she was intimate with all the coteries of the Hôtel Rambouillet, and her special ally was Mademoiselle de la Vergne, afterwards Madame de la Fayette. In person she was extremely attractive, though the minute critics of the time (which was the palmy day of portraits in words) objected to her divers deviations from strictly regular beauty, such as eyes of different colours and sizes, a "square-ended" nose, and a somewhat heavy jaw. Her beautiful hair and complexion, however, were admitted even by these censors, as well as the extraordinary spirit and liveliness of her expression. Her long minority, under so careful a guardian as Coulanges, had also raised her fortune to the amount of 100,000 crowns—a large sum for the time, and one which with her birth and beauty might have allowed her to expect a very brilliant marriage. That which she finally made was certainly one of affection on her side rather than of interest. There had been some talk of her cousin Bussy, but very fortunately for her this came to nothing. She actually married Henri, Marquis de Sévigné, a Breton gentleman of a good family, and allied to the oldest houses of that province, but of no great estate. The marriage took place on August 4, 1644, and the pair went almost immediately to Sévigné's manor-house of Les Roches, near Vitry, a place which Madame de Sévigné was in future years to immortalize. It was an unfortified chateau of no very great size, but picturesque enough, with the peaked turrets common in French architecture, and surrounded by a park and grounds of no large extent, but thickly wooded and communicating with other woods. The abundance of trees gave it the reputation of being damp and somewhat gloomy. Fond, however, as Madame de Sévigné was of society, it may be suspected that the happiest days of her brief married life were spent there. For there at any rate her husband had less opportunity than in Paris of neglecting her, and of wasting her money and his own. Very little good is said of Henri de Sévigné by any of his contemporaries. He was one of the innumerable lovers of Ninon de l'Enclos, and made himself even more conspicuous with a certain Madame de Gondran, known in the nickname slang of the time as "La Belle Lolo." He was wildly extravagant. That his wife loved him and that he did not love her was generally admitted, and the frank if somewhat coxcomb-like accounts which Bussy Rabutin gives of his own attempt and failure to persuade her to retaliate on her husband are decisive as to her virtue. At last Sévigné's pleasant vices came home to him. He quarrelled with the Chevalier d'Albret about Madame de Gondran, fought with him and was mortally wounded on the 4th of February 1651, he died two days afterwards. There is no reasonable doubt that his wife regretted him a great deal more than he deserved. On two different occasions she is said to have fainted in public at the sight once of his adversary and once of his second in the fatal duel, and whatever Madame de Sévigné was (and she had several faults) she was certainly not a hypocrite. Her husband had when living accused her of coldness,—the common excuse of libertine husbands,—but even he seems to have found fault only with her temperament, not with her heart. To close this part of the subject it may be said that though only six and twenty, and more beautiful than ever, she never married again despite frequent offers, and that no aspersions were

ever thrown save in one instance on her fame. For the rest of her life, which was long, she gave herself up to her children. These were two in number, and they divided their mother's affections by no means equally. The eldest was a daughter, Françoise Marguerite de Sévigné, who was born on October 10, 1646, whether at Les Rochers or in Paris is not absolutely certain. The second, a son, Charles de Sévigné, was born at Les Rochers in the spring of 1648. To him Madame de Sévigné was an indulgent, a generous (though not altogether just), and in a way an affectionate mother. Her daughter, the future Madame de Grignan, she worshipped with an almost insane affection, which only its charming literary results and the delightful qualities which accompanied it in the worshipper, though not in the worshipped, save from being ludicrous if not revolting. As it is, not one in a hundred of Madame de Sévigné's readers can find in his heart to be angry with her for her devotion to a very undivine divinity.

After her husband's death Madame de Sévigné passed the greater part of the year 1651 in retirement at Les Rochers. She had, however, no intention of renouncing the world, and she returned to Paris in November of that year, her affairs having been put in such order as Sévigné's extravagance permitted by the faithful Coulanges. For nearly ten years little of importance occurred in her life, which was passed at Paris in a house she occupied in the Place Royale (not as yet in the famous Hôtel Carnavalet), at Les Rochers, at Livry, or at her own estate of Bourbilly in the Mâconnais. She had, however, in 1658 a quarrel with her cousin Bussy, which had not unimportant results, and at the end of the time mentioned above she narrowly escaped being compromised in reputation, though not politically, at Fouquet's downfall. Notwithstanding Bussy's unamiable character and the early affair of the proposed marriage, and notwithstanding also his libertine conduct towards her, the cousins had always been friends; and the most amusing and characteristic part of Madame de Sévigné's correspondence, before the date of her daughter's marriage, is addressed to him. She had a very strong belief in family ties; she recognized in Bussy a kindred spirit, and she excused his faults as *Rabutinades* and *Rabutinages*—the terms she uses in alluding to the rather excitable and humorist temper of the house. But in 1658 a misunderstanding about money brought about a quarrel, which in its turn had a long sequel, and results not unimportant in literature. Bussy and his cousin had jointly come in for a considerable legacy, and he asked her for a loan. If this was not positively refused, there was a difficulty made about it, and Bussy was deeply offended. A year later, at the escape of Roissy (see *RABUTIN*), according to his own account, he improvised (according to probability he had long before written it) the famous portrait of Madame de Sévigné which appears in his notorious *Histoire Amoureuse*, and which is a triumph of malice. Circulated at first in manuscript and afterwards in print, this caused Madame de Sévigné the deepest pain and indignation, and the quarrel between the cousins was not fully made up for years, if indeed it was ever fully made up. This portrait, however, was more wounding to self-love than in any way really dangerous, for, read between the lines, it is in effect a testimonial of character. The Fouquet matter was more serious. The superintendent was a famous lady-killer, but Madame de Sévigné, though he was her friend, and though she had been ardently courted by him as by others (one quarrel in her presence between the Duke de Rohan and the Marquis de Tonquedec had become notorious), had hitherto escaped scandal. At Fouquet's downfall in 1651 it was announced on indubitable authority that communications from her had been found in the coffer where Fouquet kept his love

letters. She protested that the notes in question were of friendship merely, and Bussy (one of the not very numerous good actions of his life) obtained from Le Tellier, who as minister had examined the letters, a corroboration of the protest. But the letters were never published, and there have always been those who held that Madame de Sévigné regarded Fouquet with at least a very warm kind of friendship. It is certain that her letters to Pomponne describing his trial are among her masterpieces of unaffected, vivid, and sympathetic narration.

During these earlier years, besides the circumstances already mentioned, Madame de Sévigné conceived, like most of the better and more thoughtful among Frenchmen and Frenchwomen, a great affection for the establishment of Port Royal, which was not without its effect on her literary work. That work, however (if writing than which certainly none was ever less called out in a spirit of mere workmanship can be so called), dates in its bulk and really important part almost entirely from the last thirty years of her life. Her letters before the marriage of her daughter, though by themselves they would suffice to give her a very high rank among letter-writers, would not do more than fill one moderate-sized volume. Those after that marriage fill nearly ten large volumes in the latest and best edition. We do not hear very much of Mademoiselle de Sévigné's early youth. For a short time, at a rather uncertain date, she was placed at school with the nuns of St. Marie at Nantes. But for the most part her mother brought her up herself, assisted by the Abbé de la Mousse, a faithful friend, and for a time one of her most constant companions. La Mousse was a great Cartesian, and he made Mademoiselle de Sévigné also a devotee of the bold soldier of Touraine to a degree which even in that century of blue stockings excited surprise and some ridicule. But Mademoiselle de Sévigné was bent on more mundane triumphs than philosophy had to offer. Her beauty is all the more incontestable that she was by no means generally liked. Bussy, a critical and not too benevolent judge, called her "la plus jolie fille de France," and it seems to be agreed that she resembled her mother, with the advantage of more regular features. She was introduced at court early, and as she danced well she figured frequently in the ballets which were the chief amusement of the court of Louis XIV. in its early days. If, however, she was more regularly beautiful than her mother she had little or nothing of her attraction, and like many other beauties who have entered society with similar expectations she did not immediately find a husband. Various projected alliances fell through for one reason or another, and it was not till the end of 1668 that her destiny was settled. On January 29 in the next year she married François Adhémar, Comte de Grignan, a Provençal, of one of the noblest families of France, and a man of amiable and honourable character, but neither young nor handsome, nor in reality rich. He had been twice married and his great estates were heavily encumbered. Neither did the large dowry (300,000 livres) which Madame de Sévigné, somewhat unfairly to her son, bestowed upon her daughter, suffice to clear encumbrances, which were constantly increased in the sequel by the extravagance of Madame de Grignan as well as of her husband.

Charles de Sévigné was by this time twenty years old, but he had no doubt already learnt that he was not the person of chief importance in the family. He never, throughout his life, appears to have resented his mother's preference of his sister, but, though thoroughly amiable, he was not (at any rate in his youth) a model character. Nothing is known of his education, but just before his sister's marriage he volunteered for a rather hairbrained

expedition to Crete against the Turks, and served with credit. Then his mother bought him the commission of *goujon* (a kind of sub-cornet) in the Gendarmes Dauphin, in which regiment he served for some years, and after long complaining of the slowness of promotion rather rapidly rose to the rank of captain, when he sold out. But though he always fought well he was not an enthusiastic soldier, and was constantly and not often fortunately in love. He followed his father into the nets of Ninon de l'Enclos, and was Racine's rival with Mademoiselle Champmeslé. The way in which his mother was made confidente of these discreditable and not very successful loves is characteristic both of the time and of the country. In 1669 M. de Grignan, who had previously been lieutenant-governor of Languedoc, was transferred to Provence. The governor-in-chief was the young duke of Vendôme. But at this time he was a boy, and he never really took up the government, so that Grignan for more than forty years was in effect viceroy of this important province. His wife rejoiced greatly in the part of vice-queen, but their peculiar situation threw on them the expenses without the emoluments of the office, and those expenses were increased by the extravagance of both, so that the Grignan money affairs hold a larger place in Madame de Sévigné's letters than might perhaps be wished.

In 1671 Madame de Sévigné with her son paid a visit to Les Rochers, which is memorable in her history and in literature. The states of Brittany were convoked that year at Vitré. This town being in the immediate neighbourhood of Les Rochers, Madame de Sévigné's usually quiet life at her country house was diversified by the necessity of entertaining the governor, the Duc de Chaulnes, of appearing at his receptions, and so forth. All these matters are duly consigned to record in her letters, together with much good-natured railery (it must be admitted that it is sometimes almost on the verge of being ill-natured, though never quite over it) on the country ladies of the neighbourhood and their ways. She remained at Les Rochers during the whole summer and autumn of 1671, and did not return to Paris till late in November. The country news is then succeeded by news of the court. At the end of the next year, 1672, one great wish of her heart was gratified by paying a visit to her daughter in her vice-royalty of Provence. Madame de Grignan does not seem to have been very anxious for this visit,—perhaps because, as the letters show in many cases, the exacting affection of her mother was somewhat too strong for her own colder nature, perhaps because she feared such a witness of the ruminous extravagance which characterized the Grignan household. But her mother remained with her for nearly a year, and did not return to Paris till the end of 1673. During this time we have (as is usually the case during these Provençal visits and the visits of Madame de Grignan to Paris) some letters addressed to Madame de Sévigné, but comparatively few from her. A visit of the second class was the chief event of 1674, and the references to this, such as they are, is the chief evidence that mother and daughter were on the whole better apart. 1675 brought with it the death of Turenne (of which Madame de Sévigné has given a very noteworthy account, characteristic of her more ambitious but not perhaps her more successful manner), and also serious disturbances in Brittany. Notwithstanding these it was necessary for Madame de Sévigné to make her periodical visit to Les Rochers. She reached the house in safety, and the friendship of Chaulnes protected her both from violence and from the exactions which the miserable province underwent as a punishment for its resistance to excessive and unconstitutional taxation. No small part of her letters is occupied by these affairs.

The year 1676 saw several things important in Madame de Sévigné's life. For the first time she was seriously ill,—it would appear with rheumatic fever,—and she did not thoroughly recover till she had visited Vichy. Her letters from this place are among her very best, and picture life at a 17th-century watering-place with unsurpassed vividness. In this year, too, took place the trial and execution of Madame de Brinvilliers. This event figures in the letters, and the references to it are among those which have given occasion to unfavourable comments on Madame de Sévigné's character—comments which, with others of the kind, will be more conveniently treated together. In the next year, 1677, she moved into the Hôtel Carnavalet, a house which still remains and is inseparably connected with her memory, and she had the pleasure of welcoming the whole Grignan family to it. They remained there a long time, indeed nearly two years seem to have been spent by Madame de Grignan partly in Paris and partly at Livry. The return to Provence took place in October 1678, and next year Madame de Sévigné had the grief of losing La Rochefoucauld, the most eminent and one of the most intimate of her close personal friends and constant associates. In 1680 she again visited Brittany, but the close of that year saw her back in Paris to receive another and even longer visit from her daughter, who remained in Paris for four years. Before the end of the last year of this stay (in February 1684) Charles de Sévigné, after all his wandering loves, and after more than one talked-of alliance, was married to a young Breton lady, Jeannette Marguerite de Maugon, who had a considerable fortune. In the arrangements for this marriage Madame de Sévigné practically divided all her fortune between her children (Madame de Grignan of course receiving an unduly large share), and reserved only part of the life interest. The greed of Madame de Grignan nearly broke her brother's marriage, but it was finally concluded and proved a very happy one in a somewhat singular fashion. Both Sévigné and his wife became deeply religious, and at first Madame de Sévigné found their household (for she gave up Les Rochers to them) not at all lively. But by degrees she grew fond of her daughter-in-law. During this year she spent a considerable time in Brittany, first on business, afterwards on a visit to her son, and partly it would appear for motives of economy. But Madame de Grignan still continued with only short absences to inhabit Paris, and the mother and daughter were practically in each other's company until 1688. The proportion of letters therefore that we have for the decade 1677–1687 is much smaller than that which represents the decade preceding it, indeed the earlier period contains the great bulk of the whole correspondence. In 1687 the Abbé de Coulanges, Madame de Sévigné's uncle and good angel, died, and in the following year the whole family were greatly excited by the first campaign of the young Marquis de Grignan, Madame de Grignan's only son, who was sent splendidly equipped to the siege of Philippsbourg. In the same year Madame de Sévigné was present at the St Cyr performance of *Esther*, and some of her most amusing descriptions of court ceremonies and experiences date from this time. 1689 and 1690 were almost entirely spent by her at Les Rochers with her son; and on leaving him she went across France to Provence. There was some excitement during her Breton stay, owing to the rumour of an English descent, on which occasion the Breton militia was called out, and Charles de Sévigné appeared for the last time as a soldier; but it came to nothing. 1691 was passed at Grignan and other places in the south, but at the end of it Madame de Sévigné returned to Paris, bringing the Grignans with her; and her daughter stayed with her till 1694. The

year 1693 saw the loss of two of her oldest friends,—Bussy Rabutin, her faithless and troublesome but in his own way affectionate cousin, and Madame de la Fayette, her lifelong companion, and on the whole perhaps her best and wisest friend. Another friend almost as intimate, Madame de Lavardin, followed in 1694. Madame de Sévigné spent but a few months in this latter year alone, and followed her daughter to Provence. She never revisited Brittany after 1691. Two important marriages with their preparations occupied most of her thoughts during 1694-1695. The young Marquis de Grignan married the daughter of Saint-Amant, an immensely rich financier, but his mother's pride, ill-nature, and bad taste (she is said to have remarked in full court that it was necessary now and then to "manure the best lands," referring to Saint-Amant's wealth, low birth, and the Grignan's nobility) made the marriage not a very happy one. His sister Pauline, who, in the impossibility of dowering her richly, had a narrow escape of the cloister, made a marriage of affection with M. de Simiane, and eventually became the sole representative and continuator of the families of Grignan and Sévigné.

Madame de Sévigné survived these alliances but a very short time. During an illness of her daughter she herself was attacked by smallpox in April 1696, and she died on the 17th of that month at Grignan, and was buried there. Her idolized daughter was not present during any time of her illness; it has been charitably hoped that she was too ill herself. Her known attention to her own good looks, and the terror of the smallpox which then prevailed, supply perhaps a less charitable but sufficient explanation. But in her will Madame de Sévigné still showed her preference for this not too grateful child, and Charles de Sévigné accepted his mother's wishes in a letter showing the good nature which he had never lacked, and the good sense which, after his early follies, and even in a way during them, he had also shown. But the two families were, except as has been said for Madame de Simiane and her posterity, to be rapidly broken up. Charles de Sévigné and his wife had no children, and he himself, after occupying some public posts (he was king's lieutenant in Brittany in 1697), went with his wife into religious retirement at Paris in 1703, and after a time sequestered himself still more in the seminary of Sainte-Magloire, where he died on March 28, 1713. His widow survived him twenty years. Madame de Grignan had died on August 16, 1705, at a country house near Marseilles, of the very disease which she had tried to escape by not visiting her dying mother. Her son, who had fought at Blenheim, had died of the same malady at Thionville the year before. Marie Blanche, her eldest daughter, was in a convent, and, as all the Comte de Grignan's brothers had either entered the church or died unmarried, the family, already bankrupt in fortune, was extinguished in the male line by Grignan's own death in 1714, at a very great age. Madame de Simiane, whose connexion with the history of the letters is important, died in 1737.

The chief subjects of public interest and the principal family events of importance which are noticed in the letters of Madame de Sévigné have been indicated already. But, as will readily be understood, neither the whole nor even the chief interest of her correspondence is confined to such things. In the latest edition the letters extend to sixteen or seventeen hundred, of which, however, a considerable number (perhaps a third) are replies of other persons or letters addressed to her, or letters of her family and friends having more or less connexion with the subjects of her correspondence. As a rule her own letters, especially those to her daughter, are of great length. Writing as she did in a time when newspapers were not, or at least were scanty and jejune, gossip of all sorts awoke among her subjects, and some of her most famous letters are pure *reportage* (to use a modern French slang term), while others deal with strictly private subjects. Thus one of her best known pieces has for subject the famous suicide of the great

cook Vatel owing to a misunderstanding as to the provision of fish for an entertainment given to the king by Condé at Chantilly. Another (one of the most characteristic of all) deals with the projected marriage of Lauzun and Mademoiselle de Montpensier, another with the refusal of one of her own footmen to turn highway-maker when it was important to get the cop in at Les Rochers, another with the fire which burnt out her neighbour's house in Paris. At one moment she tells how a forward lady of honour was disconcerted in offering certain services at Mademoiselle's levée, at another how ill a couther's clothes became him. She enters, as has been said, at great length into the pecuniary difficulties of her daughter, she tells the most extraordinary stories of the fashion in which Charles de Sévigné loved his wild oats, she takes an almost ferocious interest and side in her daughter's quarrels with rival beauties or great officials in Provence who throw difficulties in the way of government.

Almost all writers of literary letters since Madame de Sévigné's days, or rather since the publication of her correspondence, have imitated her more or less directly, more or less consciously, and it is therefore only by applying that historic estimate upon which it is therefore only by applying that historic estimate upon which the all time criticism rests, that her full value can be discerned. The charm of her work is, however, so irresistible that, read even without any historical knowledge and in the comparatively adulterated editions in which it is generally met with, that charm can hardly be missed. Madame de Sévigné was a member of the strong and original group of writers—Retz, La Rochefoucauld, Cornélie, Pascal, St Evremont, Descartes, and the rest—who escaped the fatal and weakening reforms of the later 17th century, who for the most part in the natural expression of their genius, whether for the most part in the classicism of the *Pièdes* and the imitation of Spanish and Italian which marked some early work of Louis XIII.'s time. According to the strictest standard of the Academy her phraseology is sometimes incorrect, and it occasionally shows traces of the quaint and affected style of the *Poésies*, but these things only add to its savour and piquancy. In lively narration few writers have excelled her, and in the natural expression of affection and maternal affection none. She had an all-absorbing eye for trifles and the keenest possible appreciation of the ludicrous, together with a hearty relish for all sorts of amusements, pageants, and diversions, and a deep though not volatile or over-sensitive sense of the beauties of nature. But with all this she had an understanding as solid as her temper was gay. Unlike her daughter she was not a professed blue-stocking or philosopher. But she had a strong affection for theology, in which she inclined (like the great majority of the religious and intelligent laity of her time in France) to the Jansenist side. Her favourite author in this class was Nicole. She has been reproached with her fondness for the romances of Mlle de Scudéry and the rest of her school. But probably many persons who make that reproach have themselves never read the works they depise and are ignorant of how much good there is in books whose chief faults are that they are written in a strongly marked and now obsolete fashion, and that their length (which, however, scarcely if at all exceeds that of *Clarissa*) is preposterous. In purely literary criticism Madame de Sévigné, few as were the mis she gave herself, was no mean expert. Her preference for Cornélie over Racine has much more in it than the fact that the elder poet had been her favourite before the younger began to write; and her remarks on Le Fontaine and some other authors are both judicious and independent. Nor is she wanting in original judgements of no ordinary merit. All these things, added to her abundance of amusing matter and the charm of her bright and ceaselessly flowing style, fully account for the unchanged and undiminished delight which half a dozen generations have taken in her work. But it cannot be repeated too often that to enjoy such easy style and yet to find in it all the marks of philosophy—it must be read as she wrote it, and not in the trimmed and corrected version of Perrin and Madame de Simiane.

There can, moreover, be no one, however well-to-do it may be to the plan of criticizing literature as literature, who will not admit that great part of the interest and value of these remarkable works lies in the picture of character which they present. Indeed, great part of their purely literary merit lies in the extraordinary vividness of this very presentation. Madame de Sévigné's character, however, has not united quite such a unanimity of suffrages as her ability in writing. In her own time there were not wanting enemies (indeed her unsparring partisanship on her daughter's side could not fail to provoke such) who maintained that her letters were written for effect, and that her affection for her daughter was ostentatious and unreal. But few modern critics have followed these detracers, and it may be said confidently that no competent judge of character, after patiently reading the letters, can for a moment admit their view. But this kind of enemy has been followed by another, who, not overlooking his mark so conspicuously, has been somewhat more successful in persuading spectators that he has hit it. Her excessive affection for Madame de Grignan (the almost unimportant character of which seems to

be pined by her own confessions of unhappiness if not of quarrel when they were together), her unhesitating blindness to anything but her daughter's interest (manifested especially in the part she took in most unjustifiable attempts of Madame deignan to secure her stepdaughters' dowries and to force themselves into a convent), her enlivening tolerance of her son's youthful follies on the one hand and the uneven balance which she held in money matters between him and his sister on the other, the apparent levity with which she speaks of the sufferings of Madame de Brinvilliers, of galley slaves, of the peasantry, &c., and the freedom of language which she uses herself and tolerates from others,—have all been cast up against her. Here the before-mentioned historic estimate sufficiently disposes of some of the objections, but the common sense of others, and a very little charity of the rest. If too much love felt by a mother towards a daughter be a fault, then certainly Madame de Sévigné was one of the most offending souls that ever lived, but it will hardly, even with the injustice which like all excessive affection it brought in its train, be held damning. Indeed, the guilty lady was evidently quite aware of her weakness in this respect, and it is one of the most noteworthy things of her literary capacity that, excessive as the weakness is, it does not disgust or weary the reader. The singular confidences which Madame de Sévigné received from her son and transmitted to her daughter would even at the present day be less surprising in France than in England. They are only an instance, adjusted to the manners of the time, of the system of sacrificing everything to the maintenance of confidence between mother and son, to which the almost inviolable, and to some extent sacred, bond of duty is certainly not unnamable, adoration of Frenchmen for their mothers is due. Here too, as well as in reference to the immediately kindred charge of crudity of language, and to that of want of sympathy with suffering, especially with the sufferings of the people, it is especially necessary to remember of what generation Madame de Sévigné was and what were her circumstances. That generation was the generation which Madame de Ranke had endeavoured with some success to polish and humanize, but which had but barely recovered the hardening influences of the religious and civil wars when it was plunged into the Fronde. It was the generation to which belong the almost incredible yet trustworthy *Historiettes* of Tallemant, and in which, when she herself had already reached middle life, Bussy Rabutin's *Histoire Amoureuse* exposed him indeed to powerful resentments but did not make him lose all caste as a gentleman. It is not to be expected that in such a generation a time and in private letters the delicacy proper to quite different times and circumstances. Moreover, as to the charge of inhumanity not only do these considerations apply but there is more to be pleaded than mere extenuating circumstances. It is not true that Madame de Sévigné shows no sympathy with the oppression of the Bretons, it is very far from true, though her invariable habit of humorous expression—of *Rabouinisme*, as she says—makes her occasionally use light phrases. But the matter is, that in fact as unmeasurable to expect modern political views from her (and it is from certain modern political standpoints that the charge is usually made) as it is to expect her to observe the canons of a 19th-century propriety. On the whole she may be as fairly and confidently acquitted of any moral fault, save the one peccadillo of loving her daughter too exclusively and blindly, as she may be acquitted of all literary faults whatsoever. Her letters are wholly, what her son-in-law said well of her after her death, *ouïssantes de bon sens*, and, far from faultless as Madame deignan was, none of her faults is more felt by the reader than her long visits to her mother, during which the letters ceased.

The bibliographic history of Madame de Sévigné's letters is of considerable interest in itself, and is moreover typical of much other contemporary literary history. The 17th century was *par excellence* the century of the widely-circulated literature, and from Madame de Sévigné herself we know that her own letters were copied and handed about, sometimes under special titles, as early as 1678. None of them, however, were published until her correspondence with Bussy Rabutin appeared, in his *Mémoires et Correspondance*, partly in the year of her death, partly next year. The remainder were not printed in any form for thirty years. Then between 1725 and 1728 appeared no less than seven unauthorized editions, containing more or fewer letters, and some of the copies which had been circulated privately. The bibliography of these is complicated and curious, and must be sought in special works (see especially the *Grande Encyclopédie* edition, vol. xi.). They have, however, abiding interest chiefly because they stung up Madame de Simiane, the writer's only living representative, to give an authorized version. This appeared under the care of the Chevalier de Fernin in 6 vols. (Paris, 1784-87). It contained only the letters to Madame deignan and these were subjected to cutting rather careful than conscientious, the results of which were never thoroughly removed until quite recently. In the first place, Madame de Simiane, who possessed her mother's replies, is said to have burnt the whole of these from religious motives, this phrase is explained by Madame de Grignan's Cartesianism, which is

supposed to have led her to expressions alarming to orthodoxy. In the second, scruples partly having to do with the susceptibilities of living persons, partly concerning Jansenist and other piqueuses, made her mist on numerous omissions. Thirdly, and most unfortunately, the change of taste seems to have required still more numerous alterations of style and language, such as the substitution of "Ma Fille" for Madame de Sévigné's usual and charming "Ma Bonne," and many others. Perrin followed this edition up in 1781 with a volume of supplementary letters not addressed to Madame deignan, and in 1784 published his last edition of the whole, which was long the standard (8 vols., Paris). During the last half of the 18th century numerous editions of the whole or parts important additions with important additions, such as that of 1758, giving for the first time the letters to Pomponne on the Fouquet trial, that of 1778, giving letters to Monclau, that of 1775, giving for the first time the Bussy letters separate from his memoirs, &c. An important collected edition of all these fragments, by the Abbé de Vauxcelles, appeared in 1801 (Paris, An IX.) in 10 vols., five years later Gouffier (Paris, 1806, 8 vols.) introduced the improvement of chronological order, this was reprinted in 12 vols. (Paris, 1810) with some new unpublished letters which had separately appeared meanwhile. In the same year appeared the first edition of M. de Monmerqué. From that date continual additions of unpublished letters were made, in great part by the same editor, and at last the whole was remodelled on manuscript copies (the originals unfortunately are available for but few) in the edition called *Des Grands Écrivains*, which M. de Monmerqué began, but which owing to his death was finished by M. de Sacy. This edition, published by Sommer (Paris, 1832-1838). This, which entirely supersedes all others (even a handsome edition published during its appearance by M. Silvestre de Sacy), consists of twelve volumes of text, notes, &c., two volumes of lexicon, and an album of plates. It contains all the published letters to and from Madame de Sévigné, with the replies where they exist, with all those letters to and from Madame de Simiane (many of which had been added to the main body) that contain any interest. The sole fault to be found with this excellent edition is the omission to add to each volume a table of contents giving each letter as it comes with a brief abstract of its contents. To it, however, must be added two volumes (printed uniformly of *Lettres Indites*, published by M. Ch. Capmas in 1876 and containing numerous variants and additions from a MS copy discovered in an old curiosity shop at Dijon). Of less elaborate character are the editions that in the collection *Dix-huitième* (4 vols., Paris, 1871) is by far the best, though, in common with all others except the *Grande Encyclopédie* edition, it contains an adulterated text.

Works on Madame de Sévigné are innumerable. The biography by Paul Meunier is nearly exhaustive, but the most elaborate biographical book is that of Valentin (3rd ed., Paris, 1856, 8 vols.), to which should be added the remarkable *Madame de Sévigné et de son temps* (Paris, 1871, 2 vols.). In English an excellent little book by Miss Thackeray (*Miss Arden*), Edinburgh and London, 1881, may be recommended. Most of the editions have portraits and a few.

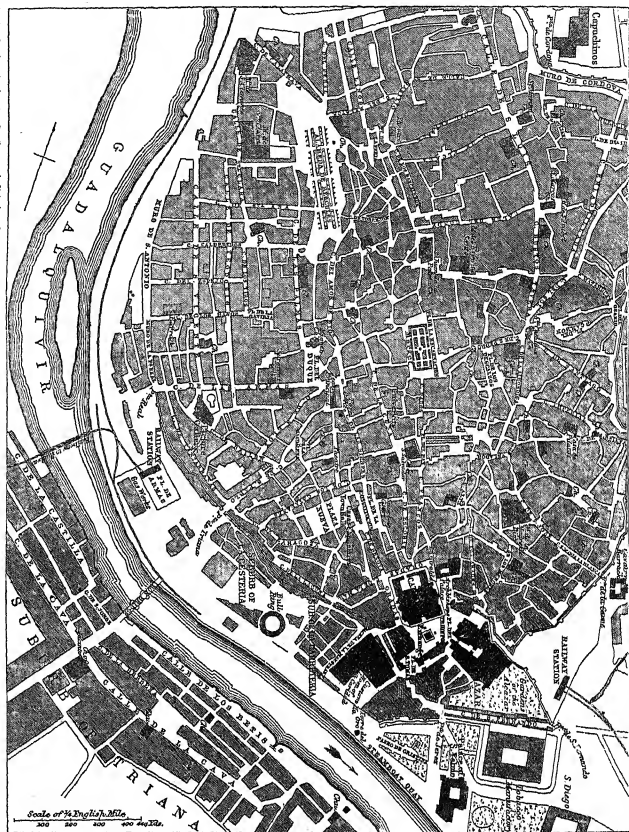

SEVILLE, a Spanish province—one of the eight into which Andalusia is divided—and formerly one of the four Moorish kingdoms, is bounded on the S by Málaga and Cadiz, on the W by Huelva, on the N by Badajoz, and on the E by Cordova. The superficial area is 5429 square miles, and in 1877 the population numbered 505,291. Northwards the province is broken up by low spurs of the Sierra Morena, the summits of which in the extreme north rise to a considerable height, but in the southern and larger half the ground is flat and fertile, and the only mountainous part is the frontier line formed by the Sierra de Ronda. The Guadalquivir traverses the province from north-east to south-west and receives in its course the waters of several streams, the chief being the Genil and the Guadara on the left, and the Guadalmar to the right. The province is one of the most productive and flourishing in Spain, and grows all kinds of grain and vegetables. Oil and wine, oranges and olives, are among its chief exports, while tobacco, leather, paper, spirits, chocolate, textile fabrics of silk and wool, soap, glass, and earthenware are amongst its manufactures. Sheep and oxen, horses and asses, are reared on its pastures, and in the mountainous districts there are copper, silver, lead, iron, coal, and salt mines, and quarries of chalk and marble. Commerce has made great strides of late years owing to the opening up of the country by railways, and foreign capital has developed the natural resources of the district. The province is divided for administrative purposes into fourteen *partidos judiciales* and ninety-eight *ayuntamientos*,

and is represented in the cortes by four senators and twelve deputies. The following towns have a population of more than 10,000 within the municipal boundaries:—Seville (see below), Carmona (17,426), Constantina (10,988), Ecija (24,955), Lebrija (12,864), Marchena (13,768), Moron de la Frontera (14,879), Osuna (17,211), and Utrera (15,093).

SEVILLE (Span. *Sevilla*, Latin *Isipalis*, Arabic *Ishbīlīya*), capital of the above province and the seat of an archbishopric, with a population of 133,938 in 1877, is

situated in $37^{\circ} 22' N.$ lat. and $5^{\circ} 58' W.$ long., 62 miles (95 by rail) north-north-east of Cadiz and 355 miles south-south-west of Madrid, on the left bank of the Guadalquivir, which here flows through a level country as productive as a garden. The river is navigable up to the city, which is highly picturesque in its combination of ancient buildings with busy commerce. From the earliest times the port has been a chief outlet for the wealth of Spain. Under the Romans the city was made the capital of Bætica, and became a favourite resort for wealthy Romans. The emperors Hadrian, Trajan, and Theodosius were born in the neighbourhood at Italica (now Santiponce) where are the remains of a considerable amphitheatre. The chief existing monument of the Romans in Seville itself is the aqueduct, on four hundred and ten arches, by which the water from Aloá de Guadaira continued until recently to be supplied to the town. At the beginning of the 5th century the Silingi Vandals made Seville the seat of their empire, until it passed in 531 under the Goths, who chose Toledo for their capital. After the defeat of Don Roderick at Guadalete in 712 the Arabs took possession of the city after a siege of some months. Under the Arabs Seville continued to flourish. Edrisi speaks in particular of its great export trade in the oil of Aljarafe. The district was in great part occupied by Syrian Arabs from Emesa, part of the troops that entered Spain with Balj in 741 at the time of the revolt of the Berbers. It was a scion of one of these Emesani families, Abū 'I-Kāsim Mohammed, cadí of Seville, who on the fall of the Spanish caliphate headed the revolt of his townsmen against their Berber masters (1023) and became the founder of the Abbāsid dynasty, of which Seville was capital, and which lasted under his son Mo'tamid (1042–1069) and grandson Mo'tamid (1069–1091) till the city was taken by the

Almoravids. The later years of the Almoravid rule were very oppressive to the Moslems of Spain; in 1133 the people of Seville were prepared to welcome the victorious arms of Alfonso VII., and eleven years later Andalusia broke out in general rebellion. Almohade troops now passed over into Spain and took Seville in 1147. Under the Almohades Seville was the seat of government and enjoyed great prosperity; the great mosque was commenced by Yūsuf I. and completed by his son the famous Almanzor. In the decline of the dynasty between 1228

Plan of Seville.

and 1248 Seville underwent various revolutions, and ultimately acknowledged the Hafsīte prince, who, however, was unable to save the city from Ferdinand III., who restored it to Christendom in 1248. The aspect of the town even now is essentially Moorish, with its narrow tortuous streets and fine inner court-yards to the houses. Many of these date from before the Christian conquest, and the walls and towers which until recently encircled the city for a length of 5 miles have a similar origin. The victory of

Ferdinand brought temporary ruin on the city, for it is said that 400,000 of the inhabitants went into voluntary exile, and some time elapsed before Seville recovered from the loss. But its position was too favourable for trade for it to fall into permanent decay, and by the 15th century it was again in a position to derive full benefit from the discovery of America. After the reign of Philip II its prosperity gradually waned with that of the rest of the Peninsula, yet even in 1700 its silk factories gave employment to thousands of work-people; then numbers, however, by the end of the 18th century had fallen to four hundred. In 1800 an outbreak of yellow fever carried off 30,000 of the inhabitants, and in 1810 the city suffered severely from the French under Soult, who plundered to the extent of six millions sterling. Since that time it has gradually recovered prosperity, and is now one of the most busy and active centres of trade in the peninsula. Politically Seville has always had the reputation of peculiar loyalty to the throne from the time when, on the death of Ferdinand III, it was the only city which remained faithful to his son Alphonso the Wise. It was consequently much favoured by the monarchs, and frequently a seat of the court. In 1729 the treaty between England, France, and Spain was signed in the city, in 1808 the central junta was formed here and removed in 1810 to Cadiz, in 1823 the cortes brought the king with them from Madrid; and in 1848 Seville combined with Malaga and Granada against Espartero, who bombarded the city but fled on the return of Queen Maria Christina to Madrid.

Seville contains treasures of art and architecture which make it one of the most interesting cities in Europe. The cathedral, dedicated to Santa Maria de la Sede, ranks in size only after St Peter's at Rome, being 415 feet long, 165 feet wide, and 150 feet high to the roof of the nave. The west front is approached by a high flight of steps, and the platform on which the cathedral stands is surrounded by a hundred shafts of columns from the mosque which formerly occupied the site. The work of building began in 1403 and was finished in 1510, so that the one style of Spanish Pointed Gothic is fully preserved throughout the interior, however much the exterior is spoiled by later additions. Unfortunately the west front remained unfinished until 1827, when the central doorway was completed in a very inferior manner; but this has now been renewed in a purer style. At the east end are two fine Gothic doorways with good sculpture in the tympana, and on the north side the Puerta del Perdón, as it is called, has some very exquisite detail over the horse-shoe arch, and a pair of fine bronze doors. The exterior of the cathedral may be disappointing, but the interior leaves little to be desired. It forms a parallelogram containing a nave and four aisles with surrounding chapels, a central dome 171 feet high inside, and at the east end a royal sepulchral chapel, which was an addition of the 16th century. The thirty-two immense clustered columns, the ninety-three windows, mostly filled with the finest glass by Flemish artists of the 16th century, and the profusion of art work of various kinds displayed on all sides produce an unusual effect of magnificence and grandeur. The interior is an enormous Gothic work containing forty-four panels of gilt and coloured wood carvings by Doncett, dating from 1482, and a silver statue of the Virgin by Francisco Alfaro of 1596. The archbishop's throne and the choir-stalls (1475-1548) are fine pieces of carving, and amongst the notable metal-work are the railings (1619) by Sanchez Nunez, and the lectern by Bartolomé Meil of the same period. The bronze candelabrum for tenebræ, 25 feet in height, is a splendid work of metal in the Sacristia Alta. The archbishop's reliquary presented by Alphonso the Wise in the 13th century, and in the Sacristia Mayor, which is a good plateresque addition by Diego de Riaño in 1580, is a magnificent collection of church plate and vestments. At the west end of the nave is the grave of Ferdinand, the son of Columbus, and at the east end, in the royal chapel, lies the body of St Ferdinand, which is exposed three times in the year. This chapel also contains a curious life-size image of the Virgin, which was presented to the royal saint by St Louis of France in the 13th century. It is in carved wood with movable arms, seated on a silver throne and with hair of spun gold. The chief pictures in the cathedral are the Guardian Angel and the St Anthony of Murillo, the Holy Family of Tobar, the Nativity and La Generación of Luis de Vargas, Valdés Leal's Marriage of the Virgin, and Guadalupe's Descent from the Cross. In the Sacristia Alta are

three fine paintings by Alexo Fernandez, and in the Sala Capitular are a Conception by Murillo and a St Ferdinand by Pacheco. The organ is one of the largest in the world, it contains over 5300 pipes. A curious and unique ritual is observed by the choir boys on the festival of Corpus Christi and the Immaculate Conception, — a solemn dance with castanets, being performed by them before the altar, the custom is an old one but its origin is obscure. The Sagrario on the north of the cathedral is a Renaissance addition by Miguel de Zumaiaga, which serves as the parish church. At the north-east corner of the cathedral stands the Giralda, a bell tower of Moorish origin, 275 feet in height. The lower part of the tower, of about 185 feet, was built in the latter half of the 12th century by the Emir Yusuf Yaqub, and the upper part, the bell tower, which is surmounted by a vast, formed of a bronze figure 14 feet high representing The Earth, were added by Fernando Ruiz in 1568. The ascent is made by a series of inclined planes. The exterior is encased with delicate Moorish detail, and the tower is altogether the finest specimen of its kind in Europe. At the base lies the Court of Oranges, of which only two aisles now remain, the original Moorish fountain, however, is still preserved. But the chief relic of the Arab dominion in Seville is the Alcazar, a palace excellent in interest and beauty only by the Alhambra of Granada. It was begun in 1181 by Jalubi during the best period of the Almohads, and was surrounded by walls and towers of which the Torre del Oro, a decagonal tower on the river side, is now the principal survival. Pedro the Cruel made considerable alterations and additions in the 14th century, and worse havoc was afterwards wrought by the Catholic Kings. In the reign of Charles V, as far as possible, and the palace is now an extremely beautiful example of Moorish work. The facade, the hall of ambassadors, and the Patio de las Muñecas are the most striking portions, after which may be ranked the Patio de las Doncellas and the chapel of Isabella. Among other Moorish remains in Seville may be mentioned the Casa O'Shea, which is somewhat spoiled by whitewash, and the Casa de las Dugias, with eleven court-yards and nine fountains. The Casa de Platos is in a pseudo-Moorish style of the 15th century, and, in addition to its elegant court-yard surrounded by a marble colonnade, contains some fine decorative work. The Casa de los Abades is in the Sevillian plateresque style, which is strongly tinged with Moorish feeling. The following are the most notable churches in Seville — Santa Maria la Blanca, an old Jewish synagogue, San Juan de los Rios, badly restored, but with a remarkable mosaic floor; Santa Catalina, in San Francisco, an excellent example of the temple, San Juan de la Palma, San Julian, Santa Catalina; San Miguel, San Clemente el Real, the church of La Sangre Hospital, the Gothic Parroquia of Santa Ana, in the Triana suburb, and La Cañada. The last-named belongs to a well-conducted almshouse founded by the Sevillian Don Juan, Miguel de Maná. It possesses six masterpieces by Murillo, and two by Valdés Leal. The other churches, though generally defective in architecture, are enriched by the products of the brush or chisel of Pacheco, Montañes, Alonso Cano, Valdés Leal, Rocas, Campaña, Morales, Vargas, and Zurbaran. The museum was formerly the church and convent of La Merced. It now contains priceless examples of the Sevillian school of painting, which flourished during the 16th and 17th centuries. Among the masters represented are Velazquez and Murillo. (Both natives of Seville), Zurbaran, Rocas, Herrera, the Elder, Pacheco, Juan de Castillejo, Alonso Cano, Céspedes, Bodegna, Valdés Leal, Goya, and Martín de Vos. The university was founded in 1502, and its present buildings were originally a convent built in 1507 from designs by Herrera, but devoted to its present use in 1767 on the expulsion of the Jesuits. The Casa del Ayuntamiento, in the cinquecento style, was begun in 1546, and has a fine staircase and hall and immense carved doors. The Hospicio, an orphanage, was built by Herrera in 1640, has a wide dome and Ionic style, the brown and red marble staircase which leads to the Archivo de Indias is the best part of the design. The archives contain 30,000 volumes relating to the voyages of Spanish discoverers, many of which are still unexamined. The archbishop's palace dates from 1697, the most notable features are the Churrigueresque doorway and staircase. The royal cigar factory is an immense building 662 feet long by 524 feet wide, and contains twenty-eight courts. Employment is given to 1,400 hands, who work up 2,600,000 pounds of tobacco yearly. The palace of San Telmo, now occupied by the duke of Montpensier, was formerly the seat of a naval college originally founded by the son of Columbus. The immense doorway is the principal architectural feature. The picture gallery is interesting and important. The chief squares in Seville are the Plaza Nueva, the Plaza del Constitucion, the Plaza del Duque, and the Plaza del Triunfo. The bull-ring accommodates 18,000 spectators, and is the next in size to that at Madrid. There are several beautiful promenades, the principal being Las Delicias, along the river bank below the town. The city also contains several theatres. Across the river, and connected with the city by a bridge, is the Gipsy quarter of the Triana. The navigation of the river has been improved of late years so that vessels of large draught can now ascend the stream. The results are shown in a large trade, and in

1883 the aggregate burthen of vessels cleared amounted to 353,541 tons (65,324 British). The imports were valued at £1,879,522, and the exports at £1,190,625. In the latter were included 3110 tons of olive oil shipped to the United Kingdom, and 1610 tons of quicksilver from the Almaden mines, which had formerly sent their produce *via* Lisbon. In addition to strictly local industries the chief factories of the city are the tobacco factory, the cannon foundry, and the small-arms works. There are also a petroleum refinery, some soap works, non foundries, artificial ice and marmalade factories, and several potteries. The ancient sources of water supply having proved insufficient, a new system of water-works was designed, and was brought to a successful completion in 1853 by a firm of English engineers. (H B R.)

SEVRES, a town of France, in the department of Seine-et-Oise, on the left bank of the Seine, midway between Paris and Versailles, with a population of 6768 in 1881, owes its celebrity to the Government porcelain manufactory, which dates from 1766. In 1876 a new building was erected at the end of the park of St Cloud to replace the older structures, which were in a dangerous state, but have since been transformed into a normal school for girls. In the museum connected with the works are preserved specimens of the different kinds of ware manufactured in all ages and countries, and the whole series of models employed at Sevres from the commencement of the manufacture, for an account of which see vol xix pp 637-38. A technical school of mosaic was established at Sevres in 1875.

SEVRES, DEUX, a department of western France, formed in 1790 mainly of the districts of Thouars, Gâtinais, and Niortais, which constituted about one-fourth of Poitou, and to a small extent of a portion of Basse-Saintonge and Angoumois, and a very small fragment of Aunis. It derives its name from the Sèvre of Niort, which flows across the south of the department from east to west, and the Sèvre of Nantes, which drains the north-west. Lying between 45° 58' and 47° 7' N. lat. and between 0° 56' W. and 0° 13' E. long, it is bounded (for the most part conventionally) N. by Maine-et-Loire, E. by Vienne, S.E. by Charente, S. by Lower Charente, and W. by La Vendée. Part belongs to the basin of the Loire, part to that of the Sèvres of Niort, and part to that of the Charente. There are three regions,—the Gâtinais, the "Plain," and the "Marsh,"—distinguished by their geological character and their general physical appearance. The Gâtinais, formed of primitive rocks (granite and schists), is the continuation of the "Bocage" of La Vendée and Maine-et-Loire. It is a poor district with an irregular surface, covered with hedges and clumps of wood or forests. The Plain, resting on Oolitic limestone or the "white rock" (*Pierre blanche*), is a fertile grain country. The Marsh, occupying only a small part of the department to the south-west, consists of alluvial clays which also are extremely productive when properly drained. The highest point in the department (892 feet above the sea) is to the east of Parthenay; the lowest lies only 10 feet above sea-level. The climate is mild, the annual temperature at Niort being 54° Fahr., and the rainfall a little more than 24 inches. The winters are colder in the Gâtinais, the summers warmer in the Plain; and the Marsh is the moistest and mildest of the three districts.

With a total area of 1,482,655 acres, the department contains 1,048,752 acres of arable ground, 125,534 acres of meadows, 49,129 of vineyards, 100,229 of forests, 20,429 of heath. The live stock in 1880 comprised 36,150 horses, 12,500 mules, 2012 asses, 217,935 cattle, 13,405 sheep (wool clip 102 tons) 73,930 pigs, 60,321 goats, 13,845 beehives (55 tons of honey). The horses are a strong breed, and the department raises mules for Spain, the Alps, Auvergne, and Provence. In 1883 there were produced—wheat, 3,909,260 bushels, meslin, 466,900; rye, 678,920; and in 1880 barley 260,129, 1,293,600 bushels of buckwheat, 138,650; maize and millet, 508,062; oats, 2,744,500; potatoes, 4,312,000; pulse, 192,500 bushels; beetroot, 123,429 tons; hemp, 945 tons; flax, 245 tons; colza seed, 75,900 bushels (640 tons of oil). The wine and cider

amounted in 1882 to 2,859,912 and 210,914 gallons respectively. Vegetables (artichokes, asparagus, cabbage, pease, onions) are largely cultivated. Oaks, chestnuts, and beeches are the most important trees. The apple trees of the Gâtinais and the walnut-trees of the Plain are also of considerable value. Coal (200 mines, and 21,467 tons in 1882) and peat are worked, iron-ore, argentiferous lead, and antimony exist but are not worked, and flintstone, both hard and soft, is very extensively quarried. There are several sulphurous mineral waters in the department. The most important industry is the manufacture of cloth—serges, druggets, linen, handkerchiefs, flannels, swan-skins, and knitted goods. Wool and cotton spinning, tanning, and currying, glove, brush, and hat making, distilling, brewing, flour-milling, and oil-refining are also carried on. In 740 establishments water-power is used to the extent of 3600 horse-power, and 301 stationary and 165 movable steam-engines represent respectively 185 and 677 horse-power. The commerce of the department, which supplies mules, cattle, and provisions for Paris and the neighbouring great towns, is facilitated by 21 miles of waterway (the Sèvre and its left-hand tributary the Maynon), 289 miles of national roads, 8335 of other roads, and 232 miles of railway. In density of population (350,108 in 1881) the department is below the average of France. It contains 38,000 French-foreigners, especially in the south-east, these being only three Triest departments—Gard, Ardèche, and Diôme—which surpass it in this respect. The four arrondissements are Niort, Bessune (3649 inhabitants in the town), Melle (2488), Thairy (467), the cantons number 81, and the communes 356. It is part of the diocese of Poitiers, whose also is the court of appeal, its military headquarters are at Tours. St Maixent (4790) has an infantry school.

SEWAGE. See SEWERAGE.

SEWARD, WILLIAM HENRY (1801-1872), American statesman, was born May 16, 1801, in the town of Florida, Orange county, N.Y. He was graduated at Union College in 1820, and began the practice of law three years after in the town of Auburn, which became his home for the rest of his life. Several of his cases brought him reputation as a lawyer, but he soon drifted into the more congenial field of politics. After he had served for four years in the State senate, the Whig party of New York nominated him for governor of the State in 1834. Though then defeated, he was nominated again in 1838 and elected, serving until 1842. He then returned to his law practice, retaining, however, the recognized leadership of the Whig party in the most important State of the Union. During the next seven years slavery became the burning question of American politics. The purely ethical and the philanthropic sides of the anti-slavery struggle are represented by GARRISON and GREENLEY (*q.v.*). Seward was the first to develop that purely political side, with an economic basis, which probably best met the desires and prejudices of the great mass of those who took part, willing or unwilling, in the struggle. The keynote of his theory was struck in 1848 in a speech at Cleveland.—"The party of slavery upholds an aristocracy, founded on the humiliation of labour, as necessary to the existence of a chivalrous republic." The absurdity of the conception of a civilized nation which, in flat opposition to historical development, should tolerate for ever a systematic humiliation of labour was only his starting point. His theory culminated naturally in his famous Rochester speech of 1858, in which he enumerated the inevitable direct and indirect consequences of a free-labour and a slave-labour system respectively, showed the two to be absolutely irreconcilable and yet steadily increasing their interferences with one another, and drew this pregnant inference.—"there is here "an irrepressible conflict between opposing and enduring forces, and it means that the United States must and will, sooner or later, become either entirely a slave-holding nation or entirely a free-labour nation." But the germ of the "irrepressible conflict" of 1858 lay clearly in the utterances of 1848, and Seward was even then most widely known as its exponent. When, therefore, the New York Whigs, who in 1840 controlled the State legislature, which elects United States senators, sent Seward to the senate with hardly a show of opposition, their defiance of

the southern wing of their party was a premonition of the general break up of parties three years afterwards. In the senate Seward had at first but two pronounced anti-slavery associates. As anti-slavery feeling increased, and the Republican party was organized in 1855-56, he went into it naturally, for it was to him only an anti-slavery Whig party, and his pre-eminent ability made him at once its recognized leader. In the Republican convention of 1860 he was the leading candidate for the nomination for president, and it was only by a sudden union of all the elements of opposition to him that the nomination was finally given to Abraham Lincoln, whose name was then hardly known outside of Illinois. It has been an almost invariable rule that American presidents have found their most irritating difficulties in dealing with the New York leaders of their respective parties, Lincoln when elected removed any such possibility by offering Seward the chief position in his cabinet, that of secretary of state. Here, for at least four years, Seward did the great work of his life. His errors, whether of constitutional law, international law, or policy, are more clearly seen now than they were then. In spite of them all the estimate of the value of his work must be very high, if we consider the chances in favour of foreign intervention at some time during a four years' war, and his unbroken success in inculcating on other Governments the propriety and wisdom of neutrality. Much of this success was due to circumstances which he did not create, to his ability to rely solidly on the cordial friendship of the "plain people" (to use Lincoln's common phrase) of Great Britain and France, and particularly to the change of policy induced by the emancipation proclamations of 1862-63, but much is still left to the credit of the secretary, whose zeal, activeness, and efficiency brought the ship safely through the intricacies of international relations while the crew were putting out the fire in her hold. In the process of reconstruction which immediately followed the war Seward sided heartily with President Johnson and shared his defeat. The Whig element had been burned out of the Republican party by the war; a new party had grown up, not limited by *ante bellum* notions, and it rapidly came to look upon Seward, its once trusted leader, not only as a traitor but as the main intellectual force which supported Johnson's clumsy attempts at treason. At the end of his second term as secretary of state in 1869 he retired to his home at Auburn, broken by loss of health, by loss of political standing, and by the death of his wife and daughter. He spent the next two years in foreign travel, and died at Auburn, October 10, 1872.

Of Seward's Life and Works, in 5 vols., edited by George F. Baker, the last volume deals with his career during his last term as secretary of state.

SEWERAGE is the process of systematically collecting and removing refuse from dwellings. The matter to be dealt with may conveniently be classified as made up of four parts—(1) dust, ashes, kitchen waste, and solid matters generally, other than solid excreta, (2) excreta, consisting of urine and faeces, (3) slop-water, or the discharge from sinks, basins, baths, &c., and the waste water of industrial processes; (4) surface water due to rainfall. Before the use of underground conduits became general, the third and fourth constituents were commonly allowed to sink into the neighbouring ground, or to find their way by surface channels to a watercourse or to the sea. The first and second constituents were conserved in middens or pits, either together or separately, and were carried away from time to time to be applied as manure to the land. In more modern times the pits in which excrement was collected took the form of covered tanks called cesspools, and with this modification the primitive system

of conservancy, with occasional removal by carts, is still to be found in many towns. Even where the plan of removing excrement by sewers has been adopted, the first kind of refuse named above is still treated by collecting it in pails or bins, whose contents are removed by carts either daily or at longer intervals. It therefore forms no part of the nearly liquid sewage which the other constituents unite to form.

The second constituent is from an agricultural point of view the most valuable, and from a hygienic point of view the most dangerous, element of sewage. Even healthy excreta decompose, if kept for a short time after they are produced, and give rise to noxious gases, but a more serious danger proceeds from the fact that in certain cases of sickness these products are charged with specific germs of disease. Speedy removal or destruction of excremental sewage is therefore imperative. It may be removed in an unmixed state, either in pails or tanks or (with the aid of pneumatic pressure) by pipes, or it may be defecated by mixture with dry earth or ashes; or, finally, it may be conveyed away in sewers by gravitation, after the addition of a relatively large volume of water. This last mode of disposal is termed the water-carriage system of sewerage. Water-carriage system. It is the plan now usually adopted in towns which have a sufficient water supply, and it is probably the mode which best meets the needs of any large community. The sewers which carry the diluted excreta serve also to take slop-water, and may or may not be used to remove the surface water due to rainfall. The water-carriage system has the disadvantage that much of the agricultural value of sewage is lost by its dilution, while the volume of foul matter to be disposed of is greatly increased. But it has been found that, even when the excrement of a community is kept out of the sewers, and subjected to distinct treatment, the contents of the sewers are still so foul that their discharge into streams is scarcely less objectionable than when the water-carriage system is adopted, and, further, it appears difficult if not impossible to realize the agricultural value of excrement by any process of separate treatment that is not offensive or dangerous or inapplicable to towns.

When, in the water-carriage system, the same sewers carry foul sewage and surface-water due to rainfall, the sewage is said to be "combined", the "separate" system, on the other hand, is that in which a distinct set of sewers is provided to carry off rainfall. Each plan has its advantages. In the separate system the foul-water sewers need be large enough to take only the normal flow, they may thus be made self-cleansing much more readily than if their size were sufficient to carry the immensely greater volume to which (on the combined plan) sewage may be swollen during heavy rain. The amount of dangerously foul matter is also much reduced. On the other hand, the contents of the rain-water sewers are still too much tainted by the filth of the streets to render their discharge into rivers or lakes desirable; and the complication of two sets of mains and branches is a serious drawback. Where old sewers are giving place to new ones it is not unusual to retain the old sewers for the carriage of surface-water, but in new works a single system of sewers, provided with storm-overflows to relieve them of part of the rainfall during exceptionally heavy showers, would probably be preferred in nearly every case.¹ Since sewers should, in all cases, be water-tight, they do not form suitable collectors of subsoil water.

¹ An exception to this remark may be made in the case of London, where the enormous area to be drained, as well as the difficulty of disposing of the foul sewage on account of its large volume, has led the Commissioners on Metropolitan Sewage Discharge to advise (in their Report of 1884) that "in new drainage works the sewage should be, as far as possible, separated from the rainfall."

Heads of treatment

The water-carriage system of sewerage will be noticed here under its three aspects —(1) the ultimate disposal of sewage, (2) the system of common sewers by which sewage is conveyed to its destination, (3) the domestic arrangements for the collection of sewage.

Disposal of water-carried sewage

I THE ULTIMATE DISPOSAL OF WATER-CARRIED SEWAGE—In the water-carriage system of sewerage the fertilizing elements are so largely diluted that it becomes a matter of the utmost difficulty to turn them to profitable account. It has been estimated that every ton of London sewage contains ingredients whose value as manure is rather more than 2d., a value which, could it be realized, would make the sewage of the metropolis worth a million and three quarters sterling per annum. Sewage farming, however, does not pay. After much costly experiment the conviction is gaining ground that, neither by applying sewage directly to land, nor by any process of chemical treatment that has yet been proposed, can sewage be made to yield a return as manure which will cover the cost of its transport, treatment, and distribution, except perhaps in a few cases where the circumstances are peculiarly favourable.

Sewage farms

At the same time, sewage farming does afford one satisfactory solution of the problem of how to dispose of sewage without creating a nuisance—a problem in which any question of profit or loss is of secondary importance. A very early instance of irrigation by sewage is that of the Cragsmenny Meadows, a sandy tract of 400 acres, on which part of the sewage of Edinburgh has been discharged during certain seasons for nearly a century. There, owing to favourable conditions, and to the fact that complete purification of the sewage is not attempted, the process yields a profit, but no such result could be looked for if the sea were not at hand to receive the imperfectly cleansed sewage and the wholly uncleansed surplus. Germany furnishes a still older example of irrigation in the sewage farm of the town of Dunsin, which has been in existence for more than three hundred years.

Five methods of treating sewage may be named, of which two or more are often found in combination.

Discharge into the sea

Discharge into the Sea is into a large watercourse is in general the least costly means by which a community can rid itself of its sewage. Much care in the choice of outlets is necessary to make this plan efficient in avoiding nuisance. Some towns make use of tanks or outlet sewers of large capacity, from which the discharge is allowed to occur only when the tide is ebbing. When the volume of sewage is very large, even this precaution does not wholly protect the neighbouring coast from foul deposits. A striking instance is furnished by the case of London, which discharges its sewage into the tidal estuary of the Thames at Barking and Crossness during only some three or four hours from the time of each high tide. It is found that the discharged matter is washed up and down the river with every tide, occasionally reaching as far up as Teddington, and that the portion which is not deposited in the form of mud banks only very slowly works its way to the sea.

Broad irrigation

Broad Irrigation—By this is meant the use of sewage to irrigate a comparatively large tract of cultivated land, in the proportion of about 1 acre (or more) of land to every 120 persons in the sewage-contributing population. This system is now largely and successfully used, especially where the soil is a porous sandy loam. Fears that the farms would prove damage to the health of the neighbouring district, and that the crops and vegetables grown on them would be unwholesome, have proved groundless. When the farm is properly laid out and carefully managed the effluent water is pure enough to be admitted to a clear stream from which water-supply is drawn. Broad irrigation is practised at Groydon, Cheltenham, Blackburn, and many other English towns, and it has recently been applied, on a very large scale, to dispose of the sewage of Berlin.

Intermittent filtration through land.

Intermittent Downward Filtration—This is another mode of purifying sewage by applying it to land, which differs from broad irrigation in requiring a much smaller area in proportion to the sewage dealt with. In 1870 Dr. Frankland¹ drew attention to the fact that if sewage were passed through porous soil, not continuously but at intervals long enough to let the soil become aerated, rapid purification took place through the oxidizing action of the

air which the soil held in its pores. He estimated that an acre of suitable ground, well furnished with subsoil drains to remove the water after percolation, could in this way take the sewage of 2000 persons. This estimate is now considered excessive, and 1000 persons to the acre is a more recent limit. Mr J. Bailey-Denton at once took up Dr. Frankland's suggestion, and in his hands the system of intermittent filtration through land has been successfully applied to the sewage of many towns.² The land which constitutes the filter is used to grow vegetables and other crops. Clay soils are, as far as possible, avoided, and the land is thoroughly underdrained at a depth of about 6 feet. The sewage is distributed over the surface in open channels, the open laying out of which is an important item in the cost of the system, but is essential to its success. When the number of persons exceeds 600 per acre it is advisable to precipitate the solid matter that is held in suspension before the liquid is applied to the land, in order to prevent the surface of the ground from becoming clogged with sewage sludge. Mr Bailey-Denton has pointed out the advantage which the system of intermittent filtration offers as a supplement to bioid filtration, where that is carried out. A serious objection to the disposal of sewage by irrigation is the fact that the farmer must take the sewage always—at times when it huts the land as well as at times when the land wants it. But by laying out a portion of the land Combination as a filter bed the sewage may be thrown on that whenever it is of presence on the remainder would do harm rather than good. Mr Bailey-Denton has applied this combined system in several instances, and intermittent manure, apparently with much reason, that the combination filtration offers a better prospect of profit than the other methods of sewage purifying sewage. The system of intermittent filtration through broad land has been recommended by the Royal Commission of 1882-84 irrigation as a mode of treating London sewage.

Filter action through Artificial Filters of sand, gravel, ashes, charcoal, coal, coke, peat, &c., though often experimented on, can scarcely be fitted as an actual system. It is attended by the difficulty that the filter becomes speedily choked by the deposit of sludge. The intermittent use of a suitable artificial filter wall, however, saves efficiently to oxidize and therefore purify the liquid portion of sewage from which the sludge has been previously precipitated, and filtration through coke is used in some instances as a supplement to the process which is next to be described.

Chemical Treatment, or Precipitation—When sewage is allowed to stand, or to flow very slowly through a large tank, a gradual heat-substances of the solid particles takes place. The substances, ment however, much too slow to be complete before decomposition sets in. But it may be very greatly accelerated by the addition of certain reagents, with the object of producing a precipitate which, in falling, will carry down with it the minute particles of solid matter that are suspended throughout the mass. Lime is the substance most usually employed. It is introduced in the form of milk of process lime, and in the proportion of about one ton of lime to one million gallons of sewage. When thoroughly mixed, the liquid is left at rest, and a rapid separation of the sewage follows, into a comparatively clear supernatant liquid and a glutinous precipitate or "sludge." The sludge has little value as manure, for the best agricultural constituents of sewage are contained in solution, and very little of the soluble matter is carried down in the deposit. The sludge is dried by being strained over beds of slag, pressed into blocks for transport, and got rid of by being burnt or dug into the ground or thrown into the sea. It has been used in the manufacture of bricks and of cement (Scott's 190388), but in general it can be disposed of only at a loss. The clarified effluent still contains dissolved organic matter, and may be admitted into running streams only when a high standard of purity is not compulsory. When, however, the volume of the running water which it enters is relatively very large a quick purification takes place by means of the oxygen which the water carries in solution.

The lime process is practised, without further purification of the effluent water, at Leeds and at Runcy. At Bradford, after precipitation by lime, the effluent is filtered through beds of coke-breeze. At Birmingham the sewage of 600,000 people, after clarification by lime (which also serves to neutralize the acid contributed by manufactures), is used to irrigate a farm of 1200 acres.

Very many patents have been obtained for the precipitation of sewage by other chemicals in place of, or in addition to, lime. In Hill's process lime is the chief ingredient, with iron and chloride of magnesium or calcium added. At Coventry the precipitants are sulphate of ammonia, protosulphate of iron, and lime, and the effluent is afterwards filtered through land, in the proportion of 1 acre to 5000 of the population.

Sillar's "ABC" process, worked by the Native Gunno Com. The ABC pany at Aylesbury, differs from others in producing a sludge process which has considerable value as manure. An emulsion of clay and carbon with a little blood is first mixed with the sewage; a precipitating solution of alum is then added, and the mixture

¹ Hoffman and Witt, *Report to the Government Referees on Metropolitan Drainage*, 1867.

² *Report of the Rivers Pollution Commissioners*, 1870.

³ J. Bailey-Denton, *Intermittent Downward Filtration, with notes on the Practice and Results of Sewage Farming*, 1st ed. 1880, 2d ed. 1885.

is allowed to settle. The process gives a remarkably clear effluent, practically the whole of the insoluble constituents of the sewage and a portion of the dissolved impurities are carried down in the precipitate, which, when dried and ground along with some sulphates of magnesia, is sold under the name of native guano. The ABC process has been in successful use for nine years at Aylesbury, where the "guano" finds a sale at 70s. per ton. In 1870 the Rivers Pollution Commission reported unfavorably on the process, a fact which may have prevented its adoption by other towns, but it has since then received the approval of many specialists. A recent protracted investigation by Dr. O. M. Tidy and Prof. Dewar showed that the percentage of oxidizable organic matter removed by the process ranges from 75 to 88—a result, in their judgment, satisfactory. At Leeds, where the process was tried for a time, it was given up because the effluent was purer than the river into which it ran, and the simple lime-process, which costs less but gives a less clear effluent, was adopted in its place.

Relative
merits
of the
systems

Much difference of opinion still exists as to the relative merits of broad irrigation, filtration through land, and chemical treatment, as means of disposing of sewage. That either of the two first plans or a combination of them both can be made to yield a satisfactory solution of the sewage problem, from a hygienic point of view, seems unquestionable. That chemical treatment, especially if supplemented by filtration through land, will also purify well, is generally admitted. No process of effective purification is now expected to yield a profit, but the question of cost, on which the choice of a system principally turns, is too extensive to be touched in this article.

Convey-
ance of
sewage

Pipe
sewers

II. **THE CONVEYANCE OF SEWAGE.**—For small sewers, circular pipes of glazed earthenware or fire-clay or of moulded cement as used, from 6 inches to 18 inches and even 20 inches in diameter. The pipes are made in short lengths, and are usually jointed by passing the end or spigot of one into the socket or facet of the next. Into the space between the spigot and facet a ring of gasket or tarred hemp should be forced, and the rest of the space filled up with cement, not clay. The gasket prevents the cement from entering the pipe, and so obstructing the flow, at the same time it forms an elastic packing which serves to keep the successive lengths of pipe concentric, even if the cement should fail. The pipes are laid with the spigot ends pointing in the direction of the flow, with a uniform gradient, and, where practicable, in straight lines. In special positions, such as under the bed of a stream, cast-iron pipes are used for the conveyance of sewage. Where the capacity of an 18-inch circular pipe would be insufficient, built sewers are used in place of earthenware pipes. These are sometimes circular or oval, but more commonly of an egg-shaped section, the invert or lower side of the sewer being a curve of shorter radius than the arch or upper side. The advantage of this form lies in the fact that great variations in the volume of flow must be expected, and the egg-section presents for the small or dry-weather flow a narrower channel than would be presented by a circular sewer of the same total capacity. Figs. 1 and 2 show

Built
sewers

Fig. 1

Fig. 2

Figs. 1, 2.—Forms of Sewers

two common forms of egg-sections, with dimensions expressed in terms of the diameter of the arch. Fig. 2 is the more modern form, and has the advantage of a sharper invert. The ratio of width to height is 2 to 3.

Built sewers are most commonly made of bricks, moulded to suit the curved structure of which they are to form part. Separate invert blocks of glazed earthenware, terra-cotta, or fire-clay are often used in combination with

brickwork. The bricks are laid over a template made to the section of the sewer, and are grouted with cement. An egg-shaped sewer, made with two thicknesses of brick, an invert block, and a concrete setting, is illustrated in fig. 3.

Concrete is now very largely used in the construction of sewers, either in combination with brickwork or alone.

For this purpose the concrete consists of from 5 to 7 parts of sand and gravel or broken stone to 1 of Portland cement. It may be used as a cradle for or as a backing to a brick ring, or as the sole material of construction by running it into position round a mould which is removed when the concrete is sufficiently set, the inner surface of the sewer being in this case coated with a thin layer of cement.

Fig. 3.—Brick Sewer

In determining the dimensions of sewers, the amount of sewage dis-charge may be taken as equal to the water supply (generally about 80 gallons per head per diem), and to this must be added an allow-ance for the surface water due to rainfall. The latter, which is generally by far the larger constituent, is to be estimated from the maximum rate of rainfall for the district and from the area and character of the surface.

In the sewerage of Berlin, for example, (one of the most recent instances of the combined water-carriage system applied on a large scale), the maximum rainfall allowed for is $\frac{1}{2}$ of an inch per hour, of which one-third is supposed to enter the sewers. In any estimate of the size of sewers based on rainfall account must of course be taken of the effect provided by storm-overflows, and also of the capacity of the sewers to become simply charged with water during the short time to which very heavy showers are invariably limited. Rainfall at the rate of 6 or 6 inches per hour has been known to occur for a few minutes, but it is altogether unnecessary to provide (even above storm-overflows) sewers capable of discharging any such amount as this, the time taken by sewers of moderate size to fill would of itself prevent the discharge from them from reaching a condition of steady flow and, apart from this, the risk of damage by such an exceptional fall would not warrant so great an initial expenditure. Engineers differ widely in their estimates of the allowance to be made for the discharge of surface water, and no rule can be laid down which would be of general application.

In order that sewers should be self-cleaning, the mean velocity V of flow should be not less than $9\frac{1}{2}$ feet per second. The gradient of the sewer is calculated on principles which have been already stated in the article HYDROCELANICS (*q.v.*) The velocity of flow, V , is

$$V = c\sqrt{m},$$

where θ is the inclination, or ratio of vertical to horizontal distance, m is the "hydraulic mean depth," or the ratio of area of section of the stream to the wetted perimeter, and c is a coefficient depending on the dimensions and the roughness of the channel and the depth of the stream. A table of values of c will be found in § 90 of the article referred to. This velocity multiplied by the area of the stream gives the rate of discharge. Tables to facilitate the determination of velocity and discharge in sewers of various dimensions, forms, and gradients will be found in Mr. Letham's and other practical treatises.

Where the contour of the ground does not admit of a sufficient inter-gradient from the gathering ground to the place of destination, the certain sewage must be pumped to a higher level at one or more points in sewers its course. To minimize this necessity, and also for other reasons, it is frequently desirable not to gather sewage from the whole area into a single main, but to collect the sewage of higher portions of the town by a separate high-level or interception sewer.

Sewer gas is a term applied to the air, loaded by mixture with Sewer gases which are formed by the decomposition of sewage, and by gases the organic germs which it carries in suspension, that fills the sewer in the variable space above the liquid stream. It is universally recognized that sewer gas is a medium for the conveyance

of disease, and in all well-designed systems of sewerage stringent precautions (which will be presently described) are taken to keep it out of houses. It is equally certain that the dangerous character of sewer gas is reduced, if not entirely removed, by free admixture with the oxygen of fresh air. Sewers should be liberally ventilated, not only for this reason, but to prevent the air within them considerably as to force the "traps," which separate it from the atmosphere of dwellings. The plan of ventilation now most approved is the very simple one of making openings from the sewer to the surface of the street at short distances,—generally shafts built of brick and cement,—and covering these with metallic gratings. Under each grating it is usual to hang a box or tray to catch any stones or dirt that may fall through from the street, but the openings to the street are frequently made large enough to allow a man to go down to examine or clean the sewers, and are then called "manholes." Smaller openings, large enough to allow a lamp to be lowered for purposes of inspection, are called "lampholes," and are often built up of vertical lengths of drain-pipe.

Ventilation of sewers.

Manholes.

FIG. 4.—Field's Siphon Flush Tank

the tank accumulates so that it reaches the top of the annular siphon, and begins to flow over the lip, it carries with it enough air to produce a partial vacuum in the tube. The siphon then bursts into action, and a rapid discharge takes place, which continues till the water level sinks to the foot of the bell-shaped cover.

III. DOMESTIC SEWERAGE.—In the water-carriage system each house has its own network of drain-pipes, soil-pipes, and waste-pipes, which lead from the basins, sinks, closets, and gullies within and about the house to the common sewer. These must be planned to remove sewage from the house and its precincts quickly and without leakage or deposit by the way, the air within them must be kept out of the dwelling, by placing a water-trap at every opening through which sewage is to enter the pipes, and by making all internal pipes gas-tight, the pipes must be freely ventilated by a current of fresh air, in order to oxidize any deposited filth and to dilute any noxious gas they may contain; finally—and this is of prime importance—the air of the common sewer must be rigorously shut out from all drains and pipes within the house. To disconnect the pipes of each individual house from the atmosphere of the common sewer is the first principle of sound domestic sanitation. When this is done the house is safe from contagion from without, so far as contagion can come through sewer gas, and, however faulty in other respects the internal fittings may be, the house can suffer no other risk than that which arises from its own sewage.

Domestic sewerage.

Primary requisites.

Traps.

Protection against the passage of gas through openings which admit of the entry of water is secured by the familiar device known as the water-trap.

Common trap.

The simplest and in many respects the best form of trap is a bent pipe or inverted siphon (fig. 5) which is sealed by water lying in the bend. The amount of the seal (measured by the vertical distance between the lines *a* and *b*) varies in practice from about 1 inch to 3 inches. If the pressure of air within the pipe, below

To facilitate inspection and cleaning, sewers are, as far as possible, laid in straight lines of uniform gradient, with a manhole or lamphole at each change of direction or of slope and at each junction of mains with one another or with branches. The sewers may advantageously be stepped here and there at manholes. Sir R. Davison has pointed out that a difference of level between the entrance and exit pipes tends to prevent continuous flow of sewer gas towards the higher parts of the system, and makes the ventilation of each section more independent and thorough. When the gradient is slight, and the dry-weather flow very small, occasional flushing must be resorted to. Stop valves or sliding flushing penstocks are introduced at manholes by closing these for a of sewers is dammed up behind the valve either in higher parts of the sewer or in a special flushing chamber, and is then allowed to advance with a rush. Many self-acting arrangements for flushing have been devised which act by allowing a continuous stream of comparatively small volume to accumulate in a tank that discharges itself suddenly when full. A very valuable contrivance of this kind is Mr. Rogers' Field's siphon flush tank, shown in fig. 4. When the liquid in

the trap, is greater than that of the air above the trap by an amount exceeding the pressure due to a column of water equal in height to the seal, the trap will be forced and air will bubble through. This possible is one way in which a trap may fail, but this may be prevented by causes of sufficient ventilation of the pipe below the trap. Other possibilities of failure are, however, only too numerous.

If the pipe is closed for some time, the water may evaporate so considerably as to break the seal. The pipe, if of lead, may bend out of shape, or it may even be so badly set in the first instance as to make the trap inoperative. The seal may be broken by the capillary action of a thread or strip of cloth, hanging over the lip of the trap and causing the water to drain away. A rush of water down the pipe, suddenly arrested, may pass the trap with such momentum as to leave it wholly or partly empty. Another and a common cause of failure can be explained by reference to fig. 6.

FIG. 5.—Common Water Trap.

Let a column of water rush down the soil-pipe *c* from a closet or sink which discharges into it at some higher point. As the water passes the junction with the branch *d* it will produce a partial vacuum in the branch, and so tend to suck over the contents of the trap. This process, which is sometimes called the siphonage of traps, can be guarded against by ventilating the branch, either by a separate ventilating pipe leading to the open air or by a pipe (shown by dotted lines) connecting the top of the branch *d* with a point sufficiently far up on the soil-pipe to be above the column of water which is passing the junction. One more imperfection in traps may be named. The experiments of Dr. Fergus have shown that the water in traps will allow gases to pass through, by absorbing the gas on one surface and giving it off at the other. It is improbable that this action occurs to such an extent as to be dangerous by permitting the transfer of disease germs from one to the other side. Apart from any risk of this kind, however, it is clear that a trap is open to so many possibilities of failure as to form a very insufficient barrier between the air of a room and the foul air of a sewer. Nevertheless the practice was until very lately almost universal, and is still far from uncommon, of connecting closets, sinks, and

even bed-room basins with common sewers by a continuous system of piping, in which the only safeguard against the entry of sewer gas is a single trap close to each sink or basin. This means that sewer gas, charged with the infection of a whole community, is brought within a few inches of the atmosphere of the dwelling, ready to contaminate it whenever the trap fails from any of the causes which have been named, or whenever, by a flow of water through it, the seal is sufficiently disturbed to allow bubbles of gas to escape into the room.

The remedy for this lies in having, at any convenient point on each house-drain, a disconnecting trap which separates the house system from the sewer, and so establishes what may be called an outer line of defence.

Any accidental leakage of sewer gas through it then does no more than cause a comparatively slight pollution of the air within the house-drains, and if these are well ventilated the effects of this are insensible. At each individual basin or other fitting a trap is still required, but its function is now merely to shunt out the air of the house-drains from the rooms, and, as the air of the house-drains is no longer polluted by connexion with the sewers, the occasional failure of this function is a matter of comparatively small moment. Further, the disconnecting trap on the house-drain furnishes a convenient place of access for fresh air, and the ventilation is completed by carrying the highest point of the soil-pipe or waste-pipe up to the level of the roof and leaving it open there. This arrangement will be understood by reference to fig. 6, which shows a soil-pipe, open at its upper end, discharging into a house-drain in which there is a disconnecting trap provided with an open grating for the entry of air. The soil-pipe is ventilated by a current of air which (usually if not always) flows upwards. This not only dilutes any gases that are produced in the pipe, but quickly oxidizes any foul matter that may adhere to the sides. Care must be taken to avoid having the upper end of the pipe open near windows or under eaves.

In the figure the branch leading to the water-closet is ventilated by a pipe carried into an upper part of the soil-pipe; this is scarcely necessary if the branch be short. Another construction is to carry a distinct ventilating pipe up from the top of the branch to a point above the roof, and where several fittings discharge into one soil-pipe, the same ventilating pipe may be made to serve for all. An example of the latter arrangement is shown in fig. 10. The form of disconnecting trap shown in fig. 6 is that of Mr. W. P. Buchan of Glasgow, who has done excellent service to the cause of sanitary reform by practising and advocating the disconnection and ventilation of house-drains and soil-pipes. The same trap is shown to a larger scale in fig. 7, where it appears imbedded in concrete and covered by a built manhole, which gives access to the trap in case of its becoming choked. The manhole may have an open grating at the top; or the top may be closed by a solid plate (if a grating there be for any reason inadmissible), in which case a ventilating shaft is carried from the manhole to some other opening.

Fig. 7 shows such a shaft leading to a grating which is placed vertically in a neighbouring wall. Among other good forms of disconnecting trap, more or less like Buchan's, mention may be made of Weaver's, Potts's, and Hellyer's.

Disconnecting trap on house-drain.

FIG. 8.—Double Disconnecting Trap

stoppage and greater complexity which this arrangement entails.

The extent to which it is permissible or advisable in practice to discharge allow several fittings to discharge into a single waste-pipe or from soil-pipe will vary in different cases. We can recognize a broad basis, distinguish between sewage from closets and rooms, liable to the sinks, most dangerous taint should disease occur within the house, and the comparatively innocuous sewage that comes from basins, baths, and sinks.

Some sanitarians go so far as to advise that these two classes of sewage should be kept absolutely apart within the house, by the use of a complete double system of house drain-pipes. This, however, is an extreme measure, no reasonable objection can be urged against the discharge into a water-closet soil-pipe of water from a bath or wash-hand basin in the same room, except perhaps that if the soil-pipe is of lead its corrosion is hastened by hot water, and the additional flushing which this soil-pipe so receives is a distinct advantage. But to connect a water-closet soil-pipe with sinks and basins in other apartments is to multiply possibilities for the spread of disease within the house, and it is strongly advisable to convey the waste from them by a separate pipe, protected from the sewer by a disconnecting trap of its own, with a grating open to the air. This applies with special force to the wash-hand basins that are often fixed in bed-rooms and dressing-rooms basins. Nothing could be more dangerous than the use—of which many good houses still furnish instances—of multiplying these conveniences without regard to the risk they involve, and making this risk as great as possible by placing each in direct communication through an ordinary trap with the soil-pipe, itself perhaps unventilated and provided with no disconnection from the sewer. Even when the drain or soil-pipe is ventilated and disconnected from the sewer, no bed-room basin should, under any circumstances, be allowed to discharge into it without first passing a separate open trap. On the other hand, a bed-room basin may be made perfectly safe by leading its waste-pipe (tapped under the basin in the usual way) into an open-air channel which communicates with the sewer by a surface-trap or a gully outside the house (fig. 9). Similar treatment should be adopted in the case of pantry and scullery sinks.

Under most plumbing fixtures it is usual to place a safe-tray to receive any water accidentally split. The discharge pipes from these trays are sometimes, but very obtrusively, joggled, led into the waste-pipe or soil-pipe below the fixture. The proper method of providing for the discharge of water split into the safe-trays is to lead a pipe from it through the wall and allow it to end in the open air (fig. 10, where each of the safe-trays is marked "waste-pipe"), a flap valve fixed on the end will serve, if need be, to keep out draught.

Overflow-pipes from cisterns used for domestic purposes should be cistern led, in the same way, into the open air and not into soil-pipes or overflows. waste-pipes (fig. 10). Traps on them cannot be depended on to remain sealed, and any connexion of an overflow-pipe with a soil-pipe would result in allowing foul air from the pipe to diffuse itself over the surface of water in the cistern—a state of things peculiarly likely to cause pollution of the water. When a cistern is used only for water-closet service, its overflow-pipe may properly be led into the basin of the closet.

Rain-pipes, extending as they do to the roof, are sometimes used

FIG. 9.—Open Trap

Rain-
pipes

to serve as ventilating continuations of soil-pipes and waste-pipes. The practice is open to serious objection, for it discharges the drain air just under the eaves, at a place where air is generally being drawn into the house. The ventilating end of a soil-pipe should be carried to a higher level, as in fig. 6, clear of the lower edge of the roof. It is better to restrict rain-pipes to their legitimate function of taking surface water from the roof, or at most to allow them to receive slop-water from sinks and basins, and to make them terminate in or over open traps from which a connexion is taken to the house-drain or sewer (fig. 9)

Complete
system
for a
small
house

to take in 10 and 11 the sanitary fittings of a small house are shown by diagram, which should be carefully studied as exemplifying a well-arranged system. Two closets, and a bath and basin in the closet apartment, discharge into a soil-pipe on the right, and the branches (except that of the basin) are vented by pipes leading to a separate air pipe, which the two soil-pipes are carried above the roof. The overflow of a cistern which supplies bath, basin, and boiler is carried out to the open air, and so are the waste-pipes of the leaden sifonians. A separate cistern supplies each water-closet, and its overflow runs into the closet basin. A sump (in the middle of the figure)

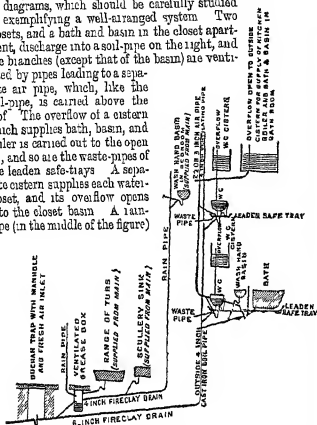

FIG. 10.—Diagram Section of the Drains and Fittings of a Small House

receives a bed-room basin waste, and leads by a 4-inch drain to a ventilated grease-box, into which the seullery sink and wash-tubs and another rain-pipe also discharge. Finally, the whole system is protected by a Brohan trap in a built manhole, which is covered with a grate.

House
di cins[illegible]

Danger of leaks

Defective joints in soil-pipes and waste-pipes, particularly where they connect with drains, closet-basins, sinks, &c., are another frequent cause of leakage. Any want of air-tightness in drains or soil-pipes within a dwelling leads to the pollution of the air.

merely by diffusion, but by an actual in-draught, for generally the air of the house has its pressure reduced by chimney draughts to a value slightly lower than that of the air outside. The house, in fact, ventilates itself by drawing in air from the pipe at any hole, a fact which may easily be demonstrated by holding the flame of a taper near the hole.

A third new and original method is used of detecting such leaks Smoke is variously employed in several methods. One of these is the test as follows: admit foul air to the dwelling. Of these the best is the test "smoke test." It consists of filling the house-drain, soil-pipes, and waste-pipes with a dense and pungent smoke, any ascope of which into the house is readily observed by eye and nose. A quantity of cotton-waste soaked in oil is lighted, and its fumes are blown into the house-drain by a revolving fan, at the ventilating corner of the disconnecting tap, or at any other convenient opening. Smoke soon fills the pipes, and begins to escape at the roof. The upper ends of the pipes are then closed, and the house is searched for smoke? Another test, especially applicable to these parts of drains that are laid under passages, is the hydraulic syringe test, which consists in stopping up the lower end of the pipe, and forcing water into it, so as to produce a moderate pressure, and then observing whether the level of the water falls. This test, however, is too slow for all but new and very well constructed drains.

Every basin, sink, or other fitting should be separately trapped. Traps are made by a bend on the waste-pipe or some other form of trap. A brass cap, secured on a fatig wrench, is let into the pipe on the bend, facilitates cleaning (fig 5). The warm wastewater from pantry and scullery sinks contains much grease, and should be discharged into a grease box (fig 12) where the water becomes cool and deposits its grease before overflowing into

FIG. 12 — Glucose TOL

the drain. To collect surface water from gutters, moldy areas, contaminants, etc., an open trap or gully is used. Fig 6 shows a Open traps or gullies

Many of the fumes favored by builders are bad either because of an insecure seal, a narrow outlet, or a tendency to gather filth. One in particular, the well-known "Bell" trap, is an example of nearly everything a trap should not be.

Fig. 13—Onlyx.Tie

Water-closets need to be almost invariably of the "pan" type, but whenever sanitary reform has been needed, any pan closet has given place to cleaner and wholesome patterns. The crisis of the pan closet will be evident from an inspection of fig. 14. At each use of the closet the hinged pan is tilted down so that it discharges its contents into the container. The sides of the container are inaccessible for cleaning, and then upper portions are out of reach of the flushing action of the pan. They gradually become caked with a foul deposit. A gust of tainted air escapes at every use of the closet; and it rarely happens that the container is air-tight, and that the filth it has gathered does not cause a smell even in intervals of disuse. The conditions make matters worse, many of the older pan closets are provided with the kind of trap shown in the sketch, called the D trap, which is also liable to become a gathering place for filth. Even with an ordinary trap, however, the pan closet remains so bad that its use is liable to cause disease.

A much better closet is the valve or Biamah closet, an excellent Valve closets.

¹ A novel plan of making the smoke test has lately been introduced, in which smoke is given off by a "smoke rocket" or cake of slowly combustible compound which is lighted and placed in the drain.

example of which by Fiew of Perth is shown in fig 15. The basin is kept partly full of water by a ground gun-metal valve tightly pressed up against a conical seat at the basin's foot.

The chamber below is only large enough to allow the valve to turn down, it cannot collect much foul matter and may be ventilated by a separate pipe. A trapped overflow prevents the basin from being overflowed. The whole closet is trapped by an ordinary bend on the soil-pipe, which is not shown in the figure. The volume of water in the basin is much greater than in pan closets, where the height is limited by the overflow which occurs round the lip of the pan. In some closets of this kind the valve is placed at the side, and, when closed, lies nearly vertical. In another type of valve closet (Jennings's) the valve is a conical plug, pressed vertically down on a seat at the sole.

Valve closets can be made fully effective and satisfactory from a sanitary point of view, but a much cheaper and certainly not less excellent type of closet is the "washout," an example of which (the "National") is shown in fig 15. (Another washout closet, by Dorton, appears in fig 6.) These are now made in a great variety of good forms, sometimes of a single piece of white stoneware. They combine cheapness and simplicity with a degree of sanitary perfection that is probably not reached by the most expensive closets of the kinds already named. They have no working parts, the closet is cleaned after use simply by the flush of water, which sweeps everything before it. The flush must of course be good—a 1½-inch service pipe from a cistern not less than 5 feet above the closet will do well. In some recent designs the cistern is a box at the back of the seat with a wide

FIG. 15.—Bramah Water Closet

Washout closet.

FIG. 17.—Hopkop Closet

oval mouth leading from it to the flushing rim of the pan. This gives a good flush although the cistern is low. A feature of construction which may be strongly recommended is to leave the closet entirely open for inspection and cleaning, instead of concealing it in a wooden case. The seat can generally be raised on iron brackets projecting from the wall, and can be raised on hinges at the back, so that the pan may be used as a urinal or slop-sink without the risk of fouling. Another good type of closet, sharing with the washout the advantage of having no mechanical parts, is the "hopper," illustrated in fig. 17 (Dodd's Hopper). In all these closets the lion marked V is for attaching a ventilating pipe.

For the supply of water to a closet a separate cistern is desirable, especially when water for distaste purposes is liable to be drawn from the main cistern (instead of being taken direct from the water service pipe, which is better). It would seem needless to add, were it not that such faults are common, that no cistern—unless it be exclusively used for water-closet supply—should be placed in the same room with or just under a water-closet, and that the room itself should be well lighted, well ventilated, and well shut off from bedrooms. To prevent flushing of closets from being imperfect through carelessness, many plans have been devised for ensuring that once the flow of water is started it will continue until a given volume has been discharged. One of the best of these is the arrangement of siphon flush sketched in fig. 18, when the valve *a* is opened the downrush of water starts the siphon *b* into action, and even should *a* be then closed the flow continues until the water-level falls to *c*, when air is admitted

FIG. 18.—Water-Closet Cistern with Siphon Flush

Auto-matic flush

and the siphon ceases to act. The air-pipe *c* is cut to give the desired volume.

As regards house-drains generally, the points of chief sanitary importance may be briefly summed up as follows:—(1) the use of one or more disconnecting traps to shut off sewer gas from the whole system of house-drains and pipes; (2) the thorough ventilation of house-drains, soil-pipes, and branches, by providing openings through which air can enter at the foot and escape at the top, (3) the discharge of all sinks, basins, &c., other than water-closet fittings, and especially of fixed bedroom basins, into open traps in the open air, (4) the direct discharge of cistern overflows and safe-trays into the open air, (5) the use of cleanly and well-designed closets, basins, &c., each sealed by an ordinary bent trap, (6) the use of separate service cisterns for water-closets.

It may seem superfluous to add that the system of actual pipes must provide a rapid and effective carriage of all state of sewage to the sewer, and must be water-tight and airtight. During the last five years, however, it has been proved, by examination of the best houses in London, that it is no uncommon case for a house to be so completely without effective connexion with the sewer that all its own sewage sinks into the soil under the basement, and about 75 per cent of the houses inspected have failed to pass the "smoke test."

In this connexion mention should be made of the Co-operative system of co-operative house-inspection originated by the late Prof. Fleeming Jenkin. The Edinburgh Sanitary Protection Association was founded by him in 1878 to carry out the idea that the sanitary fittings of a house should be periodically submitted to examination by an expert, and that householders should combine to secure for this purpose the continuous service of an engineer able to detect flaws, to advise improvements, and to superintend alterations. The Edinburgh association soon justified its existence by discovering, in the houses of its members, a state of things even worse than students of sanitary science had imagined possible. Similar associations are now doing excellent work in London, Glasgow, and many other large towns.

Space admits of only a very brief mention of those systems of sewerage in which excreta are not removed by the aid of water. The dry-earth system, introduced by the Rev. H. Moule, takes advantage of the oxidizing effect which a porous substance such as dry earth exerts by bringing any sewage with which it is mixed into intimate contact with the air contained in its pores. A discharge of urine and faeces is quickly and completely deodorized and absorbed when covered with a small quantity of dry earth, and the same soil, if exposed to the air and allowed to dry, may be used over and over again for the same purpose. Even after soil has been several times used, however, its value as manure is not so great as to pay for its transport to any considerable distance, and for this reason, as well as from the fact that it leaves other constituents of sewage to be dealt with by other means, the system is of rather limited application. So far as it goes it is excellent, and where there is no general system of water-carriage sewerage, or where the water-supply is small or uncertain, an earth-closet will, in careful hands, give perfect satisfaction. Numerous forms of earth-closet are sold in closets, which a suitable quantity of earth is automatically thrown into the pan at each time of use. Arrangements of this kind are, however, not necessary to the success of the system, a box filled with dry earth and a hand scoop will answer the purpose almost effectively. Ashes are sometimes substituted for or mixed with the dry earth, and powdered charcoal is also used.

The most primitive method of dealing systematically with Pail excreta is to collect the discharges directly in a vessel which is itself either carried to the country, and its contents applied to the land, or is emptied into a more portable vessel for that purpose. In Japan, for example, in spite of the difficulty of transport over bad roads and by human labour, the latter plan is universally followed. The land and the people have in fact performed for centuries what may be called a complete cycle of operations. The agricultural return is so good that farmers pay for leave to remove excrement, and householders look to their discharges as a source of income. The plan, although carried out in the roughest manner, appears to involve fewer sanitary drawbacks than might be expected, but

the smells from privies and carts, and, above all, from the process of emptying by ladle, are a nuisance which no Western community would tolerate. A simple pail system, in which the sewage is collected and removed in the same vessel, has been used at Rochdale, another, with an absorbent lining in the pails, at Halifax. A plan much used in Continental cities is to collect excrement in tight vials, which are emptied at intervals into a tank cast by a suction pump or injector. A more recent pneumatic system is that of Lierum, applied at Amsterdam, where sewage reservoirs at individual houses are permanently connected with a central reservoir by pipes, through which the contents of the former are sucked by exhausting air from the reservoir at the central station. A similar plan has been tried at Lyons and Paris by M Berlier.

Pneumatic system

SEWIN, or SEWEN. See SALMONDAE, vol. xxi. p. 222.

SEWING MACHINES. The sewing machine, as is the case with most mechanical inventions, is the result of the efforts of many ingenious persons, although it would appear that the most meritorious of these worked in entire ignorance of the labours and successes of others in the same field. Many of the early attempts to sew by machinery went on the lines of imitating ordinary hand-sewing, and all such inventions proved conspicuous failures. The method of hand-sewing is of necessity slow and intermittent, seeing that only a definite length of thread is used, which passes its full extent through the cloth at every stitch, thus causing the working arm, human or otherwise, to travel a great length for every stitch made, and demanding frequent renewals of thread. The foundation of machine-sewing was laid by the invention of a double-pointed needle, with the eye in the centre, patented by Charles F. Weisenthal in 1755. This device was intended to obviate the necessity for inverting the needle in sewing or embroidering, and it was subsequently utilized in Heilmann's well-known embroidery machine.

Many of the features of the sewing machine are distinctly specified in a patent secured in England by Thomas Saint in 1790, in which he, *inter alia*, describes a machine for stitching, quilting, or sewing. Saint's machine, which appears to have been intended principally for leather work, was fitted with an awl which, working vertically, pierced a hole for the thread. A spindle and projection laid the thread over this hole, and a descending forked needle pressed a loop of thread through it. The loop was caught on the under side by a reciprocating hook; a feed moved the work forward the extent of one stitch; and a second loop was formed by the same motions as the first. It, however, descended within the first, which was thrown off by the hook as it caught the second, and being thus secured and tightened up an ordinary tambour or chain stitch was formed. Had Saint hit on the idea of the eye-pointed needle his machine would have been a complete anticipation of the modern chain-stitch machine.

The inventor who first devised a real working machine was a poor tailor, Barthélemy Thimomier, of St Etienne, who obtained letters patent in France in 1830. In Thimomier's apparatus the needle was crocheted, and descending through the cloth it brought up with it a loop of thread which it carried through the previously made loop,

and thus it formed a chain on the upper surface of the fabric. The machine was a rather clumsy affair, made principally of wood, notwithstanding which as many as eighty were being worked in Paris in 1841, making army clothing, when an ignorant and furious crowd wrecked the establishment and nearly murdered the unfortunate inventor. Thimomier, however, was not discouraged, for in 1845 he twice patented improvements on it, and in 1848 he obtained both in France and the United Kingdom patents for further improvements. The machine was then made entirely of metal, and vastly improved on the first model. But the troubles of 1848 blasted the prospects of the resolute inventor. His patent rights for Great Britain were sold, a machine shown in the Great Exhibition of 1851 attracted no attention, and Thimomier died in 1857 unfriended and unrequited.

The most important ideas of an eye-pointed needle and a double thread or lock-stitch are strictly of American origin, and that combination was first conceived by Walter Hunt of New York about 1832-34. Hunt reaped nothing of the enormous pecuniary reward which has been shared among the introducers of the sewing machine, and it is therefore all the more necessary that his great merit as an inventor should be insisted on. He constructed a machine having a vibrating arm, at the extremity of which he fixed a curved needle with an eye near its point. By this needle a loop of thread was formed under the cloth to be sewn, and through that loop a thread carried on an oscillating shuttle was passed, thus making the lock-stitch of all ordinary two-thread machines. Hunt's invention was purchased by a blacksmith named Anson Smith, and a good deal was done towards improving its mechanical details, but no patent was sought, nor was any serious attempt made to draw attention to the invention. After the success of machines based on his two devices was fully established, Hunt in 1853 applied for a patent; but his claim was disallowed on the ground of abandonment. The most important feature in Hunt's invention—the eye-pointed needle—was first patented in the United Kingdom by Newton and Aichbold in 1841, in connexion with glove-stitching.

Apparently quite unconscious of the invention of Walter Hunt, the attention of Elias Howe, a native of Spencer, Mass., was directed to machine-sewing about the year 1843.

In 1844 he completed a rough model, and in 1846 he patented his sewing machine (fig. 1). Howe was thus the first to patent a lock-stitch machine, but his invention had the two essential features—the curved eye-pointed needle and the under-thread shuttle—which undoubtedly were invented by Walter Hunt

FIG. 1.—Howe's original Machine

twelve years previously. Howe's invention was sold in England to William Thomas of Chislehurst, London, a corset manufacturer, for £250. Thomas secured in December 1846 the English patent in his own name, and engaged

Howe on weekly wages to adapt the machine for his manufacturing purposes. The career of the inventor in London was chequered and unsuccessful, and, having pawned his American patent rights in England, he returned in April 1849 in deep poverty to America. There in the meantime the sewing machine was beginning to excite public curiosity, and various persons were making machines which Howe found to trench on his patent rights. The most prominent of the manufacturers, if not of inventors, ultimately appeared in the person of Isaac Meritt Singer, who in 1851 secured a patent for his machine (fig. 2),

Fig. 2—Singer's original Machine

and immediately devoted himself with immense energy to push the fortunes of the infant industry. Howenow became alert to vindicate his rights, and, after regaining possession of his pawned patent, he instituted suits against the infringers. A enormous amount of litigation ensued, in which Singer figured as a most obstinate defendant, but ultimately all makers became tributary to Elias Howe. It is calculated that Howe received in the form of royalties on machines made up to the period of the expiry of his extended patent—September 1867—which was also the month of his death, a sum of not less than two millions of dollars.

The practicability of machine-sewing being demonstrated, inventions of considerable originality and merit followed in quick succession. One of the most ingenious of all the inventors—who worked also without knowledge of previous efforts—was Mr Allan B Wilson. In 1849 he devised the rotary hook and bobbin combination, which now forms the special feature of the Wheeler & Wilson machine. Mr Wilson obtained a patent for his machine, which included the important and effective four-motion feed, in November 1850. In February 1851 Mr William O Grover, tailor, of Boston, patented his double chain-stitch action, which formed the basis of the Grover & Baker machine. At a later date, in 1856, Mr James A. E. Gibbs, a Virginia farmer, devised the improved chain-stitch machine now popularly known as the Willcox & Gibbs. These together—all American inventions—form the types of the various machines now in common use. Several thousands of patents have been issued in the United States and Europe, covering improvements in the sewing machine; but, although the efficiency of the machine has been greatly increased by numerous accessories and attachments, the main principles of the various machines have not been affected thereby.

In machine sewing there are three varieties of stitch made,—(1) the simple chain or tambour stitch, (2) the double chain stitch, and (3) the lock stitch. In the first variety the machine works with a single thread, the other forms use two, an upper and an under thread.

The structure of the chain stitch is shown in fig. 3. The needle first descends through the cloth, then as it begins to ascend the friction of the thread against the fabric is sufficient to form a small loop into which the point of a hook operating under the cloth plate enters, expanding and holding the loop while the needle rises to its full height. The feed then moves the fabric forward one stitch length, the hook with its loop is also

Fig. 3.—Chain Stitch.

projected so that when next the needle descends its loop is formed within the previous loop. The hook then releases loop No. 1, seizes and expands loop No. 2, and in so doing draws up the previous loop into a stitch, chain-like on the under side but plain on the upper surface of the fabric. The seam so made is firm and elastic, but easily undone, for if at any point a thread is broken the whole of the sewing can be readily run out backwards by pulling the thread, just as in crochet work. To a certain extent this imperfection in the chain-stitch machine is overcome in the Willcox & Gibbs machine, in which each loop is, by means of a rotating hook, twisted half a revolution after it has passed through its predecessor.

The double chain stitch is made by machines associated with the name of Grover & Baker. The somewhat complicated course of the threads in this stitch is shown in fig. 4. The under thread in this machine is supplied from an ordinary bobbin and is threaded through a circular needle of peculiar form. The machine is a wasteful of thread, and the sewing forms a knotted ridge on the under side of the fabric. Except for special manufacturing and ornamental purposes the machine is now in little use.

Fig. 4—Double Chain Stitch

The lock stitch is that made by all ordinary two-thread sewing machines, and is a stitch peculiar to machine sewing. Its structure is, as shown in fig. 5, very simple, and when by proper tension the threads interlock within the work the stitch shows the same on both sides and is very secure. When, however, the tension on the upper thread is weak, the under thread runs along the surface as at *b*, held more or less tightly by the upper loops. It will be seen that to make the chain stitch the under thread has to be passed quite through the loop of the upper thread. That is done in two principal ways. By the first plan a small metal shuttle, holding within it a bobbin of thread, is carried backward and forward under the cloth plate, and at each forward movement it passes through the upper thread loop formed by each succeeding stroke of the needle. Such is the principle devised by Hunt, introduced by Howe, and improved by Singer and many others.

Fig. 5—Lock Stitch

The second principal method of forming the lock stitch consists in seizing the loop of the upper thread by a rotating hook, expanding the loop and passing it around a stationary bobbin within which is wound the under thread. The method is the invention of Mr A. B. Wilson, and is known generally as the Wheeler & Wilson principle. The rotary hook seen at *b*, fig. 6, is so bevelled and notched that it opens and expands the upper thread loop, causing it quite to enclose the bobbin of under thread, after which it throws it off and the so-formed lock stitch is pulled up and tightened either by an independent take-up motion as in recent machines, or by the expansion of the next loop as in the older forms. The bobbin *A*, lenticular in form, and its case *B*,

Fig. 6—Rotary Hook, Bobbin, and Bobbin Case (Wheeler & Wilson Machine)

fig. 6, fit easily into a circular depression within the hook, against which they are held by the bobbin holder *a*, fig. 6.

Intermediate between the shuttle and the rotary-hook machines is the new oscillating-shuttle machine introduced by the Singer Co. The shuttle is hook-formed, not unlike the Wilson hook, and it carries within it a capacious circular bobbin of thread *b*, fig. 7. This shuttle is driven by an oscillating driver *ab* within an annular raceway *a a*, and, instead of revolving completely like the Wilson hook, it only oscillates in an arc of 150°, so far as serves to catch and clear the upper thread. The oscillating-

shuttle and to stay-hook machines work with great smoothness and rapidly

FIG. 7—Singer's Oscillating Shuttle Machine

There are numerous special sewing machines adapted for leather work, glove-sewing, &c., some of which will be alluded to under SHOES (J PA.)

SEX Since the article REPRODUCTION (*q.v.*) includes not only some account of the reproductive processes but an outline of the comparative anatomy of the reproductive organs, and even a somewhat detailed description of the essential sexual elements, it only remains here to make a brief survey of the more important groups with respect to the absence, union, or distinction of the sexes and to the associated "secondary sexual characters" which distinctly male and female organisms so frequently and strikingly present, and to follow up that outline of the morphological facts with a brief discussion of the nature and origin of the sexes and of the theory of reproduction.

Characters of the Sexes—Starting with the *Protozoa*, we find indeed that union or conjugation of two or more individuals is of frequent if not universal occurrence, yet, since, at any rate with rare and slight exceptions, no permanent morphological difference can be made out which would entitle us to speak of males or females, the group is generally defined as characterized by the absence of sexual reproduction. Without at present accepting or rejecting this view, it is convenient to postpone its discussion until the origin of sex comes to be considered.

Passing to the *Celenterata*, we find among the *Hydromedusae* the sexes usually distinct, and this distinction of the sexes has lately been traced back to the apparently asexual colonies from which the gonophores arise. Exceptions, however, occur,—e.g., *Tubularia*, which is monocious. The higher *Medusae* are also usually unisexual, and occasionally even show secondary sexual differences, as in the form and length of the prehensile filaments (*Aurelia*). *Physalia*, however, is hermaphrodite. The *Siphonophore* usually present both sexes within a single colony,—the gonophores themselves being, however, unisexual. In a few cases (*Asplenaria* var., *Diphyes acuminata*) the colony itself is entirely male or female. The *Climacophora* are invariably hermaphrodite, and among the *Hexactinellida* this is frequently though not generally the case, completely dioecious colonies even occurring (*Gerardia*). Among the *Ocellularia* the sexes are usually distinct, even so far as the colonies are concerned, yet there are many exceptions, e.g., *Coralium*, which has male, female, and hermaphrodite polyps on the same stock. See HYMENOCYSTES, CORALS, &c.

The *Echinodermata* are very rarely hermaphrodite (*Synapta*, *Amphipura squamata*), but secondary sexual characters are almost unknown. *Thyone*, however, has the male orifice on a small protuberance. See ECHINODERMATA.

Probably no invertebrate group presents so varied and interesting a series of sexual phenomena as the *Porosoa*. Thus the *Polyspa* exhibit that remarkable association of hermaphroditism with asexual reproduction which so frequently recurs in organisms of vegetative habit. The *Brachipoda* also are hermaphrodite, as also are the *Ophiuroids*; the *Polychaeta* only exceptionally so, some (*Nereide*) exhibit secondary sexual characters so well marked as to have been mistaken for specific or even generic ones. The *Platyhelminthes* with few exceptions are hermaphrodite, the

Nemerteans (except *Boloesia*) are unisexual and occasionally exhibit secondary sexual differences. The Nematodes are very rarely hermaphrodite (*Ascaris*, *Pelodytes*), but present very marked sexual differences, the male being usually recognizable by smaller size and caudal curvature. Spicules or clasper for coitus are also present. In *Strongylus* the female is caused by the male in a ventral furrow. The aberrant nematode *Echinorhynchus* is also dioecious. *Sagitta* is hermaphrodite, *Balanoglossus* unisexual, but without secondary sexual differences. Some of the most striking cases of sexual dimorphism are presented by the *Rotifera*, where the male is often a fallen representative of the specific type presented by the female, having not only greatly diminished in size but having undergone thorough degeneration in structure, the alimentary canal especially becoming represented by a mere impotente thread of cells. Not in such cases of male degeneration by any means confined to this group, a yet more striking instance is presented by the Gephyrean *Bonellia*, in which the oviduct of the large and well-grown female contains a number of almost microscopic everted Tubellarian-looking parasites, which have been shown to be the degenerate males. The other *Gephyrea* present no such extraordinary dimorphism, while the *Desophrea* are hermaphrodite. See POLYCHAETA, BRACHIOPODA, ANNELIDA, NEMERTEANS, PLANARIANS, TAPEWORMS, SAGITTA, LEBECS, &c.

Among Crustaceans the males are frequently smaller or relatively dwarfish, sometimes attached parasitically to the female, and the sexes are generally distinguishable at least by differences in the structure of some of the appendages,—generally, however, in evident relation to their respective functions. In Crustacea the sexes are separate, and a marked tendency to dimorphism is manifested, even among the free-living forms. This is sometimes manifested in a way which suggests the sexual magnificence of the highest animals; thus, for instance, the male *Sapphirina* has the brilliancy of a gem. With the appearance of parasitism in the group the reproductive relations become profoundly modified, thus it is the always less active females which first become sessile and parasitic; the male occasionally permanently retains freedom, as in the common *Neobothus* of the lobster's gill, more usually, however, he settles down beside or even upon the female and becomes more or less completely epiparasitic, undergoing a more thorough degeneration than the female herself. The analogous series from free to parasitic forms furnished by the *Ostracoda* and *Crepidula* are yet more remarkable in their sexual degeneration, since not only does hermaphroditism become the rule, but the females are "most frequently two to one female" appendages. These are utterly degenerate in size and structure, in fact often quite unrecognizable as Crustaceans at all, much less as members of the same species, save for their developmental history and the existence of a few intermediate degrees of degeneration between the normal and the lost Crustacean organization, e.g., *Tilia* or *Scalpellina*, where the males of some species still retain curl and lateral pincers. In some cases at least their male reproductive structures seem to be discharged early in larval life, before the exchange of few for sessile habits, their subsequent life apparently even sinking below the level of reproductive activity. A reversal of sex has actually been alleged in some cases, the males having been said to become female. In the Phylloporids the sexes are separate, but hermaphroditism very frequently occurs, as in *Daphnia*, *Aphis*, &c., and even in *Aphis* tends to replace sexual reproduction very completely. You should examine thousands of specimens during two years, without finding a single male; in other years, however, from 10 to 45 per cent. of males have more been found. Besides the usual copulatory modifications of appendages the males of some Phylloporids have more olfactory filaments on the antennae. In Amphipods similar differences have been noted; in Isopods these often become much more marked,—sometimes, as in the classical case of *Pro sepioides*, reaching a degree of dimorphism without degeneration which is hardly exceeded in the animal kingdom, and which quite naturally led to the separation of the sexes into distinct genera. In the parasitic forms (*Dappyrina*) the females degenerate much more thoroughly than the small and active males. The Schizopods exhibit considerable sexual differences. Thus among the males the antennae bear larger olfactory comb-like structures and larger abdominal members; respiratory appendages may also be enlarged, while the females, as in many Isopods, &c., have a broad pouch formed of overlapping ventral lamellae. The different position of the sex-openings and the characteristic forms of the limbs render the sexes easily distinguishable among the Desapods; the crabs have an obviously broader abdomen in the female (see CRUSTACEA). Among the *Arachnida*, the arachnid crabs already show slight external sex differences; among the spiders the males have a maxillary palp specially modified for a copulatory organ, an adaptation which, coupled with their often extremely small size, is of great importance in aiding their escape from their larger and voracious mates. Some species of *Theridium* have a stridulating apparatus. The male scorpions on the other hand seem to possess a rather stronger development; in the *Acarina* the smaller males are more distinctly segmented,

possess appendages modified for attachment, and sometimes retain a free habit of life as distinguished from the parasitic females. See ARACHNIDA.

Among INSECTA the sexes are distinguished by varying modifications of different parts of the body, and differences in external form and in colour are frequent. The males are generally active and more beautiful, and seem better endowed with sense organs, though usually smaller than the females. The males have also a pre-eminence or even monopoly in producing sounds, and it is perhaps in relation to this that the psychology of sex can first be said to come within the range of observation. Thus the field-micket is said to lower the tone of his song while caressing the female with his antennæ. In the parasitic forms dimorphism, as might be expected, becomes very marked, in *Staphylea* the males are free and winged, while the females are blind and wingless, in fact, permanently larval. Similar cases occur in other orders, the glow-worm being probably the most familiar instance. In parasitic or abundantly nourished forms pathogenesis very frequently appears, the extreme case being presented by *Cordomyia*, a fly which exhibits rapid pathogenic reproduction in the larval state. The dimorphism of many beetles, in which the male frequently acquires the most extraordinary specializations of external form, has received especial attention from Darwin, whose *Descent of Man* includes the fullest details. Here it is enough to mention that Koechlin has recently pointed out the coexistence of the larger size and greater vigour of the male with the presence of these functionless outgrowths. The beautiful sexual dimorphism so common among the Lepidoptera need not be more than mentioned at present, while the very remarkable sexual differentiation of *Thymoplectra* (bees, ants, wasps, &c.) may also be assumed to be sufficiently familiar. See INSECTS, ANTS, BEES. In several orders (*Diptera*, *Lepidoptera*, *Coleoptera*) cases of dimorphism occur among the male slaves, or eunuchs, and the males, as many as three forms of females have been described in certain butterflies.

The Molluscan sexes opens with the normally dioecious Lamellibranchs, of which some genera (most species of *Ostrea*, *Pecten*, &c.) are, however, hermaphrodite. The Pelecypods, Pulmonates, and Opisthobranchs are hermaphrodite, the Prosobranchs, Heteropods, and Cephalopods are unisexual. Of the latter have been described even in Lamellibranch shells (*Union*), and though the internal anatomy of the essential and accessory organs is of very high complexity, the extraordinary phenomena associated with "hermaphroditism" among the Cephalopods are the only marked outward manifestations of that sexual dimorphism which reaches its climax in the Argonaut. (See MOLLUSCS, CEPHALOPODS.) The Annelids are usually hermaphrodite; *Annelidus*, however, is unisexual (See TURTLES).

Among Fishes hermaphroditism is extremely rare (*Argemone*). The males are sometimes characterized by the modification of the pelvic limbs as claspers, &c., and are at the reproductive period often readily distinguishable from the females by their brighter colour or other extraneous changes, such as ruffling of the skin. Male and female rays are readily also distinguishable by their teeth and dorsal defences. The hooked jaw of the male salmon gives him a characteristic physiognomy during the breeding season. The carp undergoes a sort of epidemic eruption at the same period, male and female eels, too, are said often to become distinguishable both in colour and shape. Stomatopod apparatus may be present, notably in the Stomatopods. (See BRANCHIOPODS.) Among Amphibians the bright dorsal crest of the male newt is perhaps the most striking of sex distinctions, and in the breeding season, the vocal air sacs, external calluses, and some (*Bolitoglossa*, *Pelodactylus*) possess a gland under the fore-limb. (See AMPHIBIANS.)

Among the Ophidiiforms the males are smaller, and have longer and more slender tails; the sexes, too, differ sometimes in colour and markings. Male Chelonians, too, have sometimes longer tails and claws and may even give voice. The subaxillary musk-gland of the crocodile is especially active in the breeding season; the lizards have remarkably throat-throches and crests, which may be epidemic or even correspond to cranial outgrowths, as in the chameleon.

But it is among Birds and Mammals that the observer of sexual characters finds abundant and remarkable differences extending to the minutest details, and showing how the higher evolution of parental care which the inevitably prolonged embryonic life involves and the wider range of sexual selection have co-operated in modifying the whole organism. As might be expected, the lower mammals show least of this; but as we ascend the adult males become differentiated from the females by the acquirement of secondary sexual characters which are mainly either offensive and defensive aids for battle with each other, or which assist in gaining the admiration of the females, and these may coexist or coincide in very various degrees. The males of many birds and mammals have the *Placenta* (perhaps even from *Ornithogynus*) upwards. Greater beauty of markings or more vivid colours are acquired, — in many *Anthropidae* (baboons, &c.) the latter being of peculiarly

eude magnificence. Abundant local growths of hair often appear, most notably in the lion and in many *Anthropidae*. The development of tusks and horns is also too familiar to need more than passing mention.

But it is unquestionable that in this as in not a few other respects the birds, rather than the mammals, have reached the highest stages of evolution. For here sexual characters no longer seem merely superadded or supplementary to the apparatus of individual life, but habits and organization alike become thoroughly adapted to those—the sex-differences and the reproductive functions—as it were saturating the whole life, and producing so many and marvellous results, in habits and characters, in beauty and song, that it is not to be wondered at that the descriptive labours of the professed ornithologist have constantly risen into those of the artist and even the poet. See BIRDS, and Darwin's *Descent of Man*.

Nature and Determination of Sex.—It is not here proposed to enter upon the task of historical review and criticism of the various theories of sex—which were estimated at so many as five hundred at the beginning of the last century, or even to attempt any sketch of the present very conflicting state of opinion on the subject.¹

Although our theories of sex may be still vague enough, the greatest step to the solution has been made in the general abandonment by scientific men of the doubtless still popular explanation—in terms of a "natural tendency" for the production of an excess of males or the like. It is now held that "quality and quantity of food, elevation of abode, conditions of temperature, relative age of parents, their mode of life, habits, rank, &c., are all factors which have to be considered." The idea that the problem of the nature of sex is capable of being approached by empirical observation of the numbers of different sexes produced under known sets of conditions, and the obvious practical corollary of this, viz., that the proportion of the sexes must therefore be capable of being experimentally modified and regulated, are conceptions which have steadily been acquiring prominence, especially of late. In short, if we can find how sex is determined, we shall have gone far to investigate sex itself.

One of the most crude attempts has been that of Canevari, who ascribes the determination of sex to the number of sperms entering the ovum, but this view has been already demolished by Fol and Pfleger. The time of fertilization has also and apparently with greater weight been insisted upon, thus Thury, followed by Dising, holds that the sex of the offspring depends on the period of fertilization: an ovum fertilized soon after liberation produces a female, while the fertilization of an older ovum produces a male. This view has been carried a step farther by Hansen, who suggests that the same should probably hold true of the spermatozoa, and thus the fertilization of a young ovum by a fresh sperm would have a double likelihood of resulting in a female. There are some observations which support this: thus Thury and other cattle-breeders have claimed to determine the sex of cattle on this principle, and (from long ago alleged that female flowers, fertilized as soon as they are able to receive pollen, produced a distinct excess of female offspring.

Great weight has also been laid on the relative age of the parents. Thus Hofacker, so long ago as 1828, and Sadler a couple of years later, independently published a body of statistics (each of about 2000 births) in favour of the generalization (since known as Hofacker's and Sadler's law) that when the male parent is the elder the offspring are preponderantly male, while, if the parents be of the same age, or a *fortiori* if the male parent be younger,

¹ As for reproduction in general, so far sex, the most convenient starting-point is the work of Hansen ("Die Zeugung," in Hermann's *Tab. d. Physiologie*), while other dissertations are to be found in the leading manuals of zoology and botany, especially, however, in special papers too numerous to mention. See also REMONSTRATION, and for fuller bibliographical details see Gaides, "On the Theory of Growth, Reproduction, Sex, and Heredity," *Proc. Roy. Soc. Edin.* 1886.

female offspring appear in increasing majority. This view has been confirmed by Goehliert, Boulanger, Legoyt, and others; some breeders of horses, cattle, and pigeons have also accepted it. Other breeders, however, deny it altogether, moreover, the recent statistics of Stieda and of Berner (taken independently from Alsace-Lorraine and Scandinavia) seem to stand in irreconcilable contradiction. At any rate at present we do not seem justified in ascribing greater importance to the relative age of parents than as a secondary factor, which may probably take its place among those causes influencing nourishment discussed below.

That good nourishment appears to produce a distinct preponderance of females is perhaps the single result which can at present be regarded as clearly proven and generally accepted. Yet it would be too much to say that unanimity is even here complete, thus, among plants, the experiments of Girou (1823), Haberlandt (1869), and others gave no certain result; those of Heyer (1883) have led him to dispute the validity of the generalization altogether, while Haberlandt (1877) brought evidence for regarding the excess of females as largely due to the greater mortality of the males. The investigations of agricultural observers, especially Meehan (1878), which are essentially corroborated by Dusing (1883), however, leave little doubt that abundant moisture and nourishment tend to produce females. Some of Meehan's points are extremely instructive. Thus old branches of Conifers overgrown and shaded by younger ones produce only male inflorescences, a fact which may be taken in connexion with Sadebeck's observation that some fern prothallia, under unfavourable conditions, can still form antheridia but not archegonia. The formation of female flowers on male heads of maize is ascribed by Knop to better nutrition consequent on abundant moisture. The only seriously contradictory observations are thus those of Heyer, and it is therefore reassuring when a detailed scrutiny of his paper shows his ill-conducted experiments (which land him in the conclusion that the organism is not modifiable by its environment at all) to be largely capable of a reversed interpretation. The agency of temperature is also of considerable importance. Thus Meehan finds that the male plants of hazel grow more actively in heat than the female, and Ascherson states that *Stratiotes aloides* bears only female flowers north of 52° lat., and from 50° southwards only male ones. Other instances might be given.

Passing to the animal kingdom we find the case of insects peculiarly clear, thus Mrs Treat showed that if caterpillars were starved before entering the chrysalis state the resultant butterflies or moths were males, while others of the same brood highly nourished came out females. Gentry too has shown for moths that unnutritious or diseased food produced males; hence perhaps a partial explanation of the excess of male insects in autumn, although temperature is probably more important. The recent experiments of Yung on tadpoles are also very conclusive. Thus he raised the percentage of females in one brood from 56 in those unfed to 78 in those fed with beef, and in another supply from 61 to 81 per cent. by feeding with fish, while, when the especially nutritious flesh of frogs was supplied, the percentage rose from 54 to 92. Among mammals the difficulties of proof are greater, but evidence is by no means wanting. Thus an important experiment was long ago made by Girou, who divided a flock of 300 ewes into equal parts, of which the one half were extremely well fed and served by two young rams, while the other was served by two mature rams and poorly fed. The proportion of ewe lambs in the two cases was respectively 60 and 40 per cent. Dusing also states that it is usually the heavier ewes which bring forth ewe lambs.

Not does sex in the human species appear to be independent of differences of nutrition. After a cholera epidemic or a war more boys are said to be born, and Dusing also points out that in females with small placenta and little menstruation more boys are found, and even affirms that the number of male children varies with the use in process. In towns and in prosperous families there are also more females, while males are more numerous in the country and among the poor. The influence of temperature is also marked, more males are born during the colder months, a fact noted also by Schlechter for horses.

The best known and probably still most influential theory is that systematized by Girou and known as that of "comparative vigour." This makes sex of offspring depend on that of the more vigorous parent. But to this view there are serious difficulties, thus consumptive mothers produce a great excess of daughters, not sons as might be expected from the superior health of the father. Still less weight can be attached to that form of the hypothesis which would make sex follow "genital superiority" or "relative aidency" alone. Any new theory has thus to reconcile the arguments in favour of each of the preceding views, and meet the difficulties which beset all. As Starkweather puts it, it must at once account for such facts as "the preponderance of male births in Europe, of females among mulattoes and other hybrid races, as also among polygamous animals, and for the equality among other animals. More especially it must suggest some principle of self-adjustment by which not only is the balance of the sexes nearly preserved on the whole, but by which also in cases of special disturbance the balance tends to readjust itself." Starkweather proceeds to attempt this, and his argument may be briefly summarized. While few maintain any essential equality of the sexes, and still fewer any superiority of the female, the weight of authority has been from the earliest times in favour of the doctrine of male superiority. From the earliest ages philosophers have contended that woman is but an undeveloped man; Darwin's theory of sexual selection presupposes a superiority in the male line and entailed on that sex; for Spencer the development of woman is early arrested by procreative functions; in short, Darwin's man is as it were an evolved woman, and Spencer's woman an arrested man. On such grounds we have a number of theories of sex. Though thinks males are born when the system is at its best, more females when occupied in growth, reparation, or disease. So, too, Tiedman and others regard every embryo as originally female and remaining female if erected, while Veljan conversely regards embryos as all naturally male, but frequently degenerating to the female state. Starkweather points out some of the difficulties to the view of female inferiority, and lays it down as the foundation of his work that "neither sex is physically the superior, but both are essentially equal in a physiological sense." But, while this is true of the average, there are many grades of individual differences and deficiencies in detail, involving a greater or less degree of superiority in one or other of every pair. Starkweather's theory then is "that sex is determined by the superior parent, also that the superior parent produces the opposite sex." The arguments adduced in favour of this view, however, are scarcely worthy of it, since, save a chapter of pseudo-physiological discussion of vital forces and polarities, of superiority, nervous, electrical, &c.,—they rest mainly on the vague and shifting grounds of physiognomy and temperament. And when superiority is analysed into its factors,—cerebral development and activity, temperament, state of health, of nutrition, &c.,—soon we find under the appearance of simplicity a law has been obtained not by discovering any real unity under the many

apparently different factors, but by simply lumping them under a common name. Not is a rationale given of the affirmed reversal of sex, which Schlechter and other authorities moreover wholly deny. Despite these and other faults and failures the work is interesting and often suggestive, and that not only on account of its theoretic position but its sanguine proposals for the practical control of sex.

The work of Dusing (1883), while less speculative, is of great importance in respect to the causes which regulate the proportions of the sexes, since, instead of falling back with Darwin on the unexplained operation of natural selection, he seeks to note the circumstances in which a majority of one sex is profitable, and to show that organisms have really the power to produce in such circumstances a majority of one sex,—in short, that disturbances in the proportion of the sexes bring about their own compensation, and further supports these views by calculation and statistical evidence.

He separates the causes determining sex into those affecting (a) one parent and (b) both alike. Starting with a minority of one sex, he emphasizes the importance of delayed fertilization, accepting it as a fact that females late fertilized bear more males (this corresponding in man to a scarcity of males among the lower animals). He notes that the firstborn child is most frequently a male, especially among older persons, and thus explains how after a war, when there is a want of males, most male children are born. He ascribes importance to the amount of sexual intercourse. Thus, suppose a minority of females; their fertilization tends to occur more frequently, and thus (if the general statement be correct) they should produce a majority of their own sex, or similarly with males. This is supported by inference to catall-breeding, and it is interpreted physiologically to involve that young spermatozoa produce a majority of males. Suppose a great majority of males: the chances of early fertilization of the females are of course great, but eggs fertilized only tend to produce females. Or suppose equality of sex: a great majority must—the chances of early fertilization are small, but old eggs tend to produce males, and either excess will thus become compensated. Or again, the more decided the minority of one sex the more frequent the sexual activity of its individuals, the younger their sexual elements, and consequently the more individuals of that sex are produced. Dusing next takes up as indirect causes equivalent to a minority of males: overabundant nutrition, just as frequent copulation overstimulates the genital organs the same result may arise from the deficient nutrition of the system, hence an ill-fed cow yields a female to a well-fed bull and *vice versa*, (b) relative age; the nearer either parent is to the period of greatest reproductive capacity the less, he thinks, is a birth of that sex probable.

As factors affecting both parents he first discusses variations in nutrition, although means of subsistence may decrease, there is at first no decrease in the number of progeny. But it is necessary to distinguish the reproduction of the species from its multiplication, so that in defective nutrition, though an animal may not reproduce less, it will permanently multiply much less. He agrees with Darwin that the reproductive system is most sensitive to changes of nutrition; gives cases showing the effect of abundant nutrition on reproductive activity, notes the influence of climate, function, &c., and contrasts organisms of high activity, like birds and insects, with parasites. The nutritive relations of the sexes are also contrasted, since females have to give to the embryo more than the male, they are much more dependent on food for vigour of their reproductive capacity, and hence the frequent contrast of their size, &c. Furthermore, animals suit their multiplication to their conditions of nutrition; if food be abundant there is an increase in the number of females, and therefore a further increase in number of individuals of the species; if food be scanty, however, be too scarce the more males are produced, and the number of the species tends to diminish. Hence the connexion above mentioned between increase of children (especially females) in prosperity and after a good harvest, and the rising proportion of boys during a rise of prices. Similarly for animals: the more food the more females, and the more rapidly the species increases; the less food the more males, and the less rapid the increase. Again, plants on good soil produce more female flowers and more seed with profit to the species; on bad soil male flowers preponderate, mostly perianth, and the species tends to disappear. The extreme case of optimum nutrition tends to produce normal parthenogenesis ("thelytokia"), yielding only females, different in cause and operation from the parthenogenesis resulting from the absence of males ("arrhenotokia").¹

Theory of Reproduction and Sex.—If we now attempt to reach a rational standpoint from which to criticize and compare the innumerable empirical conceptions of sex,—much more if we seek a firm basis for the construction of a really comprehensive theory,—it is evident that such a theory must be addressed not merely to the specialist concerned with problems of reproduction and development, but, while embracing details and anomalies, must be satisfactory alike to the general morphologist and physiologist. We must therefore have before us that conception of the main lines of thought on each of these subjects which has been outlined under the headings *Physiology* and *Morphology*.

The close coincidence between these two independent developments is especially to be noted. From the vague account of general form and appearance, of habits and temperaments, which made up the descriptive natural history of the past, the two streams of progress, though distinct, are wholly parallel. Thus Buffon furnished a brilliant and synthetic exposition of the oldest view, while one side of their general aspect received new precision at the hands of Linnaeus,—to some extent the other also at the hands of his physiological contemporaries. The anatomical advance of Cuvier is parallel to the detailed study of the functions of the organs, while the great step made by Bichat lay in piercing below the conception of the organ and its function as ultimate, and in seeking to interpret both by reference to the component tissues. The cell-theory of Schwann and his successors analysed these tissues a step farther, while the latest and deepest analysis refers all structure ultimately to the substance called protoplasm, and similarly claims to express all function in terms of the construction and destruction, synthesis and analysis, anabolism and katabolism of this. See *Physiology*, *Protoplasm*, *Morphology*.

Now, since every morphological and physiological fact or theory is in one or other of these few categories, it is evident that we have here the required criterion of theories of reproduction and sex. The question, What is sex? what is meant by male or female? admits of a regular series of answers. The first and earliest is in terms of general aspect, temperament, and habit, and, though crude, empirical, and superficial, it looks neither unity nor usefulness. At this plane are not only most popular conceptions but many theories like that of Starkweather, which may be mentioned as the most recent. The anatomist contents himself with the recognition of specific organs of sex, or at most with a similarly empirical account of their functions; while the embryologist and histologist will not rest contented without seeking to refer these organs to the tissues of which they are composed and the layer from which they spring, and even reaches and describes the ultimate cellular elements essential to sex,—the ovum and spermatozoon. A parallel physiological interpretation of these is next required, and at this point appear such hypotheses as those of Weismann and others.

Thus the bewildering superabundance of widely different theories at the present juncture becomes intelligible enough, and, each once classified according to its stage of progress, a detailed criticism would be easy. But this is not enough: the demand for an explanation at once rational and ultimate, to comprehend and underlie all the preceding ones, is only the more urgent. Where shall we seek for it? On the one hand the morphological aspect of such an explanation must interpret the forms of sex cells in terms of those of cells in general, and in terms of the structural properties of protoplasm itself; while its more difficult yet more satisfying physiological aspect must express the mysterious difference of male and female in terms of the life processes of that protoplasm,—in terms,

¹ See Dusing, *Jena Zeitschr.*, 1883; Starkweather, *Laws of Sex*, 1893.

that is to say, of anabolism and katabolism. Were these steps made a new synthesis would be reached, and from this point it should even next be possible to retraced the progress of the science, and interpret the foms and the functions of tissues and organs, nay, even of the facts of aspect, habit, and temperament, so furnishing the deductive rationale of each hitherto merely empirical order of observed fact and connecting theory.

While this conception does not admit of development within the present limits,¹ a brief abstract of such an interpretation of reproduction and sex in terms of anabolism and katabolism may be of interest to the reader. The theory of reproduction, in general principle at least, is simple enough. A continued surplus of anabolism involves growth, and the setting in of reproduction when growth stops implies a relative katabolism. This in short is merely a more precise restatement of the familiar antithesis between nutrition and reproduction. At first this disintegration and reintegration entirely exhaust the organism and conclude its individual existence, but as we ascend the process becomes a more and more localized one. The origin of this localization of the reproductive function may not be understood if we figure to ourselves a fragment of the genealogical tree of the evolutionist in greater detail, and bear in mind that this is made up of a continuous alternation series of sex-cell and organism, the organism, too, becoming less and less distinguished from its parent cell until the two practically coincide in the *Protozoa*, which should be defined not so much as "organisms devoid of sexual reproduction" but rather as undifferentiated reproductive cells (*Protoplasms* or *Protoplasts*) which they might in fact be called), how the continuous unimodal stream of Protozoan life (see *PROTOZOA*) is continued by that of ordinary reproductive cells among the higher animals, for the mortality of these does not affect this continuity any more than the fall of leaves does the continual life of the tree. The interpretation of sex is thus less difficult than might at first sight appear. For anabolism and katabolism cannot and do not absolutely balance, as all the facts of rest and motion, nutrition and reproduction, variation and disease, in short of life and death, clearly show. During life neither process can completely stop, but their algebraic sum keeps varying within the widest limits. Let us note the result, stating from the undifferentiated amoeboid cell. A surplus of anabolism over katabolism involves not only a growth in size but a reduction in kinetic energy, a more or less complete cessation of movement. Inorganisms thus tend to disorganize, a surface tension force may aid, and the cell acquires a spheroidal form. The large and quiescent ovum is thus intelligible enough. Again stating from the amoeboid cell, if katabolism be in increasing preponderance the increasing liberation of kinetic energy thus implied must find its outward expression in increased activity of movement and in diminished size, the more active cell becomes modified in form by passage through its fluid environment, and the flagellate form of the spermatozoon is thus natural enough. It is noteworthy, too, that these physiologically normal results of the rhythm of cellular life, the resting, amoeboid, and ciliate forms, are precisely those which we empirically reach on morphological grounds alone (see *MORPHOLOGY*, vol. xvi p. 841).

Given, then, the conception of the cellular life rhythm as capable of thus passing into a "resting," amoeboid or katabolic habit or diathesis, the explanation of the phenomena of reproduction becomes only a special field within a more general view of structure and function, nay even of variation, normal and pathological. Thus the generality, use, and nature of the process of fertilization becomes readily intelligible. The profound chemical difference assumed by so many authors becomes intelligible as the outcome of anabolism and katabolism respectively. The passage from ovary growth to that discontinuous growth which we term asexual reproduction, and from this again to sexuality or the frequent reverse progress, is capable of rational interpretation in like manner—the "alteration of gene-

rations" is but a rhythm between a relatively anabolic and katabolic preponderance, a pathogenetic ovum is an incompletely differentiated ovum which retains a measure of katabolic (male) products, and this does not need fertilization, while hemaphroditism is due to the local preponderances of anabolism or katabolism in one set of reproductive cells or in one period of their life. The reversion of unisexual forms to hemaphroditic ones, or of these to asexual ones, which we have seen in such constant association with high nutrition and low expenditure,² is no longer inexplicable. The female sex being thus preponderantly anabolic, the importance of good nutrition in determining it is explained—menstruation is seen to be the means of getting rid of the anabolic surplus in absence of its fetal consumption, while the high temperature and greater activities of the male sex express its katabolic diathesis. The phenomena of sex, then, are no isolated ones, but express the highest outcome of the whole activities of the organism—the literal blossoming of the individual life. (P. GE.)

SEXTANT, an instrument for measuring angles on the celestial sphere. The name (indicating that the instrument is furnished with a graduated arc equal to a sixth part of a circle) is now only used to designate an instrument employing reflexion to measure an angle, but originally it was introduced by Tycho Brahe, who constructed several sextants with two sights, one on a fixed, the other on a movable radius, which the observer pointed to the two objects of which the angular distance was to be measured.

In the article **NAVIGATION** the instruments are described which were in use before the invention of the reflecting sextant. Their imperfections were so evident that the idea of employing reflexion to remove them occurred independently to several minds. Hooke contrived two reflecting instruments. The first is described in his *Posthumous Works* (p. 503), it had only one mirror, which reflected the light from one object into a telescope which is pointed directly at the other. Hooke's second plan employed two single reflexions, whereby an eye placed at the side of a quadrant could at the same time see the images formed in two telescopes, the axes of which were radii of the quadrant and which were pointed at the two objects to be measured. This plan is described in Hooke's *Animadversions to the Machina Cœlestis of Hevelius*, published in 1674, while the first one seems to have been communicated to the Royal Society in 1666. Newton had also his attention turned to this subject, but nothing was known about his ideas till 1712, when a description in his own handwriting of an instrument devised by him was found among Halley's papers and printed in the *Philosophical Transactions* (No. 465). It consists of a sector of brass, the arc of which, though only equal to one-eighth part of a circle, is divided into 90°. A telescope is fixed along a radius of the sector, the object glass being close to the centre and having outside it a plane mirror inclined 45° to the axis of the telescope, and intercepting half the light which would otherwise fall on the object glass. One object is seen through the telescope, while a movable radius, carrying a second mirror close to the first, is turned round the centre until the second object by double reflexion is seen in the telescope to coincide with the first.

But long before this plan of Newton's saw the light the sextant in its present form had been invented and had come into practical use. On May 13, 1731, John Hadley gave an account of an "octant," employing double reflexion, and a fortnight later he exhibited the instrument.³

² Thus Marshall Ward has lately drawn attention to the association of parasitism with the disappearance of sexual reproduction in *Pimpla* (*Quart. Jour. Microsc.*, xiv.).

³ Hadley described two different constructions: in one the telescope was fixed along a radius as in Newton's form, in the other it was placed in the way afterwards universally adopted; an octant of the first construction was made as early as the summer of 1730, according to a statement made to the Royal Society by Hadley's brother George on Feb. 7, 1734.

¹ See paper by Geddes already mentioned at p. 721, footnote.

On the 20th May Halley stated to the society that Newton had invented an instrument founded on the same principle, and had communicated an account of it to the society in 1699, but on search being made in the minutes it was only found that Newton had showed a new instrument "for observing the moon and stars for the longitude at sea, being the old instrument mended of some faults," but nothing whatever was found in the minutes concerning the principle of the construction. Halley had evidently only a very dim recollection of Newton's plan, and at a meeting of the Royal Society on December 16, 1731, he declared himself satisfied that Hadley's idea was quite different from Newton's. The new instrument was already in August 1732 tried on board the "Chatham" yacht by order of the Admiralty, and was found satisfactory, but otherwise it does not seem to have superseded the older instruments for at least twenty years. As constructed by Hadley the instrument could only measure angles up to 90°, but in 1757 Captain Campbell of the navy, one of the first to use it assiduously, proposed to enlarge it so as to measure angles up to 130°, in which form it is now generally employed.

Quite independently of Hadley and Newton the sextant was invented by Thomas Godfrey, a poor glazier in Philadelphia. In May 1732 Mr James Logan of that city wrote to Halley that Godfrey had about eighteen months previously showed him a common sea quadrant "to which he had fitted two pieces of looking-glass in such a manner as brought two stars at almost any distance to coincide." The letter gave a full description of the instrument; the principle was the same as that of Hadley's first octant which had the telescope along a radius. At the meeting of the Royal Society on January 31, 1734, two affidavits sworn before the mayor of Philadelphia were read, proving that Godfrey's quadrant was made about November 1730, that on the 28th November it was brought by (i) Stewart, mate, on board a sloop, the "Truman," John Cox, master, bound for Jamaica, and that in August 1731 it was used by the same persons on a voyage to Newfoundland. There can thus be no doubt that Godfrey invented the instrument independently, but the statement of several modern writers that a brother of Godfrey, a captain in the West India trade, sold the quadrant at Jamaica to a Captain or Lieutenant Hadley of the British navy, who brought it to London to his brother, an instrument maker in the Strand, has been proved to be devoid of all foundation. Not only is this totally at variance with all the particulars given in the affidavits, but between 1719 and 1743 there was no officer in the British navy of the name of Hadley, and John Hadley cannot possibly have been in the West Indies at that time, as he was present at many meetings of the Royal Society between November 1730 and May 1731, besides, neither Hadley nor his brothers were professional instrument makers. A detailed discussion of this question by Prof. Wiggles is found in the *Nautical Magazine*, vol. ii. No. 21.¹

The annexed figure gives an idea of the construction of the sextant. ABC is a light framework of brass in the shape of a sector of 60°, the limb AB having a graduated arc of silver (sometimes of gold) metal in the centre. It is held in the hand by a small handle at the back, either vertically to measure the altitude of an object, or in the plane passing through two objects the angular distance of which is to be found. OD is a radius movable round C, where a small plane mirror of silvered plate-glass is fixed perpendicular to the plane of the sextant and in the line CD. At D is a vernier read through a small lens, also a clamp and a tangent

which enable the observer to give the arm CD a very slow motion within certain limits. At E is another mirror "the horizon glass," also perpendicular to the plane of the sextant and parallel to CB. F is a small telescope fixed across CB, parallel to the plane CAB and pointed to the mirror E. Dark-glasses can be placed outside E and between E and C when observing the sun. As only the lower half of E is silvered, the observer can see the horizon in the telescope through the unsilvered half, while the light from the sun or a star S may be reflected from the "index-glass" C to the silvered half of E and thence through F to the observer's eye. If CD has been moved so as to make the image of a star or of the limb of the sun coincide with that of the horizon, it is easy to see that the angle SOH (the altitude of the star or solar limb) is equal to twice the angle BCD. The limb AB is so

graduated so as to avoid the necessity of doubling the measured angle, a space marked as a degree on the limb being in reality only 30°. The vernier should point to 0° 0' 0" when the two mirrors are parallel, or in other words, when the direct and reflected images of a very distant object are seen to coincide. For the methods of adjusting the mirrors and finding the index error see NAVIGATION (vol. xvii p. 208).

If the sextant is employed on land, an artificial horizon has to be used. This is generally a basin of mercury protected from the wind by a roof of plate-glass with perfectly parallel faces, sometimes a glass plate is used (with the lower surface blackened), which can be levelled on three screws by a circular level. The telescope is directed to the image of the celestial object reflected from the artificial horizon, and this image is made to coincide with that reflected from the index-glass. In this case the angle BCD will double the altitude of the star. Towards the end of last and the beginning of the century the sextant was much used on land for determining latitudes, but, though in the hands of a skilful observer it can give results far superior to what one might expect from a small instrument held in the hand (or attached to a small stand), it has on shore been quite superseded by the portable altazimuth or theodolite, while at sea it continues to be indispensable.

The principle of the sextant has been applied to the construction of reflecting circles, on which the index arm is a diameter with a vernier at each end to eliminate the error of eccentricity. The circles constructed by Pistor and Martins of Berlin have a glass prism instead of the horizon glass and are extremely convenient. (J. L. E. D.)

SEXTUS EMPIRICUS. See SCEPTICISM.

SEYCHELLES, an archipelago in the Indian Ocean, consisting of eighty islands—several of them mere islets—situated between 3° 38' and 5° 45' S. lat. and 52° 55' and 53° 50' E. long., about 1400 miles south-east of Aden and 1000 miles east of Zanzibar. They are the only small tropical oceanic islands of granitic structure, and rise steeply out of the sea, culminating in the island of Mahé, at an elevation of 2998 feet above the sea-level. The most northerly island is Bird, $\frac{1}{2}$ by $\frac{1}{2}$ mile; the most southerly, Plato, the most easterly, Frégates; the most westerly, Silhouette. Mahé, the largest island of the group, 3 by 14 miles, is very nearly central, 60 miles south of Bird, and having to the north and north-east of it La Digne, Félicité, Praslin, and Curieuse. Only a few—Mahé, Praslin, La Digne, Denis, and Bird—are inhabited. The total area is about 50,120 acres, of which Mahé alone comprises 34,749. The beaches of glistening calcareous sand are begirt by coral reefs which form a wall round the islands. The valleys and easier slopes are overlaid with a very fertile soil, and vegetation is most luxuriant. Though the climate is tropical, the heat is tempered and rendered uniform by the sea breezes, and probably this accounts for epidemic diseases and endemic fever being of uncommon

¹ John Hadley was a country gentleman of independent means, and the fact that he was the first to bring the construction of reflecting telescopes into any perfection has made many authors of astronomical books believe that he was a professional instrument maker. His brother George, who assisted him in his pursuits, was a barnster.

occurrence. There are numerous brooks and torrents, making their way to the sea between blocks of granite. The islands are green and fresh at all times, particularly during the wet season from November to May. The total rainfall in 1881 was 113.50 inches. The extreme range of the thermometer in 1881 and 1882 was only 32° (minimum 71°, maximum 93°). The heat is seldom sultry and oppressive. The Seychelles lie too far to the north to receive the hurricanes which occasionally sweep over Bourbon and Mauritius, and even thunderstorms are rare. The population at the census of 1881 was 14,081 (7179 males and 6902 females)—500 white (mostly French creoles), 11,500 black, and 2000 coolies. Since 1881 the population has considerably increased in consequence of a tide of immigration from Mauritius. Men and women of exceptionally great age are frequently met with, and the death-rate for 1880 amounted to only 13 per 1000. The prevailing language is a French patois, but English is taught in the schools.

These islands were discovered at the beginning of the 16th century, but never occupied, by the Portuguese. In 1742 the French took possession of them, calling them the *Îles des Labordeuses*, but afterwards the Seychelles, from Count Hilaire de Seychelles, an officer of the East Indian fleet. The first settlement was made in 1768 at Mahé, now Port Victoria. In 1794 the English wrested them from the French along with Mauritius, and they are now ruled by a board of six civil commissioners, as a dependency under the governor of Mauritius. In 1884 slavery was abolished, and since then the plantations have been in a declining state. In 1884 there were in the islands 20 primary schools aided by Government grants and attended by 1820 children. There are 16 churches belonging to the Roman Catholics (the dominant faith) and 11 to the Church of England. The main product is the cocoa-nut, but tobacco, coffee, rice, maize, sweet potatoes, and manioc are raised for home consumption, while cotton, pepper, cinnamon, and other spices grow wild. Many of the trees display simultaneous male and female blossoms and the fruit. The so-called sea or Maldiva double cocoa nut, "coco de mer," the fruit of the palm-tree *Lodococcus Sechellarum*, is peculiar to certain of those islands. It was long known only from sea-borne specimens cast up on the Maldiva and other coasts, was thought to grow on a submarine palm, and, being esteemed a sovereign antidote to poisons (*Lusidæ*, x 186), commanded exorbitant prices in the East. This palm will grow to a height of 100 feet and shows fern-like leaves of enormous size. The sensitive plants from America spread like lawns over the soil and quake at every step taken over them. The cocoa-nut palm flourishes in the gardens, overtopping the houses and most other trees, lining the shore, climbing high up the mountains, and in many places forming extensive forests. There are no native mammals, and domestic animals are scarce. The birds comprise gannets, terns in great numbers, and white egrets. Tortoises are common,—among them the gigantic turtle and black turtle, whose flesh is exported. The sea abounds in fish, many of them distinguished by splendid colours, and yields the inhabitants not only a large part of their animal food but also material for building their houses,—a species of massive coral, *Porites guerardæ*, being hewn into square building blocks which at a distance glisten like white marble.

The principal harbour is Port Victoria, situated on Mahé island. The total value of imports here in 1884, including Rs. 27,097 specie, was Rs. 498,005, and of the exports, including Rs. 21,568 specie, Rs. 892,175. The chief imports were coffee and cotton manufactures, the chief exports, cocoa-nut, cocoa-nut oil, and sperm oil. The fiscal receipts for 1884 amounted to Rs. 130,047. The cultivation of cocoa is progressing favourably, but the same cannot be said of the vanilla and clove plantations, which suffer from want of regular labour, attributable to the widespread slave system, which the negroes refuse to regular work. The leaf disease affecting coffee has done great injury, and cocoa-nut plantations have suffered from the ravages of an insect, but no effort seems to have yet been made by weeding the plantations to stamp out the disease. Of the 34,749 acres of land making up Mahé, 19,000 acres are laid out in cocoa nut, 800 in vanilla, coffee, and clove, and 1600 are in forest; of the uncultivated land 8000 acres are well suited for vanilla, cocoa, and coffee plantations.

SEYMOUR, EDWARD. See SOMERSET, DUKE OF.

SEYNE, LA, a town of France, in the department of Var, 5 miles south-west of Toulon, with a population of 9788 in 1881. It owes its importance mainly to its ship-building, the Société des Forges et Chantiers de la Méditerranée having here one of the finest building yards in

Europe, in which more than 2000 workmen are employed; contracts are executed for private shipowners, for the great Messageries Maritimes Company, and for various Governments. The port, which has communication by steamer and omnibus with that of Toulon, is 6 acres in extent, and admits vessels of the largest tonnage.

SFAKX, a city of Tunis, second in importance only to the capital, is situated 116 miles south of Mahadia, on the coast of the Gulf of Gabes (Syrtis Minor) opposite the Kerkenah Islands. It consists of three distinct portions. —the new European quarter to the south, with roads, piers, and other improvements carried out by the municipality, the *Asiab* town in the middle with its tower-flanked walls entered by only two gates, and to the north the French camp. Round the town for 5 or 6 miles to the north and west stretch orchards and gardens and country houses, where most of the Sfax families have their summer quarters. Dates, almonds, grapes, figs, peaches, apricots, olives, and in many years melons and cucumbers, grow there in great abundance without irrigation. Two enormous cisterns maintained by public charitable trusts supply the town with water in dry seasons. Sfax was formerly the terminus of a caravan route to Central Africa, but its inland trade now extends only to Gafsa. The export trade (esparto grass, oil, almonds, pistachio nuts, sponges, wool, &c.) has attained considerable dimensions. Fifty-one English vessels (34,757 tons) visited the port in 1884. The anchorage is 2 miles from the shore, and there is a rise and fall of 5 feet at spring tides (a rare phenomenon in the Mediterranean). In 1881 the population was said to be about 15,000 (including 1200 Arabs, 1500 Tunisian Jews, 1000 Maltese, &c., 500 Europeans); in 1886 it is stated at 32,000 (1200 Maltese, 1000 Europeans).

Sfax (the Arabic *Asfik* or *Safik*), sometimes called the City of Cucumbers occupies the site of the ancient *Tapharna*. In the Middle Ages it was famous for its vast export of olive oil. The Sicilians took Sfax under Roger the Norman in 1070, and the Spaniards occupied it for a brief period in the 16th century. The bombardment of the town in 1881 was one of the principal events of the French conquest of Tunis, it was pillaged by the soldiers on July 16th and the inhabitants had afterwards to pay a war indemnity of £250,000.

SPORZA, HOURS of Soc MILAN, vol. xvi. p. 203, and ITALY, vol. xiii. p. 470.

SHAD is the name given to certain migratory species of Herrings (*Clupea*), which are distinguished from the herrings proper by the total absence of teeth in the jaws. Two species occur in Europe, much resembling each other,—one commonly called Allis Shad (*Clupea albus*), and the other known as Twaité Shad (*Clupea phletus*). Both are, like the majority of herrings, greenish on the back and bright silvery on the sides, but they are distinguished from the other European species of *Clupea* by the presence of a large blackish blotch behind the gill-opening, which is succeeded by a series of several other similar spots along the middle of the side of the body. So closely allied are these two fishes that their distinctness can be proved only by an examination of the gill-apparatus, the allis shad having from sixty to eighty very fine and long gill-rakers along the concave edge of the first branchial arch, whilst the twaité shad possesses from twenty-one to twenty-seven stout and stiff gill-rakers only. In their habits and geographical distribution also the two shads are very similar. They inhabit the coasts of temperate Europe, the twaité shad being more numerous in the Mediterranean. While they are in salt water they live singly or in very small companies, but during May (the twaité shad some weeks later) they congregate, and in great numbers ascend large rivers, such as the Severn (and formerly the Thames), the Seine, the Rhine, the Nile, &c., in order to deposit their

spawn,—sometimes travelling hundreds of miles, until their progress is arrested by some natural obstruction. A few weeks after they may be observed dropping down the river, lean and thoroughly exhausted, numbers floating dead on the surface, so that only a small proportion seem to regain the sea. Although millions of ova must be deposited by them in the upper reaches of a river, the fry does not seem to have been actually observed in fresh water, so that it seems probable that the young fish travel to the sea long before they have attained to any size.

On rivers in which these fishes make their periodical appearance they have become the object of a regular fishery, and their value increases in proportion to the distance from the sea at which they are caught. Thus they are much esteemed on the middle Rhine, where they are generally known as "Mafisch", those caught on their return journey are worthless and uneatable. The allis shad is caught at a size from 15 to 24 inches, and is considered to be better flavoured than the twaite shad, which generally remains within smaller dimensions.

Other, but closely allied species, occur on the Atlantic coasts of North America, all surpassing the European species in importance as food-fishes and economic value, viz. the American Shad (*Clupea sapidissima*), the Gaspeian or Alewife (*C. multirostrata*), and the Menhaden (*C. menhaden*). See MENHADEN.

SHADDOCK (*Citrus decumana*) is a tree allied to the orange and the lemon, presumably native to the Malay and Polynesian islands, but generally cultivated throughout the tropics. The leaves are like those of the orange, but downy on the under surface, as are also the young shoots. The flowers are large and white, and are succeeded by very large globose or pear-shaped fruits like oranges, but paler in colour, and with less flavour. The name Shaddock is asserted to be that of a captain who introduced the tree to the West Indies. The fruit is also known under the name of pommeloos and "forbidden fruit." There are two varieties commonly met with, one with pale and the other with red pulp.

SHADWELL, THOMAS (1610-1692), a playwright and miscellaneous versifier of the Restoration period, Dryden's successor in the laureateship, is remembered now, not by his works, though he was a prolific writer of comedies highly successful in their day, but as the subject of Dryden's satirical portraits "MacFlecknoe" and "Og." He was a native of Norfolk—not an Irishman, as he retorted with significant imbecility when Dryden's satire appeared,—went through the forms of study at Cambridge and the Inner Temple, travelled abroad for a little, returned to London, cultivated the literary society of coffee-houses and taverns, and in 1668, at the age of 28, gained the ear of the stage with a comedy *The Sullen Lovers*. For fourteen years afterwards, till his memorable encounter with Dryden he continued regularly to produce a comedy nearly every year, showing considerable cleverness in caricaturing the oddities of the time. Ben Jonson was his model, but he drew his materials largely from contemporary life. He also acquired standing among the wits as a talker. In the quarrel with Dryden he was the aggressor. They had been good enough friends, and Dryden in 1679 had furnished him with a prologue for his *True Widow*. But when Dryden threw in his lot with the court, and satirized the opposition in *Absalom and Achitophel* and *The Medal*, Shadwell was rash enough to constitute himself the champion of the true-blue Protestants and wrote a grossly personal and scurrilous attack on the poet, entitled *The Medal of John Bayes*. Dryden immediately retorted in *MacFlecknoe*, the most powerful and contemptuously scornful personal satire in our language, adding next month a few more rough touches of supercilious mockery in the second part of *Absalom and Achitophel*, where Shadwell figures as "Og":—

Og from a treason-tavern rolling home,
Round as a globe, and liquored every chink;
Goodly and great he sails behind his link

Dryden may not be strictly fair when he addresses his enemy as "thou last great prophet of tautology," and makes Flecknoe extol him because "he never deviates into sense," but Shadwell had fairly earned his chastisement, the sting of which lay in its substantial truth. He survived till 1692, and on Dryden's resignation of the laureateship in 1688 was promoted to the office, a sign of the poverty of the Whig side at the time in literary men, and part of the explanation of their anxiety in the next generation to secure literary talent.

A complete edition of Shadwell's works was published in 1720, in 4 vols. 12mo. His dramatic works are—*The Sullen Lovers*, 1668, *The Royal Shepherdess*, 1669, *The Humourist*, 1671, *The Miser*, 1672, *Esopus Walde*, 1673, *Psyche*, 1675, *The Libertine*, 1676, *The Virtuoso*, 1676, *Timon of Athens*, 1678, *A True Widow*, 1679, *The Woman Captain*, 1680, *The Lancashire Witches*, 1682, *The Square of Alacka*, 1688, *Dury Furr*, 1689, *The Amorous Dugot*, 1690, *The Scoundrels*, 1691, and *The Volanteers*, 1693.

SHAFI, SHAFITES See SUNNITES

SHAFESBURY, ANTHONY ASHLEY COOPER, FIRST EARL OF (1621-1683), was the son of Sir John Cooper of Rockbourne in Hampshire, and of Anne, the only child of Sir Anthony Ashley, Bart. and was born at Wimborne St Giles, Dorset, on July 22, 1621. His parents died before he was ten years of age, and he inherited extensive estates in Hampshire, Wiltshire, Dorsetshire, and Somersetshire, much reduced, however, by litigation in Chancery. He lived for some time with Sir Daniel Norton, one of his trustees, at Southwick, and upon his death in 1635 with Mr Tooker, an uncle by marriage, at Salisbury. In 1637 he went as a gentleman-commoner to Exeter College, Oxford, where he remained about a year. No record of his studies is to be found, but he has left an amusing account of his part in the wilder doings of the university life of that day, in which, in spite of his small stature, he was recognized by his fellows as their leader. At the age of eighteen, on February 25, 1639, he married Margaret, daughter of Lord Coventry, with whom he and his wife lived at Durham House in the Strand, and at Canonbury House in Islington. In March 1640, though still a minor, he was elected for Tewkesbury, and sat in the parliament which met on April 13, but appears to have taken no active part in its proceedings. In 1640 Lord Coventry died, and Cooper then lived with his brother-in-law at Dorchester House in Covent Garden. For the Long Parliament, which met on November 3, 1640, he was elected for Downton in Wiltshire, but the return was disputed, and he did not take his seat,—his election not being declared valid until the last days of the Rump. He was present as a spectator at the setting up of the king's standard at Nottingham on August 25, 1642, and in 1643 he appeared openly on Charles's side in Dorsetshire, where he raised at his own expense a regiment of foot and a troop of horse of both of which he took the command. He was also appointed governor of Weymouth, sheriff of Dorsetshire for the king, and president of the king's council of war in the county. In the beginning of January 1644, however, for reasons which are variously reported by himself and Clarendon, he resigned his governorship and commissions and went over to the Parliament. He appeared on March 6 before the standing committee of the two Houses to explain his conduct, when he stated that he had come over because he saw danger to the Protestant religion in the king's service, and expressed his willingness to take the Covenant. In July 1644 he went to Dorsetshire on military service, and on August 3 received a commission as field-marshal general. He assisted at the taking of Wareham, and shortly afterwards compounded for his estates by a fine of £500 from

which, however, he was afterwards relieved by Cromwell On October 25 he was made commander-in-chief in Dorsetshire, and in November he took by storm Abbotsbury, the house of Sir John Strangways,—an affair in which he appears to have shown considerable personal gallantry In December he relieved Taunton. His military service terminated at the time of the Self-denying Ordinance in 1645, he had associated himself with the Presbyterian faction, and naturally enough was not included in the New Model. For the next seven or eight years he lived in comparative privacy. He was high sheriff of Wiltshire during 1647, and displayed much vigour in this office Upon the execution of Charles, Cooper took the Engagement, and was a commissioner to administer it in Dorsetshire On April 25, 1650, he married Lady Frances Cecil, sister of the earl of Essex, his first wife having died in the previous year leaving no family In 1651 a son was born to him, who died in childhood, and on January 16, 1652, another son, named after himself, who was his heir On January 17 he was named on the commission for law reform, of which Hale was the chief; and on March 17, 1653, he was pardoned of all delinquency, and thus at last made capable of sitting in parliament He sat for Wiltshire in the Barebones parliament, of which he was a leading member, and where he zealously and prudently supported Cromwell's views against the extreme section He was at once appointed on the council of thirty On the resignation of this parliament he became a member of the council of state named in the "Instrument" In the first parliament elected under this "Instrument" he sat for Wiltshire, having been elected also for Poole and Tewkesbury, and was one of the commissioners for the ejection of unworthy ministers After December 28, 1654, for reasons which it is impossible to ascertain with clearness, he left the privy council, and henceforward is found with the Presbyterians and Republicans, in opposition to Cromwell His second wife had died during this year, in 1656 he married a third, who survived him, Margaret, daughter of Lord Spencer, niece of the earl of Southampton, and sister of the earl of Sunderland, who died at Newbury By his three marriages he was thus connected with many of the leading politicians of Charles II's reign.

Cooper was again elected for Wiltshire for the parliament of 1656, but Cromwell refused to allow him, with many others of his opponents, to sit He signed a letter of complaint, with sixty-five excluded members, to the speaker, as also a "Remonstrance" addressed to the people In the parliament which met on January 20, 1658, he took his seat, and was active in opposition to the new constitution of the two Houses He was also a leader of the opposition in Richard Cromwell's parliament, especially on the matter of the limitation of the power of the Protector, and against the House of Lords. He was throughout these debates celebrated for the "nervous and subtle oratory" which made him so formidable in after days. he had "his tongue well hung, and words at will."

Upon the replacing of the Rump by the army, after the breaking up of Richard's parliament, Cooper endeavoured unsuccessfully to take his seat on the ground of his former disputed election for Downton. He was, however, elected on the council of state, and was the only Presbyterian in it; he was at once accused by Scot, along with Whitelocke, of corresponding with Hyde This he solemnly denied After the rising in Cheshire Cooper was arrested in Dorsetshire on a charge of correspondence with its leader Booth, but on the matter being investigated by the council he was unanimously acquitted In the disputes between Lambert at the head of the military party and the Rump in union with the council of state, he supported the latter, and upon the temporary supremacy of Lambert's

party worked indefatigably to restore the Rump With Monk's commissioners he, with Haselrig, had a fruitless conference, but he assured Monk of his co-operation, and joined with eight others of the overthrown council of state in naming him commander-in-chief of the forces of England and Scotland He was instrumental in securing the Tower for the Parliament, and in obtaining the adhesion of Admiral Lawson and the fleet Upon the restoration of the Parliament on December 26 Cooper was one of the commissioners to command the army, and on January 2 was made one of the new council of state On January 7 he took his seat on his election for Downton in 1640, and was made colonel of Fleetwood's regiment of horse He speedily secured the admission of the secluded members, having meanwhile been in continual communication with Monk, was again one of the fresh council of state, consisting entirely of friends of the Restoration, and accepted from Monk a commission to be governor of the Isle of Wight and captain of a company of foot He now steadily pursued the design of the Restoration, but without holding any private correspondence with the king, and only on terms similar to those proposed in 1618 to Charles I. at the Isle of Wight. In the Convention Parliament he sat for Wiltshire Monk cut short these deliberations and forced on the Restoration without condition Cooper was one of the twelve commissioners who went to Charles at Breda to invite him to return On his journey he was upset from his carriage, and the accident caused an internal abscess which was never cured.

Cooper was at once placed on the privy council, receiving also a formal pardon for former delinquencies His first duty was to examine the Anabaptist prisoners in the Tower In the prolonged discussions regarding the Bill of Indemnity he was instrumental in saving the life of Haselrig, and opposed the clause compelling all officers who had served under Cromwell to refund their salaries, but himself never having had any He showed indeed none of the grasping and avaricious temper so common among the politicians of the time He was one of the commissioners for conducting the trials of the regicides, but was himself vehemently "fallen upon" by Pym for having acted with Cromwell He was named on the council of plantations and on that of trade In the debate abolishing the court of wards he spoke, like most landed proprietors, in favour of laying the burden on the exors instead of on the land, and on the question of the restoration of the bishops carried in the interests of the court an adjournment of the debate for three months At the coronation in April 1661 Cooper had been made a peer, as Baron Ashley of Wimborne St Giles, in express recognition of his services at the Restoration; and on the meeting of the new parliament in May he was appointed chancellor of the exchequer and under-treasurer, aided no doubt by his connexion with Southampton He vehemently opposed the persecuting Acts now passed,—the Corporation Act, the Uniformity Bill, against which he is said to have spoken three hundred times, and the Millia Act He is stated also to have influenced the king in issuing his dispensing declaration of December 26, 1662, and he zealously supported a bill introduced for the purpose of confirming the declaration, rising thereby in favour and influence with Charles. He was himself the author of a treatise on tolerance. He was now recognized as one of the chief opponents of Clarendon and the High Anglican policy. On the breaking out of the Dutch War in 1664 he was made treasurer of the prizes, being accountable to the king alone for all sums received or spent He was also one of the grantees of the province of Carolina and took a leading part in its management; it was at his request that Locke in 1669 drew up a constitution for the new colony. In September

1665 the king unexpectedly paid him a visit at Wimbome. He opposed unsuccessfully the appropriation proviso introduced into the supply bill as hindering the due administration of finance, and this opposition seems to have brought about a reconciliation with Clarendon. In 1668, however, he supported a bill to appoint commissioners to examine the accounts of the Dutch War, though in the previous year he had opposed it. In accordance with his former action on all questions of religious toleration he strongly opposed the shameful Five Mile Act of 1665. In 1667 he eagerly supported the bill for prohibiting the importation of Irish cattle on the ground that it would lead to a great fall of rents in England. Ashley was himself a large landowner, and moreover was opposed to Ormonde who would have greatly benefited by the importation. In all other questions of this kind he shows himself far in advance of the economic fallacies of the day. His action led to an altercation with Ossory, the son of Ormonde, in which Ossory used language for which he was compelled to apologize. On the death of Southampton, Ashley was placed on the commission of the treasury, Clifford and William Coventry being his principal colleagues. He appears to have taken no part in the attempt to impeach Clarendon on a general charge of treason.

The new administration was headed by Buckingham, in whose toleration and comprehension principles Ashley shared to the full. A most able paper written by him to the king in support of these principles, on the ground especially of their advantage to trade, has been preserved. He excepts, however, from toleration Roman Catholics and Fifth Monarchy men. His attention to all trade questions was close and constant; he was a member of the council of trade and plantations appointed in 1670, and was its president from 1672 to 1676. The difficulty of the succession also occupied him, and he co-operated thus early in the design of legitimizing Monmouth as a rival to James. In the intrigues which led to the infamous treaty of Dover he had no part. That treaty contained a clause by which Charles was bound to declare himself a Catholic, and with the knowledge of this Ashley, as a staunch Protestant, could not be trusted. In order to blind him and the other Protestant members of the Cabal a sham treaty was arranged in which this clause did not appear, and it was not until a considerable while afterwards that he found out that he had been duped. Under this misunderstanding he signed the sham Dover treaty on December 31, 1670. This treaty, however, was carefully kept from public knowledge, and Ashley did not hesitate to help Charles to hoodwink parliament by signing a similar treaty on February 2, 1672, which was then laid before them as the only one in existence. This is one of the proved dishonourable actions of his life. His approval of the attempt of the Lords to alter a money bill led to the loss of the supply to Charles and to the consequent displeasure of the king. His support of the Lord Roos Act, ascribed generally to his desire to ingratiate himself with Charles, was no doubt due in part to the fact that his son had married Lord Roos's sister. It is, too, necessary to notice that, so far from advising the "Stop of the Exchequer," he actively opposed this bad measure, the reasons which he left with the king for his opposition are extant. The responsibility rests with Clifford alone. In the other great measure of the Cabal ministry, Charles's Declaration of Indulgence, he cordially concurred. He was now rewarded by being made Earl of Shaftesbury and Baron Cooper of Pawlett by a patent dated April 23, 1672. It is stated too that he was offered, but refused, the lord treasurership. On November 17, 1672, however, he became lord chancellor, Bridgman having been compelled to resign the seat. As chancellor he issued writs for the

election of thirty-six new members to fill vacancies caused during the long recess, this, though grounded upon precedent, was certainly open to the gravest suspicion as an attempt to fortify Charles, and was vehemently attacked by an angry House of Commons which met on February 4, 1673. The writs were cancelled, and the principle was established that the issuing of writs rested with the House itself. It was at the opening of parliament that Shaftesbury made his celebrated "delenda est Carthago" speech against Holland, in which he urged the Second Dutch War, on the ground of the necessity of destroying so formidable a commercial rival to England, excused the Stop of the Exchequer which he had opposed, and vindicated the Declaration of Indulgence. On March 8 he announced to parliament that the declaration had been cancelled, though he did his best to induce Charles to remain firm. For affixing the great seal to this declaration he was threatened with impeachment by the Commons. The Test Act was now brought forward, and Shaftesbury, who appears to have heard how he had been duped in 1670, warmly supported it, with the object probably of thereby getting rid of Clifford. He now began to be regarded as the chief upholder of Protestantism in the ministry, he rapidly lost favour with Charles, and on Sunday, September 9, 1673, was dismissed from the chancellorship. Among the reasons for this dismissal is probably the undoubted fact that he opposed reckless grants to the king's mistresses. He has been accused of much vanity and ostentation in his office, but his reputation for ability and integrity as a judge was high even with his enemies.

Charles soon regretted the loss of Shaftesbury, and endeavoured, as did also Louis, to induce him to return, but in vain. He preferred now to become the great popular leader against all the measures of the court, and may be regarded as the intellectual chief of the opposition. At the meeting of parliament on January 8, 1674, he carried a motion for a proclamation banishing Catholics to a distance of ten miles from London. During the whole session he organized and directed the opposition in their attacks on the king's ministers. On May 19 he was dismissed the privy council and ordered to leave London. He hereupon retired to Wimbome, from whence he urged upon his parliamentary followers the necessity of securing a new parliament. He was in the House of Lords, however, in 1675, when Danby brought forward his famous Non-resisting Test Bill, and headed the opposition which was carried on for seventeen days, distinguishing himself, says Burnet, more in this session than ever he had done before. The bill was finally shelved, a prorogation having taken place in consequence of a quarrel between the two Houses, supposed to have been purposely got up by Shaftesbury, in which he vigorously supported the right of the Lords to hear appeal cases, even where the defendant was a member of the Lower House. Parliament was prorogued for fifteen months until February 15, 1677, and it was determined by the opposition to attack its existence on the ground that a prorogation for more than a year was illegal. In this matter the opposition were clearly in the wrong, and by attacking the parliament discredited themselves. The immediate result was that Shaftesbury, Buckingham, Wharton, and Salisbury were sent to the Tower. In June Shaftesbury applied for a writ of *habeas corpus*, but could get no release until February 26, 1678, after his letter and three petitions to the king. Being brought before the bar of the House of Lords he at length made a complete submission as to his conduct in declaring parliament dissolved by the prorogation, and in violating the Lords' privileges by granting a *habeas corpus* in the King's Bench.

The breaking out of the Popish Terror in 1678 marks

the worst part of Shaftesbury's career. That so clear-headed a man could have really credited the extravagant lies of Oates and the other perjurers is beyond belief, and the manner in which by incessant agitation he excited the most baseless alarms, and encouraged the wildest excesses of fanatic cruelty, for nothing but party advantage, is utterly without excuse. On November 2 he opened the great attack by proposing an address declaring the necessity for the king's dismissing James from his council. Under his advice the opposition now made an alliance with Louis whereby the French king promised to help them to run Danby on condition that they would compel Charles, by stopping the supplies, to make peace with France, doing thus a grave injury to Protestantism abroad for the sake of a temporary party advantage at home. Upon the refusal in November of the Lords to concur in the address of the Commons requesting the removal of the queen from court, he joined in a protest against the refusal, and was foremost in all the violent acts of the session. He urged on the bill by which Catholics were prohibited from sitting in either House of Parliament, and was bitter in his expressions of disappointment when the Commons passed a proviso excepting James, against whom the bill was especially aimed, from its operation. A new parliament met on March 6, 1679. Shaftesbury had meanwhile ineffectually warned the king that unless he followed his advice there would be no peace with the people. On March 25 he made a striking speech upon the state of the nation, especially upon the dangers to Protestantism and the misgovernment of Scotland and Ireland. He was, too, suspected of doing all in his power to bring about a revolt in Scotland. By the advice of Temple, Charles now tried the experiment of forming a new privy council in which the chief members of the opposition were included, and Shaftesbury was made president, with a salary of £4000, being also a member of the committee for foreign affairs. He did not, however, in any way change either his opinions or his action. He vigorously opposed the compelling of Protestant Nonconformists to take the oath required of Roman Catholics. That indeed, as Ranke says, which makes him memorable in English history is that he opposed the establishment of an Anglican and Royalist organization with decisive success. The question of the succession was now again prominent, and Shaftesbury, in opposition to Halifax, committed the error, which really brought about his fall, of putting forward Monmouth as his nominee, thus alienating a large number of his supporters, he encouraged, too, the belief that this was agreeable to the king. He pressed on the Exclusion Bill with all his power, and, when that and the inquiry into the payments for secret service and the trial of the five peers, for which too he had been eager, were brought to an end by a sudden prorogation, he is reported to have declared aloud that he would have the heads of those who were the king's advisers to this course. Before the prorogation, however, he saw the invaluable Act of Habeas Corpus, which he had carried through parliament, receive the royal assent. In pursuance of his patronage of Monmouth, Shaftesbury now secured for him the command of the army sent to suppress the insurrection in Scotland, which he is supposed to have fomented. In October 1679, the circumstances which led Charles to desire to conciliate this opposition having ceased, Shaftesbury was dismissed from his presidency and from the privy council; when applied to by Sunderland to return to office he made as conditions the divorce of the queen and the exclusion of James. With nine other peers he presented a petition to the king in November, praying for the meeting of parliament, of which Charles took no notice. In April, upon the king's declaration that he was resolved to send

for James from Scotland, Shaftesbury strongly advised the popular leaders at once to leave the council, and they followed his advice. In March we find him unexpectingly eager in the prosecution of the alleged Irish Catholic plot. Upon the king's illness in May he held frequent meetings of Monmouth's friends at his house to consider how best to act for the security of the Protestant religion. On June 26, accompanied by fourteen others, he presented to the grand jury of Westminster an indictment of the duke of York as a Popish recusant. In the middle of September he was seriously ill. On November 15 the Exclusion Bill, having passed the Commons, was brought up to the Lords, and an historic debate took place, in which Halifax and Shaftesbury were the leaders on opposite sides. The bill was thrown out, and Shaftesbury signed the protest against its rejection. The next day he urged upon the House the divorce of the queen. On December 7, to his lasting dishonour, he voted for the condemnation of Lord Stafford. On the 23d he again spoke vehemently for exclusion, and his speech was immediately printed. All opposition was, however, checked by the dissolution on January 18. A new parliament was called to meet at Oxford, to avoid the influences of the city of London, where Shaftesbury had taken the greatest pains to make himself popular. Shaftesbury, with fifteen other peers, at once petitioned the king that it might as usual be held in the capital. He prepared, too, instructions to be handed by constituencies to their members upon election, in which exclusion, disbanding, the limitation of the prerogative in proroguing and dissolving parliament, and security against Popery and arbitrary power were insisted on. At this parliament, which lasted but a few days, he again made a personal appeal to Charles, which was cutly rejected, to permit the legitimizing of Monmouth. The king's advisers now urged him to arrest Shaftesbury; he was seized on July 2, 1681, and committed to the Tower, the judges refusing his petition to be tried or admitted to bail. This refusal was twice repeated in September and October, the court hoping to obtain evidence sufficient to ensure his ruin. In October he wrote offering to return to Carolina if he were released. On November 24 he was indicted for high treason at the Old Bailey, the chief ground being a paper of association for the defence of the Protestant religion, which, though among his papers, was not in his handwriting; but the grand jury ignored the bill. He was released on bail on December 1. In 1682, however, Charles secured the appointment of Tory sheriffs for London, and, as the juries were chosen by the sheriffs, Shaftesbury felt that he was no longer safe from the vengeance of the court. Failing health and the disappointment of his political plans led him now into violent courses. He appears to have entered into consultation of a treasonable kind with Monmouth and others; he himself had, he declared, ten thousand brisk boys in London ready to rise at his bidding. For some weeks he was concealed in the city and in Wapping; but, finding the schemes for a rising hang fire, he determined to flee. He went to Harwich, disguised as a Presbyterian minister, and after a week's delay, during which he was in imminent risk of discovery, if indeed, as is very probable, his escape was not winked at by the Government, he sailed to Holland on November 28, 1682, and reached Amsterdam in the beginning of December. Here he was welcomed with the jest, referring to his famous speech against the Dutch, "non-dum deleta Carthago." He was made a citizen of Amsterdam, but died there of gout in the stomach on January 21, 1683. His body was sent in February to Poole, in Dorset, and was buried at Wimborne St Giles.

Few politicians have been the mark of such unsparring abuse as Shaftesbury. Dryden, while compelled to honour him as an

upright judge, overwhelmed his memory with seething, if vocal, satire, and Dryden's satire has been accepted as truth by later historians. Macaulay in especial has exerted all his art, though in flagrant contradiction of probability and fact, to deepen still further the shade which rests upon his reputation. Mr Christie, on the other hand, in possession of later sources of information, and with more honest purpose, has done much to rehabilitate him. Occasionally, however, he appears to hold a brief for the defence, and, though his picture is comparatively a true one, should be read with caution. Finally, in his monograph in the series of "English Worthies," Mr H. D. Thirlall professes to hold the scales equally. He makes an interesting addition to our conception of Shaftesbury's place in English politics, by insisting on his position as the first great party leader in the modern sense, and as the founder of modern parliamentary oratory. In other respects his book is derived almost entirely from Christie. Much of Shaftesbury's career, increasingly so as it came near its close, is incapable of defence, but it has escaped his critics that his life up to the Restoration, apparently full of inconsistencies, was evidently guided by one leading principle, the determination to uphold the supremacy of parliament, a principle which, however obtained by self-interest, appears also to have underlain his whole political career. He was, too, over the friend of religious freedom and of an enlightened policy in all trade questions. And, above all, it should not be forgotten, in justice to Shaftesbury's memory, that "during his long political career, in an age of general corruption, he was ever incorrupt, and never grasped either money or land. In the days of the Commonwealth he never obtained or sought grants of forfeited estates. In the days of the restored monarchy he never profited by the king's favour for aught beyond the legal emoluments of office, and in office or out of office spurned all any offers of bribes from the French king" (O. A.).

SHAFTESBURY, ANTHONY ASHLEY COOPER, THIRD EARL OF (1671-1713), was born at Exeter House in London, February 26, 1670-71. He was grandson of the first and son of the second earl. His mother was Lady Dorothy Manners, daughter of John, earl of Rutland. According to a curious story, told by the third earl himself, the marriage between his father and mother was negotiated by John Locke, who was a trusted friend of the first earl. The second Lord Shaftesbury appears to have been a poor creature, both physically and mentally,—"born a shapeless lump, like anarchy," according to what is doubtless the exaggerated metaphor of Dryden. At the early age of three his son was made over to the formal guardianship of his grandfather, Locke, who in his capacity of medical attendant to the Ashley household had already assisted in bringing the boy into the world, though not his instructor, was entrusted with the superintendence of his education. This was conducted according to the principles enunciated in Locke's *Thoughts concerning Education*, and the method of teaching Latin and Greek conversationally was pursued with such success by his instructress, Mrs Elizabeth Birch, that at the age of eleven, it is said, young Ashley could read both languages with ease. In November 1683, some months after the death of the first earl, his father entered him at Winchester as a wardon's boarder. Being a shy, retiring boy, and being moreover constantly taunted with the opinions and fate of his grandfather, he appears to have been rendered miserable by the rough manners of his schoolfellows, and to have left Winchester in 1686 for a course of foreign travel. By this change he was brought into direct contact with those artistic and classical associations which afterwards exercised so marked an influence on his character and opinions. On his travels he did not, we are told by the fourth earl, "greatly seek the conversation of other English young gentlemen on their travels," but rather that of their tutors, with whom he could converse on congenial topics.

In 1689, the year after the Revolution, Lord Ashley returned to England, and for nearly five years from this time he appears to have led a quiet, uneventful, and studious life. There can be no doubt that the greater part of his attention was directed to the perusal of those classical authors, and to the attempt to realize the true spirit of that classical antiquity, for which he had

conceived so ardent a passion. He had no intention, however, of becoming a recluse, or of permanently holding himself aloof from public life. Accordingly, he became a candidate for the borough of Poole, and was returned May 21, 1695. He soon distinguished himself by a speech, which excited great attention at the time, in support of the Bill for Regulating Trials in Cases of Treason, one provision of which was what seems to us the obviously reasonable one that a person indicted for treason or misprision of treason should be allowed the assistance of counsel. In connection with this speech a story is told of Shaftesbury which is also told, though with less verisimilitude, of Halifax, that, being overcome by shyness, and unable to continue his speech, he simply said, before sitting down "If I, sir, who rise only to speak my opinion on the bill now depending, am so confounded that I am unable to express the least of what I proposed to say, what must the condition of that man be who is pleading for his life without any assistance and under apprehensions of being deprived of it?" "The sudden turn of thought," says his son, the fourth earl, "pleased the House extremely, and, it is generally believed, carried a greater weight than any of the arguments which were offered in favour of the bill." But, though a Whig, alike by descent, by education, and by conviction, Ashley could by no means be depended on to give a party vote, he was always ready to support any propositions, from whatever quarter they came, that appeared to him to promote the liberty of the subject and the independence of parliament. Unfortunately, his health was so treacherous that, on the dissolution of July 1698, he was obliged to retire from parliamentary life. He suffered much from asthma, a complaint which was aggravated by the London smog.

Lord Ashley now retired into Holland, where he became acquainted with Le Clerc, Bayle, Benjamin Furly, the English Quaker merchant, at whose house Locke had resided during his stay at Rotterdam, and probably Limborch and the rest of the literary circle of which Locke had been a cherished and honoured member nine or ten years before. To Lord Ashley this society was probably far more congenial than his surroundings in England. Unrestrained conversation on the topics which most interested him—philosophy, politics, morals, religion—was at this time to be had in Holland with less danger and in greater abundance than in any other country in the world. To the period of this sojourn in Holland must probably be referred the surreptitious impression or publication of an imperfect edition of the *Inquiry concerning Virtue*, from a rough draught, sketched when he was only twenty years of age. This liberty was taken, during his absence, by Toland.

After an absence of over a twelvemonth, Ashley returned to England, and soon succeeded his father as earl of Shaftesbury. He took an active part, on the Whig side, in the general election of 1700-1, and again, with more success, in that of the autumn of 1701. It is said that William III showed his appreciation of Shaftesbury's services on this latter occasion by offering him a secretaryship of state, which, however, his declining health compelled him to decline. Had the king's life continued, Shaftesbury's influence at court would probably have been considerable. After the first few weeks of Anne's reign, Shaftesbury, who had been deprived of the vice-admiralty of Dorset, returned to his retired mode of life, but his letters to Furly show that he still retained a keen interest in politics. In August 1703 he again settled in Holland, in the air of which he seems, like Locke, to have had great faith. At Rotterdam he lived, he says in a letter to his steward Wheelock, at the rate of less than £200 a

year, and yet had much "to dispose of and spend beyond convenient living." He returned to England, much improved in health, in August 1704. But, though he had received immediate benefit from his stay abroad, symptoms of consumption were constantly alarming him, and he gradually became a confirmed invalid. His occupations were now almost exclusively literary, and from this time forward he was probably engaged in writing, completing, or revising the treatises which were afterwards included in the *Chambers*. He still continued, however, to take a warm interest in politics, both home and foreign, and especially in the war against France, of which he was an enthusiastic supporter.

Shaftesbury was nearly forty before he married, and even then he appears to have taken this step at the urgent instigation of his friends, mainly to supply a successor to the title. The object of his choice (or rather of his second choice, for an earlier project of marriage had shortly before fallen through) was a Miss Jane Ewer, the daughter of a gentleman in Hertfordshire. The marriage took place in the autumn of 1709, and on February 9, 1710, was born at his house at Regate, in Surrey, his only child and heir, the fourth earl, to whose manuscript accounts we are in great part indebted for the details of his father's life. The match appears to have been a happy one, though Shaftesbury neither had nor pretended to have much sentiment on the subject of married life.

With the exception of a *Preface to the Sermons of Dr Whateley*, one of the Cambridge Platonists or Latitudinarians, published in 1698, Shaftesbury appears to have printed nothing himself till the year 1708. About this time the French prophets, as they were called, attracted much attention by the extravagances and follies of which they were guilty. Various remedies of the repressive kind were proposed, but Shaftesbury maintained that their fanaticism was best encountered by "raillery" and "good-humour." In support of this view he wrote a letter to Lord Somers, dated September 1707, which was published anonymously in the following year, and provoked several replies. In May 1709 he returned to the subject, and printed another letter, entitled *Sensus Communis, an Essay on the Freedom of Wit and Humour*. In the same year he also published *The Moralists, a Philosophical Rhapsody*, and in the following year *Soliloquy, or Advice to an Author*. None of these pieces seem to have been printed either with his name or his initials. In 1711 appeared the *Characteristics of Men, Manners, Opinions, Times*, in three volumes, also without any name or initials on the title-page, and without even the name of a printer. These three handsome volumes contain in addition to the four treatises already mentioned, *Miscellaneous Reflections*, now first printed, and the *Inquiry concerning Virtue or Merit*, described as "formerly printed from an imperfect copy, now corrected and published entire," and as "printed first in the year 1699."

The declining state of Shaftesbury's health rendered it necessary for him to seek a warmer climate, and in July 1711 he set out for Italy. He settled at Naples in November, and lived there considerably over a year. His principal occupation at this time must have consisted in preparing for the press a second edition of the *Characteristics*, which appeared in 1713, soon after his death. The copy, most carefully corrected in his own handwriting, is still preserved in the British Museum. He was also engaged, during his stay at Naples, in writing the little treatise (afterwards included in the *Characteristics*) entitled *A Notion of the Historical Draught or Tablature of the Judgments of Hercules*, and the letter concerning *Design*. A little before his death he had also formed a scheme of writing a Discourse on the Arts of Painting,

Sculpture, Etching, &c., but when he died he had made but little progress with it. "Medals, and pictures, and antiquities," he writes to Furlly, "are our chief entertainments here." His conversation was with men of art and science, "the virtuous of this place."

The events preceding the peace of Utrecht, which he regarded as preparing the way for a base desertion of our allies, greatly troubled the last months of Shaftesbury's life. He did not, however, live to see the actual conclusion of the treaty (March 31, 1713), as he died the month before, February 4, 1712, O.S. At the time of his death he had not yet completed his forty-second year. His body was brought back by sea to England and buried at St Giles's, the family seat in Dorsetshire. Though he died so long ago, and was one of the earliest of the English moralists, his descendant, the celebrated philanthropist, who died so recently as 1885, was only his great-grandson.

Shaftesbury's amiability of character seems to have been one of his principal characteristics. All accounts concur in representing him as full of sweetness and kindness towards others, though he may sometimes himself have been the victim of melancholy and despondency. Luke Locke he had a peculiar pleasure in bringing forward young men. Amongst those may be especially mentioned Michael Answorth, a native of Wimborne St Giles, the young man who was the recipient of the *Letters* addressed to a student at the university, and who was maintained by him at University College, Oxford. The keen interest which Shaftesbury took in his studies, and the desire that he should be specially fitted for the profession which he had selected, that of a clergyman of the Church of England, are marked features of the letters. Other proteges were Crell, a young Pole, the two young Furllys, and Harry Wilkinson, a boy who was sent into Furlly's office at Rotterdam, and to whom several of the letters still extant in the Record Office are addressed.

In the popular mind, Shaftesbury is generally regarded as a writer hostile to religion. But, however short his orthodoxy might fall if tried by the standards of any particular church, his temperament was pre-eminently a religious one. This fact is shown conspicuously in his letters, where he had no reason for making any secret of his opinions. The belief in a God, all-wise, all-just, and all-merciful, governing the world providentially for the best, pervades all his works, his correspondence, and his life. Nor had he any wish to undermine established beliefs, except where he conceived that they conflicted with a truer religion and a purer morality.

To the public ordinances of the church he scrupulously conformed. But, unfortunately, there were many things both in the teaching and the practice of the ecclesiastics of that day which were calculated to rouse him of sober judgment and high principle. These civil tendencies in the popular presentation of Christianity undoubtedly bogged in Shaftesbury's mind a certain amount of repugnance and contempt to some of the doctrines of Christianity itself; and, cultivating, almost of set purpose, his sense of the ridiculous, he was too apt to assume towards such doctrines and their teachers a tone of raillery and banter, which sometimes even approaches grimace.

But, whatever might be Shaftesbury's speculative opinions or his mode of expressing them, all witnesses concur in bearing testimony to the elevation and purity of his life and aims. Molesworth, who had no special reason for flattering him, speaks of him as "possessing right reason in a more eminent degree than the rest of mankind," and of his character as "the highest that the perfection of human nature is capable of." Even Warburton, in his dedication of the *Divine Legation* to the free-thinkers, is compelled to "own that this lord had many

excellent qualities, both as a man and a writer. He was temperate, chaste, honest, and a lover of his country."

As an earnest student, an ardent lover of liberty, an enthusiast in the cause of virtue, and a man of unblemished life and untiring beneficence, Shaftesbury probably had no superior in his generation. His character and pursuits are the more remarkable, considering the rank of life in which he was born and the circumstances under which he was brought up. In many respects he reminds us of the imperial philosopher Marcus Aurelius, whose works we know him to have studied with avidity, and whose influence is unmistakably stamped upon his own productions.

Most of Shaftesbury's writings have been already mentioned. In addition to these there have been published fourteen letters from Shaftesbury to Moleworth, edited by Toland in 1721, some letters to Benjamin Felly, his sons, and his clerk Harry Wilkinson, included in a volume entitled *Original Letters of Locke, Shaftesbury, and Moleworth*, which was published by Mr. T. Foster in 1830, and again in an enlarged form in 1847; three letters, written respectively to Stungel, Lord Oxford, and Lord Godolphin, which appeared for the first time, in the *General Dictionary*, and lastly a letter to Le Clerc, in his recollections of Locke, first published in *Notes and Queries*, Feb. 8, 1851. The *Letters to a Young Man at the University* (Michael Answorth), already mentioned, were first published in 1716, it being uncertain by whom. The letter on *Education* was first published in the edition of the *Characteristics* issued in 1732. Besides the published writings, there are still to be found several memoranda, letters, rough drafts, &c., in the Shaftesbury papers in the Record Office.

Shaftesbury, it is plain, took great pains in the elaboration of his style, and he succeeded so far as to make his meaning transparent. The thought is always clear. But, on the other hand, he did not greatly succeed in attaining elegance, an object at which he seems equally to have aimed. There is a curious affectation about his style,—a falsetto note,—which, notwithstanding all his efforts to please, is often irritating to the reader. Its main characteristic is perhaps best hit off by Charles Lamb when he calls it "genteel." It poses too much as a fine gentleman, and is so anxious not to be taken for a polemic of the vulgar scholastic kind that he falls into the hardly more attractive pedantry of the evasive and evasive. There is a certain refinement, but it possesses the great merits of being easily read and easily understood. Hence, probably, the wide popularity which his works enjoyed in the last century; and hence, undoubtedly, the agreeable feeling with which, notwithstanding all their false taste and their tiresome digressions, they still impress the modern reader.

It is usually as a moralist that Shaftesbury has a claim to a place in the history of literature and philosophy. Like most of the classical writers of his time his first impulse to speculation, or at least to publication, seems to have been derived from a desire to combat the still fashionable paradoxes of Hobbes, and to arrest the progress of doctrines at which society still continued to be seriously alarmed. Hence it became his main concern to assert the reality and independence of our benevolent affections, and to show that those and the net which result from them are what mainly stir the feeling of moral duty. To mark he appears to have conceived it his special mission to undertake not a "polemic" or a "Schoolman," but as a "man of taste." It was probably in accordance with this conception that he refrained from using the language about the "laws of nature" which had hitherto been current in ethical treatises, and that he preferred to represent morality as a matter of "taste," "sentiment," or "affection," rather than as dictated simply by reason.

The leading theme in Shaftesbury's ethical theory are those of a system, or the relation of parts to a whole, benevolence, moral beauty, and a moral sense.

The individual man himself is a system consisting of various appetites, passions, and affections, all united under the supreme control of reason. Of this system the parts are so nicely adjusted to each other that any disarrangement or disproportion, however slight, may mar and disfigure the whole. "Whoever is in the least versed in this moral kind of architecture will find the inward fabric so adjusted, and the whole so nicely fitted, that the barely extending of a single passion a little too far, or the continuance of it too long, is able to bring irrecoverable ruin and misery."

But morality and human nature cannot be adequately studied in the system of the individual man. There are parts in that system, both mental and bodily, which have an evident respect to something outside it. Neither man nor any other animal, though ever so complete a system of parts as to all within, can be allowed in the same manner complete as to all without; he must be considered as having a further relation abroad to the system of his kind. So even this system of his kind to the animal system; this to the world (our earth); and this again to the bigger world

and to the universe. No being can properly be called good or ill except in reference to the systems of which he is a part. "When, in general, all the affections or passions are suited to the public good or end of the species, then is the natural temper entirely good. If, on the contrary, any requisite passion be wanting, or if there be any one superfluous or weak, of anywise dissolvable or contrary to that end, then is the natural temper, and art, and consequently the creature himself, in some measure corrupt and ill." Hence it follows that benevolence, if not the sole, is at least the principal moral virtue.

The idea of a moral and social system, the parts of which are in a constant proportion to each other, and so nicely adjusted that the slightest disarrangement would mar the unity of design, almost necessarily suggests an analogy between morality and art. As the beauty of an external object consists in a certain proportion between its parts, or in a certain harmony of colouring, so the beauty of a virtuous character consists in a certain proportion between the various affections, or in a certain harmonious blending of the various springs of action as they contribute to promote the great ends of our being. And similarly, we may suppose, the beauty of a virtuous action would be explained as consisting in its relation to the various characters in which it has its source, or to the other acts of a virtuous life, or to the general condition of a virtuous state of society. This analogy between art and morality, or, as it may otherwise be expressed, between the beauty of external objects and the beauty of actions or characters, is never long absent from Shaftesbury's mind. Closely connected with it is the idea that morals, no less than art, is a matter of taste or taste.

This idea leads us to the last of the distinctive features in Shaftesbury's ethical philosophy. The faculty which approves of right and disapproves of wrong actions is with him a sense, and more than once he anticipates Hutcheson by calling it a "moral sense," an expression, indeed, which he may be said to have contributed to the English language. This "sense of right and wrong" is "as natural to us as natural affection itself," "the first principle in our constitution and nature." At the same time it includes a certain amount of judgment or reflection, that is to say, a rational element. Shaftesbury's doctrine on this head may, perhaps, briefly be summed up as follows. Each man has from the first a natural sense of right and wrong, a "moral sense" or "conscience" (all which expressions he employs as synonymous). This sense is, in its natural condition, wholly or mainly emotional, but it is subject to constant intellectual refinement, so that the rational or collective element in it gradually becomes more prominent. Its decisions are generally described as if they were immediate, and, beyond the occasional recognition of a rational as well as an emotional element, little or no attempt is made to analyse it. It was reserved for Hume properly to discriminate between these two elements, and to point out that, while the feeling of moral approbation or disapprobation is instantaneous, the moral judgment which precedes it is often the result of an intellectual process of considerable length and complexity.

It may be sufficient to supplement this brief survey of Shaftesbury's system by a still briefer summary of the answers, so far as they can be collected from his works, which he would have given to the principal questions of ethics as they are now usually propounded. His answers to these questions are, as it appears to the present writer, the most important and valuable part of his system, and vice, right and wrong—can be found in the very make and constitution of our nature; that morality is independent of theology, actions being denominated good or just, not by the arbitrary will of God (as had recently been maintained by Locke), but in virtue of some quality existing in themselves, that the ultimate test of a right action is its tendency to promote the general welfare; that we have a peculiar organ, the moral sense, connected with art, by which we are enabled to distinguish between characters and actions as good or bad, that the higher natures among mankind are impelled to right action, and deterred from wrong action, partly by the moral sense, partly by the love and reverence of a just and good God, while the lower natures are mainly influenced by the opinions of others, or by the hope of reward and the fear of punishment; that appetite and reason both concur in the determination of action; lastly, that the question whether the will does or does not possess any freedom of choice, irrespectively of character and motives, is one (at least so we may gather from Shaftesbury's sentence) which it does not concern the moralist to solve.

The close resemblance of Hutcheson's speculations to those of Shaftesbury, amounting sometimes to identity, will be apparent on reference to the account of that philosopher (vol. xii. pp. 408-11). Next to Hobbes, the moralist with whose views Shaftesbury's stand in most direct antagonism is Locke, who not only maintained that moral distinctions depend solely on the arbitrary will of God, but that the sanctions by which they are mainly enforced are the hope of future reward and the fear of future punishment. "By the fault is the rod, and with the transgression a fire ready to

punish it" Shaftesbury's was in reality, though perhaps not in appearance, a more truly religious philosophy. For with him the incentives to well-doing and the deterrents from evil-doing are to be sought not solely, or even mainly, in the opinion of mankind, or in the rewards and punishments of the magistrate, or in the hopes and terrors of a future world, but in the answer of a good conscience approving of the good and disapproving of the evil, and in the love of a God, who, by His infinite wisdom and His all-embracing beneficence, is worthy of the love and admiration of His creatures.

The main object of the *Moralists* is to propound a system of natural theology, and to vindicate, so far as natural religion is concerned, the ways of God to man. The articles of Shaftesbury's religious creed were few and simple, and these he embodied with a conviction amounting to enthusiasm. They may briefly be summed up as a belief in one God whose most characteristic attribute is universal benevolence in the moral government of the universe, and in a future state of man making up for the imperfections and repairing the inequalities of the present life. Shaftesbury is emphatically an optimist, but there is a passage in the *Moralists* (pt. n. sect. 4) which would lead us to suppose that he regarded matter as an indifferent principle, co-existent and co-eternal with God, limiting His operations, and the cause of the evil and imperfection which, notwithstanding the benevolence of the Creator, is still to be found in His work. If this view of his optimism be correct, Shaftesbury, as Mill says of Leibnitz, must be regarded as maintaining, not that this is the best of all imaginable but only of all possible worlds. This brief notice of Shaftesbury's scheme of ethics and religion would not be sensibly incomplete unless it mentioned that it is vulgarized in Pope's *Essay on Man*, several lines of which, especially of the first epistle, are simply statements from the *Moralists* done into verse. Whether, however, these were taken immediately by Pope from Shaftesbury, or whether they came to him through the papers which Bolingbroke had prepared for his use, we have no means of determining.

Shaftesbury's philosophical activity was confined to ethics, aesthetics, and religious philosophy, and he was not a philosopher, even psychology, except so far as it afforded a basis for ethics, he evidently had no taste. Logic he probably despised as merely an instrument of pedants, a judgment for which, in his day, and especially at the universities, there was only too much ground.

The influence of Shaftesbury's writings was very considerable both at home and abroad. His ethical system was reproduced, though in a more popular and philosophical form, by Hutcheson and from him descended, with certain variations, to Hume and Adam Smith. Nor was it without its effect even on the speculations of Butler. Of the so-called deists Shaftesbury was probably the most important, as he was certainly the most plausible and the most respectable. No sooner had the *Characteristics* appeared than they were welcomed, in terms of warm commendation, by Le Clez and Leibnitz. The *Discourse* was also reproduced, the *Inquiry concerning Virtue* in what was afterwards known as his *Essays on the Merit of La Vertu*. In 1769 a French translation of the whole of Shaftesbury's works, including the *Letters*, was published at Geneva. Translations of separate treatises into German began to be made in 1738, and in 1776-1779 there appeared a complete German translation of the *Characteristics*. Hermann Heitner says that not only Leibnitz, Voltaire, and Diderot, but Lessing and Goethe in that work he was obliged to supplement the most stimulating tributaries from Shaftesbury. "His charms," he adds, "are ever fresh. A new-born Hellesmus, or divine cultus of beauty presented itself before his inspired soul." Heider is especially eulogistic. In the *Adriastet* he pronounces the *Moralists* to be a composition in form well-nigh worthy of Grecian antiquity, and in its contents almost superior to it. The interest felt by German literary men in Shaftesbury has been recently revived by the publication of two excellent monographs, one dealing with him mainly from the theological side by Dr Gudrun Speker (Freiburg in Baden, 1872), the other dealing with him mainly from the philosophical side by Dr Georg von Gnyzelski (Leipzig, 1876).

In the foregoing article the writer has made free use of his monograph on Shaftesbury and Hutcheson in the series of "English philosophers" (1882), published by Sampson Low & Co. In that work he was obliged to supplement the printed materials for the life by extracts from the Shaftesbury papers now deposited in the Record Office. These include, besides many letters and memoranda, two lives of him, composed by his son, the fourth earl, one of which is evidently the original, though it is by no means always closely followed, of the life contributed by Dr Birch to the *Oxford Dictionary*. For a description and criticism of Shaftesbury's philosophy reference may also be made to Montagu's *Progress of Ethical Philosophy*, Whewell's *History of Moral Philosophy in England*, Jouffroy's *Introduction to Ethics* (Channing's translation), Leslie Stephen's *English Philosophers in the Eighteenth Century*, *Types of Ethical Theory*, and the article *Erasmus* in the present work (vol. viii. pp. 495, 600). For his relation to the religious and theological controversies of his day, see, in addition to one of the above, *Erasmus* in the *Practical Dictionary of Theology*, Leathes's *Geschichte des Englischen Denkens*, Hunt's *Religious Thought in England*, Abbey and Overton's *English Church in the Eighteenth Century*, and A. S. F. Johnson's *Lectures*.

SHAFTESBURY, ANTHONY ASHLEY COOPER, SEVENTH EARL OF (1801-1885), was the son of Cropley, sixth earl,

and Anne, daughter of the third duke of Marlborough, and was born 28th April 1801. He was educated at Harrow and Christ Church, Oxford, where he obtained a first class in classics in 1822, and graduated M.A. in 1832. In 1841 he received from his university the degree of D.C.L. He entered parliament as member for the pocket borough of Woodstock in 1826, in 1830 he was returned for Dorchester, from 1831 till February 1846 he represented the county of Dorset, and he was member for Bath from 1847 till (having previously borne the courtesy title Lord Ashley) he succeeded his father as earl in 1851. Although giving a general support to the Conservatives, his parliamentary conduct was greatly modified by his intense interest in the improvement of the social condition of the working classes, his efforts in behalf of whom have made his name a household word. He opposed the Reform Bill of 1832, but was a supporter of Catholic emancipation, and his objection to the continuance of resistance to the abolition of the Corn Laws led him to resign his seat for Dorset in 1846. In parliament his name, more than any other, is associated with the factory legislation (see *Factory Acts*, vol. viii p. 845). He was a lord of the admiralty under Sir Robert Peel (1834-35), but on being invited to join Peel's administration in 1841 refused, having been unable to obtain Peel's support for the Ten Hours' Bill. Chiefly by his persistent efforts a Ten Hours' Bill was carried in 1847, but its operation was impeded by legal difficulties, which were only removed by successive Acts, instigated chiefly by him, until legislation reached a final stage in the Factory Act of 1874. The part which he took in the legislation bearing on coal mines was equally prominent. It is worthy of notice that his efforts in behalf of the practical welfare of the working classes were guided by his own personal knowledge of their circumstances and wants. Thus in 1846 he took advantage of his leisure after the resignation of his seat for Dorset to explore the slums of the metropolis, and by the information he obtained not only gave a new impulse to the movement for the establishment of ragged schools, but was able to make it more widely beneficial. For over forty years he was president of the Ragged School Union. He was also one of the principal founders of reformatory and refuge unions, young men's Christian associations, and working men's institutes. He took an active interest in foreign missions, and was president of several of the most important philanthropic and religious societies of London. He died 1st October 1885. By his marriage to Lady Emily, daughter of the fifth Earl Cowper, he left a large family, and was succeeded by his eldest son Anthony, who committed suicide shortly afterwards.

SHAGREEN. See LEATHER, vol. xiv. p. 390, and SHARK.

SHAHABÁD, a British district in the Patna division of the lieutenant-governorship of Bengal, India, between 24° 31' and 25° 43' N lat. and between 83° 23' and 84° 55' E. long., with an area of 4365 square miles. It is bounded on the N. by the district of Ghazipur in the North-Western Provinces and by Saran, on the E. by Patna and Gayá districts, on the S. by Lohardaga, and on the W. by Mirzapur, Benares, and Ghazipur districts of the North-Western Provinces. About three-fourths of the whole area lying to the north is an alluvial flat, wholly under cultivation, and fairly planted with mangoes, bamboos, and other trees, while the southern portion of the district is occupied by the Kaimur Hills, a branch of the great Vindhyan range, and is a densely wooded tract. The chief rivers are the Ganges and the Son, which unite in the north-eastern corner of Shahábád. A series of canals on the Son are reported to have secured for the district immunity from future famine. In the southern portion

of the district large game abounds, including the tiger, bear, leopard, and several varieties of deer, and among other animals met with are the wild boar, hyena, jackal, and fox. The nyghau is seen on the Kaimur hills. The climate is very sultry, and the rains heavy. The East Indian Railway traverses the north of the district for 60 miles, and the aggregate length of roads is about 1000 miles.

The census of 1881 disclosed a population of 1,964,909 (males 950,250, females 1,014,659), Hindus numbered 1,817,881, Mohammedans 116,732, and Christians 271. Four towns contain a population exceeding 10,000, viz., Atia 42,998, Dammun 17,429, Bara 16,498, and Jagmoh 12,568. The administrative headquarters of the district are at Atia. The chief staple of Shāhābād is rice, which produces three crops during the year, wheat, barley, maize, cereals, and various other plants are also grown. The principal manufactures of the district are sugar, paper, saltpetre, blankets, coarse cotton cloth, and brass utensils. Its trade is chiefly carried on by means of peasant markets in the town and at fairs. The principal exports are rice, wheat, barley, pulses, grain, oats, linseed, curraway seed, paper, and spices; imports consist of cleaned rice, betel-nut, tobacco, sugar, molasses, salt, pepper, cotton, iron, brass, zinc, copper, lead, tin, and betel-nut. The revenue of Shāhābād district in 1883-84 amounted to £253,542, of which the land yielded £171,263. The southern part of the district was ceded to the British by Shah Alum, emperor of Delhi in 1705, and the northern part by Am-ul-Dowla, vizier of Oudh, ten years later.

SHAH JAHAN, Mogul emperor from 1627 to 1658
See ENCYCLOPEDIA, vol. xii p. 795.

SHAHJAHANPUR, the easternmost district of the Rohilkhand division in the lieutenant-governorship of the North-Western Provinces of British India, lying between 27° 36' and 28° 29' N. lat. and between 79° 23' and 80° 30' E. long. It has an area of 1746 square miles, and is bounded on the N and N.W. by Pilibhit, on the E. by Haridwar and Kheri, on the S. by the Ganges, separating it from Farukhabad, and on the W. by Banda and Bareilly. The district consists of a long and narrow tract running up from the Ganges towards the Himalayas, and is for the most part level and without any hills or considerable undulations. The principal rivers are the Gomti, Khannat, Garā, and Rānganga. The last-named is the main waterway of the district, and is navigable as far as Kola Ghat near Jāldābād, whence grain is shipped for the Ganges ports. To the north-east beyond (towards the country resembles the *terai* in the preponderance of waste and forest over cultivated land, in the sparseness of population, and in general unhealthiness. Between the Gomti and the Khannat the country varies from a rather wild and unhealthy northern region to a densely inhabited tract in the south, with a productive soil well cultivated with sugar-cane and other remunerative crops. The section between the Dooha and Garā comprises much marshy land, but south of the Garā, and between it and the Rānganga, the soil is mostly of a sandy nature. From Rānganga to the Ganges in the south is a continuous low country of marshy patches alternating with a hard clayey soil requiring much irrigation in parts. Shāh-jahānpur contains a number of hills or lakes, which afford irrigation for the spring crops in their neighbourhood. The Oudh and Rohilkhand Railway traverses the district a distance of 39 miles. The climate of the district is very similar to that of most parts of Oudh and Rohilkhand, but moister than that of the Doab. Except in May and June, the country has a fresh and green appearance. Its average annual rainfall is about 38 inches.

In 1881 the population of Shāh-jahānpur numbered 856,946 (males 400,044, females 396,882), of whom 735,244 were Hindus and 120,214 were Mohammedans. The district contains only two towns with a population exceeding 10,000, viz., SHAHJAHANPUR (9,711) and Talhar (16,321). Of the total area of 1746 square miles 1090 were under cultivation in 1883-84, and 464 were returned as cultivable. The chief agricultural products are wheat and gram in spring, and in the autumn sugar-cane, rice, joar, and bajra, and

several kinds of pulses. Exports are chiefly sugar, grain of all kinds, pulses, indigo, cotton, and timber, and the imports are mainly European goods, metals, and salt. The gross revenue raised in the district in 1883-84 amounted to £186,162, of which the land contributed £118,638. The only manufactures of any importance under European supervision are those of sugar and rum and of indigo. Shāh-jahānpur was ceded to the English by treaty in 1801. During the mutiny of 1857 it became the scene of open rebellion. The Europeans were attacked when in which, three were shot down, but the remainder, aided by a hundred faithful sepoy, escaped. The forces under Lord Clyde put a stop to the anarchy in April 1858, and shortly afterwards peace and authority were restored.

SHAHJAHANPUR, municipal town and administrative headquarters of the above district, lies in 27° 53' 41" N lat and 79° 57' 30" E long., on the left bank of the Dooha. It is a large place, with some stately old mosques and a castle now in ruins. The city was founded in 1647 during the reign of Shāh Jāhān, whose name it bears, by Nawāb Bahādur Khān, a Tāhān. It has a considerable export trade in cereals, pulses, and sugar. In 1881 the population was 74,830 (36,840 males, and 37,990 females).

SHAHPUR, the southernmost district of the Rawal Pindi division in the lieutenant-governorship of the Punjab, India, between 31° 33' and 32° 42' N. lat. and between 71° 37' and 73° 24' E long., with an area of 4691 square miles. The district is bounded on the N. by the Jhelum district, on the E. by Gujrat and the Chenab, on the S. by Jhang, and on the W and N.W. by Dera Ismail Khan and Bannu. On both sides of the Jhelum stretch wide upland plains, utterly barren or covered only with brushwood, a considerable portion of this area, however, is composed of good soil, only requiring irrigation to make it productive. The most important physical subdivisions of the district are the Salt range in the north, the valleys of the Chenāb and Jhelum, and the plains between those rivers and between the Jhelum and the Salt range. The characteristics of these two plains are widely different: the desert portion of the southern plain is termed the *bar*, the corresponding tract north of the Jhelum is known as the *thal*. That part of Shāhpur to the north of the Jhelum is by far the most interesting, containing as it does such varieties of scenery and climate, such contrasts of soil, vegetation, and natural capabilities. Communications are carried on by well-made roads, by the Jhelum, which is navigable for country craft throughout its course within the district, and by 52 miles of the Salt branch of the Punjab Northern State Railway. The climate of the plains is hot and dry, but in the Salt range it is much cooler; the average annual rainfall is about 15 inches. Tigers, leopards, and wolves are found in the Salt range, while small game and antelope abound among the thick jungle of the *bar*.

The census of 1881 disclosed a population of 421,508 (males 221,076, females 199,882); of these 59,026 were Hindus and 367,742 were Mohammedans. The only town in the district with more than 10,000 inhabitants is Bhera, with 15,166, but the administrative headquarters of the district are at the small town of Shāhpur on the Jhelum river, the population of which in 1881 was 5424. Of the total area only 871 square miles were under cultivation in 1883-84, and 3055 square miles were returned as cultivable. Wheat is the chief staple, and covers nearly a half of the cultivated area; barley and cotton are the next most extensively grown crops, among other crops are sugar-cane and opium. The commercial importance of the district depends almost entirely upon its connection with the Salt range, salt being found throughout these hills. The revenue derived from this product, however, though collected in the Shāhpur district, cannot properly be credited to it, as the mineral, though abundant in the Shāhpur portion of the range, is worked chiefly in that part of it which lies in the Jhelum district. The chief exports are grain, rice, cotton, wool, *ghat*, and saltpetre; the imports sugar, English piece-goods, and metals. The manufactures consist of silk and cotton goods, toys, and folded blankets. The gross revenue in 1883-84 amounted to £55,290, of which the land contributed £39,020.

Shāhpur passed into the hands of the English along with the rest of the Punjab on the suppression of the Miltan rebellion in

1849 During the mutiny of 1857 the district remained tranquil, and though the villages of the *kes* gave cause for alarm no outbreak of sepoy occurred Since annexation the limits and constitution of the district have undergone many changes

SHAHRASTĀNĪ (1086-1153) Abū'l-Faṭḥ Mohammed ibn 'Abd al-Karīm, called al-Shahraṣṭānī, a native of Shahraṣṭān (Shehrstān) in Khorāsān, Persia, was noted as a juriconsult and theologian of the Ash'arite school He went to Baghdad in 1116 and stayed there three years, but afterwards returned to his native place, where he died Sam'ānī, the famous historian of Baghdad, was one of his hearers, and to him Ibn Khalkhān (No 632, Eng tr 11 675 *sg*) mainly owes the title that is known of Shahraṣṭān's life

He wrote various works, of which several still exist, that which gives him a claim to notice here is the interesting *Kutub al-Matal wa-Nihāṭ*, or "Account of Religious Sects and Philosophical Schools," published by Careton in 1846 and translated into German by Haubruker (Halle, 1850-51) The book was already used by Pocock for his account of the ancient Arabs and has been much referred to since, but has to be read with caution, as the author is often very unimpartial. It treats successively of the Mohammedan sects, of other religious bodies (Jews, Samaritans, Christians, Magians, Manichæans, &c.), of philosophical schools (including the Greeks), and of the ancient Arabs and Indians, and contains a great deal of curious and valuable matter

SHARP, JOHN CAMPBELL (1819-1885), principal of the United College, St Andrews, and professor of poetry at Oxford, was born at Houstoun House, Lanthlughwshire, on July 30, 1819 He was the third son of Major Norman Sharp of Houstoun and E Binning, daughter of J Campbell of Kildaloe, Argyllshire He was educated at Edinburgh Academy and Glasgow University, where he gained the Snell exhibition, and entered at Balliol College, Oxford, in 1840 While a student at Glasgow and an undergraduate at Oxford it was his privilege to make many warm friends and to be very widely loved. At Glasgow began his lifelong friendship with Dr Norman McLeod, while among those with whom he was most intimate at Oxford were the names of Bradley, Coleridge, Temple, Clough, Walrod, Tiddell, Pichard, and Edwin Palmer In 1842 he gained the Newdigate prize for a poem on Charles XII, and in 1844 took his degree with second class honours During these years the "Oxford movement" was at its height. Sharp's earnest nature was greatly stirred by Newman's sermons, while Keble's poetry spoke home to his heart, but, though full of warm sympathy for many High Church views, he remained faithful to his Presbyterian upbringing. After leaving Oxford he took a mastership at Rugby under Dr Tait; here he sought loyally to develop Dr Arnold's system by appealing to the better feelings of his pupils and by giving them wide views of culture and education. And in this he was successful, making among his pupils warm and lasting friends. In 1857 he became assistant to the professor of humanity in the university of St Andrews, and in 1861 he was appointed professor of that chair. In 1853 he married Eliza, daughter of Henry Alexander Douglas, Kilhead, Dumfriesshire, and had one surviving son, John Campbell, who became an advocate at the Scottish bar Sharp was highly respected by the more earnest students, and much loved by some whose spiritual as well as mental nature he helped to quicken. In 1864 he published *Kilmahoe, a Highland Pastoral*; in this his devotion to the scenery and the people of the Scottish Highlands, where he always spent his vacations, found vent In this poem there was a directness, simplicity, and moral earnestness which showed the true poet. In 1868 he republished some articles under the name of *Studies in Poetry and Philosophy*; this book showed him to be one of the foremost critics of his day, the chief subjects it discussed were Wordsworth, Coleridge, and Keble. He insisted strongly on the high spiritual teaching and the deep poetical power of the great lake bard.

While not blind to his many faults of style, his occasional puerility, and his prossiness, he urged his claims as a unique interpreter of Nature and a spiritual philosopher. Coleridge interested him as a poet, but much more as a religious teacher, the *Aids to Reflection* was a favourite present to his young friends, and often gave a text for his deeper conversations. The most popular essay was that on Keble, in which he gave a vivid sketch of Newman's influence in Oxford, while he spoke of the author of *The Christian Year* with enthusiasm as a Christian teacher, and with discerning criticism as a poet. In 1868 he was presented to the principalship of the United College, vacant by the death of J D Forbes, he discharged the duties of this office with conscientious zeal and interest, and also continued to lecture from time to time on literary and ethical subjects A course of the lectures, published in 1870, *Culture and Religion*, is one of his most popular works In 1873 he helped to edit the life of Principal Forbes, and in 1874 he edited Dorothy Wordsworth's charming *Recollections of a Tour in Scotland in 1803* In 1877 he was elected professor of poetry at Oxford in succession to Sir F H Doyle Of his lectures from this chair the best were published in 1880 as *Aspects of Poetry* In 1877 he had published *The Poetic Interpretation of Nature*, in which he enters fully into the "old quarrel," as Plato calls it, between science and poetry, and traces with great clearness and literary acumen the ideas of nature in all the chief Hebrew, classical, and English poets In 1879 he published a short life of Robert Burns Such were Sharp's chief literary works, though many uncollected magazine articles and a few poems show the versatility of his mind, attention may be specially called to his article *Критика* in this *Encyclopaedia* as an example of his critical power. In 1882 he was re-elected to the poetry chair and discharged his duties there and at St Andrews till the end of 1884, but his health had been frail for some time, and in March 1885 he sought a change of air in the Riviera He returned in June somewhat benefited, but he caught a chill in the autumn, and, after a short illness, died at Ormsary, Argyllshire, on September 18, 1885.

SHAKERS is the name commonly applied to and not rejected by a religious denomination of which the official title is "The United Society of Believers in Christ's Second Appearing" The founders was Ann Lee, who was born in Toul Lane, Manchester, 29th February 1736, but only privately baptized 1st June 1742 Her father was a blacksmith, and at an early age she found employment, being at one time a cutter of hutter's fur, and at another cook in the infirmary of her native town. She was a quiet child of a somewhat visionary temperament, and in 1758 joined a small religious body, a remnant of the French Prophets. The leader was Jane Wardley, who was regarded by her followers as the "spirit of John the Baptist operating in the female line." These people were called Shakers because, like the early Quakers, they were seized with violent trumbings and shakings when under the influence of strong religious emotion. Ann Lee in 1762 married a blacksmith whose character was not very good. Their four children died in infancy. She became "a seeker after salvation," and her conversion was followed by her taking the lead in the Shaker Society, to which she promulgated a doctrine of celibacy. Their previous training had led them to expect that the second coming of Christ would be in the form of a woman; as Eve was the mother of all living, so in their new leader the Shakers recognized "the first mother or spiritual parent in the line of the female." With their new-born zeal aflame, they preached their doctrine in season and out of season, and suffered something from mob violence and from the intolerance of the constituted authorities. In

1774 Ann the Word and eight of her disciples emigrated to America, and landed at New York on August 1st of that year. Abraham Stanley, not relishing his wife's celibate creed, abandoned her for another woman. The "Believers" settled at Neukensia, now called Watervliet, and were imprisoned for refusing to take the oath, for which reason they were suspected of being unfavourable to the cause of the Revolution. On being released they preached their creed and gradually gained converts. Ann Lee died at Watervliet 8th September 1780. She was succeeded by James Whittaker, who died in 1788, when Joseph Meacham succeeded to the leadership and organized the society on that communistic basis which now distinguishes it. In the early history of the Shakers various charges were brought against them, including flagellation and naked dancing, but they have outlived these scandals and are now generally respected. There is an interesting sketch of a Shaker community in Howell's *Undiscovered Country*. They all work; they are capital agriculturists, they have a widespread reputation for thoroughness, frugality, and temperance. They believe in the reality of constant intercourse with the world of spirits. There are "poems" by Mother Ann which it is claimed have been dictated by her from the spirit world. They claim from

time to time the exercise of the gift of tongues and the gift of healing. The theological ideas of the Shakers are set forth in the *Testimony of Christ's Second Appearing exemplified by the Principle and Practice of the True Church of Christ*, of which a fourth edition, printed in 1856, was extensively circulated. A compacter statement is that in F. W. Evans's *Shakers' Compendium*, which was printed at New Lebanon in 1859. Elder Evans, who is the best-known representative of Shakerism, is of English birth, and has published an autobiography. In 1870 there were eighteen distinct Shaker communities, with eighteen church buildings capable of seating 8850 persons, and possessing property valued at \$86,900. These socialist villages are in Connecticut, Kentucky, Maine, Massachusetts, New York, New Hampshire, and Ohio.

The best known of the settlements is that at New Lebanon, where there are three separate societies in view of each other. The North Family, the Church Family, and the Second Family are distinct groups, whose members live together and have a common right to land, house, hats, tools, books, and all that there is. The only form of government is that supplied by the public opinion of the community, as expressed in its social meetings for mutual confession, counsel, and criticism. Mr. Heyworth Brown's *New Jerusalem* gives an interesting account of their communistic methods.¹

There is an extensive literature respecting the Shakers, a bibliography is appended to W. E. A. Aron's *Biographical Notices of Ann Lee*, Liverpool, 1870.

SHAKESPEARE

WILLIAM SHAKESPEARE (1564-1616), the national poet of England, the greatest dramatist that modern Europe has produced, was born in April, in the year 1564, at Stratford-upon-Avon, in the county of Warwick. The known facts of the poet's personal history are comparatively few, and before giving them in order we purpose considering in some detail the larger educational influences which helped to stimulate his latent powers, to evoke and strengthen his poetical and patriotic sympathies, and thus prepare and qualify him for his future work. In dealing with these influences we are on firm and fruitful ground. We know, for example, that Shakespeare was born and lived for twenty years at Stratford-upon-Avon; and we can say therefore with certainty that all the physical and moral influences of that picturesque and richly-stored Midland district melted as years went by into the full current of his ardent blood, became indeed the vital element, the very breath of life his expanding spirit breathed. We know a good deal about his home, his parents, and his domestic surroundings; and these powerful factors in the development of any mind gifted with insight and sensibility must have acted with redoubled force on a nature so richly and harmoniously endowed as that of the Stratford poet. It would be difficult indeed to overestimate the combined effect of these vital elements on his capacious and retentive mind, a mind in which the receptive and creative powers were so equally poised and of such unrivalled strength. This review of the larger influences operating with concentrated force during the critical years of youth and early manhood will help to connect and interpret the few and scattered particulars of Shakespeare's personal history. These particulars must indeed be to some extent connected and interpreted in order to be clearly understood, and any intelligible account of Shakespeare's life must therefore take the shape of a biographical essay, rather than of a biography proper. We may add that the sketch will be confined to the points connected with Shakespeare's local surroundings and personal history. The large literary questions connected with his works, such as the classification, the chronology, and analysis of the plays, could not of course be adequately dealt with in such a sketch. It is

the less necessary that this wider task should be attempted as the main points it embraces have recently been well handled by competent Shakespearean scholars. The best and most convenient manuals embodying the results of recent criticism and research will be referred to at the close of the article. Meanwhile we have first to look at the locality of Shakespeare's birth, both in its material and moral aspects.

Warwickshire was known to Shakespeare's contemporaries as the central county or heart of England. It ^{was} ^{the} middle shire of the Midlands, where the two great Roman roads crossing the island from east to west and west to east met,—forming at their point of junction the centre of an irregular St Andrew's cross, of which the arms extended from Dover to Chester on the one side and from Totnes to Lincoln and the north on the other. The centre in which these roads—Watling Street and the Fosse Way—thus met was early known from this circumstance as the High Cross. Being the most important Midland position during the Roman occupation of the country, several Roman stations were formed in the neighbourhood of this venerable Quatre Bras. Of these Camden specifies the ancient and flourishing city of Clwycheater, represented in part by the modern Clybrook, and Manduessedium, the memory of which is probably retained in the modern Mancetter. Important Roman remains have also been found within a few miles of Stratford, at Alcester, a central station on the third great Roman road, Rucknild Street, which runs from south to north across the western side of the county. In later times, when means of communication were multiplied, the great roads to the north-west still

¹ There is considerable similarity between the American disciples of Ann Lee and the English Shakers of the New Forest, who came into public notice in 1874. One of their members had bought 81 acres of land, which they cultivated under the direction of "Mother" Mary Ann Griling, who was at once their foundress and prophetess. As the result of some litigation the Shakers were ejected in 1874, and, after having shelter for a time on a farm belonging to the Hon. Auberon Herbert, they then became a tent community. Charges were made against them of naked dancing in the course of their religious ecstasies. They believe in the second advent, regard Mrs Griling as the woman Messiah, have all property in common, and preach the doctrine of obedience.

passed through the county, and one of them, the mail road from London through Oxford to Birmingham, Stafford, and Chester, was the "streets" or public way that crossed the Avon at the celebrated ford spanned in 1483 by Sir Hugh Clopton's magnificent bridge of fourteen arches. Immediately beyond the bridge rose the homely gables and wide thoroughfares of Shakespeare's native place.

In Shakespeare's time Warwickshire was divided by the irregular line of the Avon into two unequal but well-marked divisions, known respectively, from their main characteristics, as the woodland and the open country, or more technically as the districts of Arden and Feldon. The former included the thickly-wooded region north of the Avon, of which the celebrated forest of Aiden was the centre, and the latter the champagne country, the rich and fertile pasture-lands between the Avon and the line of hills separating Warwick from the shires of Oxford and Northampton. Shakespeare himself was of course familiar with this division of his native shire, and he has well expressed it in Lear's description of the section of the kingdom assigned to his eldest daughter Goneril,—

"Of all these bounds,—even from this line to this,
With shadowy forests and with champains rich'd,
With pleanous rivers and wide-skirted meads,—
We make this lady "

No better general description of Warwickshire could indeed be given than is contained in these lines. Taking the Roman roads, Watling and Ricknild Streets, as boundaries, they vividly depict the characteristic features of the county, including its pleanous rivers and wide-skirted meads. The old and central division of Arden and Feldon is clearly embodied in the second line, "with shadowy forests and with champains rich'd." This distinction, practically effaced in modern times by agricultural and mining progress, was partially affected by these causes even in Shakespeare's own day. The wide Arden, or belt of forest territory which had once extended not only across the county but from the Trent to the Severn, was then very much restricted to the centre of the shire, the line of low hills and undulating country which stretched away for upwards of twenty miles to the north of Stratford. The whole of the northern district was, it is true, still densely wooded, but the intervening patches of arable and pasture land gradually encroached more and more upon the bracken and brushwood, and every year larger areas were cleared and prepared for tillage by the axe and the plough. In the second half of the 16th century, however, the Arden district still retained enough of its primitive character to fill the poet's imagination with the exhilarating breadth and sweetness of woodland haunts, the beauty, variety, and freedom of sylvan life, and thus to impart to the scenery of *As You Like It* the vivid freshness and reality of a living experience. In this delightful comedy the details of forest-life are touched with so light but at the same time so sure a hand as to prove the writer's familiarity with the whole art of vinery, his thorough knowledge of that "highest franchise of noble and princely pleasure" which the royal demesnes of wood and park afforded. In referring to the maches or wide margins on the outskirts of the forest, locally known as purlieus, Shakespeare indeed displays a minute technical accuracy which would seem to indicate that in his early rambles about the forest and casual talks with its keepers and woodmen he had picked up the legal incidents of sylvan economy, as well as enjoyed the freedom and charm of forest-life. Throughout the purlieus, for instance, the forest laws were only partially in force, while the more important rights of individual owners were fully recognized and established. Hence it happened that Corin's master, dwelling, as Rosalind puts it in a quaint but characteristic

smile that betrays her sex, "here in the skirts of the forest, like fringe upon a petticoat," could sell "his cote, his flock, and bounds of feed," and that Celia and Rosalind were able to purchase "the cottage, the pasture, and the flock." It may be noted, too, that, in exchange for the independence the dwellers in the purlieus acquired as private owners, they had to relinquish their common right or customary privilege of pasturing their cattle in the forest. Sheep, indeed, were not usually included in this right of common, their presence in the forest being regarded as inimical to the deer. When kept in the purlieus, therefore, they had to be strictly limited to their bounds of feed, shepherded during the day and carefully folded every night, and these points are faithfully reflected by Shakespeare. Again, only those specially privileged could hunt venison within the forest. But if the deer strayed beyond the forest bounds they could be freely followed by the dwellers in the purlieus, and these happy hunting grounds outside the forest precincts were in many cases spacious and extensive. The special office of a forest ranger was indeed to drive back the deer straying in the purlieus. The banished duke evidently has this in mind when, as a casual denizen of the forest, he proposes to make war on its native citizens —

"Come, shall we go and kill us venison?
And yet it kills me, the poor dappled fools,
Being native bughes of this desert city,
Should, in their own confines, with forked heads,
Have their round haunches gor'd."

And the melancholy Jaques, refining as usual with cynical sentimentalism on every way of life and every kind of action, thinks it would be a special outrage

"To fright the animals, and to kill them up,
In their assign'd and native dwelling place."

Not only in *As You Like It*, but in *Love's Labour's Lost*, in *A Midsummer Night's Dream*, in the *Merry Wives of Windsor*, and indeed throughout his dramatic works, Shakespeare displays the most intimate knowledge of the aspects and incidents of forest life; and it is certain that in the first instance this knowledge must have been gained from his early familiarity with the Arden district. This, as we have seen, stretched to the north of Stratford in all its amplitude and variety of hill and dale, leafy covert and sunny glade, gant coaks and tangled thickets,—the woodland stillness being broken at intervals not only by the noise of bawling brooks below and of feathered outcries and flutterings overhead, but by dappled hords sweeping across the open lawns or twinkling in the shadowy larchen, as well as by scattered groups of timid conies feeling, at matins and vespers, on the tender shoots and sweet herbage of the forest side. The deer-stealing tradition is sufficient evidence of the popular belief in the poet's love of daring exploits in the regions of vert and venison, and of his devotion, although in a somewhat irregular way perhaps, to the attractive woodcraft of the park, the warren, and the chase. The traditional scene of this adventure was Charlecote Park, a few miles north-east of Stratford, but the poet's early wanderings in Arden extended, no doubt, much further afield. Stirred by the natural desire of visiting at leisure the more celebrated places of his native district, he would pass from Stratford to Henley and Ilampton, to Wroxall Priory and Kenilworth Castle, to Stoneligh Abbey and Leamington Priors, to Warwick Keep and Guy's Cliffe. The remarkable beauty of this last storied spot stirred the learned and tranquil pens of the antiquaries Camden and Dugdale to an unwonted effort of description, even in the pre-descriptive era. "Under this hill," says Camden, "hard by the river Avon, standeth Guy-cliffe, others call it Gib-cliffe, the dwelling house at this day of Sir Thomas Beau-foc, descended from

the ancient Normans line, and the very seat itself of pleasantness. There have yet a shady little wood, cleave and cristall springs, mossy bottomes and caves, meadows alwaies fresh and green, the river rumbling here and there among the stones with his stream making a milde noise and gentle whispering, and besides all this, solitary and still quietnesse, things most grateful to the Muses." But the whole of the countie was richly wooded, the towns, as the names indicate, being forest towns,—Henley-in-Arden, Hampton-in-Arden,—while the castles and secularized religious houses were peled off within their own parks and bounds from the sylvan wilderness around them. Some, like the celebrated castle of the Mountfords, called from its pleasant situation amongst the woods Beauchert, having been dismantled during the Wars of the Roses were already abandoned, and had in Shakespeare's day relapsed from the stately revelry that once filled their halls into the silence of the surrounding woods. At every point of the journey, indeed, as the poet's eager and meditative eye embraced new vistas, it might be said,

"Towers and battlements it sees
Bosomed high in tufted trees"

On the southern margin of the Arden division, towards the Avon, small farms were indeed already numerous, and cultivation had become tolerably general. But the region as a whole still retained its distinctive character as the Arden or wooded division of the county. Even now, indeed, it includes probably more woods and parks than are to be found over the same area in any other English shire.

The
Feldon
division.

While parts of the Arden district were in this way under cultivation, it must not be supposed that the champaign or open country to the south of the Avon, the Feldon division of the county, was destitute of wood, on the contrary its extensive pastures were not only well watered by local streams overshadowed by willow and alder, but well wooded at intervals by groups of more stately trees. The numerous flocks and herds that grazed throughout the valley of the Red Horse found welcome shelter from the noonday heat and the driving wind under the green roofs and leafy screens that lined and dotted their bounds of food. And, although even the grazing farms were comparatively small, almost every homestead had its group of protecting elms, its outlying patch of hanging beech and ash, or straggling copse of oak and hazel. This is still reflected in such local names as Wood Park, Shrub Lands, Oakley Wood, Furze Hill, Oakham, Ashborne, Alenit Wood, Berecot Wood, and Radland Gorse. These features gave interest and variety to the Feldon district, and justified the characteristic epithet which for centuries was popularly applied to the county as a whole, that of "woody Warwickshire." And Shakespeare, in passing out of the county on his London journeys, would quickly feel the difference, as beyond its borders he came upon stretches of less clothed and cultivated scenery. As his stout gelding mounted Edgohill, and he turned in the saddle to take a parting look at the familiar landscape he was leaving, he would behold what Speed, in his enthusiasm, calls "another Eden, as Lot the plain of Jordan." While the general aspect would be that of green pastures and grassy levels, there would be at the same time the picturesque intermingling of wood and water, of mill and grange and manor house, which gives light and shade, colour and movement, interest and animation, to the plain sweeps and more monotonous objects of pastoral scenery.

History. On the historical side Warwickshire has points of interest as striking and distinctive as its physical features. During the Roman occupation of the county it was, as we have seen, the site of several central Roman stations, of which, besides those already noticed, the fortified camps of

Tripointum and Præsidium on the line of the Avon were the most important. A Roman road crossed the Avon at Stratford, and radiating north and south soon reached some of the larger Roman towns of the west, such as Uiconnum and Cornium. Between these towns were country villas or mansions, many of them being, like that at Woodchester, "magnificent palaces covering as much ground as a whole town." The entire district must in this way have been powerfully affected by the higher forms of social life and material splendour which the wealthier provincials had introduced. The immediate effect of this Roman influence on the native populations was, as we know, to divide them into opposed groups whose conflicts helped directly to produce the disastrous results which followed the withdrawal of the Romans from the island. But the more prominent and more important effect is probably to be traced in the far less obstinate resistance offered by the Celtic tribes of Mid Britain to the invading Angles from the north and Saxons from the south, by whom themselves and their district were eventually absorbed. Instead of the fierce conflicts and wrathful withdrawal or extermination of the conquered Britons which prevailed further east, and for a time perhaps further west also, the intervening tribes appear to have accepted the overlordship of their Teutonic neighbours and united with them in the cultivation and defence of their common territory. The fact that no record of any early Anglo conquest remains seems to indicate that, after at most a brief resistance, there was a gradual coalescence of the invading with the native tribes rather than any fierce or memorable struggle between them. Even the more independent and warlike tribes about the Severn repeatedly joined the Saxon Hwiccas, whose northern frontier was the forest of Arden, in resisting the advance of Wessex from the south. And for more than a hundred years after the establishment of the central kingdom of the Angles, the neighbouring Welsh princes are found acting in friendly alliance with the Mercian rulers. It was thus the very district where from an early period the two race elements that have gone to the making of the nation were most nearly balanced and most completely blended. The union of a strong Celtic element with the dominant Angles is still reflected in the local nomenclature, not only in the names of the chief natural features, such as rivers and heights,—Arden and Avon, Lickey, Alne, and Thame,—but in the numerous *combes* and *cotes* or *cots*, as in the reduplicative Cotswold, in the *dens*, *dons*, and *dens*, and in such distinctively Celtic elements as *nam*, *ynol*, *try*, in names of places scattered through the district. The *cotes* are, it is true, ambiguous, being in a majority of cases perhaps Saxon rather than Celtic, but in a forest country near the old Welsh marches many must still represent the Celtic *coet* or *coek*, and in some cases this is clear from the word itself, as in Kingscot, a variation of Kingswood, and even Charlecote exists in the alternative form of Charlewood. This union of the two races, combined with the stirring conditions of life in a wild and picturesque border country, gave a vigorous impulse and distinctive character to the population, the influence of which may be clearly traced in the subsequent literary as well as in the political history of the country. As early as the 9th century, when the ravages of the Danes had desolated the homes and scattered the representatives of learning in Wessex, it was to western Mercia that King Alfred sent for scholars and churchmen to unite with him in helping to restore the fallen fortunes of religion and letters. And after the long blank in the native literature produced by the Norman Conquest the authentic signs of its indestructible vitality first appeared on the banks of the Severn. Layamon's spirited poem dealing with the legendary history of Britain, and written

at Redstone near Arley, within sight of the river's majestic sweep amidst its bordering woods and hills, is by far the most important literary monument of semi-Saxon And, while the poem as a whole displays a Saxon tenacity of purpose in working out a comprehensive scheme of memorial verse, its more original parts have touches of passion and picturesque, as well as of dramatic vivacity, that recall the patriotic fire of the Celtic bards. A hundred and fifty years later the first great period of English literature was inaugurated by another poem of marked originality and power, written under the shadow of the Malvern Hills. The writer of the striking series of allegories known as *Piers Plowman's Verses* was a Shropshire man, and, notwithstanding his occasional visits to London and official employments there, appears to have spent his best and most productive years on the western border between the Severn and the Malvern Hills. In many points both of substance and form the poem may, it is true, be described as almost typically Saxon. But it has at the same time a power of vivid portraiture, a sense of colour, with an intense and penetrating if not exaggerated feeling for local grievances which are probably due to the strain of Celtic blood in the writer's veins. Two centuries later, from the same district, from a small town on an affluent of the Severn, a few miles to the west of the river, came the national poet, who not only inherited the patriotic fire and keen sensibility of Layamon and Langland, but who combined in the most perfect form and earned to the highest point of development the best qualities of the two great races represented in the blood and history of the English nation. Mr J R Green, in referring to the moral effects arising from the mixture of races in the Midland district, has noted this fact in one of those sagacious side-glances that make his history so instructive. "It is not without significance," he says, "that the highest type of the race, the one Englishman who has combined in their largest measure the mobility and fancy of the Celt with the depth and energy of the Teutonic temper, was born on the old Welsh and English borderland, in the forest of Arden." And from the purely critical side Mr Matthew Arnold has clearly brought out the same point. He traces some of the finest qualities of Shakespeare's poetry to the Celtic spirit which touched his imagination as with an enchantment's wand, and thus helped to brighten and enrich the profounder elements of his creative genius.

The history of Warwickshire in Anglo-Saxon times is identified with the kingdom of Mercia, which, under a series of able rulers, was for a time the dominant power of the country. In later times, from its central position, the county was liable to be crossed by military forces if rebellion made head in the north or west, as well as to be harassed and occupied by the rival armies during the periods of civil war. The most important events, indeed, connected with the shire before Shakespeare's time centred during the two greatest civil conflicts in the earlier national annals—the Barons' War in the 13th century, and the Wars of the Roses in the 15th. The decisive battles that closed these long and bitter struggles, and thus became turning points in our constitutional history, were both fought on the borders of Warwickshire, the battle of Breton on the south-western and the battle of Bosworth Field on the north-eastern boundary. The great leaders in each conflict—the founder of the Commons House of Parliament and the "setter up and puller down of kings"—were directly connected with Warwickshire. Kenilworth belonged to Simon de Montfort, and his siege and surrender constituted the last act in the Barons' War. During the Wars of the Roses the county was naturally prominent in public affairs, as its local earl, the last, and greatest of the lawless, prodigal, and ambitious Burens of medieval times, was for more than twenty years the leading figure in the struggle. But notwithstanding this powerful influence the county was, like the country itself, very much divided in its political sympathies and activities. The weakness and vacillation of Henry VI had established the rival houses of York and Lancaster, and, as the trading and mercantile classes were always in favour of a strong government, London, with the eastern counties and the chief ports and commercial towns, favoured the house of York. On the other

hand, South Wales, some of the Midland and most of the western shires, under the leadership of the Beauforts, and the northern counties, under the leadership of Clifford and Northumberland, supported the house of Lancaster. Political feeling in the Warwickshire itself was a good deal divided. The duke of York still possessed Ludlow Castle, and the Welsh of the northern border being devoted to the houses of March and Mortimer, Prince Edward, the young earl of March, after the defeat and death of his father at Wakefield, was able to rally on the border a "mighty power of marauders," and, after uniting his forces with those of Warwick, to secure the desolate valley of Tewkesbury which placed him securely on the throne. Still, during the earlier stages of the struggle the Beauforts, with the earls of Pembroke, Devon, and Wiltshire, were able to muster in the south and west forces sufficient to keep the Yorkists in check. And when the final struggle came,—when Henry of Richmond landed at Milford Haven,—the Welsh blood in his veins rallied to his standard so powerful a contingent of the southern marchmen that he was able at once to cross the Severn, and, traversing north Warwickshire, to confront the forces of Richard, with the assurance that in the hour of need he would be supported by Stanley and Northumberland. Warwickshire itself was, as already intimated, considerably divided even in the more active stages of the conflict, Coventry being strongly in favour of the Red Rose, while Warwick and the town which placed him securely on the throne were devoted to the cause of the White Rose. Kenilworth was still held by the house of Lancaster, and Henry VI at the outset of the conquest had more than once taken refuge there. On the other hand Edward IV and Richard III both visited Warwick, the latter being so interested in the castle that he is said to have laid the foundation of a new and "mighty forte" tower on the north side, afterwards known as the Bear's Tower. Edward IV, in harmony with his strong instinct for popularity, and command of the arts that secure it, tried to conciliate the people of Coventry by visiting the town and witnessing its celebrated pageants more than once—at Christmas in 1465 and at the festival of St George in 1474. Although he was accompanied by his queen the efforts to win the town from its attachment to the rival house do not appear to have been very successful. Under Edward's rule the manifestation of active partisanship was naturally in abeyance, and no doubt the feeling may to some extent have declined. Indeed, in the later stages of the struggle Warwickshire, like so many other counties, was comparatively weary and quiescent. When Richard III advanced to the north the shroud of the shire, and it was, in obedience to the royal mandate, forced to come on behalf of the king, but as the forces never actually joined the royal standard it is naturally assumed that it was either intercepted by Henry on his march to Bosworth Field or had voluntarily joined him on the eve of the battle. In view of the strong Lancastrian sympathies in the north and east of the shire the latter is by far the more probable supposition. In this case, or even on behalf of the county, it may be true, as asserted in the patent of arms subsequently granted to Shakespeare's ladies, that his ancestors had fought on behalf of Henry VII. in the great battle that placed the crown on his head. Many families bearing the name of Shakespeare were scattered through Warwickshire in the 16th century, and it is therefore not at all unlikely that some of their members had watched a great war with object in the battle that to the immense relief of the country, happily closed the most terrible civil conflict in its annals.

But, whether any of his ancestors fought at Bosworth Field influences or not, Shakespeare would be sure in his youth to have, almost of local at first hand, a multitude of exciting stories and stirring incidents connected with so memorable and far-reaching a victory. Thus, after the battle Henry VII had slept at Coventry, and the king entertained by the citizens and presided with handsome gifts. It seems there also to have first appeared his royal power by conferring knighthood on the mayor of the town. The battle was fought only eighty years before Shakespeare's birth, and public events of importance are vividly transmitted by local tradition far more than double that length of time. At this hour the quiet farmsteads of Mid Somersel abound with stories and traditions of Mowbray and his soldiers, and of the events that preceded and followed the battle of Solwaymoor. And a century earlier local traditions possessed still more vitality and power. In the 16th century, indeed, the great events of the nation's life, as well as more important local incidents, were popularly preserved and transmitted by means of oral tradition and scenic display. Only a small and cultured class could acquire their stories and traditions through literary chronicles and learned records. The popular mind was of necessity largely fed and stimulated by the spoken narratives of the rustic festival and the winter fire-side. And a quiet settled neighbourhood like Stratford, out of the crush, but near the great centre of national activity, would be peculiarly rich in traditionary material for its own history. The very fact that within eight miles of Shakespeare's birthplace scores of towers and older slopes the halls and towers of the great earl and for more than a quarter of a century witnessed a political and

military power mightier than any subject had wielded before would give the district an exceptional prominence in the national annals, which would be locally reflected in an answering wealth of historic tradition. In Shakespeare's day Warwickshire thus supplied the materials of a liberal elementary training in the heroic annals of the past, and especially in the great events of the recent past that had established the Tudors on the throne, consolidated the permanent interests of the Government and the country, and helped directly to promote the growing unity and strength, prosperity and renown, of the kingdom. The special value of Shakespeare's dramatic interpretation of this period, arising from his early familiarity with the rich and pregnant materials of unwritten history, has recently been insisted on afresh by one of our most careful and learned authorities. In the preface to his work on *The Houses of Lancaster and York*, Mr. James Gander says:—"For this period of English history we are fortunate in possessing an unrivalled interpreter in our great dramatic poet Shakespeare. A regular sequence of historical plays exhibits to us, not only the general characters of each successive reign, but nearly the whole chain of leading events from the days of Richard II to the death of Richard III at Bosworth. Following the guidance of such a master mind, we realize for ourselves the men and actors of the period in a way we cannot do in any other epoch. And this is the more important as the age itself, especially towards the close, is one of the most obscure in English history. During the period of the Wars of the Roses we have, comparatively speaking, very few contemporary narratives of what took place, and anything like a general history of the times was not written till a much later date. But the doublings of that stormy age,—the exultations endured by kings,—the sudden changes of fortune in great men,—the glitter of chivalry and the horrors of civil war,—all left a deep impression upon the mind of the nation, which *vera* *left alive by vivid traditions of the past at the time that our great dramatist wrote*. Hence, notwithstanding the scantiness of records and the mongrelness of ancient chronicles, we have singularly little difficulty in understanding the spirit and character of the times."

Familiar as he must have been in his youth with the materials that enabled him to interpret so stirring a period, it is not surprising that even amidst the quiet hedgerows and meadows of Stratford Shakespeare's pulses should have beat high with patriotic enthusiasm, or that when launched on his new career in the metropolis he should have sympathized to the full extent on his larger powers with the glow of royal feeling that, under Elizabeth's rule, and especially in the conflict with Spain, thrilled the nation's heart with an exultant sense of half political life, revived national power, and gathering European fame.

In the interval that elapsed between the battle of Bosworth Field and the birth of Shakespeare Warwickshire continued to be visited by the reigning monarch and members of the royal family. This year after his accession to the crown Henry VIII., with Queen Catharine, visited Coventry in state, and witnessed there a series of magnificent pageants. In 1525 the Princess Mary spent two days at the priory, being entertained with the usual sports and shows, and presented by the citizens on her departure with handsome presents. The year after Shakespeare's birth Queen Elizabeth made a state visit to Coventry, Kenilworth, and Warwick, the young queen being received at every point of her progress with unusually splendid demonstrations of loyalty and devotion. And nine years before Shakespeare's birth King Edward VI., in the last months of his reign, had specially interested himself in the re-establishment by royal charter of the free grammar school of the guild at Stratford, which had been jeopardized by the dissolution of religious houses during his father's reign.

Stratford. The town of Stratford lies on the north bank of the Avon, at a point about midway in its course from its rise in Northamptonshire hills to its junction with the Severn at Tewkesbury. On entering the town, across Sir Hugh Clopton's noble bridge, the road from the south-east fans out in three main directions,—on the right to Warwick and Coventry, on the left to Alcester, while between runs the central street, the modern representative of the old Roman way to Birmingham, Chichester, and the north. Further to the left a fourth and less important road leaves the town beyond the church, and, keeping in the main the line of the river, goes to Kilford, Salford Priors, and Evesham. It is a picturesque country road connecting a string of undulating villages and hamlets with Stratford. The town itself consisted in the 16th century of the low gable-roofed wood-and-plaster houses dotted at intervals along these roads and down the cross streets that connected them with each other and with the river. Most of the houses in Shakespeare's time had gardens at the back,

and many at the sides also; and the space between the houses, combined with the unusual width of the streets, gave the town an open cheerful look which enabled it to retain pleasant touches of its earlier rural state. As its prosperity increased the scattered dwellings naturally tended to close up their ranks, and present a more united front of exposed wares and convenient hostels to the yeomen and graziers, who with their wives and families frequented the place on fair and market days. But in Shakespeare's time the irregular line of gables and porches, of penthouse walls and garden palings, with patches of flowers and overhanging foliage between, still varied the view and refreshed the eye in looking down the leading thoroughfares. These thoroughfares took the shape of a central cross, of which Church, Chapel, and High Streets, running in a continuous line north and south, constituted the shaft or stem, while Bridge and Wood Streets, running in another line east and west, were the transverse beam or bar. At the point of intersection stood the High Cross, a solid stone building with steps below and open arches above, from which public proclamations were made, and, as in London and other large towns, sermons sometimes delivered. The open space around the High Cross was the centre of trade and merchandise on market days, and from the force of custom it naturally became the site on which at a later period the market-house was built. Opposite the High Cross the main road, carried over Sir Hugh Clopton's arches and along Bridge Street, turns to the left through Henley Street on its way to Henley-in-Ardun and the more distant northerly towns. At the western end of Wood Street was a large and open space called Rother Market, whence Rother Street running parallel with High Street led through narrower lanes into the Evesham Road.

This open ground was, as the name indicates, the great cattle market of Stratford, one of the most important features of its Rother industrial history from very early times. In the later Middle Ages most of the wealthier inhabitants were engaged in farming operations, and the growth and prosperity of the place resulted from its position as a market town in the midst of an agricultural and grazing district. In the 13th century a number of charters were obtained from the early Plantagenet kings, empowering the town to hold a weekly market and no fewer than five annual fairs, four of which were mainly for cattle. In later times a series of great cattle markets, one for each month in the year, was added to the list. The name of the Stratford cattle market embodies this feature of its history, "cudde" being a good Saxon word for horned cattle, a word freely employed in Early English, both alone and in composition. In the 16th century it was still in familiar use, not only in literature but in official documents and especially in statutes of the realm. Thus Cowell, in his law dictionary, under the heading "Rother-beasts," explains that "the name comprehends oxen, cows, steers, hollers, and such like horned beasts," and refers to statutes of Elizabeth and James in support of the usage. And Arthur Golding, in 1597 transcribes Ovid's lines—

"Mille in agros illi bellidungue an amenta per holas

Erubescunt—"

"A thousand flocks of sheep,

A thousand herds of *rotter-beasts*, be his *bellidungue* dirt keep."

The word seems to have been longer retained and more freely used in the Midland counties than elsewhere, and Shakespeare himself employs it with colloquial precision in the restored line of *Timon of Athens*. "It is the pasture larie the rother's sides." Many a time, no doubt, as a boy, during the spring and summer fairs, he had risen with the sun, and, making his way from Henley Street to the bridge, watched the first arrivals of the "large-eyed king" slowly driven in from the rich pastures of the "Red Horse Valley." There would be some variety and excitement in the spectacle as the droves of meditative oxen were invaded from time to time by groups of Herefordshire cows loving anxiously after their skittish calves, as well as by the presence and disconcerting activity of still smaller deer. And the boy would be sure to follow the crowding cattle to the Rother Market and observe at leisure the humours of the ploughmen and drovers from the Fildon District, whose heavy intermittent talk would be in perfect keeping with the bovine stolidity of the steers and heifers around them. There was a market-cross at the head of the Rother expanse, and this was the chief gathering place for the cattle-dealers, as the High Cross was the rallying point of the dealers in corn and country produce. In

modern Stratford. Rother Market retains its place as the busiest centre at the annual fairs, during one of which it is still customary to roast an ox in the open street, often amidst a good deal of popular excitement and convivial uproar.

Chief
streets
and
suburbs

The cross ways going from Rother Street to the river side, which cut the central line, divide it into three sections, are Church Street and Sheep Street in a continuous line, and Scholar's Lane and Chapel Lane in another line. They run parallel with the head line of Bridge and Wood Streets, and like them traverse from east to west the northern shaft of the cross that constituted the ground plan of the town. Starting down this line from the market house at the top, the first division, the High Street, is now, as it was in Shakespeare's day, the best part for shops and shopping, the solid building at the further corner to the left being the Corn Exchange. At the first corner of the second division, called Chapel Street, stands the town hall, while at the further corner are the site and raised-in gardens of New Place, the large mansion purchased by Shakespeare in 1597. Opposite New Place, at the corner of the third and last division, known as Church Street, is the grey mass of Gothic buildings belonging to the guild of the Holy Cross, and consisting of the chapel, the hall, the grammar school, and the almshouses of the ancient guild. Turning to the left at the bottom of Church Street, you enter upon what was in Shakespeare's day a well-wooded suburb, with a few good houses scattered among the ancient elms, and surrounded by ornamental gardens and extensive private grounds. In one of these houses, with a sunny exposure of lawn and shrubbery, lived in the early years of the 17th century Shakespeare and his daughter, the Gothic with a lofty spire, Dr. John Hall, and here in spring mornings and summer afternoons the great poet must have often strolled, either alone or accompanied by his favourite daughter, realising to the full the quiet enjoyment of the sylvan scene and its social surroundings. Thus pleasant suburb, called then as now Old Town, leads directly to the church of the Holy Trinity, near the river side. The church, a fine specimen of Decorated and Perpendicular Gothic with a lofty spire, is approached on the northern side through an avenue of limes, and sheltered on the east and south by an irregular but massive group of elms towering above the churchway path between the transcripts, the chancel, and the river. Below the church, on the margin of the river, were the mill, the mill-bridge, and the weir, half hidden by grey willows, green alders, and tall beds of rustling sedge. And, beyond the mill, the college, and the line of streets already described, the suburbs stretched away into gardens, orchards, meadows, and cultivated fields, divided by rustic lanes with mossy banks, flowering hedges, and hummocks vast of bewitching beauty. These cross and country roads were dotted at intervals with cottage homesteads, isolated farms, and the small groups of both which constituted the villages and hamlets included within the parish of old Stratford. Amongst these were the villages and hamlets of Welcombe, Ayton, Drayton, Shottery, Luddington, Little Wilmore, and Bishopcote. The town was thus girdled in the spring by daisied meadows and blossoming orchards, and encircled during the later months by the orange and gold of harvest fields and autumn foliage, mingled with the coral and purple clusters of alder, hawthorn, and mountain ash, and around the farms and cottages, with the glow of ripening fruits for the winter's store.

Forest
survivals.

But perhaps the most characteristic feature of the scenery in the neighbourhood of Stratford is to be found in the union of this rich and varied cultivation with picturesque survivals of the primeval forest territory. The low hills that rise at intervals above the well-turned soil still carry on their serrated crests the lingering glories of the ancient woodland. Though the once mighty forest of Arden has disappeared, the after-glow of its sylvan beauty rests on the neighbouring heights formerly enclosed within its ample margin. These traces of the forest wildness and freedom were of course far more striking and abundant in Shakespeare's day than now. At that time many of the farms had only recently been reclaimed from the forest, and most of them still had their bosky acres "of tooth'd briars, sharp furzes, pricking goss and thorns," their broom groves, hazel copes, and outlying patches of unshrubb'd down. And the hills that rose above the chief villages of the neighbourhood were still clothed and crowned with the green and mystic mantle of the leafy Arden. But, though much of the ancient woodland has disappeared since Shakespeare's day, many traces of it still remain. Any of the roads out of Stratford will soon bring the pedestrian to some of these picturesque survivals of the old forest wilderness. On the Warwick

road, at the distance of about a mile from the town, there are on the left the Welcombe Woods, and just beyond the woods the well-known Dingies, a belt of straggling ash and hawthorn winding irregularly through blue-bell depths and bony hollows from the pathway below to the crest of the hill above, while immediately around rise the Welcombe Hills, from the top of which is obtained the finest local view of Stratford and the adjacent country. Looking south-west and facing the central line of the town, you see below you, above the mass of roofs, the square tower of the guild chapel, the graceful spire of the more distant church, the sweep of the winding river, and beyond the river the undulating valley of the Red Horse shut in by the blue range of the Cotswold Hills. A couple of miles to the east of the Welcombe Hills is the village of Smittefield, where Shakespeare's grandfather, Richard Shakespeare, lived and cultivated to the end of his days the acres around his rustic dwelling. Beyond the village on its western side there is an upland reach of wilderness in the shape of a hill, covered with shrub and copewood, and known as the Smittefield Bushes. Here Shakespeare as a boy must have often rambled, enjoying the freedom of the unfenced downs, and enlarging his knowledge of nature's exuberant vitality. On the opposite side of the town, about a mile on the Evesham road, or rather between the Evesham and Alcester roads, lies the hamlet of Shottery, half concealed by ancestral elms and nesting amongst its homestead fruits and flowers. From one of these homesteads Shakespeare obtained his bride Anne Hathaway. A mile or two on the central road, passing out of the town through Honley Street, is the village of Bearley, and above the village another sweep of wooded upland known as Bearley Bushes. And at various more distant points between these roads the marl and sandstone heights, fringed with woods or covered with wilding growths, still bear eloquent testimony to the time when Guy of Warwick and his tutor in chivalry, Herod of Aiden, still roamed the forest in search of the wild ox and savage bear that frayed the infrequent travellers and devastated at intervals the slender cultivation of the district. The subtle power of this order of scenery, arising from the union of all that is rich and careful in cultivation with all that is wild and free in natural beauty, is exactly of the kind best fitted to attract and delight imaginative and emotional minds. It possesses the peculiar charm that in character arises from the union of refined culture with the bright and exhilarating spontaneity of a free and generous nature.

On its moral side such scenery has an expanding illuminating Moral power which links it to the wider and deeper interests of humanity as a whole. Nature seems to put forth her vital energies expressly *envis* for the relief of man's estate, appearing as his friend and helper, society, and comforter. Instead of being absorbed in her own inaccessible grandeur and solitary exultation, she exerts her benign influences expressly as it were for his good, to cheer and brighten his evanescent days, and beautify his temporary home. Bolder and more rugged landscapes, gloomy glens, and thunder-scared peaks may excite more passionate feelings, may rouse and strengthen by reaction the individualistic elements of mind and character, and thus produce the harpy, during type of mountaineer, the intense self-control and defiant local patriotism or hero, the chieftain and his clansmen, *contra mundum*. No doubt it is also true that the vaster and loftier mountain ranges have a unique power of exciting in susceptible minds the emotions of awe, wonder, and sublimity. But the very power and permanence of these mighty solitudes, the grandeur and immobility of their measureless strength and imperial repose, dwarf by comparison all merely human interests; and to the meditative mind swept by the spirit of such immensities the moments of our mortal life seem to melt as dew-drops into the silence of their eternal years. The feelings thus excited, being in themselves of the essence of poetry, may indeed find expression in verse and in verse of a noble kind, but the poetry will be lyrical and reflective, not dramatic, or if dramatic in form it will be lyrical in substance. As Mr Ruskin has pointed out, the overmastering effect of mountain scenery tends to absorb and preoccupy the

mind, and thus to disturb the impartial view, the universal vision of nature and human nature as a complex whole, or rather of nature as the theatre and scene of human life, which the dramatist must preserve in order to secure success in his higher work. Mountain scenery is, however, not only rare and exacting in the range and intensity of feeling it creates, but locally remote in its separation from the interests and occupations of men. It is thus removed from the vital element in which the dramatist works, if not in its higher influence antagonistic to that element. Mr Hamerton, who discusses the question on a wider basis of knowledge and experience than perhaps any living authority except Mr Ruskin, supports this view. "As a general rule," he says, "I should say there is an antagonism between the love of mountains and the knowledge of mankind, that the lover of mountains will often be satisfied with their appearances of power and passion, their splendour and gloom, their seeming cheerfulness or melancholy, when a mind indifferent to this class of scenery might study the analogous phases of human character." Where, indeed, the influence of nature is overpowering, as in the East, indeed,—"the wonder excited by mere physical vastness, power, and infinitude,—takes the place of intelligent interest in individual life and character."

But the dramatic poet has to deal primarily with human power and passion, and not for him therefore is the life of lonely raptures and awful delights realized by the mountain wanderer or the Alp-inspired bard. His work lies nearer the homes and ways of men, and his choicest scenery will be found in the forms of natural beauty most directly associated with their habitual activities, most completely blended with their more vivid emotional experiences. A wooded undulating country, watered by memorable streams, its ruder features relieved by the graces of cultivation, and its whole circuit rich in historical remains and associations, is outside the domain of cities, the natural stage and theatre of the dramatist and story-teller. This was the kind of scenery that fascinated Scott's imagination, amidst which he fixed his chosen home, and where he sleeps his last sleep. It is a border country of grey waving hills, divided by streams renowned in song, and enriched by the monuments of the pety, splendour, and martial power of the leaders whose fierce raids and patriotic conflicts filled with romantic tale and minstrelsy the whole district from the Lammemoors to the Cheviots, and from the Leader and the Two to the Solway Firth.

In earlier times Shakespeare's own district had been virtually a border country also. The mediæval tide of intermittent but savage warfare, between the unsubdued Welsh and the Anglo-Normans under the feudal lords of the marches, ebbed and flowed across the Severn, inundating at times the whole of Powis-land, and sweeping on to the very verge of Warwickshire. In the 12th and 13th centuries the policy of intermarriage between their own families and the Welsh princes was tried by the English monarchs, and King John, on betrothing his daughter Joan to the Welsh prince Llewelyn, gave the manor of Biddford, six miles from Stratford-on-Avon, as part of her dowry. The fact of this English princess being thus identified with South Warwickshire may help to explain the prevalence of the name Joan in the county, but the early impulse towards the giving of this royal name would no doubt be strengthened by the knowledge that John of Gaunt's daughter, the mother of the great earl of Warwick, had also borne the favourite local name. Shakespeare himself it will be remembered had two sisters of this name, the older Joan, born some time before him, the firstborn of the family indeed, who died in infancy, and the younger Joan, who survived him. But the local popularity of a name, familiarly associated with the kitchen and the scullery rather than with the court or the palace, is no doubt due to one of the more striking incidents of the long conflict between the English and the Welsh on the western border. As we have seen, during the Barons' War and the Wars of the Roses the western border was the scene of active conflict, each party seeking Welsh support, and each being able in turn to rally a

power of hardy marchmen to its banner. And that the insurgent Welsh were not idle during the interval between these civil conflicts we have the emphatic testimony of Glendower —

"Three times hath Henry Bolingbroke made head
Against my power: three from the banks of Wye
And sedge-bottomed Seven have I sent him
Bootless home, and weather-beaten back."

The Hotspur and Mortimer revolt against Henry IV. well illustrates, indeed, the kind of support which English disaffection found for centuries in the Welsh marches. A rich heritage of stirring border life and heroic martial story was thus transmitted from the stormy ages of faith and feudalism to the more settled Tudor times. Apart from the border warfare there were also the multiplied associations connected with the struggles between the nobles and the crown, and the rise of the Commons as a distinctive power in the country. The whole local record of great names and signal deeds was in Shakespeare's day so far withdrawn into the past and mellowed by secular distance as to be capable of exciting its full enchantment over the feelings and the imagination. The historical associations thus connected with the hills and streams, the abbeys and castles, of Warwickshire added elements of striking moral interest to the natural beauty of the scenery. To the penetrating imagination of poetic natures these elements reflected the continuity of national life as well as the greatness and splendour of the personalities and achievements by which it was developed from age to age. They also helped to kindle within them a genuine enthusiasm for the fortunes and the fame of their native land. And scenery beautiful in itself acquired a tenfold charm from the power it thus possessed of bringing vividly before the mind the wide and moving panorama of the heroic past. The facts sufficiently prove that scenery endowed with this multiplied charm takes, if a calmer, still a deeper and firmer hold of the affections than any isolated and remote natural features, however beautiful and sublime, have power to do. This general truth is illustrated with even exceptional force in the lives of Scott and Shakespeare. Both were passionately attached to their native district, and the memorable scenes amidst which their early years were passed. So intense was Scott's feeling that he told Washington Irving that if he did not see the grey hills and the heather once a year he thought he should die. And one of the few traditions preserved of Shakespeare is that even in the most active period of his London career he always visited Stratford at least once every year. We know indeed from other sources that during his absence Shakespeare continued to take the liveliest interest in the affairs of his native place, and that, although London was for some years his professional residence, he never ceased to regard Stratford as his home.

Amongst other illustrations of this strong feeling of local attachment that might be given there is one that has recently excited a good deal of attention and is worth noticing in some detail. Mr Hallam, in a well-known passage, has stated that "no letter of Shakespeare's writing, no record of his conversation, has been preserved." But we certainly have at least one conversation reported at first hand, and it turns directly on the point in question. It relates to a proposal made in 1614 by some of the local proprietors for the enclosure of certain common lands at Welcombe and Old Stratford. The corporation of Stratford strongly opposed the project on the ground that it would be a hardship to the poorer members of the community, and their clerk Mr Thomas Greene, who was related to Shakespeare, was in London about the business in November of the same year. Feeling
that of local
attach-
ment

17th Greene says, in notes which still exist, "My cousin Shakespeare coming yesterday to town, I went to see him how he did. He told me that they assured him they meant to inclose no further than to Gospell Bush, and so up straight (leaving out part of the Dyngles to the field) to the gate in Clopton hedge, and take in Sahsburyes pece, and that they mean in April to survey the land, and then to give satisfaction, and not before, and he and Mr Hall say they think there will be nothing done at all." This proves that the agents of the scheme had seen Shakespeare on the subject, that he had gone carefully into the details of their plan, consulted his son-in-law Dr John Hall about them, and arrived at the conclusion that for the present they need take no decided action in the matter. There is evidently on Shakespeare's part a strong feeling against the proposed enclosure, and the agents of the scheme had clearly done then best to remove his objections, promising amongst other things that if it went forward he should suffer no pecuniary loss, a promise already confirmed by a legal instrument. But nine months later, when the local proprietors seemed bent on pushing the scheme, Shakespeare takes a more decided stand, and pronounces strongly against the whole business. We have a notice, dated September 1, 1615, to the effect that Mr Shakespeare had on that day told the agent of the corporation "that he was not able to bear the enclosing of Welcombe." As his proprietary rights and pecuniary interests were not to be affected by the proposed enclosure, this strong expression of feeling must refer to the public advantages of the Welcombe common fields, and especially to what in Scotland would be called their "amenity," the element of value arising from their freedom and beauty, their local history and associations. Welcombe, as we have seen, was the most picturesque suburb of Stratford. The hills divided by the leafy Dyngles afforded the finest panoramic view of the whole neighbourhood. On their eastern slope they led to Fulbroke Park, the probable scene of the deer-stealing adventure, and towards the north-west to the village of Snitterfield with its wooded sweep of upland "bushes." Every acre of the ground was associated with the happiest days of Shakespeare's youth. In his boyish holidays he had repeatedly crossed and recrossed the unfenced fields at the foot of the Welcombe Hills on his ways to the rustic scenes and occupations of his uncle Henry's farm in the outlying forest village. He knew by heart every boundary tree and stone and bank, every pond and sheep-pool, every barn and cattle-shed, throughout the whole well-frequented circuit. And in his later years, when after the turmoil and excitement of his London life he came to reside at Stratford, and could visit at leisure the scenes of his youth, it was perfectly natural that he should shrink from the prospect of having these scenes partially destroyed and their associations broken up by the rash hand of needless innovation. In his own emphatic language, "he could not bear the enclosing of Welcombe," and the only authoritative fragment of his conversation preserved to us thus brings vividly out one of the best known and most distinctive features of his personal character and history—his deep and life-long attachment to his native place. Another illustration of the same feeling, common both to Scott and Shakespeare, is supplied by the prudence and foresight they both displayed in husbanding their early gains in order to provide, amidst the scenery they loved, a permanent home for themselves and their families. Shakespeare, the more careful and sharp-sighted of the two, ran no such risks and experienced no such reverses of fortune as those which saddened Scott's later days. Both, however, spent the last years of their lives in the home which their energy and affection had provided, and both

slept their last sleep under the changing skies and amidst the fields and streams that gave light and music to their earliest years. Hence, of all great authors, they are the two most habitually thought of in connexion with their native haunts and homesteads. Even to his contemporaries Shakespeare was known as the Swan of Avon. The two spots on British ground most completely identified with the noblest energies of genius, consecrated by life-long associations, and hallowed by sacred dust are the banks of the Tweed from Abbotsford to Dryburgh Abbey, and the sweep of the Avon from Charlecote Park to Stratford church. To all lovers of literature, to all whose spirits have been touched to finer issues by its regenerating influence, these spots, and above all the abbey grave and the chancel tomb, are holy ground,—national shrines visited by pilgrims from every land, who breathe with pride and gratitude and affection the household names of Shakespeare and of Scott.

The name Shakespeare is found in the Midland counties Shakespeare two centuries before the birth of the poet, scattered so widely that it is not easy at first sight to fix the locality of its rise or trace the lines of its progress. Several facts, however, would seem to indicate that those who first bore it entered Warwickshire from the north and west, and may therefore have migrated in early times from the neighbouring marches. The name itself is of course thoroughly English, and it is given by Camden and Verstegan as an illustration of the way in which surnames were fabricated when first introduced into England in the 13th century. But it is by no means improbable that some hardy borderers who had fought successfully in the English ranks may have received or assumed a significant and sounding designation that would help to perpetuate the memory of their martial prowess. We have indeed a distinct and authoritative assertion that some of Shakespeare's ancestors had served their country in this way. However this may be, families bearing the name are found during the 15th and 16th centuries in the Arden district, especially at Wroxhall and Nowington,—some being connected with the priory of Wroxhall, while during the 16th century the names of more than twenty are enumerated as belonging to the guild of St Ann, at Knoll near Rowington. In the roll of this guild or college are also found the representatives of some of the best families in the county, such as the Ferrerses of Tanworth and the Clintons of Coleshill. Among the members of the guild the poet's ancestors are to be looked for, and it is not improbable, as Mr French suggests, that John and Joan Shakespeare, entered on the Knoll register in 1527, may have been the parents of Richard Shakespeare of Snitterfield, whose sons gave each to his children the favourite family names. Richard Shakespeare, the poet's grand-uncle, occupied a substantial dwelling and cultivated a forest farm at Snitterfield, between 3 and 4 miles from Stratford. He was the tenant of Robert Arden of Wilmote, "a gentleman of worship," who farmed his own estate, situated a few miles to the west of Snitterfield. Richard Shakespeare was settled at the latter hamlet and doing well as early as 1543, Thomas Atwood of Stratford having in that year bequeathed to him four oxen which were then in his keeping; and he continued to reside there certainly till 1560, and probably till his death. He appears to have had two sons, John and Henry, of whom John, the eldest, early broke through the contracted circle of rustic life at Snitterfield, made his way to Stratford, and established himself as a trader in one of the leading thoroughfares of the town. This movement to the town probably took place in 1551, as in 1552 John Shakespeare is described in an official document as residing in Henley Street, where the poet was subsequently born. As to this

precise nature of his occupation, the kind of wares in which he principally dealt, there are various and conflicting statements that have given rise to a good deal of discussion. The earliest official statement on the subject occurs in the register of the bailiff's court for the year 1556. He is there described as a "glover," which, according to the verbal usage of the time, included dealing in skins, as well as in the various leather-made articles of farming gear, such as rough gauntlets and leggings for hedging and ditching, white leather gloves for chopping wood, and the like. But in addition to the trade of glover and fell-monger tradition assigns to John Shakespeare the functions of butcher, wool-stapler, corn-dealer, and timber-merchant. These occupations are not incompatible, and together they represent the main lines some of which at least a young farmer going into the town for trading purposes would be likely to pursue. He would naturally deal with the things he knew most about, such as corn, wool, timber, skins, and leather-made articles used in farm work—in a word, he would deal in farm conveniences and farm products. In a town that was the centre and chief market of an agricultural and grazing district, and as the member of a family whose wide connexions were nearly all engaged in farming operations, his prospects were certainly rather favourable than otherwise. And he soon began to turn his country connexion to account. There is distinct evidence that he only dealt in corn and wool as well as gloves and leather, for in 1556 he sues a neighbour for eighteen quarters of barley, and a few years later is paid three shillings by the corporation for a load of timber.

The poet's father was evidently a man of energy, ambition, and public spirit, with the knowledge and ability requisite for pushing his fortune with fair success in his new career. His youthful vigour and intelligence soon told in his favour, and in a short time we find him taking an active part in public affairs. He made way so rapidly indeed amongst his fellow-townsmen, that within five years after entering Stratford he is recognized as a fitting recipient of municipal honours; and his official appointments steadily rise in dignity and value through the various gradations of leet-juror, ale-taster, constable, alderor, Burgess, chamberlain, and alderman, until in 1568 he gains the most distinguished post of official dignity, that of high-bailiff or mayor of the town. Within twenty years after starting in business in Henley Street he thus rises to the highest place in the direction of municipal affairs, presiding as their head over the deliberations of his fellow aldermen and burgesses, and as chief magistrate over the local court of record. Three years later, in 1571, he was again elected as chief alderman. There is ample evidence, too, that during those years he advanced in material prosperity as well as in municipal dignities and honours. As early as 1556 he had means at his command which enabled him to purchase two houses in the town, one in Henley Street with a considerable garden, and another in Greenhill Street with a garden and croft attached to it. In the following year he married an heiress of gentle birth, Mary Arden of the Asbies, who had recently inherited under her father's will a substantial sum of ready money, an estate at Wilmoote, consisting of nearly 60 acres of land with two or three houses, and a reversionary interest in houses and lands at Snitterfield, including the farm tenanted by Richard Shakespeare, her husband's father. Being now a landed proprietor and a man of rising position and influence, John Shakespeare would be able to extend his business operations, and it is clear that he did so, though whether always with due prudence and foresight may be fairly questioned. To a man of his sanguine and somewhat impetuous temper the sudden increase of wealth was

probably by no means an unmixed good. But for some years, at all events, he was able to maintain his more prosperous state, and his new ventures appear for a time to have turned out well. He is designated in official documents as yeoman, freholder, and gentleman, and has the epithet "master" prefixed to his name, this, being equivalent to esquire, was rarely used except in relation to men of means and station, possessing landed property of their own. In a note to another official document it is stated that about the time of his becoming chief magistrate of Stratford John Shakespeare had "lands and tenements of good worth and substance" estimated in value at £500, and though there may be some exaggeration in this estimate his property from various sources must have been worth nearly that sum. And in 1575 he increased the total amount by purchasing two houses in Henley Street, the two that still remain identified with the name and are consecrated by tradition as the birthplace of the poet. But this was his last purchase, the tide of his hitherto prosperous fortunes being but too clearly already on the turn. Having passed the highest point of social and commercial success, he was now facing the downward slope, and the descent once begun was for some years continuous, and at times alarmingly and almost inscrutably rapid.

It seems clear indeed from the facts of the case that, notwithstanding John Shakespeare's intelligence, activity, and early fortune success, there was some defect of character which introduced an element of instability into his career, and in the end very much neutralized the working of his nobler powers. Faultily discernible perhaps from the first, and overpowered only for a time by the access of prosperity that followed his fortunate marriage, this vital flaw ultimately produced its natural fruit in the serious embarrassments that clouded his later years. This precise nature of the defect can only be indicated in general terms, but its symptoms to have consisted very much in a want of measure and balance, of adequate care and forethought, in his business dealings and calculations. He seems to have possessed the eager sanguine temperament which, absorbed in the immediate object of pursuit, overlooks difficulties and neglects the wider considerations on which lasting success depends. Even in his early years at Stratford, there are signs of this ardent, impatient, somewhat impetuous nature. He is not only active and pushing, but too restless and exacting to pay proper attention to necessary details, or discharge with punctuality the minor duties of his position. The first recordal fact in his local history illustrates this feature of his character. In April 1552 John Shakespeare is fined twelve pence, equal to between eight and ten shillings of our English money now, for not removing the heap of household dirt and refuse that had accumulated in front of his own door. Another illustration of his want of thorough method and system in the management of his affairs is supplied by the fact that in the years 1556-57 he allowed himself to be sued in the bailiff's court for comparatively small debts. This could not have arisen from any want of means, as during the same period, in October 1556, he made the purchase already referred to of two houses with extensive gardens. The active and energetic nature here have been the result of negligence or temper on John Shakespeare's part, and either alternative tells almost equally against his habits of business exactness and regularity. Another illustration of his restless, ill-considered, and unbalanced energy may be found in the number and variety of occupations which he seems to have added to his early trade of glover and leather-dealer. As his prospects improved, he appears to have succumbed to some branches of business, much to his detriment, without having grasped the whole circle of agricultural products that could in any way be brought to market. It would seem also that he added farming, to a not inconsiderable extent, to his expanding retail business in Stratford. But it is equally clear that he lacked the orderly method, the comprehensive outlook, and the vigilant care for details essential for holding well in hand the diversified so-called plebeian commercial web. Other disturbing forces may probably be discovered in the pride and ambition, the love of social excitement and display, which appear to be among the ground notes of John Shakespeare's character so far as it is revealed to us in the few facts of his history. His strong social feeling and love of pleasurable excitement are illustrated by the fact that during the year of his mayoralty he brought companies of players into the town, that magnificent dramatic performance in the great hall. It is during the year of his filling the post of high-bailiff that we first hear of stage plays at Stratford, and the players must have visited the town, if not, as is most likely, at the invitation and domicile of the poet's father, at least with his sanction and support.

The
poet's
father.

Early
pros-
perity.

In such cases the players could not act at all without the permission of the mayor and council, and their first performance was usually a free entertainment, patronized and paid for by the corporation, and called the mayor's play. In all this John Shakespeare took the initiative, and in so doing probably helped to decide the future career of his son. The notes of personal piety and social ambition are everywhere. It is on record, for example, that soon after reaching the highest post of municipal distinction the poet's father applied to the heralds' college for a grant of arms. This application was not at the time successful, but it seems to have been so far seriously entertained that official inquiries were made into the family history and social standing of the Shakespeares. But the remarkable fact is that such an application should have been made at all by John Shakespeare whose position and prospects were so unstable and precarious as the events of the next few years showed those of Shakspeare to be. At the time of the application his increasing family must have enlarged his household expenses, while his official position, combined with his open and generous nature, his love of social sympathy, distinction, and support, would probably have led him into habits of free-handed hospitality and inconsiderate expenditure. All this must have helped to introduce a scale of lavish domestic outlay that would tend directly to hasten the financial collapse in his affairs that speedily followed. And on finding things going against him John Shakespeare was just the man to discount his available resources, and, as the pressure increased, mortgage his future and adopt any possible expedient for maintaining the increased poet and social consequences he had impudently assumed.

Moral
effects.

Thus to the poet the consequences of his position when pecuniary difficulties arose. During the three years that elapsed after his last purchase of house property his affairs became so seriously embarrassed that it was found necessary, if not to sacrifice, at least to jeopardize the most cherished future of the family in order to meet the exigencies of the moment. In 1578 John and Mary Shakespeare mortgaged for forty pounds their most considerable piece of landed property, the estate of the house which they remained to be a family connection of their own, Edmund Lambert, who had married Mary Shakespeare's sister Joan. The subsequent history of this transaction shows how bitter must have been the need that induced the Shakespeares to surrender, even for a time, their full control over the ancestral estate. The next year, however, the pressure, instead of being relieved by the sacrifice, had become still more urgent, and the only cutting purvey that remained to be made was a visionary interest in the Sutterfield estate. Under a family settlement Mary Shakespeare, on the death of her stepmother, would come into the possession of houses and land at Sutterfield almost equal in value to the Ashes estate. But in 1579 the Shakespeares found it necessary to dispose altogether of this visionary interest. In that year it was sold to Robert Webb for the sum of forty pounds. The buyer was nephew of Mary Shakespeare, being the son of Alexander Webb, who had married her sister Margaret. In this applying to relatives or family connections in their need, and disposing of their property to them, the Shakespeares may have hoped it would be more easily regained should times of prosperity return. The sacrifice of the remaining interests in the Sutterfield property afforded, however, only a temporary relief, quite insufficient to remove the accumulating burden of debt and difficulty which now weighed the Shakespeares down. The notes of the proceedings of the Stratford corporation and of the local court of record sufficiently show that John Shakespeare's misfortune from time continued through a series of years, and they also enable us in part to understand how he bore himself under the changes in his social position that followed. These changes began in the critical year 1578. In January of that year, when his brother alderman Shakespeare called upon to pay a considerable sum each as a contribution to the military equipment to be provided by the town, John Shakespeare was so far relieved that only one half the amount is required from him. Later in the year we find him wholly exempted from the weekly tax paid by his fellow-aldermen for the relief of the poor. In the spring of the following year, on a further tax for military purposes being laid on the town, he is unable to contribute anything, and is accordingly reported as a defaulter. A few years later, when an order is made that a verdict is recorded against him, with the official report that he had no goods on which distraint could be made. About the same time he appears to have been under some restraint, if not actually imprisoned for debt. And as late as 1592 it is officially stated, as a result of an inquiry into the number who fail to attend the church service once a month according to the statutory requirement, that John Shakespeare, with some others, two of whom, curiously enough, are named Flanzen and Bardoll, "came not to church for fear of process for debt." In the year 1598 another alderman had at length been chosen in his place, the reason given being expressly because "John Shakespeare doth not come to the halloo when they are warned, nor hath not done for a long time."

From this brief official record it would seem that under his reverse of fortune he was treated with marked sympathy and consideration

by his fellow townsmen. For at least seven years after his troubles first began his fellow-burgesses persist in keeping his name in its place of honour on their roll, partly no doubt as a mark of respect for his character and past services, and partly it may be in the hope that his fortunes might improve, and his propensities days return. And, when at length he is superseded by the appointment of another in his place, this is done, not on the ground of his reduced circumstances, but simply because he voluntarily absents himself from the council, never attends its meetings or takes any part in its affairs. This is a noteworthy fact illustrating still further John Shakespeare's character. The statement clearly indicates the kind of moral collapse that had followed the continuous pressure of material reverses. The eager sanguine poet that had so generally expanded in prosperity was, it is clear, sorely chilled and depressed by adversity. He abandons the usual places of resort, withdraws himself from the meetings of the corporation, and ceases to associate with his fellow-burgesses. And, what is perhaps still more noticeable, he gives up attending church, and no longer even worships with his fellow-townsmen. All this is the more significant because his circumstances, though seriously embarrassed, for some years much reduced, was never so desperate as to compel him to part with his freehold property in Henley Street. In the darkest hours of his clouded fortune he still retained the now world-famous houses associated with the poet's birth and early years. There was no adequate reason therefore why John Shakespeare should have so completely forsaken the usual haunts and regular assemblies of his fellow-townsmen and friends. But it seems clear, as already intimated, that he was afflicted with a fatal goal of nerve energy and intelligence, and possessing a temper that was proud, sensitive, and even passionate, John Shakespeare lacked the kind of fortitude and moral courage which enables men to meet serious reverses of fortune with dignity and reserve, if not with cheerfulness and hope. With the misfortune of a wounded animal he seems to have lost the prosperous head and retired apt to beat his head and lose in solitude and alone. No apparently he had held up his head, but the official signature of his prosperous son enabled him to take active measures for the recovery of his alienated estate and lost position in the town. By the middle of the last decade of the 16th century the poet's success in his profession was thoroughly assured, and he was on the high road to wealth and fame. As actor, dramatist, and probably also as sharer in the Blackfriars theatre, he was in the receipt of a large income, and according to tradition he had the official signature from the young earl of Southampton, to whom his poems were dedicated. The son was now therefore as able as he had always been willing to help his father to regain the position of comfort and dignity he had formerly occupied. We find accordingly that in 1597 John and Mary Shakespeare filed a bill in Chancery against John Lambert for the recovery of the Ashes estate, which had been mortgaged for his father's debt twenty years before. There had indeed been some movement in the matter ten years earlier, on the death of Edmund Lambert the mortgagee. His son John being apparently anxious to settle the dispute, it was proposed that he should pay an additional sum of twenty pounds in order to convert the mortgage into a sale, and that he should then receive from the Shakespeares an absolute title to the estate. The arrangement was not, however, carried out, and in 1599 John Shakespeare brought a bill of complaint against Lambert in the Court of Queen's Bench. Nothing further, however, seems to have been done, probably because Lambert may have felt that in the low state of the Shakespeares' fortune the action could not be passed. In 1597, however, there was a change in the relative position of the litigants, John Shakespeare having now the purse of his son at his command, and a bill in Chancery was accordingly filed against John Lambert. The plea in support of the Shakespeares was that the mortgage had been a condition of the mortgage had been fulfilled, the money in discharge having been offered to Edmund Lambert at the proper date, but refused by him on the ground that other sums were owing which must also be repaid at the same time. To this plea John Lambert replied, and there is a still further "repetition" on the part of the Shakespeares. How the matter was eventually decided is not known, no decision of the court in the case having been discovered. But the probabilities are that it was a case that the court, as the estate did not return to the Shakespeares, probably on the basis of the proposal already made,—that of the payment of an additional sum by John Lambert. About the same date, or rather earlier, in 1596, John Shakespeare also renewed his application to the heralds' college for a grant of arms, and this time with success. The grant was made on the ground that the history and position of the Shakespeares and Asker families fully entitled the applicant to receive coat armour. There can be no doubt that the means required for supplying these applications were supplied by the poet, and he would be well rewarded by the knowledge that in the evening of his days his father had at length realized the desire of his heart, being officially recognized as a "gentleman of worship." And, what would now perhaps please his father still better, he

would be able to hand on the distinction to his son, whose profession prevented him at the time from gaining it on his own account. John Shakespeare died in 1601, leaving through the affectionate care of his son spent the last years of his life in the ease and comfort befitting one who had not only been a prosperous business, but chief alderman and mayor of Stratford.

The
poet's
mother.

Of Mary Arden, the poet's mother, we know little, hardly anything directly indeed, but the little known is wholly in her favour. From the provisions of her father's will it is clear that of his seven daughters she was his favourite, and the links of evidence are now complete connecting her father Robert Arden with the great Warwickshire family of Arden, whose members had more than once filled the posts of high-sheriff and lord-lieutenant of the county. She was thus descended from an old county family, the oldest in Warwickshire, and had inherited the traditions of gentle birth and good breeding. Her ancestors are traced back, not only to Norman, but to Anglo-Saxon times.

Family of
Arden.

Alwin, an early representative of the family, and himself connected with the royal house of Athelstane, having been *over-constable* or sheriff of Warwickshire in the time of Edward the Confessor. His son Turhill retained his extensive possessions under the Conqueror, and, when they were divided on the marriage of his daughter Margaret to a Norman noble created by William Rufus earl of Warwick, Turhill betook himself to his numerous lordships in the Arden district of the county, and assumed the name of De Arden or Arden. His descendants, who retained the name, multiplied in the shire, and were united in marriage from time to time with the best Norman blood of the kingdom. The family of Arden thus represented the union, under somewhat rare conditions of original distinction and equality, of the two great race elements that have gone to the making of the typical modern Englishman. The immediate ancestors of Mary Shakespeare were the Ardens of Parkhall, near Aston in the north-western part of the shire. During the Wars of the Roses Robert Arden of Parkhall, being at the outset of the quarrel a devoted Yorkist, was seized by the Lancastrians, attached for high treason, and executed at Ludlow in 1452. He left an only son, Walter Arden, who was restored by Edward IV. to his position in the country, and received back his hereditary lordships and lands. At his death in 1502 he was buried with great state in Aston church, where three separate monuments were erected to his memory. He had married Eleanor, second daughter of John Hampden of Bucks, and by her had eight children, six sons and two daughters. The eldest son, Sir John Arden of Parkhall, having been for some years esquire of the body of Henry VII., was knighted and rewarded by that monarch. Sir John was the great-uncle of Mary Shakespeare,—his brother Thomas, the second son of Walter Arden, being her grandfather. Thomas Arden is found residing at Aston Centlowes during the first half of the 16th century, and in the year 1501 he united with his son Robert Arden, Mary Shakespeare's father, in the purchase of the Snitterfield estate. Mary Shakespeare was thus directly connected by birth and lineage with those who had taken, and were to take, a foremost part in the great conflicts which constitute turning-points in the history of the country. On her father's side she was related to Robert Arden, who in the 15th century lost his life while engaged in rallying local forces on behalf of the White Rose, and on her mother's side to John Hampden, who took a still more distinguished part in the momentous civil struggles of the 17th century.

A very needless and abortive attempt has been made to call in question Robert Arden's social and family position on the ground that in a contemporary deed he is called a husbandman (*agricola*),—the assumption being that a husbandman is simply a farm-labourer. But the term husbandman was often used in Shakespeare's day to designate

a landed proprietor who farmed one of his own estates. The fact of his being spoken of in official documents as a husbandman does not therefore in the least affect Robert Arden's social position, or his relation to the great house of Arden, which is now established on the clearest evidence. He was, however, a younger member of the house, and would naturally share in the diminished fortune and obscure career of such a position. But, even as a cadet of so old and distinguished a family, he would tenaciously preserve the generous traditions of birth and breeding he had inherited.

Mary Arden was thus a gentlewoman in the truest sense of the term, and she would bring into her husband's household elements of character and culture that would be of priceless value to the family, and especially to the eldest son, who naturally had the first place in her care and love. A good mother is to an imaginative boy his earliest ideal of womanhood, and in her form are gathered up, in all their vital fulness, the tenderness, sympathy, and truth, the infinite love, patient watchfulness, and self-abnegation of the whole sex. And the experience of his mother's bearing and example during the vicissitudes of their home life must have been for the future dramatist a vivid revelation of the more sprightly and gracious, as well as of the profounder elements, of female character. In the earlier and prosperous days at Stratford, when all within the home circle was bright and happy, and in her intercourse with her boy Mary Shakespeare could freely unfold the attractive qualities that had so endeared her to her father's heart, the delightful image of the young mother would melt unconsciously into the boy's mind, fill his imagination, and become a storehouse whence in after years he would draw some of the finest lines in his matchless portraiture of women. In the darker days that followed he would learn something of the vast possibilities of suffering, personal and sympathetic, belonging to a deep and sensitive nature, and as the troubles made head he would gain some insight into the quiet courage and self-possession, the unweakened fortitude, sweetness, and dignity which such a nature reveals when stirred to its depths by adversity, and rallying all its resources to meet the inevitable storms of fate. These storms were not simply the ever deepening pecuniary embarrassments and consequent loss of social position. In the very crisis of the troubles, in the spring of 1570, death entered the straitened household, carrying off Ann, the younger of the only two remaining daughters of John and Mary Shakespeare. A characteristic trait of the father's grief and pride is afforded by the entry in the church books that a somewhat excessive sum was paid on this occasion for the tolling of the bell. Even with ruin staring him in the face John Shakespeare would forego no point of customary respect nor abate one jot of the ceremonial usage proper to the family of an eminent burgess, although the observance might involve a very needless outlay. In passing through those chequered domestic scenes and vividly realizing the alternations of grief and hope, the eldest son, even in his early years, would gain a fund of memorable experiences. From his native sensibility and strong family affection he would passionately sympathize with his parents in their apparently hopeless struggle against the slings and arrows of outrageous fortune. Above all he would cherish the memory of his mother's noble bearing alike under serene and clouded skies, and learn to estimate at their true worth the refined strength of inherited courage, the dignified grace and silent helpfulness of inherited courtesy and genuine kindness of heart. These recollections were vitalized in the sprightly intelligence, quick sympathy, and loving truthfulness belonging to the female characters of his early comedies, as well as in the profounder notes of womanly grief and suffering,

Mary

struck with so sure a hand and with such depth and intensity of tone, in the early tragedies

Qualities
inherited
from his
mother.

But in addition to her constant influence and example the poet was probably indebted to his mother for certain elements of his own mind and character directly inherited from her. This position may be maintained without accepting the vague and comparatively empty dictum that Shakespeare derived his genius from his mother, as many eminent men are loosely said to have done. The sacred gift of genius has ever been, and perhaps always will be, inexplicable. No analysis, however complete, of the forces acting on the individual mind can avail to extract this vital secret. The elements of race, country, parentage, and education, though all powerful factors in its development, fail adequately to account for the mystery involved in pre-eminent poetical genius. Like the unseen wind from heaven it bloweth where it listeth, and the inspired voice is gladly heard of men, but none can tell whence it cometh or whither it goeth. While, however, genius is thus without ancestry or lineage, there are elements of character and qualities of mind that, like the features of the countenance and the lines of the bodily frame, appear to be cleanly transmissible from parent to child. Shakespeare not unfrequently recognizes this general truth, especially in relation to moral qualities, and it is mainly qualities of this kind that he himself appears to have inherited from his gently born and nurtured mother, Mary Aiden of the Asbies. At least it is hardly fanciful to say that in the life and character of the poet we may trace elements of higher feeling and conduct derived from the hereditary culture and courtesy, the social insight and refinement, of the Ardens. Amongst such elements may be reckoned his strong sense of independence and self-respect, his delicate feeling of honour, his habitual consideration for others, and, above all perhaps, his deep instinctive regard for all family interests and relationships, for everything indeed connected with family character and position. The two epithets which those who knew Shakespeare personally most habitually applied to him appear to embody some of these characteristics. They unite in describing him as "gentle" and "honest" in character, and of an open and free, a frank and generous disposition. The epithet "gentle" may be taken to represent the innate courtesy, the delicate consideration for the feelings of others, which belongs in a marked degree to the best representatives of gentle birth, although happily it is by no means confined to them. The second epithet, "honest," which in the usage of the time meant honourable, may be taken to express the high spirit of independence and self-respect which carefully respects the just claims and rights of others. One point of the truest gentle breeding, which, if not inherited from his mother, must have been derived from her teaching and example, is the cardinal maxim, which Shakespeare seems to have faithfully observed, as to nice exactness in money matters—the maxim not lightly to incur pecuniary obligations, and if incurred to meet them with scrupulous precision and punctuality. This he could not have learnt from his father, who, though an honest man enough, was too eager and careless to be very particular on the point. Indeed, carelessness in money matters seems rather to have belonged to the Swinfield family, the poet's uncle Henry having been often in the courts for debt, and, as we have seen, this was true of his father also. But, while his father was often prosecuted for debt, no trace of any such action against the poet himself, for any amount however small, has been discovered. He sued others for money due to him and at times for sums comparatively small, but he never appears as a debtor himself. Indeed, his whole life contradicts the supposition that he would ever

have rendered himself liable to such a humiliation. The family troubles must have very early developed and strengthened the high feeling of honour on this vital point he had inherited. He must obviously have taken to heart the lesson his father's imprudence could hardly fail to impress on a mind so capacious and reflective. John Shakespeare was no doubt a warm-hearted lovable man, who would carry the sympathy and affection of his family with him though all his troubles, but his eldest son, who early understood the secret springs as well as the open issues of life, must have realized vividly the rock on which their domestic prosperity had been wrecked, and before he left home he had evidently formed an invincible resolution to avoid it at all hazards. This helps to explain what has often excited surprise in relation to his future career—his business industry, financial skill, and steady progress to what may be called worldly success. Few things are more remarkable in Shakespeare's personal history than the resolute spirit of independence he seems to have displayed from the moment he left his staidened household to seek his fortunes in the world to the time when he returned to live at Stratford as a man of wealth and position in the town. While many of his fellow dramatists were spendthrifts, in constant difficulties, leading disorderly lives, and sinking into unhonoured graves, he must have husbanded his early resources with a rare amount of quiet firmness and self-control. Chettie's testimony as to Shakespeare's character and standing during his first years in London is decisive on this head. Having published a posthumous work by Greene, in which Marlowe and Shakespeare were somewhat sharply referred to, Chettie expressed his regret in a preface to a work of his own issued a few months later, in December 1592, he intimates that at the time of publishing Greene's *Greene's worth of Wit* he knew neither Marlowe nor Shakespeare, and that he does not care to become acquainted with the former. But having made Shakespeare's acquaintance in the interval he expresses his regret that he should, even as editor, have published a word to his disparagement, adding this remarkable testimony: "Because myself have seen his demeanour, no less civil than he excellent in the qualities he professes, besides, divers of worship have reported his uprightness of dealing, which argues his honesty, and his facetious grace in writing, which approves his art." So that Shakespeare, during his earliest and most anxious years in London, had not only kept himself out of debt and difficulty, but had established a reputation of strictly honourable conduct, "divers of worship," i.e., men of position and authority entitled to speak on such a point, "having reported his uprightness of dealing, which argued his honesty." Now, considering the poet's associates, occupations, and surroundings, this is significant testimony, and conclusively proves that, although fond of social life and its enjoyments, and without a touch of harshness or severity in his temper, he yet held himself thoroughly in hand, that amidst the ocean of new experiences and desires on which he was suddenly launched he never abandoned the helm, never lost command over his course, never sacrificed the larger interests of the future to the clamorous or excessive demands of the hour. And this no doubt indicates the direction in which he was most indebted to his mother. From his father he might have derived ambitious desires, energetic impulses, and an excitable temper capable of rushing to the verge of passionate excess, but, if so, it is clear that he inherited from his mother the firmness of nerve and fibre as well as the ethical strength required for regulating these violent and explosive elements. If he received as a paternal heritage a very tempest and whirlwind of passion, the maternal gift of temperance and

measure would help to give it smoothness and finish in the working, would supply in some degree at least the power of concentration and self-control indispensable for moulding the extremes of exuberant sensibility and passionate impulse into forms of intense and varied dramatic portraiture, and of course all the finer and regulative elements of character and disposition derived from the spindle side of the house would, throughout the poet's early years, be strengthened and developed by his mother's constant presence, influence, and example.

Shakespeare's birth

John and Mary Shakespeare had eight children, four sons and four daughters. Of the latter, two, the first Joan and Margaret, died in infancy, before the birth of the poet, and a third, Anne, in early childhood. In addition to the poet, three sons, Gilbert, Richard, and Edmund, and one daughter, the second Joan, lived to maturity and will be referred to again. William Shakespeare was christened in Stratford church on April 26, 1564, having most probably been born, according to tradition, on the 33d. In July of the same year the town was visited by a severe outbreak of the plague, which in the course of a few months carried off one-sixth of the inhabitants. Fortunately, however, the family of the Shakespeares wholly escaped the contagion, their exemption being probably due to the fact that they lived in the healthiest part of the town, away from the river side, on a dry and porous soil. At the back of Henley Street, indeed, were the gravel pits of the guild, which were in frequent use for repairing the inundated pathways near the river after its periodical overflows. For two years and a half William, their first-born son, remained the only child of his parents, and all his mother's love and care would naturally be lavished upon him. A special bond would in this way be established between mother and child, and, his father's affairs being at the time in a highly prosperous state, Mary Shakespeare would see to it that the boy had all the pleasures and advantages suitable to his age, and which the family of a foremost Stratford burgess could easily command.

Early life.

Healthful outdoor enjoyment is not the least valuable part of a boy's education, and the chief recreations available for the future dramatist in those early years would be the sports and pastimes, the recurring festivals, spectacles, and festivities, of the town and neighbourhood, especially the varying round of rural occupations and the celebration in the forest farms and villages of the chief incidents of the agricultural year. Seed time and harvest, summer and winter, each brought its own group of picturesque merry-makings, including some more important festivals that evoked a good deal of rustic pride, enthusiasm, and display. There were, during these years, at least three of the forest farms where the poet's parents would be always welcome, and where the boy must have spent many a happy day amidst the freedom and delights of outdoor country life. At Snitterfield his grandfather would be proud enough of the curly-headed youngster with the fine hazel eyes, and his uncle Henry would be charmed at the boy's interest in all he saw and heard as he trotted with him through the byres and barns, the poultry yard and standing, or, from a safe nook on the busy margin of the pool, enjoyed the fun and excitement of sheep-washing, or later on watched the mysteries of the shearing and saw the heavy fleece fall from the sides of the panting victim before the sure and rapid furrowing of the shears. He would no doubt also be present at the shearing feast and see the queen of the festival receive her rustic guests and distribute amongst them her floral gifts. At Wilmcote, in the solid oak-timbered dwelling of the Ashlows, with its well-stocked garden and orchard, the boy would be received with cordial hospitality, as well as with the attention and respect due

to his parents as the proprietors and to himself as the heir of the maternal estate. At Snitterfield the welcome of the Shakespeares would not be less cordial or friendly, as there is evidence to show that as early as 1566 the families were known to each other; John Shakespeare having in that year rendered Richard Hathaway an important personal service. Here the poet met his future bride, Anne Hathaway, in all the charm of her sunny girlhood, and they may be said to have grown up together, except that from the difference of their ages she would reach early womanhood while he was yet a stripling. In his later youthful years he would thus be far more frequently at the Hathaway farm than at Snitterfield or the Ashlows. There were, however, family connexions of the Shakespeares occupying farms further afield,—Hills and Webbs at Beasley and Lamberts at Barton-on-the-Heath. There was thus an exceptionally wide circle of country life open to the poet during his growing years. And in those years he must have repeatedly gone the whole picturesque round with the fresh senses and eager feeling, the observant eye and open mind, that left every detail, from the scarlet lips by the wayside to the proud tops of the eastern pines, unimprinted indelibly upon his heart and brain. Hence the apt and vivid references to the scenes and scenery of his youth, the intense and penetrating glances at the most vital aspects as well as the minutest beauties of nature, with which his dramas abound. These glances are so penetrating, the result of such intimate knowledge and enjoyment, that they often seem to reveal in a moment, and by a single touch as it were, all the loveliness and charm of the objects thus rapidly flashed on the inward eye. In relation to the scenes of his youth what fresh and delightful hours at the farms are reflected in the full summer beauty and molley humours of a sheep-shearing festival in the *Winter's Tale*; in the autumn glow of the "sun-burnt sickle-moon and sedge-crowned nymphs" of the masque in the *Tempest*; and in the vivid pictures of rural sights and sounds in spring and winter so musically rendered in the owl and cuckoo songs of *Love's Labour's Lost*! But, in addition to the festivities and merry-makings of the forest farms, it is clear that, in his early years, the poet had some experience of country sports proper, such as hunting, hawking, coursing, wild-duck shooting, and the like. Many of these sports were pursued by the local gentry and the yeomen together, and the poet, as the son of a well-connected burgess of Stratford, who had recently been mayor of the town and possessed estates in the country, would be well entitled to share in them, while his handsome presence and courteous bearing would be likely to ensure him a hearty welcome. If any of the stiffer local magnates looked coldly upon the high-spirited youth, or resented in any way his presence amongst them, their conduct would be likely enough to provoke the kind of sportive retaliations that might naturally culminate in the deer-stealing adventure. However this may be, it is clear from internal evidence that the poet was practically familiar with the field sports of his day.

In the town the chief holiday spectacles and entertainments were those connected with the Christmas, New Year, and Easter festivals, the May-day rites and games, the pageants of delight of Whitsuntide, the beating of the bounds during Rogation week, and the occasional representation of mysteries, moralities, and stage-plays. In relation to the main bent of the poet's mind, and the future development of his powers, the latter constituted probably the most important educational influence and stimulus which the social activities and public entertainments of the place could have supplied. Most of these recurring celebrations involved, it is true, a dramatic

Emul sports and country rumbles.

Holiday spectacles and festivities

element,—some hero or exploit, some emblem or allegory, being represented by means of costumed personations, pantomime, and dumb show, while in many cases songs, dances, and brief dialogues were interposed as part of a performance. There were masques and morris-dancing on May-day, as well as mummers and waits at Christmas. In a number of towns and villages the exploits of Robin Hood and his associates were also celebrated on May-day, often amidst a picturesque confusion of floral emblems and forestry devices.

In Shakespeare's time the May-day rites and games thus included a variety of elements charged with legendary, historical, and emblematical significance. But, notwithstanding this mixture of festive elements, the celebration as a whole retained its leading character and purpose. It was still the spontaneous meeting of town and country to welcome the fresh beauty of the spring, the welcome being reflected in the open spaces of the sports by tall painted masts decked with garlands, streamers, and flowery crowns, and in the public thoroughfares by the leafy screens and arches, the bright diffused blossoms and fragrant spoils brought from the forest by rejoicing youths and maidens at the dawn. May-day was thus well fitted to be used, as it often is by Shakespeare, as the comprehensive symbol of all that is delightful and exhilarating in the renewed life and vernal freshness of the opening year.

After May-day, Whitsuntide was at Stratford perhaps the most important season of festive pageantry and scenic display. In addition to the procession of the guild and trades and the usual holiday ales and sports, it involved a distinct and somewhat noteworthy element of dramatic representation. And, as in the case of the regular stage-plays, the high-bailiff and council appear to have patronized and supported the performances. We find in the chamberlain's accounts entries of sums paid "for exhibiting a pastyme at Whitsuntide." Shakespeare himself refers to these dramatic features of the celebration, and in a manner that almost suggests he may in his youth have taken part in them. However this may be, the popular celebrations of Shakespeare's youth must have supplied a kind of training in the simpler forms of poetry and dramatic art, and have afforded some scope for the early exercise of his own powers in both directions. This view is indirectly confirmed by a passage in the early scenes of *The Return from Parma*, where the academic speakers sneer at the poets who come up from the country without any university training. The sneer is evidently the more bitter as it implies that some of these poets had been successful,—more successful than the college-bred wits. The academic critics suggest that the nurseries of these poets were the country ale-house and the country green,—the special stimulus to their powers being the May-day celebrations, the morris-dances, the hobby-horse, and the like.

But the moralities, interludes, and stage-plays proper afforded the most direct and varied dramatic instruction available in Shakespeare's youth. The earliest popular form of the drama was the mystery or miracle play, dealing in the main with Biblical subjects; and, Coventry being one of the chief centres for the production and exhibition of the mysteries, Shakespeare had ample opportunities of becoming well acquainted with them. Some of the acting companies formed from the numerous trade guilds of the "shire-town" were moreover in the habit of visiting the neighbouring cities for the purpose of exhibiting their plays and pageants. There is evidence of their having performed at Leicester and Bristol in Shakespeare's youth, and on returning from the latter city they would most probably have stopped at Stratford and given some performances there. And in any case,

Coventry being so near to Stratford, the fame of the multiplied pageants presented during the holiday weeks of Easter and Whitsuntide, and especially of the brilliant concourse that came to witness the grand series of Corpus Christi plays, would have early attracted the young poet, and he must have become familiar with the precincts of the Grey Friars at Coventry during the celebration of these great ecclesiastical festivals. The indirect evidence of this is supplied by Shakespeare's references to the well-known characters of the mysteries, such as Herod and Pilate, Cain and Judas, Temeraunt with his turbaned Turks and infidels, black-burning souls, grim and gaping hell, and the like. The moralities and interludes that gradually took the place of the Biblical mysteries were also acted by companies of strolling players over a wide area in the towns and cities of the Midland and western counties. Malone gives from an eye-witness a detailed and graphic account of the public acting of one of these companies at Gloucester in 1569, the year during which the poet's father as high-bailiff had brought the stage-players into Stratford and inaugurated a series of performances in the guild hall. The play acted at Gloucester was *The Cradle of Security*, one of the most striking and popular of the early moralities or interludes. Willis, the writer of the account, was just Shakespeare's age, having been born in 1564. As a boy of five years old he had been taken by his father to see the play, and, standing between his father's knees, watched the whole performance with such intense interest that, writing about it seventy years afterwards, he says, "the subject took such an impression upon me that when I came afterwards towards man's estate it was as fresh in my memory as if I had soon it newly enacted." In proof of this he gives a clear and detailed outline of the play. Willis was evidently a man of no special gifts, and, if the witnessing a play when a child could produce on an ordinary mind so memorable an impression, we may imagine what the effect would be on the mind of the marvellous boy who, about the same time and under like circumstances, was taken by his father to see the performances at Stratford. The company that first visited Stratford being a distinguished one, their plays were probably of a higher type and better acted than *The Cradle of Security* at Gloucester; and their effect on the young poet would be the more vivid and stimulating from the keener sensibilities and intense dramatic power to which in his case they appealed. These early impressions would be renewed and deepened with the boy's advancing years. During the decade of Shakespeare's active youth from 1573 to 1584 the best companies in the kingdom constantly visited Stratford, and he would thus have the advantage of seeing the finest dramas yet produced acted by the best players of the time. This would be for him a rich and fruitful experience of the flexible and impressive form of art which at a moment of exuberant national vitality was attracting to itself the scattered forces of poetic genius, and soon gained a position of unrivalled supremacy. As he watched the performance in turn of the various kinds of interlude, comedy, and pastoral, of chronicle and biographical plays, of historical, domestic, or realistic tragedy, he would gain in instructive insight into the wide scope and vast resources of the rising drama. And he would have opportunities of acquiring some knowledge of stage business, management, and effects, as well as of dramatic form. Amongst the companies that visited Stratford were those of the powerful local earls of Leicester, Warwick, and Worcester, whose members were largely recruited from the Midland counties. The earl of Leicester's company, the most eminent of all, included several Warwickshire men, while some of the leading members, like the elder Burbage, appear to have

May-day

Interludes and stage-plays.

been natives of Stratford or the immediate neighbourhood. And the poet's father being, as we have seen, so great a friend of the players, and during his most prosperous years in constant communication with them, his son would have every facility for studying their art. Curiosity and interest and the like would prompt him to find out all he could about the use of the stage "books," the distribution of the parts, the cues and exits, the management of voice and gesture, the graduated passion and controlled power of the leading actors in the play, the just subordination of the less important parts, and the measure and finish of each on which the success of the whole so largely depended. It is not improbable, too, that in connexion with some of the companies Shakespeare may have tried his hand both as poet and actor even before leaving Stratford. His poetical powers could hardly be unknown, and he may have written scenes and passages to fill out an imperfect or complete a defective play, and from his known interest in their work he may have been pressed by the actors to appear in some secondary part on the stage. In any case he would be acquainted with some of the leading players in the best companies, so that when he decided to adopt their profession he might reasonably hope on going to London to find occupation amongst them without much difficulty or delay.

School
educa-
tion

Shakespeare received the technical part or scholastic elements of his education in the grammar school of his native town. The school was an old foundation dating from the second half of the 15th century and connected with the guild of the Holy Cross. But, having shared the fate of the guild at the suppression of religious houses, it was restored by Edward VI. in 1553, a few weeks before his death. The "King's New School," as it was now called, thus represented the fresh impulse given to education throughout the kingdom during the reign of Henry VIII.'s earnest-minded son, and well sustained under the enlightened rule of his sister, the learned virgin queen. What the course of instruction was in these country schools during the second half of the 16th century has recently been ascertained by special research,¹ and may be stated, at least in outline, with some degree of certainty and precision. As might have been expected, Latin was the chief scholastic drill, the thorough teaching of the Roman tongue being, as the name implies, the very purpose for which the grammar schools were originally founded. The regular teaching of Greek was indeed hardly introduced into the country schools until a somewhat later period. But the knowledge of Latin, as the language of all the learned professions, still largely used in literature, was regarded as quite indispensable. Whatever else might be neglected, the business of "gerund-grinding" was vigorously carried on, and the methods of teaching, the expedients and helps devised for enabling the pupils to read, write, and talk Latin, if rather complex and obscure, were at the same time ingenious and effective. As a rule the pupil entered the grammar school at seven years old, having already acquired either at home or at the petty school the rudiments of reading and writing. During the first year the pupils were occupied with the elements of Latin grammar, the accidence, and lists of common words which were committed to memory and repeated two or three times a week, as well as further impressed upon their minds by varied exercises. In the second year the grammar was fully mastered, and the boys were drilled in short phrase-books, such as the *Sententiae Pueriles*, to increase their familiarity with the structure and idioms of the language. In the third year the books used were *Æsop's Fables*, *Cato's Maxims*, and some good manual of

school conversation, such as the *Confabulationes Pueriles*. The most popular of these manuals in Shakespeare's day was that by the eminent scholar and still more eminent teacher Corderius. His celebrated *Colloques* were probably used in almost every school in the kingdom, and Hoole, writing in 1653, says that the worth of the book had been proved "by scores if not hundreds of impressions in this and foreign countries." Bayle, indeed, says that from its universal use in the schools the editions of the book might be counted by thousands. This helps to illustrate the colloquial use of Latin, which was so essential a feature of grammar school discipline in the 16th and 17th centuries. The evidence of Bunsley, who was Shakespeare's contemporary, conclusively proves that the constant speaking of Latin by all the boys of the more advanced forms was indispensable even in the smallest and poorest of the country grammar schools. The same holds true of letter-writing in Latin; and this, as we know from the result, was diligently and successfully practised in the Stratford grammar school. During his school days, therefore, Shakespeare would be thoroughly trained in the conversational and epistolary use of Latin, and several well-known passages in his dramas show that he did not forget this early experience, but that like everything else he acquired it turned to fruitful uses in his hands. The books read in the more advanced forms of the school were the *Elogues* of Mantuanus, the *Trusta* and *Metamorphoses* of Ovid, Cicero's *Offices*, *Orations*, and *Epistles*, the *Georgics* and *Æneid* of Virgil, and in the highest form parts of Juvenal, of the comedies of Terence and Plautus, and of the tragedies of Seneca. Shakespeare, having remained at school for at least six years, must have gone through a greater part of this course, and, being a pupil of unusual quickness and ability, endowed with real strength of mental grip and firmness of moral purpose, he must during those years have acquired a fair mastery of Latin, both colloquial and classical. After the difficulties of the grammar had been overcome, his early intellectual cravings and poetic sensibilities would be alike quickened and gratified by the new world of heroic life and adventure opened to him in reading such authors as Ovid and Virgil. Unless the teaching at Stratford was very exceptionally poor he must have become so far familiar with the favourite school authors, such as Ovid, Tully, and Virgil, as to read them intelligently and with comparative ease.

And there is no reason whatever for supposing that the instruction at the Stratford grammar school was less efficient than in the grammar schools of other provincial towns of about the same size. There is abundant evidence to show that, with the fresh impulse given to education under energetic Protestant auspices in the second half of the 16th century, the teaching even in the country grammar schools was as a rule painstaking, intelligent, and fruitful. Bunsley himself was for many years an eminent and successful teacher in the grammar school of Ashby-de-la-Zouch, a small town on the borders of Warwickshire, only a few miles inland from Coventry; and in his *Juditha Literaria*, referring to a book of exercises on the Latin accidence and grammar he had purchased, he says that he had chiefly followed the order of the questions "of that ancient schoolmaster Master Bunsword of Maxfield (Maxcelfield) in Cheshire, so much commended for his order and scholars, who, of all other, cometh therein the nearest unto the marks." Another provincial schoolmaster, Mr. Robert Doughty, a contemporary of Shakespeare, who was for nearly fifty years at the head of the Wakefield grammar school, retold by Hoole, not only as an eminent teacher who had constantly sent out good scholars, but as one who had produced a class of teachers emulating his own educational zeal and intelligence. The masters of the Stratford grammar school in Shakespeare's time seem to have been men of a similar stamp. One of them, John Bunsword, who held the post for three years during the poet's childhood, was almost certainly a relative, probably a son, of the eminent Maxcelfield master whose character and work Bunsley praises so highly. At least, Bunsword being an uncommon name, when we find it borne by two grammar-school masters in neighbouring counties who flourished either together or in close succession to each other, it is natural to conclude that there must have been some relationship between

¹ "What Shakespeare learnt at School," *Fraser's Magazine*, Nov. 1879, Jan. and May, 1880.

them, and if so we may be sure that the Stratford master, who was evidently the younger man, had been well tanned and must have proved an efficient teacher. The masters who followed Bunsword were university men of at least average attainments and ability, as they rapidly gained promotion in the church. Thomas Hunt, who was head-master during the most important years of Shakespeare's school course, became incumbent of the neighbouring village of Luddington, and, if there is any truth in the tradition that the poet's marriage was celebrated there, it is not improbable that, from having been a favourite pupil, he may have become the personal friend of his former master. In any case, during the years of his school attendance the poet must have gained sufficient knowledge of Latin to tend for his own instruction and delight the arduous school course, became incumbent of the school curriculum who had struck his fancy and stimulated his awakening powers. While his writings supply clear evidence in support of this general position, they also bring out vividly the fact that Ovid was a special favourite with Shakespeare at the outset of his career. The influence of this romantic and elegant Roman poet is indeed strongly marked and clearly traceable in the poems as well as in the early plays.

Home
life on
leaving
school

According to Rowe's account, Shakespeare was withdrawn from school about 1578, a year or two before he had completed the usual course for boys going into business or passing on to the universities. The immediate cause of the withdrawal seems to have been the growing embarrassments of John Shakespeare's affairs, the boy being wanted at home to help in the various departments of his father's business. The poet had just entered on his fifteenth year, and his school attainments and turn for affairs, no less than his native energy and ability, fitted him for efficient action in almost any fairly open career. But open careers were not numerous at Stratford, and John Shakespeare's once prosperous way of life was now hampered by actual and threatening difficulties which the zeal and affection of his son were powerless to remove or avert. No doubt the boy did his best, trying to understand his father's position, and discharging with prompt alacrity any duties that came to be done. But he would soon discover how hopeless such efforts were, and with this deepening conviction there would come upon him the reaction of weariness and disappointment, which is the true *inferno* of ardent youthful minds. His father's difficulties were evidently of the chronic and complicated kind against which the generous and impulsive forces of youth and inexperience are of little avail. And, after his son had done his utmost to relieve the sinking fortunes of the family, the aching sense of failure would be among the bitterest experiences of his early years, would be indeed a sharp awakening to the realities and responsibilities of life. Within the narrow circle of his own domestic relationships and dearest interests he would feel with Hamlet that the times were out of joint, and in his gloomier moods be ready to curse the destiny that seemed to lay upon him, in part at least, the burden of setting the obstinately crooked straight. As a relief from such moods and a distraction from the fruitless toils of home affairs, he would naturally plunge with keener zest into such outlets for youthful energy and adventure as the town and neighbourhood afforded. What the young poet's actual occupations were during the four years and a half that elapsed between his leaving school and his marriage we have no adequate materials for deciding in any detail. But the local traditions on the subject would seem to indicate that after the adverse turn in his fortunes John Shakespeare had considerably contracted the area of his commercial transactions. Having virtually alienated his wife's patrimony by the mortgage of the Ashes and the disposal of all interest in the Sutterfield property, he seems to have given up the agricultural branches of his business, retaining only his original occupation of dealer in leather, skins, and sometimes carcasses as well. His wider speculations had probably turned out ill, and heaving no longer any land of his own he apparently relinquished

the corn and timber business, restricting himself to the town trades of fellmonger, wool-stapler, and butcher. Aubrey at least had heard that Shakespeare after leaving school assisted his father in these branches,—and at times with a deal of youthful extravagance indicative of irrepressible energy and spirit. Aubrey also reports, on the authority of Beeston, and as incidentally proving he knew Latin fairly well, that for a time the poet was a teacher in a country school, while Malone believed from the internal evidence of his writings that he had spent two or three years in a lawyer's office. These stories may be taken to indicate, what is no doubt true, that at a time of domestic need the poet was ready to turn his hand to anything that offered. It is no doubt also true that he would prefer the comparative retirement and regularity of teaching or clerk's work to the intermittent drudgery and indolence of a retail shop in a small market-town. There is, however, no direct evidence in favour of either supposition, and the indirect evidence for the lawyer's office theory which has found favour with several recent critics is by no means decisive. Whether engaged in a lawyer's office or not, we may be quite sure that during the years of adolescence he was actively occupied in work of some kind or other. He was far too sensible and energetic to remain without employment; shapeless idleness had no attraction for his healthy nature, and his strong family feeling is certainly in favour of the tradition that for a time he did his best to help his father in his business.

But, however he may have been employed, this interval of home life was for the poet a time of active growth and development, and no kind of business routine could avail to absorb his expanding powers or oppress the exuberant vitality of his nature. During these critical years, to a vigorous and healthy mind such as Shakespeare possessed, action—action of an adventurous and recreative kind, in which the spirit is quickened and refreshed by new experiences—must have become an absolute necessity of existence. The necessity was all the more urgent in Shakespeare's case from the narrower circle within which the once prosperous and expanding home life was now confined. We have seen that the poet occasionally shared the orthodox field sports organized by the country gentlemen, where landlords and tenants, yeomen and squires, animated by a kindred sentiment, meet to a certain extent on common ground. But this long-thrown pursuit of pleasure as an isolated unit in a local crowd would hardly satisfy the thirst for passionate excitement and personal adventure which is so dominant an impulse in the hey-day of youthful blood. It is doubtful, too, whether in the decline of his father's fortunes Shakespeare would have cared to join the prosperous concourse of local sportsmen. He would probably be thrown a good deal amongst a somewhat lower, though no doubt energetic and intelligent, class of town companions. And they would devise together exploits which, if somewhat irregular, possessed the inspiring charm of freedom and novelty, and would thus be congenial to an ardent nature with a passionate interest in life and action. Such a nature would eagerly welcome enterprises with a dash of hazard and daring in them, fitted to bring the more resolute virtues into play, and develop in moments of emergency the manly qualities of vigilance and promptitude, courage and endurance, dexterity and skill. It would seem indeed at first sight as though a quiet neighbourhood like Stratford could afford little scope for such adventures. But even at Stratford there were always the forest and the river, the outlying farms with adjacent parks and manor houses, the wide circle of picturesque towns and villages with their guilds and clubs, their local Shallows and Slenders, Dogberries and Verges; and in the most quiet neigh-

bourhoods it still remains true that adventures are to the adventurous. That this dictum was verified in Shakespeare's experience seems clear alike from the internal evidence of his writings and the concurrent testimony of local tradition. In its modern form the story of the Bidford challenge exploit may indeed be little better than a myth. But in substance it is by no means incredible, and if we know all about the incident we should probably find there were other points to be tested between the rival companies besides strength of head to reast the effects of the well-known Bidford bear. The prompt refusal to return with his companions and renew the contest on the following day,—a decision playfully expressed and emphasized in the well-known doggie lines,—implies that in Shakespeare's view such forms of good fellowship were to be accepted on social not self-indulgent grounds, that they were not to be resorted to for the sake of the lower accessories only, or allowed to grow into evil habits from being unduly repeated or prolonged. It is clear that this general principle of recreative and adventurous enterprise, announced more than once in his writings, guided his own conduct even in the excitable and impulsive season of youth and early manhood. If he let himself go, as he no doubt sometimes did, it was only as a good rider on coming to the turf gives the horse his head in order to enjoy the exhilaration of a gallop, having the bridle well in hand the while, and able to rein in the excited steed at a moment's notice. It may be said of Shakespeare at such seasons, as of his own Prince Hal, that he—

"Obscure'd his contemplation
Under the veil of wildness; which, no doubt,
Grow like the summer grass, fastest by night,
Unseen, yet crescent in his faculty."

Deer-
stealing
tradition.

The deer-stealing tradition illustrates the same point; and though belonging perhaps to a rather later period it may be conveniently noticed here. This fragment of Shakespeare's personal history rests on a much surer basis than the Bidford incident, being supported not only by early multiplied and constant traditions, but by evidence which the poet himself has supplied. Rowe's somewhat formal version of the narrative is to the effect that Shakespeare in his youth was guilty of an extravagance which, though unfortunate at the time, had the happy result of helping to develop his dramatic genius. This misfortune was that of being engaged with some of his companions more than once in robbing a park belonging to Sir Thomas Lucy of Charlcoote. Sir Thomas, it is said, prosecuted him sharply for the offence, and in retaliation he wrote a satirical ballad upon him, which so incensed the baronet that Shakespeare thought it prudent to leave Stratford and join his old friends and associates the players in London. Other versions of the tradition exist giving fresh details, some of which are on the face of them later additions of a fictitious and fanciful kind. But it would be useless to discuss the accretions incident to any narrative, however true, orally transmitted through two or three generations before being reduced to a written shape. All that can be required or expected of such traditions is that they should contain a kernel of biographical fact, and be true in substance although possibly not in form. And tried by this test the tradition in question must certainly be accepted as a genuine contribution to our knowledge of the poet's early years. Indeed it could hardly have been repeated again and again by inhabitants of Stratford within a few years of Shakespeare's death if it did not embody a characteristic feature of his early life which was well known in the town. This feature was no doubt the poet's love of woodland life, and the woodland sports through which it is realized in the most animated and vigorous form.

The neighbourhood of Stratford in Shakespeare's day afforded considerable scope for this kind of healthy recreation. There was the remnant of the old Aiden forest, which, though still nominally a royal domain, was virtually free for many kinds of sport. Indeed, the observance of the forest laws had fallen into such neglect in the early years of Elizabeth's reign that even the most diligent hunting in the royal domains was common enough. And hardly any attempt was made to prevent the pursuit of the smaller game belonging to the warden and the chase. Then, three or four miles to the east of Stratford, between the Warwick road and the river, stretched the romantic park of Fulbroke, which, as the property of an attainted exile, sequestered though not seized by the crown, was virtually open to all comers. Hence, no wonder that when Shakespeare and his companions wished a day's outing in the woods they usually resorted to some part of the Aiden forest still available for sporting purposes. But sometimes, probably on account of its greater convenience, they seem to have changed the venue to Fulbroke Park, and there they might easily come into collision with Sir Thomas Lucy's keepers. There has been a good deal of discussion as to the scene of the individual adventure, but the probabilities of the case are strongly in favour of Fulbroke. When Sir Walter Scott visited Sir Thomas Lucy at Charlcoote in 1828, Sir Thomas told him that the park from which Shakespeare stole the deer was not Charlcoote, but one belonging to a mansion at some distance, the context indicating Fulbroke as the scene of the exploit. And Mr. Braddon, in his interesting pamphlet *Shakespeare no Deer-Stealer*, has thrown fresh light on the subject, and made the whole matter more intelligible by mentioning the reasons in favour of this view. The park had, it seems, been held by the Lucys under the crown in the time of Henry VIII., but was afterwards granted by Queen Mary to one of his privy councillors,—Sir Francis Englefield. Being a devoted Romanist, he fled to Spain on the accession of Elizabeth and was subsequently adjudged a traitor, the Fulbroke estate being sequestered though not confiscated by the crown. The park being thus without a legal custodian for more than a quarter of a century became despoiled, the palings having fallen into decay and the fences being in many places broken down. The deer with which it abounded were thus left without any legal protection, and might be hunted at will by enterprising sportsmen. The only person likely to check this freedom or to attempt to do so was Sir Thomas Lucy, whose own park of Charlcoote ran for miles along the river, and lay just below Fulbroke. As the nearest large landed proprietor, having a direct interest in the state of the neighbouring park, he might naturally think himself entitled to act as a kind of *ad interim* custodian of Fulbroke. And with his aristocratic feeling, his severe and exacting temper, he would be likely enough to push his temporary guardianship of custom or courtesy into an exclusive right, at least as far as the venue of the chase was concerned. In any case Sir Thomas's keepers would occasionally permeate Fulbroke Park as a protection to Charlcoote, and in doing so they probably came upon Shakespeare and his companions after they had brought down a buck and were about to break it up for removal. Or the hunted deer may have crossed the river at the shallow ford between the two parks, and, pursued by the eager sportsman, have been brought down within the Charlcoote grounds. In either case the keepers would denounce the trespass, and possibly with menacing and abusive words demand the buck for their master. On being treated in this insulting way, Shakespeare, who had pride and personal dignity as well as courage, would deny any intentional or actual trespass, refuse to give up the venison, and plainly tell the keepers that they might report the matter to Sir Thomas Lucy and he would answer for himself and his companions. On finding what had happened, Sir Thomas would be all the more incensed and indignant from the consciousness that he had pushed his claims beyond the point at which they could legally be enforced. And, being to some extent in a false position, he would be proportionately watchful and vindictive against the youthful sportsman, and especially against their leader who had dared to resist and defy his authority. Sir Thomas was the greatest man of Stratford, who came personally to the town by magistrate's business, was appealed to as arbitrator in special cases, and entertained by the corporation during his visits. In character he seems to have combined aristocratic pride and narrowness with the harshness and severity of the Puritan temper. As a landed proprietor and local magnate he was exacting and exclusive, looking with a kind of Puritanical sourness on all youthful frolic, merriment, and recreation. He was stern and austere, such a man to young Shakespeare's free, generous, and enquiring nature, and would resent as an unpardonable outrage his high-spirited conduct in attempting to resist any claims he chose to make. Sir Thomas would no doubt vent his indignation to the authorities at Stratford, and try to set the law in motion, and failing in this might have threatened, as Justice Shallow does, to make a Star-Chamber matter of it. This was the kind of attitude which a man in his position might take where there was no available local redress for any wrong he imagined himself to have suffered. And

the Stratford authorities, being naturally anxious to propagate the great man, may have suggested that it would be well if young Shakespeare could be out of the way for a time. This would help him to decide on the adoption of a plan already seriously entertained of going to London to push his fortune among the players.

There is, however, another aspect in which this traditional incident may be looked at, which seems at least worthy of consideration. It is possible that Sir Thomas Lucy may have been prejudiced against the Shakespeares on religious grounds, and that this feeling may have prompted him to a display of exceptional severity against their eldest son. As we have seen, he was a narrow and extreme, a persecuting and almost fanatical Protestant, and several events had recently happened calculated to intensify his bitterness against the Romanists. In particular, Mary Shakespeare's family connexions—the Ardens of Parkhall—had been convicted of conspiracy against the queen's life. The son-in-law of Edward Arden, John Somerville, a rash and "hot-spirited young gentleman," instigated by Hall, the family priest, had formed the design of going to London and assassinating Queen Elizabeth with his own hand. He started on his journey in November 1583, but talked so incautiously by the way that he was arrested, conveyed to the Tower, and under a threat of the rack confessed everything, accusing his father-in-law as an accomplice and the priest as the instigator of the crime. All three were tried and convicted, their fate being probably hastened, as Dugdale states, by the animosity of Leicester against the Ardens. Somerville strangled himself in prison, and Edward Arden was hanged at Tyburn. These events produced a deep impression in Warwickshire, and no one in the locality would be more excited by them than Sir Thomas Lucy. His intensely vindictive feeling against the Romanists was exemplified a little later by his bringing forward a motion in parliament in favour of devising some new and ingenious tortures for the execution of the Romanist conjurator Parry. As Mr Froide puts it, "Sir Thomas Lucy,—Shakespeare's Lucy, the original perhaps of Justice Shallow, with an English fierceness at the bottom of his stupid nature,—having studied the details of the execution of Gerard, proposed in the House of Commons 'that some new law should be devised for Parry's execution, such as might be thought fittest for his extraordinary and horrible treason.'" The Ardens were devoted Romanists; the terrible calamity that had befallen the family occurred only a short time before the deer-stealing adventure; and the Shakespeares themselves, so far from being Puritans, were suspected by many of being but indifferent Protestants. John Shakespeare was an irregular attendant at church, and soon ceased to appear there at all, so that Sir Thomas Lucy probably regarded him as little better than a recusant. In any case Sir Thomas would be likely to resent the elder Shakespeare's convivial turn and profuse hospitality as alderman and bailiff, and especially his official patronage of the players and active encouragement of their dramatic representations in the guild hall. The Puritans had a rooted antipathy to the stage, and to the jaundiced eyes of the local justice the reverses of the Shakespeares would probably appear as a judgment on their way of life. He would all the more eagerly seize any chance of humiliating their eldest son, who still held up his head and dared to look upon life as a scene of cheerful activity and occasional enjoyment. The young poet, indeed, embodied the very characteristics most opposed to Sir Thomas's dark and narrow conceptions of life and duty. His notions of public duty were very much restricted to persecuting the Romanists and preserving the game on Protestant estates. And Shakespeare probably took no pains to conceal his want of sympathy with these

supreme objects of aristocratic and Puritanical zeal. And Sir Thomas, having at length caught him, as he imagined, in a technical trespass, would be sure to pursue the culprit with the unrelenting rigour of his hard and gloomy nature. But, whatever may have been the actual or aggravating circumstances of the original offence, there can be no doubt that an element of truth is contained in the deer-stealing tradition. The substantial facts in the story are that Shakespeare in his youth was fond of woodland sport, and that in one of his hunting adventures he came into collision with Sir Thomas Lucy's keepers, and fell under the severe ban of that local potentate. The latter point is indirectly confirmed by Shakespeare's immutable sketch of the formal county justice in the *Second Part of Henry IV.* and the *Merry Wives of Windsor*.—Robert Shallow, Esq., being sufficiently identified with Sir Thomas Lucy by the pointed allusion to the coat of arms, as well as by other allusions of a more indirect but hardly less decisive kind. To talk of the sketch as an act of revenge is to treat it too seriously, or rather in too didactic and pedestrian a spirit. Having been brought into close relations with the justice, Shakespeare could hardly be expected to resist the temptation of turning to dramatic account so admirable a subject for humorous portraiture. The other point of the tradition, Shakespeare's fondness for woodland life, is supported by the internal evidence of his writings, and especially by the numerous allusions to the subject in his poems and earlier plays. Many references to woods and sports in the poems are well known, and in the early plays the allusions are not less frequent and in some respects even more striking. Having no space, however, to give these in detail, a general reference must suffice. The entire action of *Lore's Labour's Lost* takes place in a royal park, while the scene of the most critical events of the *Two Gentlemen of Verona* is a forest inhabited by generous outlaws whose offences appear to have been youthful follies, and who on being pardoned by the duke become his loyal followers. In these early plays it seems as though Shakespeare could hardly conceive of a royal palace or capital city without a forest close at hand as the scene of princely sport, criminal intrigue, or fairy enchantment. Outside the gates of Athens swept over hill and dale the wonderful forest which is the scene of the *Midsummer Night's Dream*, and in *Titus Andronicus* imperial Rome seems to be almost surrounded by the brightness and terror, the inspiring charm and sombre shades of rolling forest lawns and ravines, the "rudness, vast, and gloomy woods."

There can be no doubt, therefore, that during the years Shakespeare of home life at Stratford Shakespeare was often in the forest. But in the latter part of the time he would be found still more frequently hastening through the fields to Shottery, paying long visits at the Hathaway farm, followed by late and reluctant leave-takings. For the most important fact in Shakespeare's history is his marriage with Anne Hathaway. This event, or rather the formal and ecclesiastical part of it, took place in the end of November 1582, the bond for the licence from the consistory court being dated on the 28th of the month. Mr Halliwell-Phillips has, however, sufficiently proved by detailed instances that the formal and public part of the ceremony would, according to the usage of the time, have been preceded some months earlier by the betrothal or pre-contract, which was in itself of legal validity. Shakespeare's marriage may therefore be dated from the summer of 1582, he being then in his nineteenth year, while his bride was between seven and eight years older. Many of the poet's biographers have assumed that the marriage was a hasty, unsuitable, and in its results an unhappy one. It is necessary therefore to repeat with all possible

emphasis the well-founded statement of Mr Halliwell-Phillips that "there is not a particle of direct evidence" for either of these suppositions. The marriage could hardly have been a hasty one, for, as we have seen, the two families had been intimate for fifteen years, and Shakespeare had known Anne Hathaway from his early boyhood. As to whether it was suitable or not Shakespeare himself was the best and only adequate judge, and there is not, in the whole literature of the subject, even the shadow of a successful appeal against his decision. And, so far from the marriage having been unhappy, all the evidence within our reach goes to show that it was not only a union of mutual affection but a most fortunate event for the poet himself, as well as for the wife and mother who remained at the head of his family, venerated and loved by her children, and a devoted helpmate to her husband to the very end. Looking at the matter in its wider aspects, and especially in relation to his future career, it may be said that Shakespeare's early marriage gave him at the most emotional and unsettled period of his life a fixed centre of affection and a supreme motive to prompt and fruitful exertion. This would have a salutary and steadying effect on a nature so richly endowed with plastic fancy and passionate impulse, combined with rare powers of reflective foresight and self-control. If Shakespeare's range and depth of emotional and imaginative genius had not been combined with unusual force of character and strength of ethical and artistic purpose, and these elements had not been early stimulated to sustained activity, he could never have had so great and uninterrupted a career. And nothing perhaps is a more direct proof of Shakespeare's manly character than the prompt and serious way in which, from the first, he assumed the full responsibility of his acts, and unflinchingly faced the wider range of duties they entailed. He himself has told us that

"Love is too young to know what conscience is
Yet who knows not conscience is born of love?"

and it remains true that conscience, courage, simplicity, and nobleness of conduct are all, in generous natures, evoked and strengthened by the vital touch of that regenerating power. Shakespeare's whole course was changed by the new influence; and with his growing responsibilities his character seems to have rapidly matured, and his powers to have found fresh and more effective development. His first child Susanna was born in May 1583, and, as she was baptized on the 26th, the day of her birth may have been the 23d, which would be exactly a month after her father completed his thirtieth year. In February 1585 the family was unexpectedly enlarged by the birth of twins, a boy and a girl, who were named respectively Hamnet and Judith, after Hamnet and Judith Sadler, inhabitants of Stratford, who were lifelong friends of Shakespeare. Before he had attained his majority the poet had thus a wife and three children dependent upon him, with little opportunity or means apparently of advancing his fortunes in Stratford. The situation was in itself sufficiently serious. But it was complicated by his father's increasing embarrassments and multiplied family claims. Four children still remained in Henley Street to be provided for,—the youngest, Edmund, born in May 1580, being scarcely five years old. John Shakespeare, too, was being sued by various creditors, and apparently in some danger of being arrested for debt. All this was enough to make a much older man than the poet look anxiously about him. But, with the unflinching sense and sagacity he displayed in practical affairs, he seems to have formed a sober and just estimate of his own powers, and made a careful survey of the various fields available for their remunerative exercise. As the result of his delibera-

tions he decided in favour of trying the metropolitan stage and theatre. He had already tested his faculty of acting by occasional essays on the provincial stage, and, once in London amongst the players, where new pieces were constantly required, he would have full scope for the exercise of his higher powers as a dramatic poet. At the outset he could indeed only expect to discharge the lower function, but, with the growing popular demand for dramatic representations, the actor's calling, though not without its social drawbacks, was in the closing decades of the 16th century a lucrative one. Greene, in his autobiographical sketch *Never Too Late*, one of the most interesting of his prose tracts, illustrates this point in the account he gives of his early dealings with the players and experiences as a writer for the stage. Speaking through his hero Francesco, he says that "when his fortunes were at the lowest ebb he fell in amongst a company of players who persuaded him to try his wit in writing of comedies, tragedies, or pastorals, and if he could perform anything worth the stage, then they would largely reward him for his pains." Succeeding in the work, he was so well paid that he soon became comparatively wealthy, and went about with a well-filled purse. Although writing from the author's rather than the actor's point of view, Greene intimates that the players grew rapidly rich and were entitled both to praise and profit so long as they were "neither covetous nor insolent." In the *Return from Parmaceus* (1601) the large sums, fortunes indeed, realized by good actors are referred to as matter of notoriety. One of the disappointed academic scholars, indeed, moralizing on the fact with some bitterness, exclaims,—

"England affords those glorious vagabonds,
That cannot rest their heads on their backs,
Conveyers to ride on through the gaming streets,
Sweeping it in their glazing satin suits,
And pages to attend their masterships
With mottling words that better wits have framed
They purchase lauds, and now equities are made."

And in a humorous sketch entitled *Ratsel's Ghost*, and published in the first decade of the 17th century, an apparent reference to Shakespeare himself brings out the same point. The hero of the tract, Ratsel, a highwayman, having compelled a set of strolling players to act before him, advised their leader to leave the country and get to London, where, having a good presence for the stage and a turn for the work, he would soon fill his pockets, adding, "When thou findest thy purse well-lined, buy thee some place of lordship in the country, that, growing weary of playing, thy money may bring thee dignity and reputation." The player, thanking him for his advice, replies, "I have heard indeed of some that have gone to London very meanly, who have in time become exceedingly wealthy." The movement to the London stage was therefore from a worldly point of view a prudent one, and for the higher purposes of Shakespeare's life it was equally wise and necessary. For besides the economic and practical considerations in favour of the step there must have pressed on the poet's mind the importance of a wider sphere of life and action for the enlargement of his inward horizon, and the effective development of his poetical and dramatic gifts.

The exact date of this event—of Shakespeare's leaving Stratford for London—cannot be fixed with any certainty. All the probabilities of the case, however, indicate that it must have taken place between the spring of 1585 and the autumn of 1587. In the latter year three of the leading companies visited Stratford, those belonging to the queen, Lord Leicester, and Lord Essex; and, as Lord Leicester's included three of Shakespeare's fellow townsmen,—Burbage, Heminge, and Greene,—it is not improbable that he may then have decided on trying his fortune in London.

Goes to London and becomes an actor.

At the same time it is quite possible, and on some grounds even likely, that the step may have been taken somewhat earlier. But for the five years between 1587 and 1592 we have no direct knowledge of Shakespeare's movements at all, the period being a complete biographical blank, dimly illuminated at the outset by one or two doubtful traditions. We have indeed the assurance that after leaving Stratford he continued to visit his native town at least once every year, and if he had left in 1586 we may confidently assume that he returned the next year for the purpose, amongst others, of consulting with his father and mother about the Asbies mortgage and of taking part with them in their action against John Lambert. His uniting with them in this action deserves special notice, as showing that he continued to take the keenest personal interest in all home affairs, and, although living mainly in London, was still looked upon, not only as the eldest son, but as the adviser and friend of the family. The anecdotes of Shakespeare's occupations on going to London are, that at first he was employed in a comparatively humble capacity about the theatre, and that for a time he took charge of the horses of those who rode to see the plays, and was so successful in this work that he soon had a number of juvenile assistants who were known as Shakespeare's boys. Even in their crude form these traditions embody a tribute to Shakespeare's business promptitude and skill. If there is any truth in them they may be taken to indicate that while filling some subordinate post in the theatre Shakespeare perceived a defective point in the local arrangements, or heard the complaints of the mounted gallants as to the difficulty of putting up their horses. His provisions for meeting the difficulty seem to have been completely and even notoriously successful. There were open sheds or temporary stables in connexion with the theatre in Shoreditch, and Shakespeare's boys, if the tradition is true, probably each took charge of a horse in these stables while its owner was at the play. But in any case this would be simply a brief episode in Shakespeare's multifarious employments when he first reached the scene of his active labours in London. He must soon have had more serious and absorbing professional occupations in the green room, on the stage, and in the laboratory of his own teeming brain, "the quick forge and working house of thought."

But his leisure hours during his first years in London would naturally be devoted to continuing his education and equipping himself as fully as possible for his future work. It was probably during this time, as Mr. Halliwell-Phillips suggests, that he acquired the working knowledge of French and Italian that his writings show he must have possessed. And it is perhaps now possible to point out the sources whence his knowledge of these languages was derived, or at least the master under whom he chiefly studied them. The most celebrated and accomplished teacher of French and Italian in Shakespeare's day was the resolute John Florio, who, after leaving Magdalen College, Oxford, lived for years in London, engaged in tutorial and literary work and intimately associated with eminent men of letters and their noble patrons. After the accession of James I., Florio was made tutor to Prince Henry, received an appointment about the court, became the friend and personal favourite of Queen Anne (to whom he dedicated the second edition of his Italian dictionary, entitled *The World of Words*), and died full of years and honours in 1625, having survived Shakespeare nine years. Florio had married the sister of Daniel the poet, and Ben Jonson presented a copy of *The Fox* to him, with the inscription, "To his loving father and worthy friend Master John Florio, Ben Jonson seals this testimony of his friendship and love." Daniel writes a poem

of some length in praise of his translation of Montaigne, while other contemporary poets contribute commendatory verses which are prefixed to his other publications. There are substantial reasons for believing that Shakespeare was also one of Florio's friends, and that during his early years in London he evinced his friendship by yielding for once to the fashion of writing this kind of eulogistic verse. Prefixed to Florio's *Second Fruits*, Prof. Minto discovered a sonnet so superior and characteristic that he was impressed with the conviction that Shakespeare must have written it. The internal evidence is in favour of this conclusion, while Mr. Minto's critical analysis and comparison of its thought and diction with Shakespeare's early work tends strongly to support the reality and value of the discovery. In his next work, produced four years later, Florio claims the sonnet as the work of a friend "who loved better to be a poet than to be called one," and vindicates it from the indirect attack of a hostile critic, H. S., who had also disparaged the work in which it appeared. There are other points of connexion between Florio and Shakespeare. The only known volume that certainly belonged to Shakespeare and contains his autograph is Florio's version of Montaigne's *Essays* in the British Museum, and critics have from time to time produced evidence to show that Shakespeare must have read it carefully and was well acquainted with its contents. Victor Hugo in a powerful critical passage strongly supports this view. The most striking single proof of the point is Gonzalo's ideal republic in the *Tempest*, which is simply a passage from Florio's version turned into blank verse. Florio and Shakespeare were both, moreover, intimate personal friends of the young earl of Southampton, who, in harmony with his generous character and strong literary tastes, was the munificent patron of each. Shakespeare, it will be remembered, dedicated his *Venus and Adonis* and his *Lucifer* to this young nobleman, and three years later, in 1598, Florio dedicated the first edition of his Italian dictionary to the earl in terms that almost recall Shakespeare's words. Shakespeare had said in addressing the earl, "What I have done is yours, what I have to do is yours, being part in all I have devoted yours." And Florio says, "In truth I acknowledge an entire debt, not only of my best knowledge, but of all, yea of more than I know or can to your bounteous lordship, most noble, most virtuous, and most honourable earl of Southampton, in whose pay and patronage I have lived some yeares, to whom I owe and vow the years I have to live." Shakespeare was also familiar with Florio's earlier works, his *First Fruits* and *Second Fruits*, which were simply carefully prepared manuals for the study of Italian, containing an outline of the grammar, a selection of dialogues in parallel columns of Italian and English, and longer extracts from classical Italian writers in prose and verse. We have collected various points of indirect evidence showing Shakespeare's familiarity with these manuals, but these being numerous and minute cannot be given here. It must suffice to refer in illustration of this point to a single instance—the lines in praise of Venice which Holofornes gives forth with so much unctious in *Love's Labour's Lost*. The *First Fruits* was published in 1578, and was for some years the most popular manual for the study of Italian. It is the book that Shakespeare would naturally have used in attempting to acquire a knowledge of the language after his arrival in London; and on finding that the author was the friend of some of his literary associates he would probably have sought his acquaintance and secured his personal help. As Florio was also a French scholar and habitually taught both languages, Shakespeare probably owed to him his knowledge of French as well as of Italian. If the sonnet

is accepted as Shakespeare's work he must have made Florio's acquaintance within a year or two after going to London, as in 1591 he appears in the character of a personal friend and well-wisher. In any case Shakespeare would almost certainly have met Florio a few years later at the house of Lord Southampton, with whom the Italian scholar seems to have occasionally resided. It also appears that he was in the habit of visiting at several titled houses, amongst others those of the earl of Bedford and Sir John Harrington. It seems also probable that he may have assisted Harrington in his translation of Ariosto. Another and perhaps even more direct link connecting Shakespeare with Florio during his early years in London is found in their common relation to the family of Lord Derby. In the year 1585 Florio translated a letter of news from Rome, giving an account of the sudden death of Pope Gregory XIII. and the election of his successor. This translation, published in July 1585, was dedicated "To the Right Excellent and Honourable Lord, Henry Earl of Derby," in terms expressive of Florio's strong personal obligations to the earl and devotion to his service. Three years later, on the death of Leicester in 1588, Lord Derby's eldest son Ferdinando Lord Strange became the patron of Leicester's company of players, which Shakespeare had recently joined. The new patron must have taken special interest in the company, as they soon became (chiefly through his influence) great favourites at court, superseding the Queen's players, and enjoying something like a practical monopoly of royal representations. Shakespeare would thus have the opportunity of making Florio's acquaintance at the outset of his London career, and everything tends to show that he did not miss the chance of numbering amongst his personal friends so accomplished a scholar, so alert, energetic, and original a man of letters, as the resolute John Florio. Warburton, it is well-known, had coupled Florio's name with Shakespeare in the last century. He suggested, or rather asserted, that Florio was the original of Holofornes in *Love's Labour's Lost*. Of all Warburton's arbitrary conjectures and dogmatic assumptions this is perhaps the most infelicitous. That a scholar and man of the world like Florio, with marked literary powers of his own, the intimate friend and associate of some of the most eminent poets of the day, living in princely and noble circles, honoured by royal personages and welcomed at noble houses,—that such a man should be selected as the original of a rustic pedant and dominio like Holofornes, is surely the climax of reckless guesswork and absurd suggestion. There is, it is true, a distant connexion between Holofornes and Italy—the pedant being a well-known figure in the Italian comedies that obviously affected Shakespeare's early work. This usage calls forth a kind of sigh from the easy-going and tolerant Montaigne as he thinks of his early tutors and youthful interest in knowledge. "I have in my youth," he tells us, "often-times been vexed to see a pedant brought in in most of Italian comedies for a vice or sport-maker, and the nickname of magister (dominio) to be of no better signification amongst us." We may be sure that, if Shakespeare knew Florio before he produced *Love's Labour's Lost*, it was not as a sport-maker to be mocked at, but as a friend and literary associate to whom he felt personally indebted.

Italian studies.

But, whatever his actual relation to the Italian scholar may have been, Shakespeare, on reaching London and beginning to breathe its literary atmosphere, would naturally betake himself to the study of Italian. At various altitudes the English Parnassus was at that time fanned by soft airs, swept by invigorating breezes, or darkened by gloomy and infected vapours from the south. In other words, the influence of Italian literature, so dominant in England during the second half of the 16th century,

may be said to have reached its highest point at the very time when Shakespeare entered on his poetic and dramatic labours. This influence was in part a revival of the strong impulse communicated to English literature from Italy in Chaucer's day. The note of the revival was struck in the title of Thomas's excellent Italian manual, "Principal rules of Italian grammar, with a dictionary for the better understanding of *Boccaccio, Petrarca, and Dante*" (1550). The first fruits of the revival were the lyrical poems of Surrey and Wyatt, written somewhat earlier, but published for the first time in Tottel's *Miscellany* (1557). The sonnets of these poets—the first ever written in English—produced in a few years the whole musical choir of Elizabethan sonneteers. Surrey and Wyatt were sympathetic students of Petrarch, and, as Puttenham says, reproduced in their sonnets and love poems much of the musical sweetness, the tender and refined sentiment, of the Petrarchian lyric. This perhaps can hardly in strictness of speech be called a revival, for, strong as was the influence of Boccaccio, and in a less degree of Dante, during the first period of English literature, the lyrical poetry of the south, as represented by Petrarch, affected English poetry almost for the first time in the 16th century. This influence, as subsequently developed by Lyly in his prose comedies and romances, indirectly affected the drama, and clear traces of it are to be found in Shakespeare's own work. Surrey, however, rendered the Elizabethans a still greater service by introducing from Italy the unrhymed verse, which, with the truest instinct, was adopted by the great dramatists as the metrical vehicle best fitted to meet the requirements of the most flexible and expressive form of the poetic art. But, although in part the revival of a previous impulse, the Italian literature that most powerfully affected English poetry during the Elizabethan period was in the main new. During the interval the prolific genius of the south had put forth fresh efforts which combined, in new and characteristic products, the forms of classical poetry and the substance of southern thought and feeling with the spirit of mediæval romance. The chivalrous and martial epics of Ariosto and Tasso represented a new school of poetry which embraced within its expanding range every department of imaginative activity. There appeared in rapid succession romantic pastorals, romantic elegies, romantic satires, and romantic dramas, as well as romantic epics. The epics were occupied with marvels of knightly daring and chivalrous adventure, expressed in flowing and melodious numbers; while the literature as a whole dealt largely in the favourite elements of ideal sentiment, learned allusion, and elaborate ornament, and was brightened at intervals by grave and sportive, by highly wrought but fanciful, pictures of courtly and Arcadian life. While Sidney and Spenser represented in England the new school of allegorical and romantic pastoral and epic, Shakespeare and his associates betook themselves to the study of the romantic drama and the whole dramatic element in recent and contemporary southern literature. The Italian drama proper, so far as it affected the form adopted by English playwrights, had indeed virtually done its work before any of Shakespeare's characteristic pieces were produced. His immediate predecessors, Greene, Peele, and Lodge, Nash, Kyd, and Marlowe, had all probably studied Italian models more carefully than Shakespeare himself ever did; and the result is seen in the appearance among these later Elizabethans of the romantic drama, which united the better elements of the English academic and popular plays with features of diction and fancy, incident and structure, that were virtually new. Many members of this dramatic group were, like Greene, good Italian scholars, had themselves travelled in Italy, knew the Italian stage at first

hand, and, as their writings show, were well acquainted with recent Italian literature. But the dramatic element in that literature extended far beyond the circle of regular plays, whether tragedies, comedies, or pastorals. It included the collections of short prose stories which appeared, or were published for the first time, in such numbers during the 16th century, the novels or novelettes of Sei Giovanni, Cinthio, Bandello, and their associates. These stories, consisting of the humorous and tragic incidents of actual life, told in a vivid and direct way, naturally attracted the attention of the dramatists. We know from the result that Shakespeare must have studied them with some care, as he derived from this source the plots and incidents of at least a dozen of his plays. Many of the stories, it is true, had already been translated, either directly from the Italian, or indirectly from French and Latin versions. Of Cinthio's hundred tales, however, only two or three are known to have been rendered into English; and Shakespeare derived the story of Othello from the untranslated part of this collection. Many of the Italian stories touched on darker crimes or more aggravated forms of violence than those naturally prompted by jealousy and revenge, and are indeed revolting from the atrocities of savage cruelty and lust related so calmly as to betray a kind of cynical insensibility to their true character. Shakespeare, however, with the sound judgment and strong ethical sense that guided the working of his dramatic genius, chose the better and healthier materials of this literature, leaving the morbid excesses of criminal passion to Webster and Ford. But the Italian influence on Shakespeare's work is not to be estimated merely by the outlines of plot and incident he borrowed from southern sources and used as a kind of canvas for his matchless portraiture of human character and action. It is apparent also in points of structure and diction, in types of character and shades of local colouring, which realize and express in a concentrated form the bright and luid, the brilliant and passionate, features of southern life. The great majority of the *dramatis personae* in his comedies, as well as in some of the tragedies, have Italian names, and many of them, such as Mercutio and Gratiano on the one hand, Iachimo and Iago on the other, are as Italian in nature as in name. The moonlight scene in the *Merchant of Venice* is Southern in every detail and incident. And, as M. Philaret Chasles justly points out, *Romeo and Juliet* is Italian throughout, alike in colouring, incident, and passion. The distinctive influence is further traceable in Shakespeare's use of Italian words, phrases, and proverbs, some of which, such as "tranquet" (from *trancare*), or, possibly, as Rowe suggested, "trajet" (*trajetto*), are of special local significance. In the person of Hamlet Shakespeare even appears as a critic of Italian style. Referring to the murderer who in the players' tragedy poisons the sleeping duke, Hamlet exclaims, "He poisons him in the garden for his estate. His name's Gonzago; the story is extant and written in very choice Italian." In further illustration of this point Mr. Grant White has noted some striking turns of thought and phrase which seem to show that Shakespeare must have read parts of Berni and Ariosto in the original. No doubt in the case of Italian poets, as in the case of Latin authors like Ovid, whose works he was familiar with in the original, Shakespeare would also diligently read the translations, especially the translations into English verse. For in reading such works as Golding's Ovid, Harrington's Ariosto, and Fairfax's Tasso, he would be increasing his command over the elements of expressive phrase and diction which were the verbal instruments, the material vehicle, of his art. But, besides studying the translations of the Italian poets and prose writers made available for English readers,

he would naturally desire to possess, and no doubt acquired for himself, the key that would unlock the whole treasure-house of Italian literature. The evidence of Shakespeare's knowledge of French is more abundant and decisive, so much so as hardly to need express illustration. There can be little doubt therefore that, during his early years in London, he acquired a fair knowledge both of French and Italian.

But, while pursuing these collateral aids to his higher ^{Early} work, there is abundant evidence that Shakespeare also ^{dramatic} devoted himself to that work itself. As early as 1592 he is publicly recognized, not only as an actor of distinction, but as a dramatist whose work had excited the envy and indignation of his contemporaries, and especially of one so accomplished and so eminent, so good a scholar and master of the playwright's craft, as Robert Greene. Greene had, it is true, a good deal of the nitubility and excitable temper often found in the subordinate ranks of poetical genius, and he often talks of himself, his doings, and associates in a highly coloured and extravagant way. But his reference to Shakespeare is specially deliberate, being in the form of a solemn and last appeal to his friends amongst the scholarly dramatists to relinquish their connexion with the presumptuous and ungateful stage. In his *Groatsworth of Wit*, published by his friend Chettle a few weeks after his death, Greene urges three of his friends, apparently Marlowe, Lodge, and Peele, to give up writing for the players. "Base-minded men, all three of you, if by my nursery ye be not warned; for unto none of you like mo sought those burs to cleave, those puppets, I mean, who speak from our mouths, those attacks gainst in our colours. Is it not strange that I, to whom they have all been beholding, is it not like that you, to whom they have all been beholding, shall (were ye in that case that I am now) be both of them at once forsaken? Yes, trust thou not, for there is an upstart Crow, beautified in our feathers, that, with his tiger's heart wrapt in a player's hide, supposes he is as well able to bombast out a blank verse as the best of you, and, being an absolute Johannes fac totum, is, in his own conceit, the only Shakescene in a country. Oh that I might intreat your more wise to be employed in more profitable courses, and let these eyes imitate your past excellence, and never more acquaint them with your admired inventions." This curious passage tells us indirectly a good deal about Shakespeare. It bears decisive testimony to his assured position and rapid advance in his profession. The very form of reproach applied to him, "Johannes Fac totum," is a tribute to Shakespeare's industry and practical ability. From the beginning of his career he must have been in the widest and best sense a utility man, ready to do any work connected with the theatre and stage, and eminently successful in anything he undertook. In the first instance he had evidently made his mark as an actor, as it is in that character he is referred to by Greene, and denounced for going beyond his province and usurping the functions of the dramatist. Greene's words imply that Shakespeare not only held a foremost place as an actor, but that he was already distinguished by his dramatic success in revising and rewriting existing plays. This is confirmed by the parodied line from the *Third Part of Henry VI.*, recently revised if not originally written by Shakespeare. This must have been produced before Greene's death, which took place in September 1592. Indeed, all the three parts of *Henry VI.* in the revised form appear to have been acted during the spring and summer of that year. It is not improbable that two or three of Shakespeare's early comedies may also have been produced before Greene's death. And if so, his resentment, as an academic scholar, against the country actor who had not

only become a dramatist but had excelled Greene himself in his chosen field of romantic comedy becomes intelligible enough. Even in his wrath, however, Greene bears eloquent witness to Shakespeare's diligence, ability, and marked success, both as actor and playwright. All this is fully confirmed by the more deliberate and detailed language of Chettie's apology, already quoted. Of Shakespeare's amazing industry and conspicuous success the next few years supply ample evidence. Within six or seven years he not only produced the brilliant reflective and descriptive poems of *Venus and Adonis* and *Lucrece*, but at least fifteen of his dramas, including tragedies, comedies, and historical plays. Having found his true vocation, Shakespeare works during these years as a master, having full command over the materials and resources of his art. The dramas produced have a fullness of life and a richness of imagery, a sense of joyousness and power, that speak of the writer's exultant absorption and conscious triumph in his chosen work. The sparkling comedies and great historical plays belonging to this period evince the ease and delight of an exuberant mind realizing its matured creations.

Con-
ditions
favor-
able to
success.

Nor after all is this result so very surprising. Shakespeare entered on his London career at the very moment best fitted for the full development of his dramatic genius. From the accession of Elizabeth all the dominant impulses and leading events of her reign had prepared the way for the splendid triumph of policy and arms that closed its third decade, and for the yet more splendid literary triumph of the full-orbed drama that followed. After the gloom and terror of Mary's reign the coming of Elizabeth to the crown was hailed with exultation by the people, and seemed in itself to open a new and brighter page of the nation's history. Elizabeth's personal charms and mental gifts, her high spirit and dauntless courage, her unflinching political tact and judgment, her frank bearing and popular address, combined with her unaffected love for her people and devotion to their interests, awakened the strongest feelings of personal loyalty, and kindled into passionate ardour the spirit of national pride and patriotism that made the whole kingdom one. The most powerful movements of the time directly tended to reinforce and concentrate these awakened energies. While the Reformation and Renaissance impulses had liberalized men's minds and enlarged their moral horizon, the effect of both was at first a political and practical rather than of a purely religious or literary kind. The strong and exultant sense of civil and religious freedom realized through the Reformation was inseparably associated with the exultant spirit of nationality it helped to stimulate and diffuse. The pope, and his emissaries the Jesuits, were looked upon far more as foreign enemies menacing the independence of the kingdom than as religious fous and firebrands seeking to destroy the newly established faith. The conspiracies, fomented from abroad, that gathered around the captive queen of Scots, the plots successively formed for the assassination of Elizabeth, were regarded as murderous assaults on the nation's life, and the Englishmen who organized them abroad or aided them at home were denounced and prosecuted with pitiless severity as traitors to their country. Protestantism thus came to be largely identified with patriotism, and all the active forces of the kingdom, its rising wealth, energy, and intelligence, were concentrated to defend the rights of the liberated empire against the assaults of despotic Europe represented by Rome and Spain. These forces gained volume and impetus as the nation was thrilled by the details of Alva's ruthless butcheries, and the awful massacre of St Bartholomew, until at length they were organized and hurled

with restless effect against the grandest naval and military armament ever equipped by a Continental power,—an armament that had been sent forth with the assurance of victory by the wealthiest, most absolute, and most determined monarch of the time. There was a vigorous moral element in that national struggle and triumph. It was the spirit of freedom, of the energies liberated by the revolt from Rome, and illuminated by the fair humanities of Greece and Italy, that nerved the arm of that happy breed of men in the day of battle, and enabled them to strike with fatal effect against the abettors of despotic rule in church and state. The material results of the victory were at once apparent. England became mistress of the seas, and rose to an assured position in Europe as a political and maritime power of the first order. The literary results at home were equally striking. The whole conflict reacted powerfully on the genius of the race, quickening into life its latent seeds of reflective knowledge and wisdom, of poetical and dramatic art.

Of these effects the rapid growth and develop-
ment of the national drama was the most brilliant of the
and characteristic. There was indeed at the time a
unique stimulus in this direction. The greater num-
ber of the eager excited listeners who crowded the
rude theatres from floor to roof had shared in the
adventurous exploits of the age, while all felt the keenest
interest in life and action. And the stage represented
with admirable breadth and fidelity the struggling forces,
the mingled elements, humorous and tragic, the passionate
hopes, deep-rooted animosities, and fitful misgivings of
those eventful years. The spirit of the time had made
personal during a common heritage. With noble and
commoner, gentle and simple, alike, love of queen and
country was a romantic passion, and heroic self-devotion
at the call of either a beaten way of ordinary life. To
act with energy and decision in the face of danger,
to strike at once against any odds in the cause of
freedom and independence, was the desire and ambition
of all. This complete unity of national sentiment
and action became the great characteristics of the time.
The dangers threatening the newly liberated kingdom were
too real and pressing to admit of anything like seriously
divided councils, or literally hostile parties within the
realm. Everything thus conspired to give an extraordinary
degree of concentration and brilliancy to the national life.
For the twenty years that followed the destruction of the
Armada London was the centre and focus of that life.
Here gathered the soldiers and officers who had fought
against Spain in the Low Countries, against France in
Scotland, and against Rome in Ireland. Along the river
side, and in noble houses about the Strand, were the hardy
mariners and adventurous sea captains, such as Drake,
Hawkins, and Frobisher, who had driven their dauntless
keels into unknown seas, who had visited strange lands
and alien races in order to enlarge the knowledge, increase
the dominions, and augment the wealth of their fellow-
countrymen. Here assembled the noble councillors,
scholars, and cavaliers whose foresight and skill guided the
helm of state, whose accomplishment in letters and arms
gave refinement and distinction to court pageants and
ceremonials, and whose patronage and support of the
rising drama helped to make the metropolitan theatre
the great centre of genius and art, the great school of
historical teaching, the great mirror of human nature in
all the breadth and emphasis of its interests, convictions,
and activities. The theatre was indeed the living organ
through which all the marvellous and mingled experiences
of a time incomparably rich in vital elements found
expression. There was no other, no organized or adequate
means, of popular expression at all. Books were a solitary

Growth
of the
national
drama

entertainment in the hands of few; newspapers did not exist; and the modern relief of innumerable public meetings was, fortunately perhaps, an unknown luxury. And yet, amidst the plenitude of national life centred in London, the need for some common organ of expression was never more urgent or imperious. New and almost inexhaustible springs from the well-heads of intellectual life had for years been gradually fertilizing the productive English mind. The heroic life of the past, in clear outline and stately movement, had been revealed in the recovered masterpieces of Greece and Rome. The stores of more recent wisdom and knowledge, discovery and invention, science and art, were poured continually into the literary exchequer of the nation, and widely diffused amongst eager and open-minded recipients. Under this combined stimulus the national intellect and imagination had already reacted fruitfully in ways that were full of higher promise. The material results of these newly awakened energies were, as we have seen, not less signal or momentous. The number, variety, and power of the new forces thus acting on society effected in a short period a complete moral revolution. The barriers against the spread of knowledge and the spirit of free inquiry erected and long maintained by medieval ignorance and prejudice were now thrown down. The bonds of feudal authority and Romish domination that had hitherto forcibly repressed the expanding national life were effectually broken. Men opened their eyes upon a new world which it was an absorbing interest and endless delight to explore,—a new world physically, where the old geographical limits had melted into the blue haze of distant horizons—a new world morally, where the abolition of alien dogma and priestly rule gave free play to fresh and vigorous social energies, and, above all, more surprising and mysterious than all, they opened their eyes with a strange sense of wonder and exultation on the new world of the emancipated human spirit. At no previous period had the popular curiosity about human life and human affairs been so vivid and intense. In an age of deeds so memorable, man naturally became the centre of interest, and the whole world of human action and passion, character and conduct, was invested with irresistible attraction. All ranks and classes had the keenest desire to penetrate the mysterious depths, explore the unknown regions, and realize as fully as might be the actual achievements and ideal possibilities of the nature throbbing with so full a pulse within themselves and reflected so powerfully in the world around them. Human nature, released from the oppression and darkness of the ages, and emerging with all its infinite faculties and latent powers into the radiant light of a secular day, was the new world that excited an admiration more profound and hopes far more ardent than any recently discovered lands beyond the sinking sun. At the critical moment Shakespeare appeared as the Columbus of that new world. Pioneers had indeed gone before and in a measure prepared the way, but Shakespeare still remains the great discoverer, occupying a position of almost lonely grandeur in the isolation and completeness of his work.

The theatres. Never before, except perhaps in the Athens of Pericles, had all the elements and conditions of a great national drama met in such perfect union. As we have seen, the popular conditions supplied by the stir of great public events and the stimulus of an appreciative audience were present in exceptional force. With regard to the stage conditions,—the means of adequate dramatic representation,—public theatres had for the first time been recently established in London on a permanent basis. In 1574 a royal licence had been granted by the queen to the earl of Leicester's company "to use, exercise, and occupy the art and faculty

of playing Comedies, Tragedies, Interludes, and Stage Plays, and such other like as they have been already used and studied, as well for the recreation of our loving subjects as for our solace and pleasure when we shall think good to see them", and, although the civil authorities resisted the attempt to establish a public theatre within the city, two or three were speedily erected just outside its boundaries, in the most convenient and accessible suburbs,—the Curtain and the Theatre in Shoreditch, beyond the northern boundary, and the Blackfriars theatre within the precincts of the dissolved monastery, just beyond the civic jurisdiction on the western side. A few years later other houses were built on the southern side of the river,—the Rose near the foot of London Bridge, and the Hope and Swan further afield. There was also at Newington Butts a place of recreation and entertainment for the archers and holiday people, with a central building which, like the circus at Paris Garden, was used during the summer months for dramatic purposes. These theatres were occupied by different companies in turn, and Shakespeare during his early years in London appears to have acted at several of them. But from his first coming up it seems clear that he was more identified with the earl of Leicester's players, of whom his energetic fellow townsman, James Burbage, was the head, than with any other group of actors. To Burbage indeed belongs the distinction of having first established public theatres as a characteristic feature of metropolitan life. His spirit and enterprise first relieved the leading companies from the stigma of being strolling players, and transferred their dramatic exhibitions, hitherto restricted to temporary scaffolds in the court-yards of inns and hostels, to the more reputable stage and convenient appliances of a permanent theatre. In 1575 Burbage, having secured the lease of a piece of land at Shoreditch, erected there the house which proved so successful, and was known for twenty years as *the Theatre*, from the fact that it was the first ever erected in the metropolis. It seems also to have been concerned in the erection of a second theatre in the same locality called *the Curtain*; and later on, in spite of many difficulties, and a great deal of local opposition, he provided the more celebrated home of the rising drama known as the Blackfriars theatre. When Shakespeare went to London there were thus theatres on both sides of the water—the outlying houses being chiefly used during the summer and autumn months, while the Blackfriars, being roofed in and protected from the weather, was specially used for performances during the winter season. In spite of the persistent opposition of the lord mayor and city aldermen, the denunciations of Puritan preachers and their allies in the press, and difficulties arising from intermittent attacks of the plague and the occasional intervention of the court authorities, the theatres had now taken firm root in the metropolis; and, strong in royal favour, in noble patronage, and above all in popular support, the stage had already begun to assume its higher functions as the living organ of the national voice, the many-coloured mirror and reflexion of the national life. A few years later the companies of players and the theatres they occupied were consolidated and placed on a still firmer public basis. For some years past, in addition to the actors really or nominally attached to noble houses, there had existed a body of twelve performers, selected by royal authority (in 1583) from different companies and known as the Queen's players. The earl of Leicester's, being the leading company, had naturally furnished a number of recruits to the Queen's players, whose duty it was to act at special seasons before Her Majesty and the court. But within a few years after Shakespeare arrived in London the chief

groups of actors were divided into two great companies, specially licensed and belonging respectively to the Lord Chamberlain and the Lord Admiral. Under the new arrangement the earl of Leicester's actors (who, as already stated, after the earl's death in 1588 found for a time a new patron in Lord Strange) became the servants of the Lord Chamberlain. James Burbage had already retired from the company, his place being taken by his more celebrated son Richard Burbage, the Garrick of the Elizabethan stage, who acted with so much distinction and success all the great parts in Shakespeare's leading plays. In order that the Lord Chamberlain's company might have houses of their own both for summer and winter use, Richard Burbage, his brother Cuthbert, and their associates, including Shakespeare, undertook in 1599 to build a new theatre on the bank side, not far from the old Paris Garden crens. We know from a subsequent document, which refers incidentally to the building of this theatre, that the Burbages had originally introduced Shakespeare to the Blackfriars company. He had indeed proved himself so useful, both as actor and poet, that they were evidently glad to secure his future services by giving him a share as part proprietor in the Blackfriars property. The new theatre now built by the company was that known as the Globe, and it was for fifteen years, during the summer and autumn months, the popular and highly successful home of the Shakespearean drama. Three years earlier Richard Burbage and his associates had rebuilt the Blackfriars theatre on a more extended scale; and this well-known house divided with the Globe the honour of producing Shakespeare's later and more important plays. Shakespeare's position indeed of actor and dramatist is identified with these houses and with the Lord Chamberlain's company to which they belonged. On the accession of James I., this company, being specially favoured by the new monarch, received a fresh royal charter, and the members of it were henceforth known as the King's servants. In the early years of Shakespeare's career the national drama had thus a permanent home in theatres conveniently central on either side of the river, and crowded during the summer and winter months by eager and excited audiences. Even before the building of the Globe, the house at Newington where three of Marlowe's most important plays and some of Shakespeare's early tragedies were produced was often crowded to the doors. In the summer of 1593, when the *First Part of Henry VI.*, as revised by Shakespeare, was acted, the performance was so popular that, we are told by Nashe, ten thousand spectators witnessed it in the course of a few weeks. It is true that even in the best theatres the appliances in the way of scenes and stage machinery were of the simplest description, change of scene being often indicated by the primitive device of a board with the name painted upon it. But players and playwrights, both arts being often combined in the same person, knew their business thoroughly well, and justly relied for success on the more vital attractions of powerful acting, vigorous writing, and practised skill in the construction of their pieces. In the presence of strong passions expressed in kindling words and powerfully realized in living action, gesture, and incident, the absence of canvas sunlight and painted gloom was hardly felt. Or, as the stirring choruses in *Henry V.* show, the want of more elaborate and realistic scenery was abundantly supplied by the excited fancy, active imagination, and concentrated interest of the spectators.

The dramatic conditions of a national theatre were indeed, at the outset of Shakespeare's career, more complete, or rather in a more advanced state of development, than the playhouses themselves or their stage accessories. If Shakespeare was fortunate in entering on his London work amidst the full tide of awakened patriotism and public spirit, he was equally fortunate in finding ready to his hand the forms of art in which the rich and complex life of the time could be adequately expressed. During the decade in which Shakespeare left Stratford the playwright's art had undergone changes so important as to constitute a revolution in the form and spirit of the national drama. For twenty years after the accession of Elizabeth the two roots whence the English drama sprang—the academic or classical, and the popular, developed spontaneously in the line of mysticisms, moralities, and interludes—continued to exist apart, and to produce their accustomed fruit independently of each other. The popular drama, it is true, becoming more secular and realistic, enlarged its area by collecting its materials from all sources,—from novels, tales, ballads, and histories, as well as from fairy mythology, local superstitions, and folklore. But the incongruous materials were, for the most part, handled in a crude and semi-barbarous way, with just sufficient art to satisfy the cravings and clamours of unlettered audiences. The academic plays, on the other hand, were written by scholars for courtly and cultivated circles, were acted at the universities, the Inns of Court, and at special public ceremonies, and followed for the most part the recognized and restricted rules of the classic drama. But in the third decade of Elizabeth's reign another dramatic school arose intermediate between the two older ones, which sought to combine in a new and higher form the best elements of both. The main impulse guiding the efforts of the new school may be traced indirectly to a classical source. It was due, not immediately to the masterpieces of Greece and Rome, but to the form which classical art had assumed in the contemporary drama of Italy, France, and Spain, especially of Italy, which was that earliest developed and best known to the new school of poets and dramatists. This southern drama, while academic in its leading features, had nevertheless modern elements blended with the ancient form. As the Italian epics, following in the main the older examples, were still charged with romantic and realistic elements unknown to the classical epic, so the Italian drama, constructed on the lines of Seneca and Plautus, blended with the severer form essentially romantic features. With the choice of heroic subjects, the orderly development of the plot, the free use of the chorus, the observance of the unities, and constant substitution of narrative for action were united the vivid colouring of poetic fancy and diction, and the use of materials and incidents derived from recent history and contemporary life. The influence of the Italian drama on the new school of English playwrights was, however, very much restricted to points of style and diction of rhetorical and poetical effect. It helped to produce among them the sense of artistic treatment, the conscious effort after higher and more elaborate forms and vehicles of imaginative and passionate expression. For the rest, the rising English drama, in spite of the efforts made by academic critics to narrow its range and limit its interests, retained and thoroughly vindicated its freedom and independence. The central characteristics of the new school are sufficiently explained by the fact that its leading representatives were all of them scholars and poets, living by their wits and gaining a somewhat precarious livelihood amidst the stir and bustle, the temptations and excitement, of concentrated London life. The distinctive note of their work is the reflex of

¹ This is maintained by Mr Fleay in his recent *Life and Work of Shakespeare*. But the history of the early dramatic companies is so obscure that it is difficult to trace their changing fortunes with absolute certainty.

their position as academic scholars working under poetic and popular impulses for the public theatres. The new and striking combination in their dramas of elements hitherto wholly separated is but the natural result of their attainments and literary activities. From their university training and knowledge of the ancients they would be familiar with the technical requirements of dramatic art, the deliberate handling of plot, incident, and character, and the due subordination of parts essential for producing the effect of an artistic whole. Their imaginative and emotional sensibility, stimulated by their studies in Southern literature, would naturally prompt them to combine features of poetic beauty and rhetorical finish with the evolution of character and action; while from the popular native drama they derived the breadth of sympathy, sense of humour, and vivid contact with actual life which gave reality and power to their representations.

Leading
members
of the
school.

The leading members of this group or school were Kyd, Greene, Lodge, Nash, Peele, and Marlowe, of whom, in relation to the future development of the drama, Greene, Peele, and Marlowe are the most important and influential. They were almost the first poets and men of genius who devoted themselves to the production of dramatic pieces for the public theatres. But they all helped to redeem the common stages from the reproach their rude and boisterous pieces had brought upon them, and make the plays represented poetical and artistic as well as lively, bustling, and popular. Some did this rather from a necessity of nature and stress of circumstance than from any higher aim or deliberately formed resolve. But Marlowe, the greatest of them, avowed the redemption of the common stage as the settled purpose of his labours at the outset of his dramatic career. And during his brief and stormy life he nobly discharged the self-imposed task. His first play, *Tamburlaine the Great*, struck the authentic note of autistic and romantic tragedy. With all its extravagance, and over-straining after vocal and rhetorical effects, the play throbs with true passion and true poetry, and has throughout the stamp of emotional intensity and intellectual power. His later tragedies, while marked by the same features, bring into fuller relief the higher characteristics of his personation and poetical genius. Alike in the choice of subject and method of treatment Marlowe is thoroughly independent, deriving little, except in the way of general stimulus, either from the classical or popular drama of his day. The signal and far-reaching reform he effected in dramatic metre by the introduction of modulated blank verse illustrates the striking originality of his genius. Gifted with a fine ear for the music of English numbers, and impatient of "the giggling veins of rhyming mother wit," he introduced the noble metre which was at once adopted by his contemporaries and became the vehicle of the great Elizabethan drama. The new metre quickly abolished the rhyming couplets and stanzas that had hitherto prevailed on the popular stage. The rapidity and completeness of this metrical revolution is in itself a powerful tribute to Marlowe's rare insight and feeling as a master of musical expression. The originality and importance of Marlowe's innovation are not materially affected by the fact that one or two classical plays, such as *Gorboduc* and *Jocasta*, had been already written in unrhymed verse. In any case these were private plays, and the monotony of cadence and structure in the verse excludes them from anything like serious comparison with the richness and variety of vocal effect produced by the skillful panning and musical interlinking of Marlowe's heroic metre. Greene and Peele did almost as much for romantic comedy as Marlowe had done for romantic tragedy. Greene's ease and lightness of touch, his freshness of feeling and play of fancy, his vivid sense

of the pathetic and beauty of homely scenes and thorough enjoyment of English rural life, gave to his dramatic sketches the blended charm of romance and reality hardly to be found elsewhere except in Shakespeare's early comedies. In special points of lyrical beauty and dramatic portraiture, such as his sketches of pure and devoted women and of witty and amusing clowns, Greene anticipated some of the more delightful and characteristic features of Shakespearean comedy. Peele's lighter pieces and Lyly's prose comedies helped in the same direction. Although not written for the public stage, Lyly's court comedies were very popular, and Shakespeare evidently gained from their light and easy if somewhat artificial tone, their constant play of witty banter and sparkling repartee, valuable hints for the prose of his own comedies. Marlowe again prepared the way for another characteristic development of Shakespeare's dramatic art. His *Edward II.* marks the rise of the historical drama, as distinguished from the older chronicle play, in which the annals of a reign or period were thrown into a series of loose and irregular metrical scenes. Peele's *Edward I.*, Marlowe's *Edward II.*, and the fine anonymous play of *Edward III.*, in which many critics think Shakespeare's hand may be traced, show how thoroughly the new school had felt the rising national pulse, and how promptly it responded to the popular demand for the dramatic treatment of history. The greatness of contemporary events had created a new sense of the grandeur and continuity of the nation's life, and excited amongst all classes a vivid interest in the leading personalities and critical struggles that had marked its progress. There was a strong and general feeling in favour of historical subjects, and especially historical subjects having in them elements of tragical depth and intensity. Shakespeare's own early plays—dealing with the distracted reign of King John, the Wars of the Roses, and the tragical lives of Richard II. and Richard III.—illustrate this bent of popular feeling. The demand being met by men of poetical and dramatic genius reacted powerfully on the spirit of the age, helping in turn to illuminate and strengthen its loyal and patriotic sympathies.

This is in fact the key-note of the English stage ^{spirit} in the great period of its development. It was its ^{very} breadth of national interest and intensity of tragic power ^{of the English} that made the English drama so immeasurably superior to every other contemporary drama in Europe. The Italian drama languished because, though carefully elaborated in point of form, it had no fulness of national life, no common elements of ethical conviction or aspiration, to vitalize and enoble it. Even tragedy, in the hands of Italian dramatists, had no depth of human passion, no energy of heroic purpose, to give higher meaning and power to its evolution. In Spain the dominant courtly and ecclesiastical influences limited the development of the national drama, while in France it remained from the outset under the artificial restrictions of classical and pseudo-classical traditions. Shakespeare's predecessors and contemporaries, in elevating the common stages, and filling them with poetry, music, and passion, had attracted to the theatre all classes, including the more cultivated and refined; and the intelligent interest, energetic patriotism, and robust life of so representative an English audience supplied the strongest stimulus to the more perfect development of the great organ of national expression. The forms of dramatic art, in the three main departments of comedy, tragedy, and historical drama, had been, as we have seen, clearly discriminated and evolved in their earlier stages. It was a moment of supreme promise and expectation, and in the accidents of earth, or, as we may more appropriately and gratefully say, in the ordinances of heaven, the supreme

poet and dramatist appeared to more than fulfil the utmost promise of the time. By right of imperial command over all the resources of imaginative insight and expression Shakespeare combined the rich dramatic materials already prepared into more perfect forms, and carried them to the highest point of ideal development. He quickly surpassed Marlowe in passion, music, and intellectual power; in *Giocosa* in lyrical beauty, elegiac grace, and narrative interest, in *Peele* in picturesque touch and pastoral sweetness, and in *Lily* in bright and sparkling dialogue. And having distanced the utmost efforts of his predecessors and contemporaries he took his own higher way, and reigned to the end without a rival in the new world of supreme dramatic art he had created. It is a new world, because Shakespeare's work alone can be said to possess the organic strength and infinite variety, the throbbing fulness, vital complexity, and breathing truth, of nature herself. In points of artistic resource and technical ability—such as copious and expressive diction, freshness and pregnancy of verbal combination, richly modulated verse, and structural skill in the handling of incident and action—Shakespeare's supremacy is indeed sufficiently assured. But, after all, it is of course in the spirit and substance of his work, his power of piercing to the hidden centres of character, of touching the deepest springs of impulse and passion, out of which are the issues of life, and of evolving those issues dramatically with a flawless strength, subtlety, and truth, which raises him so immensely above and beyond not only the best of the playwrights who went before him, but the whole line of illustrious dramatists that came after him. It is Shakespeare's unique distinction that he has an absolute command over all the complexities of thought and feeling that prompt to action and bring out the dividing lines of character. He sweeps with the hand of a master the whole gamut of human experience, from the lowest note to the very top of its compass, from the sportive childish trouble of Mammillius and the pleading boyish tones of Prince Arthur, up to the spectre-haunted terrors of *Macbeth*, the tropical passion of *Othello*, the agonized sense and tortured spirit of *Hamlet*, the sustained elemental grandeur, the Titanic force and utterly tragical pathos, of *Lea*.

Shakespeare's active dramatic career in London lasted about twenty years, and may be divided into three tolerably symmetrical periods. The first extends from the year 1587 to about 1593-94; the second from this date to the end of the century; and the third from 1600 to about 1608, soon after which time Shakespeare ceased to write regularly for the stage, was less in London and more and more at Stratford. Some modern critics add to these a fourth period, including the few plays which from internal as well as external evidence must have been among the poet's latest productions. As the exact dates of these plays are unknown, this period may be taken to extend from 1608 to about 1612. The three dramas produced during these years are, however, hardly entitled to be ranked as a separate period. They may rather be regarded as supplementary to the grand series of dramas belonging to the third and greatest epoch of Shakespeare's productive power. To the first period belong Shakespeare's early tentative efforts in revising and partially rewriting plays produced by others that already had possession of the stage. These efforts are illustrated in the three parts of *Henry VI.*, especially the second and third parts, which bear decisive marks of Shakespeare's hand, and were to a great extent recast and rewritten by him. It is clear from the internal evidence thus supplied that Shakespeare was at first powerfully affected by "Marlowe's mighty line." This influence is so marked in the revised second

and third parts of *Henry VI.* as to induce some critics to believe Marlowe must have had a hand in the revision. These passages are, however, sufficiently explained by the fact of Marlowe's influence during the first period of Shakespeare's career. To the same period also belong the earliest tragedy, that of *Titus Andronicus*, and the three comedies—*Love's Labour's Lost*, *The Comedy of Errors*, and *The Two Gentlemen of Verona*. These dramas are all marked by the dominant literary influences of the time. They present features obviously due to the revived and widespread knowledge of classical literature, as well as to the active interest in the literature of Italy and the South. *Titus Andronicus*, in many of its characteristic features, reflects the form of Roman tragedy almost universally accepted and followed in the earlier period of the drama. This form was supplied by the Latin plays of Seneca, their darker colours being deepened by the moral effect of the judicial tragedies and military conflicts of the time. The execution of the Scottish queen and the Catholic conspirators who had acted in her name, and the destruction of the Spanish Armada, had given an impulse to tragic representations of an extreme type. This was undoubtedly rather fostered than otherwise by the favourite exemplars of Roman tragedy. *The Medea* and *Thyestes* of Seneca are crowded with pagan horrors of the most revolting kind. It is true those horrors are usually related, not represented, although in the *Medea* the maddened heroine kills her children on the stage. But from these tragedies the conception of the physically horrible as an element of tragedy was imported into the early English drama, and intensified by the realistic tendency which the events of the time and the taste of their ruler audiences had impressed upon the common stages. This tendency is exemplified in *Titus Andronicus*, obviously a very early work, the signs of youthful effort being apparent not only in the acceptance of so coarse a type of tragedy but in the crude handling of character and motive, and the want of harmony in working out the details of the dramatic conception. Kyd was the most popular contemporary representative of the bloody school, and in the leading motives of treachery, concealment, and revenge there are points of likeness between *Titus Andronicus* and the *Spanish Tragedy*. But how promptly and completely Shakespeare's nobler nature turned from this lower type is apparent from the fact that he not only never reverted to it but indirectly ridicules the piled-up horrors and extravagant language of Kyd's plays.

The only comedies in the same way are marked by the dominant literary influences of the time, partly classic partly Italian. In the *Comedy of Errors*, for example, Shakespeare attempted a humorous play of the old classical type, the general plan and many details being derived directly from Plautus. In *Love's Labour's Lost* many characteristic features of Italian comedy are freely introduced, the pedant Holofemes, the curate Sir Nathaniel, the fantastic braggadoceo soldier Armado, are all well-known characters of the contemporary Italian drama. Of this comedy, indeed, Gervinus says, "the tone of the Italian school prevails here more than in any other play. The redundancy of wit is only to be compared with a similar redundancy of conceit in Shakespeare's narrative poems, and with the Italian style which he had early adopted." These comedies display another sign of early work in the mechanical exactness of the plan and a studied symmetry in the grouping of the chief personages of the drama. In the *Two Gentlemen of Verona*, as Prof. Dowden points out, "Proteus the fickle is set against Valentine the faithful, Silvia the light and intellectual against Julia the ardent and tender, Lance the humourist against Speed the wit." So in *Love's Labour's Lost*, the king and his three fellow-

Shakespeare's dramatic career—first period.

students balance the princess and her three ladies, and there is a symmetrical play of incident between the two groups. The arrangement is obviously more artificial than spontaneous, more mechanical than vital and organic. But towards the close of the first period Shakespeare had fully realized his own power and was able to dispense with these artificial supports. Indeed, having rapidly gained knowledge and experience, he had before the close written plays of a far higher character than any which even the ablest of his contemporaries had produced. He had firmly laid the foundation of his future fame in the direction both of comedy and tragedy, for, besides the comedies already referred to, the first sketches of *Hamlet* and *Romeo and Juliet*, and the tragedy of *Richard III.*, may probably be referred to this period.

Another mark of early work belonging to these dramas is the lyrical and elegiac tone and treatment associated with the use of rhyme, of rhyming couplets and stanzas. Spenser's musical verse had for the time elevated the character of rhyming metres by identifying them with the highest kinds of poetry, and Shakespeare was evidently at first affected by this powerful impulse. He rhymed with great facility, and delighted in the gratification of his lyrical fancy and feeling which the more musical rhyming metres afforded. Rhyme accordingly has a considerable and not inappropriate place in the earlier romantic comedies. The *Comedy of Errors* has indeed been described as a kind of lyrical farce in which the opposite qualities of elegiac beauty and comic effect are happily blended. Rhyme, however, at this period of the poet's work is not restricted to the comedies. It is largely used in the tragedies and histories as well, and plays even an important part in historical drama so late as *Richard II.* Shakespeare appears, however, to have worked out this favourite vein, and very much taken leave of it, by the publication of his descriptive and narrative poems, the *Venus and Adonis* and the *Lucifer*, although the enormous popularity of these poems might almost have tempted him to return again to the abandoned metrical form. The only considerable exception to the disuse of rhyming metres and lyrical treatment is supplied by the *Sonnets*, which, though not published till 1609, were probably begun early, soon after the poems, and written at intervals during eight or ten of the intervening years. Into the many vexed questions connected with the history and meaning of these poems it is impossible to enter. The attempts recently made by the Rev. W. A. Harrison and Mr. T. Tyler to identify the "dark lady" of the later sonnets, while of some historical interest, cannot be regarded as successful. And the identification, even if rendered more probable by the discovery of fresh evidence, would not clear up the difficulties, biographical, literary, and historical, connected with these exquisite poems. It is perhaps enough to say with Prof. Dowden that in Shakespeare's case the most natural interpretation is the best, and that, so far as they throw light on his personal character, the sonnets show that "he was capable of measureless personal devotion; that he was tenderly sensitive, sensitive above all to every diminution or alteration of that love his heart so eagerly craved; and that, when wronged, although he suffered anguish, he transcended his private injury and learned to forgive."

Whatever question may be raised with regard to the superiority of some of the plays belonging to the first period of Shakespeare's dramatic career, there can be no question at all as to any of the pieces belonging to the second period, which extends to the end of the century. During these years Shakespeare works as a master, having complete command over the materials and resources of the most mature and flexible dramatic art. "To this stage,"

says Mr. Swinburne, "belongs the special faculty of faultless, joyous, facile command upon each faculty required of the presiding genius for service or for sport. It is in the middle period of his work that the language of Shakespeare is most limpid in its fulness, the style most pure, the thought most transparent through the close and luminous riment of perfect expression." This period includes the magnificent series of historical plays—*Richard II.*, the two parts of *Henry IV.*, and *Henry V.*—and a double series of brilliant comedies. The *Midsommer Night's Dream*, *All's Well that ends Well*, and the *Merchant of Venice* were produced before 1598, and during the next three years there appeared a still more complete and characteristic group including *Much ado about Nothing*, *As you Like it*, and *Twelfth Night*. These comedies and historical plays are all marked by a rare harmony of reflective and imaginative insight, perfection of creative art, and completeness of dramatic effect. Before the close of this period, in 1598, Francis Meres paid his celebrated tribute to Shakespeare's superiority in lyrical, descriptive, and dramatic poetry, emphasizing his unrivalled distinction in the three main departments of the drama,—comedy, tragedy, and historical play. And from this time onwards the contemporary recognitions of Shakespeare's eminence as a poet and dramatist rapidly multiply, the critics and eulogists being in most cases well entitled to speak with authority on the subject.

In the third period of Shakespeare's dramatic career ^{Third period.} years had evidently brought enlarged vision, wider thoughts, and deeper experiences. While the old mastery of art remains, the works belonging to this period seem to bear traces of more intense moral struggles, larger and less joyous views of human life, more troubled, complex, and profound conceptions and emotions. Comparatively few marks of the lightness and animation of the earlier works remain, but at the same time the dramas of this period display an unrivalled power of piercing the deepest mysteries and sounding the most tremendous and perplexing problems of human life and human destiny. To this period belong the four great tragedies—*Hamlet*, *Macbeth*, *Othello*, *Leir*,—the three Roman plays—*Coriolanus*, *Julius Caesar*, *Anthony and Cleopatra*;—the two singular plays whose scenes and personages are Greek but whose action and meaning are wider and deeper than either (Greek or Roman life)—*Troilus and Cressida* and *Timon of Athens*; and one comedy—*Measure for Measure*, which is almost tragic in the depth and intensity of its characters and incidents. The four great tragedies represent the highest reach of Shakespeare's dramatic power, and they sufficiently illustrate the range and complexity of the deeper problems that now occupied his mind. *Timon* and *Measure for Measure*, however, exemplify the same tendency to brood with meditative intensity over the wrongs and miseries that afflict humanity. These works sufficiently prove that during this period Shakespeare gained a disturbing insight into the deeper evils of the world, arising from the darker passions, such as treachery and revenge. But it is also clear that, with the larger vision of a noble, well-poised nature, he at the same time gained a fuller perception of the deeper springs of goodness in human nature, of the great virtues of invincible fidelity and unswerving love, and he evidently received not only consolation and calm but new stimulus and power from the fuller realization of these virtues. The typical plays of this period thus embody Shakespeare's ripest experience of the great issues of life. In the four great tragedies the central problem is a profoundly moral one. It is the supreme internal conflict of good and evil amongst the central forces and higher elements of human nature, as appealed to and developed by sudden and powerful temptation, smitten by accu-

lated wrongs, or plunged in overwhelming calamities. As the result, we learn that there is something infinitely more precious in life than social ease or worldly success—nobleness of soul, fidelity to truth and honour, human love and loyalty, strength and tenderness, and trust to the very end. In the most tragic experiences this fidelity to all that is best in life is only possible through the loss of life itself. But when Desdemona expires with a sigh and Cordelia's loving eyes are closed, when Hamlet no more draws his breath in pain and the tempest-tossed Lear is at last liberated from the rack of this tough world, we feel that, death having set his sacred seal on their great sorrows and greater love, they remain with us as possessions for ever. In the three dramas belonging to Shakespeare's last period, or rather which may be said to close his dramatic career, the same feeling of severe but consolatory calm is still more apparent. If the deeper discords of life are not finally resolved, the virtues which soothe then perplexities and give us courage and endurance to wait, as well as confidence to trust the final issues,—the virtues of forgiveness and generosity, of forbearance and self-control,—are largely illustrated. This is a characteristic feature in each of these closing dramas, in the *Winter's Tale*, *Cymbeline*, and the *Tempest*. The *Tempest* is supposed, on tolerably good grounds, to be Shakespeare's last work, and in it we see the great magician, having gained by the wonderful experience of life, and the no less wonderful practice of his art, serene wisdom, calm and enlarged vision, and beneficent self-control, break his magical wand and retire from the scene of his triumphs to the home he had chosen amidst the woods and meadows of the Avon, and surrounded by the family and friends he loved.

Later
personal
history.

We must now briefly summarize the few remaining facts of the poet's personal history. The year 1596 was marked by considerable family losses. In August Shakespeare's only son Hamnet died in the twelfth year of his age. With his strong domestic affection and cherished hopes of founding a family, the early death of his only boy must have been for his father a severe blow. It was followed in December by the death of Shakespeare's uncle Henry, the friend of his childhood and youth, the protector and encourager of his boyish sports and enterprises at Bearly, Snitterfield, and Fulfroke. A few months later the Shakespeare household at Snitterfield, so intimately associated for more than half a century with the family in Henley Street, was finally broken up by the death of the poet's aunt Margaret, his uncle Henry's widow. Although the death of his son and heir had diminished the poet's hope of founding a family, he did not in any way relax his efforts to secure a permanent and comfortable home for his wife and daughters at Stratford. As early as 1597, when he had pursued his London career for little more than ten years, he had saved enough to purchase the considerable dwelling-house in New Place, Stratford, to which he afterwards retired. This house, originally built by Sir Hugh Clot-ton and called the "Great House," was one of the largest mansions in the town, and the fact of Shakespeare having acquired such a place as his family residence would at once increase his local importance. From time to time he made additional purchases of land about the house and in the neighbourhood. In 1602 he largely increased the property by acquiring 107 acres of arable land, and later on he added to this 20 acres of pasture land, with a convenient cottage and garden in Chapel Lane, opposite the lower grounds of the house. Within a few years his property thus comprised a substantial dwelling-house with large garden and extensive outbuildings, a cottage fronting the lower road, and about 137 acres of arable and pasture land. During these years Shakespeare made another important purchase that added considerably to his

income. From the letter of a Stratford burgess to a friend in London, it appears that as early as 1597 Shakespeare had been making inquiry about the purchase of tithes in the town and neighbourhood. And in 1605 he bought the unexpired lease of tithes, great and small, in Stratford and two adjoining hamlets, the lease having still thirty years to run. This purchase yielded him an annual income of £38 a year, equal to upwards of £350 a year of our present money. The last purchase of property made by Shakespeare of which we have any definite record is at once so interesting and so perplexing as to have stimulated various conjectures on the part of his biographers. This purchase carries us away from Stratford back to London, to the immediate neighbourhood of Shakespeare's dramatic labours and triumphs. It seems that in March 1613 he bought a house with a piece of ground attached to it a little to the south-west of St Paul's cathedral, and not far from the Blackfriars theatre. The purchase of this house in London after he had been for some years settled at Stratford has led some critics to suppose that Shakespeare had not given up all thought of returning to the metropolis, or at least of spending part of the year there with his family in the neighbourhood he best knew and where he was best known. The ground of this supposition is, however, a good deal destroyed by the fact that soon after acquiring this town house Shakespeare let it for a lease of ten years. He may possibly have bought the property as a convenience to some of his old friends who were associated with him in the purchase. In view of future contingencies it would obviously be an advantage to have a substantial dwelling so near the theatre in the hands of a friend. It was indeed by means of a similar purchase that James Burbage had originally started and established the Blackfriars theatre.

The year 1607-8 would be noted in Shakespeare's family calendar as one of vivid and chequered domestic experiences. On the 5th of June his eldest daughter Susanna, who seems to have inherited something of her father's genius, was married to Dr John Hall, a medical man of more than average knowledge and ability, who had a considerable practice in the neighbourhood of Stratford, and who was deservedly held in high repute. The newly married couple settled in one of the picturesque houses of the wooded suburb between the town and the church known as Old Stratford. But before the end of the year the midsummer marriage bells had changed to sadder music. In December Shakespeare lost his youngest brother, Edmund, at the early age of twenty-seven. He had become an actor, most probably through his brother's help and influence, and was, at the time of his death, living in London. He was buried at Southwark on the last day of the year. Two months later there was family rejoicing in Dr Hall's house at the birth of a daughter, christened Elizabeth, the only offspring of the union, and the only grandchild Shakespeare lived to see. The rejoicing at this event would be fully shared by the household in New Place, and especially by Shakespeare himself, whose cherished family hopes would thus be strengthened and renewed. Six months later in this eventful year, fortune again turned her wheel. Early in September Shakespeare's mother, Mary Arden of the Asbies, died, having lived long enough to see and welcome her great-grandchild as a fresh bond of family life. She was buried at Stratford on the 9th of September, having survived her husband, who was buried on the 8th of September 1601, exactly seven years. Mary Shakespeare died full of years and honour and coveted rewards. For more than a decade she had witnessed and shared the growing prosperity of her eldest son, and felt the mother's thrill of joy and pride in the success that had crowned his brilliant

career. The loss of his mother would be deeply felt by her favourite son, but there was no bitterness in the bereavement, and it even seems to have exerted a tranquillizing, elevating effect on the poet's mind and character. As he laid her in the grave he would recall and realize afresh the early years during which her loving presence and influence were the light and guide of his boyish life. With those vivid and varied family experiences a strong wave of home-yearning seems to have set in, which gradually drew the poet wholly back to Stratford. During the autumn visit connected with his mother's death Shakespeare must have remained several weeks at the New Place, for on the 16th of October he acted as godfather to the infant son of an old personal friend, Henry Walker, who was an alderman of the borough. The child was called Wilham after his godfather, and the poet must have taken a special interest in the boy, as he remembered him in his will.

Retires to
Stratford

It seems most probable that soon after the chequered domestic events of this year, as soon as he could conveniently terminate his London engagements, Shakespeare decided on returning to his native place. He had gained all he cared for in the way of wealth and fame, and his strongest interests, personal and relative, were now centred in Stratford. But on returning to settle in his native town he had nothing of the dreamer, the sentimentalist, or the reclus about him. His healthy natural feeling was far too strong, his character too manly and well-balanced, to admit of any of the so-called eccentricities of genius. He retired as a successful professional man who had gained a competence by his own exertions and wished to enjoy it at leisure in a simple, social, rational way. He knew that the competence he had gained, the lands and wealth he possessed, could only be preserved, like other valuable possessions, by good management and careful husbandry. And, taught by the sad experience of his earlier years, he evidently guided the business details of his property with a firm and skilful hand, was vigilant and scrupulously just in his dealings, respecting the rights of others, and, if need be, enforcing his own. He sued his careless and negligent debtors in the local court of record, had various commercial transactions with the corporation, and took an active interest in the affairs of the borough. And he went now and then to London, partly on business connected with the town, partly no doubt to look after the administration and ultimate disposal of his own theatrical property, and partly it may be assumed for the pleasure of seeing his old friends and fellow dramatists. Even at Stratford, however, Shakespeare was not entirely cut off from his old associates in arts and letters, his hospitable board being brightened at intervals by the presence, and animated by the wit, humour, and kindly gossip, of one or more of his chosen friends. Two amongst the most cherished of his companions and fellow poets, Drayton and Ben Jonson, had paid a visit of this kind to Stratford, and been entertained by Shakespeare only a few days before his death, which occurred almost suddenly on the 23d of April 1616. After three days' illness the great poet was carried off by a sharp attack of fever, at that time one of the commonest scourges, even of country towns, and often arising then as now, only more frequently than now, from the neglect of proper sanitary precautions. According to tradition the 23d of April was Shakespeare's birthday, so that he died on the completion of the 52d year of his age. Three days later he was laid in the chancel of Stratford church, on the north wall of which his monument, containing his bust and epitaph, was soon afterwards placed, most probably by the poet's son-in-law, Dr John Hall. Shakespeare's widow, the Anne Hathaway of his youth, died in 1623, having survived the poet seven years, exactly the

same length of time that his mother May Aiden had outlived her husband. Elizabeth Hall, the poet's grandchild, was married twice, first to Mr Thos Nash of Stratford, and in 1649, when she had been two years a widow, to Mr afterwards Sir John Barnard of Abington in Northamptonshire. Lady Barnard had no family by either husband, and the three children of the poet's second daughter Judith (who had married Richard Quincey of Stratford, two months before her father's death) all died comparatively young. At Lady Barnard's death in 1670 the family of the poet thus became extinct. By his will made a few weeks before his death Shakespeare left his landed property, the whole of his real estate indeed, to his eldest daughter Mrs Susanna Hall, under strict entail to her heirs. He left also a substantial legacy to his second daughter and only remaining child Mrs Judith Quincey, and a remembrance to several of his friends, including his old associates at the Blackfriars theatre, Bulstrode, Hounings, and Condell,—the two latter of whom edited the first collection of his dramas published in 1623. The will also included a bequest to the poor of Stratford.

From this short sketch it will be seen that all the best known facts of Shakespeare's personal history bring into vivid relief the simplicity and naturalness of his tastes, his love of the country, the strength of his domestic affections, and the singularly firm hold which the conception of family life had upon his imagination, his sympathies, and his schemes of active labour. He had loved the country with ardent enthusiasm in his youth, when all nature was lighted with the dawn of rising passion and kindled imagination, and after his varied London experience we may well believe that he loved it still more with a deeper and calmer love of one who had looked through and through the brilliant forms of wealthy display, public magnificence, and courtly ceremonial, who had scanned the heights and sounded the depths of existence, and who felt that for the king and beggar alike this little life of feverish joys and sorrows is soothed by natural influences, cheered by sunlight and green shadows, softened by the perennial charm of hill and dale and rippling stream, and when the spring returns no more is renewed with a sleep. In the more intimate circle of human relationships he seems clearly to have realized that the sovereign elixir against the ills of life, the one antidote of its struggles and difficulties, its emptiness and unrest, is vigilant charity, faithful love in all its forms, love of home, love of kindred, love of friends, love of everything simple, just, and true. The larger and more sacred group of those serene and abiding influences flowing from well-centred affections was naturally identified with family ties, and it is clear that the unity and continuity of family life possessed Shakespeare's imagination with the strength of a dominant passion and largely determined the scope and direction of his practical activities. As we have seen, he displayed from the first the utmost prudence and foresight in securing a comfortable home for his family, and providing for the future welfare of his children. The desire of his heart evidently was to take a good position and found a family in his native place. And if this was a weakness he shares it with other eminent names in the republic of letters. In Shakespeare's case the desire may have been inherited, not only from his father, who had pride, energy, and ambition, but especially from his gently descended mother, Mary Arden of the Asbies. But, whatever its source, the evidence in favour of this cherished desire is unusually full, clear, and decisive. While the poet had no doubt previously assisted his father to retrieve his position in the world, the first important step in building up the family name was the grant of arms or armorial bearings to John Shakespeare in the year 1596. The

Summary
of life and
character

father. It may be assumed, had applied to the heralds' college for the grant at the instance and by the help of his son. In this document, the draft of which is still preserved, the grounds on which the arms are given are stated as two—(1) because John Shakespeare's ancestors had rendered valuable services to Henry VII., and (2) that he had married Mary, daughter and one of the heirs of Robert Aiden of Wilmore, in the said county, gentleman. In the legal conveyances of property to Shakespeare himself after the grant of arms he is uniformly described as "William Shakespeare of Stratford-upon-Avon, gentleman." He is so described in the midst of his London career, and this sufficiently indicates that Stratford was even then regarded as his permanent residence or home. In the following year another important step was taken towards establishing the position of the family. This was an application by John and Mary Shakespeare to the Court of Chancery for the recovery of the estate of the Asbies, which, under the pressure of family difficulties, had been mortgaged in 1578 to Edward Lambert. The issue of the suit is not known, but, as we have seen, the pleadings on either side occupy a considerable space and show how resolutely John Shakespeare was bent on recovering his wife's family estate.

Tuning to the poet himself, we have the significant fact that during the next ten years he continued, with steady persistence, to build up the family fortunes by investing all his savings in real property,—in houses and land at Stratford. While many of his associates and partners in the Blackfriars company remained on in London, living and dying there, Shakespeare seems to have early realized his theatrical property for the sake of increasing the acreage of his arable and pasture land in the neighbourhood of Stratford. In 1598, the year after the purchase of New Place, his family are not only settled there, but he is publicly ranked among the most prosperous and well-to-do citizens of Stratford. In that year, there being some anticipation of a scarcity of corn, an official statement was drawn up as to the amount of wheat in the town. From the list contained in this document of the chief householders in Chapel Ward, where New Place was situated, we find that out of twenty holders of corn enumerated only two have more in stock than William Shakespeare. Other facts belonging to the same year, such as the successful appeal of a fellow-townsmen for important pecuniary help, and the suggestion from an alderman of the borough that, for the sake of securing certain private and public benefits, he should be encouraged to complete a contemplated purchase of land at Shroton, show that Shakespeare was now recognized as a local proprietor of wealth and influence, and that he had so far realized his early desire of taking a good position in the town and neighbourhood. It will be noted, too, that all the leading provisions of Shakespeare's will embody the same cherished family purpose. Instead of dividing his property between his two daughters, he left, as we have seen, the whole of his estate, the whole of his real property indeed, to his oldest daughter Mrs Susanna Hall, with a strict entail to the heirs of her body. This indicates in the strongest manner the fixed desire of his heart to take a permanent position in the locality, and, if possible, strike the family roots deeply into their native soil. That this purpose was realized in his own case seems clear from the special respect paid to his memory. He was buried, as we have seen, in the chancel of the parish church, where as a rule only persons of family and position could be interred. His monument, one of the most considerable in the church, holds a place of honour on the north wall of the chancel, just above the altar railing. While this tribute of marked official respect may be due in part, as the epitaph intimates, to his

eminence as a poet, it was no doubt, in a country district like Stratford, due still more to his local importance as a landed proprietor of wealth and position. Indeed, as a holder of the great tithes he was by custom and courtesy entitled to burial in the chancel.

If there is truth in the early tradition that Shakespeare originally left Stratford in consequence of the sharp prosecution of Sir Thomas Lucy, who resented with narrow bitterness and pride the presumption and audacity of the high-spirited youth found trespassing on his grounds, the victim of his petty wrath was in the end amply avenged. After a career of unexampled success in London Shakespeare returned to his native town crowned with wealth and honours, and, having spent the last years of his life in cordial intercourse with his old friends and fellow-townsmen, was followed to the grave with the affectionate respect and regret of the whole Stratford community. This feeling was indeed, we may justly assume, fully shared by all who had ever known the great poet. His contemporaries and associates unanimously bear witness to Shakespeare's frank, honourable, loving nature. Perhaps the most striking expression of this common feeling comes from one who in character, disposition, and culture was so different from Shakespeare as his friend and fellow-dramatist Ben Jonson. Even his rough and cynical temper could not resist the charm of Shakespeare's genial character and gracious ways. "I loved the man," he says, "and do honour his memory on this side idolatry as much as any. He was indeed honest, and of an open and free nature, had an excellent phantasy, brave notions, and gentle expressions." As the genius of Shakespeare united the most opposite gifts, so amongst his friends are found the widest diversity of character, endowment, and disposition. This is only another way of indicating the breadth of his sympathies, the variety of his interests, the largeness and exuberant vitality of his whole nature. He touched life at so many points, and responded so instinctively to every movement in the complex web of its throbbing activities, that nothing affecting humanity was alien either to his heart or brain. To one so gifted with the power of looking below the surface of custom and convention, and perceiving, not only the deeper elements of rapture and anguish to which ordinary eyes are blind, but the picturesque, humorous, or pathetic varieties of the common lot, every form of human experience, every type of character, would have an attraction of its own. In the view of such a mind nothing would be common or unclean. To Shakespeare all aspects of life, even the humblest, had points of contact with his own. He could talk simply and naturally without a touch of patronage or condescension to a hodman on his ladder, a costermonger at his stall, the tailor on his board, the cobbler in his comb, the hen-wife in her poultry-yard, the ploughman in his furrow, or the base mechanicals at the wayside country inn. He could watch with full and humorous appreciation the various forms of brief authority and petty officialism, the bovine stolidity and empty consequence of the local Dogberries and Shallows, the strange oaths and martial swagger of a Pistol, a Bardolph, or a Parolles, the pedantic talk of a Holofornes, the pragmatical saws of a Polonius, or the solemn absurdities of a self-conceited Malvolio. On the other hand he could seize from the inner side by links of vital affinity every form of higher character, passionate, reflective, or executive,—lover and prince, duke and captain, legislator and judge, counsellor and king,—and portray with almost equal ease and with vivid truthfulness men and women of distant ages, of different races, and widely sundered nationalities.

As in his dramatic world he embraces the widest variety of human experience, so in his personal character he may

features of Chinese cities—dirt, closeness, and absence of all sanitary arrangements, while the want of any building of architectural or antiquarian interest robs the city of any redeeming traits. On the eastern face of the city, between the walls and the river, stands the principal suburb, off which the native shipping has anchored. The native town has thus nothing to recommend it except its geographical position. Situated in the extreme eastern portion of the province of Kiang-soo, and possessing a good and commodious anchorage, as well as an easy access to the ocean, it forms the principal port of central China. From the western wall of the city there stretches away a rich alluvial plain extending over 45,000 square miles, which is intersected by numerous waterways and great chains of lakes. The products of this fertile district, as well as the teas and silks of more distant regions, find their natural outlet at Shanghai. The looms of Soochow and the tea plantations of Gan hwuy, together with the rice of this "garden of China," have for many years before treaty days supplied the Shanghai junks with their richest freight. But though thus favourably situated as an emporium of trade Shanghai did not attract the attention of foreign diplomats until the outbreak of the war of 1841, when the inhabitants purchased protection from the bombarding propensities of Admiral Parker by the payment of a ransom of one million taels. In the Nanking treaty, which was signed in the following year, Shanghai was included among the four new ports which were thrown open to trade by the terms of that document. In 1843 Sir George Balfour, then Captain Balfour, was appointed British consul, and it was on his motion that the site of the present English settlement, which is bounded on the north by the Soochow creek, on the south by the Yang-king canal, and on the east by the river, was chosen. The site, thus defined on its three sides (on the west no boundary was marked out), is three-fifths of a mile in length, and was separated from the native city by a narrow strip of land which was subsequently selected as the site of the French settlement. Later again the Americans established themselves on the other side of the Soochow creek, on a piece of land fronting on the river, which there makes a sharp turn in an easterly direction. At first merchants appeared disinclined to take advantage of the opportunities offered them at Shanghai. "At the end of the first year of its history as an open port Shanghai could count only 23 foreign residents and families, 1 consular flag, 11 merchants' houses, and 2 Protestant missionaries. Only forty-four foreign vessels had arrived during the same period."¹ By degrees, however, the manifold advantages as a port of trade possessed by Shanghai attracted merchants of all nationalities; and from the banks of the Hwang-p'u arose lines of hong and handsome dwelling-houses, which have converted a reed-covered swamp into one of the finest cities in the East.

Shanghai

The number of foreigners, other than English, who took up their abode in the English settlement at Shanghai made it soon necessary to adopt some more catholic form of government than that supplied by an English consul who had control only over British subjects, and by common agreement a committee of residents, consisting of a chairman and six members, was elected by the voters of land for the purposes of general municipal administration. It was expected when the council was formed that the three settlements—the British, French, and Americans—would have been incorporated into one municipality, but international jealousy prevented the fulfilment of the scheme, and it was not until 1863 that the Americans threw in their lot with the British. In 1853 the prosperity of the settlements received a severe check in consequence of the capture of the native city by a band of insurgents, who held possession of the walls from September in that year to February 1855. This incident, though in many ways disastrous, was the exciting cause of the establishment of the foreign customs service, which has proved of such inestimable advantage to the Chinese Government. The confusion into which the customs system was thrown by the occupation of the city by the rebels induced the Chinese authorities to request the consuls of Great Britain, France, and the United States to nominate three officers to superintend the collection of the revenue. This arrangement was found to work so well that on the re-occupation of the city the native authorities proposed that it should be made permanent, and Mr. H. N. Lay, of H. M.'s consular service, was in consequence appointed inspector of the Shanghai customs. The results of Mr. Lay's administration proved so successful that when arranging the terms of the treaty of 1858 the Chinese willingly assented to the application of the same system to all the treaty ports, and Mr. Lay was thereupon appointed inspector general of maritime customs. On the retirement of Mr. Lay in 1862 Sir Robert Hart was appointed to the post, which he still (1886) occupies.

During the period from 1856 to 1861 the trade of Shanghai increased by leaps and by bounds, and its prosperity culminated between 1860 and 1861, when, in addition to the ordinary commerce, the influx of Chinese into the foreign settlement in consequence of the advance eastward of the T'ai-ping rebels added enormously to the value of land and to the profits of the leaseholders. Both in 1860 and again in 1861 the rebels advanced to the walls of Shanghai, and on both occasions were driven back in confusion by the British troops and volunteers, aided by the naval forces of England and France. It was in connection with this resistance to the rebels at Shanghai that General Gordon assumed the command of the Chinese forces, which under his direction gave a meaning and reality to the hitherto somewhat boastful title of "ever-victorious army" it had assumed under the generalship of the two American adventurers Ward and Burgevine. To Shanghai the successful operations of Gordon against the rebels brought temporarily disastrous consequences. With the disappearance of the T'ai-pings the refugees who had sought safety in the foreign settlements returned to their homes, leaving the streets and squares deserted and the trade losses thus inflicted on the municipality was very considerable, and was intensified by a commercial crisis in the markets of cotton and tea, in both of which articles there had been a great deal of over-speculation. But, though the abnormal prosperity produced by extraordinary circumstances was thus suddenly brought to an end, the genuine trade of the port has steadily advanced, subject of course to occasional fluctuations. For example, between the years 1878 and 1881 the gross value of the trade increased from 110,955,274 taels to 141,291,367 taels. In 1883, however, this amount fell to 110,433,631 taels, while in 1884 it rose again to 113,215,520 taels, although at this time, as will be remembered, hostilities were being carried on between France and China. In the same year 53,562 bales of silk were exported, as against 47,807 bales in 1883, and 27,084,676 lb of green tea, as against 25,336,041 lb in 1883. In black tea there was a falling off, the respective figures being 43,818,058 and 48,251,687 lb. The total number of foreign steamers which entered and cleared at Shanghai during 1884 was 3,145,242 tons. Of this amount 2,238,433 tons were British, 60,222 were American, 168,484 were Japanese, 95,225 were German, 88,988 were French, 24,572 were Russian, and 11,322 were Danish.

According to the latest estimate the native population of the

¹ *The Treaty Ports of China and Japan*, by W. F. Meyer.

city and suburbs of Shanghai amounts to 156,000. When to this number the boat population, amounting to 11,000, and the mixed inhabitants of the foreign settlements, numbering 145,500, are added, a total is reached of 312,500 souls.

The vastness of English interests in China and the large British population at Shanghai gave rise in 1865 to the establishment of a British supreme court for China and Japan.—Sir Edmund Hornby, who was then the judge of the British court at Constantinople, being the first judge appointed to the new office. The court thus constituted not only exercises jurisdiction over the British subjects at Shanghai but acts as a court of appeal from all British consular courts in China and Japan. All changes against Chinamen within the settlement are made before a mixed court, which sits daily, presided over by a Chinese official and an officer of the consular service. During the year 1884, 2,804 criminal cases were tried before this tribunal, and 99 civil cases,—in 85 of which cases no less a sum than £60,000 was involved.

A handsome broad runs along the river frontage of the three foreign settlements, and the public buildings, especially in the British settlement, are large and fine. The cathedral, which is built in the Gothic style, is a notable example of Sir Gilbert Scott's skill as an architect, and the municipal offices, club-house, and hospitals are all admirable in their way. Shanghai is now connected with Peking by a telegraph, which will doubtless before long be supplemented by a railway. Some years ago a short railway was laid down between Shanghai and Woosung by some foreigners who wished to force the pace at which China was progressing. But this had not gone when such a step would be adopted by the Chinese, and after a few weeks' existence the plant was bought by the native authorities and shipped to Formosa, where it has since been allowed to rust and rot. The climate of Shanghai is essentially unhealthy. It lies low, and, though the early winter is enjoyable, snow and ice being occasionally seen, the summer months are sweetly hot. Fever, dysentery, and cholera are unfortunately common complaints, and it is only by frequent trips to Japan and Chefoo that the residents are able to preserve health and strength. But, notwithstanding every disadvantage, the position occupied by Shanghai as a centre of trade, situated as it is at the mouth of the Yang-tze-kiang, in the immediate neighbourhood of the richest silk and tea districts, and in proximity to Japan and the newly-opened ports of Corea, makes for it an increasing volume of commerce and a widening prosperity in the future. (R K W)

SIANNON. See IRELAND, vol. xiii p 216

SIANS. This name is applied to a number of the most part semi-independent communities occupying a region bounded on the W by Burmah and Assam, N. and N.E. by the Chinese province of Yun-nan, E. by Tong-king, and S. by Siam (see Plate IX.). Ethnologically the race has a much wider extension, including the Siamese (see SIAM), and also, according to Garnier and Colquhoun, the hill tribes around the Tong-king delta and various tribes of Kwang-tung and Kwang-so, and extending across the north of Burmah into Assam. It is also widely diffused through south-western Yun-nan. Torrien de Lacquerrie considers it allied to the Mon, the Mung, and the Pa, and places its early home in the mountains north of Sze-chuen, whence, not having amalgamated with the growing Chinese empire, it was gradually forced southwards. Although the level of civilization and the purity of their Buddhism vary considerably among the different branches of the race, there is everywhere a remarkable resemblance in appearance, manners, customs, and policy. The traditions current of their origin, too, though localized by each in its own habitat, are closely similar. This great homogeneity seems the more remarkable in that the race is found not only living under many different political systems,—i.e., either independent, or subject to Burmah, China, or Siam,—but often in communities isolated by mountain ranges, inhabited by tribes of different race and character. All this seems to point to a political unity in earlier times.

The Shans probably appeared on the upper Irrawadi nearly two thousand years ago, but Burmese and Shan traditions agree that they were established some centuries earlier on the upper waters of the Shweli and on the Salwin and adjacent valleys on the south-west frontiers of Yun-nan. Here, at all events, in the 7th and 8th cen-

turies, we hear of the growth of that power which, temporarily broken by Burmah in the 11th century, reached its highest development in the 13th. This Shan empire, known by the classical Indian name of Kausambi,—corrupted after the punning Chinese fashion into Koshan-pyi, i.e., nine Shan states,—was a confederacy of about ten states, known among themselves by the name of the most powerful member, Mau, or Muang Mau. A great leader, Sam Lung Pha, brother of the king of Mau, overran and conquered Upper Assam from the Satyaps in 1239, the dynasty lasting until the British annexation. These Ahoms still inhabit the Assam districts of Sibsagar and south and east Lakhimpur, though pressed on from the south-west by the Bengalis, whom they despise as a black and inferior race, preferring to associate with the Chinese, whom they regard as congeners, and as the greatest race in the world.

This 13th and the following century also saw Tali to the east and Amkan to the west invaded, Burmah being then weakened by the Mongol invasion, Chieng Mai and other southern Shan states were also annexed, and "Ayuthia" (i.e., Siam), Cambodia, and Tavoy are claimed by the Shan historians as among their conquests, the Shan influence being felt even in Java. From the 14th to the 16th century wars with both Burmah and China were frequent, and Shan dynasties ruled at times in Burmah; but in 1556-62 the Burmese conquered Mogaung, the chief province of Mau, when Buddhism is recorded to have been introduced, probably only a reform of religion is meant. In 1604 the districts now known as the Chinese Shan States, i.e., the heart of the Mau empire, lying chiefly in the Ta-peng Shan, east of Bamo,—a town whose population also is mainly Shan,—were finally conquered by China, Mogaung remaining independent on suzerainty till absorbed by Burmah in 1796.

Zummé or Chieng Mai (including Kiang Hai, Kiang Sen, Lagong, and Lapong), whose capital is now an important and well-built town, and Yen Chang on the east of the Mo-kong, were both great Shan centres, warring, with various fortunes, with Burmah and Cambodia and with each other, till subjugated by the growing power of Siam late in the last century.

The Burmese Shan States, especially those more remote from Mandalay, have lately become practically independent, and, the tyranny which led to extensive southward migration having thus ceased, the stream is partly returning northwards. Descendants, too, of the population deported by Siam from Kiang Sen about a hundred years ago are now by the king's permission returning to people that fertile territory. The Burmese plan with the Shans was to govern by fostering internal dissensions, and they are bitterly hated, while the Chinese are in an equal degree liked and respected. The great Shan state of Kiang Hung has now accepted the dictation of China, to whom in fact, like some of its lesser neighbours, it has always paid certain taxes, while acknowledging the supremacy of Burmah. Kiang Tung to the south, which has been Burmese for over a century, has lately made overtures to Siam, though not forgetting the injuries inflicted by that power in 1854. The numerous ruins of great cities over the whole region from Chieng Mai to Kiang Tung testify to former wealth and prosperity, though they may not have all existed contemporaneously. In Luang Prabang in the north-east, on the other hand, tribes of a partly Chinese race are pressing southwards. It is remarkable how many of the conquering irruptions of south-east Asia were due mainly to the eviction of such conquerors by some stronger power. Incessant wars and vast deportations have tended to assimilate the various populations of all this region.

Each Shan state is governed by a *tsobun* (chao *p'iao*), or supreme chief, aided by a council, and often by a *conductor*. While the Shans are in immediate contact with one of their great neighbors their habits and customs are necessarily modified, otherwise, speaking generally, civilization increases southwards. Religion is nominally Buddhist, and the priests, though their lives are usually far from correct, have great influence, temples, caves, and other localities sacred to Buddha are thronged with worshippers liberal with their offerings, but the practical exercise of religion consists chiefly in efforts to propitiate or avert the evil influence of the *rats* or *gloves*, demons and spirits everywhere present, to whom all accidents and illnesses are attributed. Along with the Buddha, various images, among which the horse is not uncommon, are adored (though these are temples in which these are not found), and fetiches—natural objects of special force, e. g., of a part of the body—are kept in the house to avert disease. Medical treatment consists largely in magical practices, and individuals denounced by the sick as the cause of their illness frequently have their houses burned and are themselves deported to a distance. Thus, too, ordeals have a prominent place in legal practice. The Shans have no Buddhist prejudices against killing poultry or cattle for food, but likewise Indo-Chinese and the Malays do not eat pork. Slavery is general; the supply is, as usual, derived from raids on neighbouring hill tribes, the Indo-Chinese practice of slavery for debt also prevails. The slaves are not ill-treated, and are chiefly employed in field labour by the chao, who own great numbers. In appearance the North Shans are tall, but hardly darker than South Europeans, and are characterized by a short broad face, more elongated and more the Tartar type in the upper classes, they have red cheeks, heavy eyes, low noses, and a small, but nose almost entire, and are of medium height. The Chinese Shans are much smaller, with squat figures, prominent cheek-bones, and oblique eyes.

The practice of tattooing prevails in some districts, down to the upper waters of the Me nam, and it occurs also among the Laos in the south-east, the tattooed being known as the black bellied, the non tattooed as the white bellied. The Shans are all hunters, and more mainly than the Siamese, and they are also more sedate and more self-possessed than the Burmese. Most of them speak of them as brave, friendly, social, and hospitable, but a good deal of the oppression and cruelty natural to a semi-barbarous condition prevails. They are cleanly and fond of bathing, the towns and villages being supplied with bamboo aqueducts. Drunkenness, except at festivals, is rare. Gambling is common, while firearms being sold and slavery to pay debts thus contracted. Public gaming and the sale of spirits and opium are monopolies. They show much artistic taste in the beautiful columns of their textile fabrics, the needlework and embroidery of the women, and the designing and execution of the silver ornaments which are worn in profusion. They show great aptitude for trade, and are well by Mr. H. H. Tillet to welcome the prospect of the railway intended to connect their country with Moulmein, crossing thence to Rahang or some neighbouring point on the Me nam, and on through the fertile valleys and plains on its upper tributaries to the Chinese frontier.

Tea is found, both wild and cultivated, from Zummé to Kiang Tung. Opium is exported to Mandalay and to China. Indian corn, sugar, and tobacco are grown in the low grounds, and excellent cotton and indigo (which also grows wild in the hills). Teak has long been famous by Anglo-Burmese in the eastern alluvials of the Tonquin and neighbouring valleys, and has become comparatively scarce west of the Me-nung, but it grows freely in the hills and valleys around Kiang Sea and Lagone, and in the hill region of eastern Siam, where, however, it is of inferior quality. Silk is produced, and iron, copper, and silver-lead (galena) ores are worked.

The Shan languages are classified by Dr. Cushing as follows:—Aham (Assam), Khamti, on the upper Irrawadi and other valleys on the extreme north of Burma; the Chinese (Miao) Shans, east from Bamo; Shans proper, between the mountains which bound the Burmese plains in the east and the Me-kong, and between 25° and 18° N. lat.; Laos to the south of this, from 18° north to the frontiers of Siam; and lastly, Siamese. The last two, as spoken, differ but little, and the three others may be grouped together. All have separate alphabets (related, however, in form), except the Siamese; and, the spelling being phonetic, the orthography is tolerably fixed. But it is a tonal language, and the vowel signs are few, so that some have two or three values assigned them. There are a good many Pali words due to Buddhism, many Burmese words in the districts under Burmese influence, and a large foreign element in the Chinese Shan state of Hlo thia, where the race is perhaps not fundamentally Shan.

Phayre, *History of Burma* (C. T.).

SHARK. The systematic position of the group of Sharks or *Selachoides* in the class of Fishes, their classification, and their general external and anatomical characteristics have been already sufficiently noticed under *Ichthyology* (vol. xii pp. 630 *sq.*), and we have here to supplement that article only by a fuller reference to the natural history of the more common and more important types of the group.

Sharks are almost exclusively inhabitants of the sea, but some species freely enter the mouths of large rivers, and one species (*Carcharias genivittatus*) occurs frequently high up in the large rivers of India, and in the Tigris about Baghdad, at a distance of 350 miles from the Persian Gulf in a straight line, and has even been reported from a lake in Viti Levu (Fiji Islands) which is shut off from the sea by a catenae. Sharks are found in all seas, most numerous between the tropics, they become scarcer beyond, a few only reaching the Arctic circle, it is not known how far they advance southwards in the Antarctic region. Altogether some hundred and fifty different species have been described.

With regard to their habits many are littoral species, the majority pelagic, and a few are known to belong to the bathyal fauna, having hitherto been obtained down to a depth of 500 fathoms.

Littoral Sharks.—The littoral forms are of small size, and generally known under the name of "dog-fishes," "hounds," &c. Some pelagic sharks of larger size also live near the shore on certain parts of a coast, but they are attracted to it by the abundance of food, and are as frequently found in the open sea, which is their birth-place; therefore we shall refer to them when we speak of the pelagic kinds.

The majority of the littoral species live on the bottom, sometimes close inshore, and feed on small marine animals or on any animal substance. The following are deserving of special notice.

The Tope (*Gadus*) is common on the coasts not only of England, Ireland, and of the more southern parts of Europe, but also of South Africa, California, Tasmania, and New Zealand. Its teeth are equal in both jaws, of rather small size, flat, triangular, with the point directed towards the outer side, and with a notch and denticulations on the shorter side (fig. 1). It is of a uniform slaty-grey colour, and attains to a length of 6 feet. The female brings forth some thirty living young at one birth in May. It cannot be regarded as a very destructive fish, but becomes troublesome at times to fishermen by taking their bait and driving away other fish they desire to catch.

The Hounds proper (*Mustelus*) possess a very different dentition, the teeth being small, obtuse, numerous, arranged in several rows like pavement (fig. 2). Five or six species are known from the shores of the various temperate and subtropical seas, one (*M. medialis*) being common on the coasts of Great Britain and the United States on the Pacific as well as the Atlantic side. It is of a uniform grey colour or sparingly spotted with white, and attains to a length of 3 or 4 feet. The young, about twelve in number, are brought forth alive in November. It is a comparatively harmless fish, which feeds on shells, crustaceans, and decomposing animal substances.

Of the Dog-Fishes proper (*Squalus*, *Chiloscyllium*, &c.) some twenty species are known, which are spread over nearly all the temperate and tropical seas. Their teeth are small, in several series, with a longer pointed cusp in the middle, and generally one or two smaller ones on each side (figs.

FIG. 1.—Tooth of Tope, *Gadus*, upper, *Chiloscyllium*, &c. (< 2)

FIG. 2.—Tooth of *Mustelus*.

3 and 5). They are all oviparous, their oblong egg-shells being produced at each corner into a long thread by which the egg is fastened to some fixed object. Some of the tropical species are ornamented with a pretty pattern of coloration. The two British species, the Lesser and the Larger Spotted Dog-Fish (*Sc. canicula* and *Sc. catulus*), belong to the most common fishes of the coast, and are often confounded with each other. But the former is finely dotted with brown above, the latter having the same parts covered with larger rounded brown spots, some of which are nearly

FIG. 3.—Teeth of *Scyllium canicula*.FIG. 4.—*Chiloscyllium triapicatum*.

as large as the eye. As regards size, the latter exceeds somewhat the other species, attaining to a length of 4 feet. Dogfishes may become extremely troublesome by the large numbers in which they congregate at fishing stations; nor do they compensate for the injury they cause to fishermen, being but rarely used as food, except at certain seasons by the poorer classes of the Mediterranean countries, in China and Japan, and in the Orkneys, where they are dried for home consumption.

FIG. 5.—Confluent Nasal and Buccal Cavities of the same fish.

The Black-mouthed Dog-Fish (*Pristiscirus melanostomus*) is another European species which is rarely caught on the British coasts, and is recognized by a series of small, flat spinous with which each side of the upper edge of the caudal fin is armed.

The Tiger-Shark (*Stegostoma tigrinum*) is one of the commonest and handsomest sharks in the Indian Ocean. The ground colour is a brownish-yellow, and the whole fish is ornamented with black or brown transverse bands or rounded spots. It is a littoral species, but adult specimens, which are from 10 to 15 feet long, are not rarely met far from land. It is easily recognized by its enormously long blade-like tail, which is half as long as the whole fish. The teeth are small, trilobed, in many series. The fourth and fifth gill-openings are close together.

The genus *Crossorhinus*, of which three species are known from the coasts of Australia and Japan, is remarkable as the only instance in this group of fishes in which the integuments give these inactive ground-sharks, whilst they lie concealed watching for their prey, what may be called a "relative" rather than a "protective" resemblance to their surroundings. Skinny frond-like appendages are developed near the angle of the mouth, or form a wreath round the side of the head, and the irregular and varied coloration of the whole body closely assimilates that of a rock covered with short vegetable and coralline growth. This peculiar development reminds us of the similar condition in the sea-devil (*Lophius*), where it serves also to conceal the fish from its prey, rather than to protect it from its enemies. The species of *Crossorhinus* grow to a length of 10 feet.

The so-called Port Jackson Shark (*Cestracion*) is likewise a littoral form. Besides the common species (*C. philippi*),

FIG. 6.—*Cestracion galeatus*.

three other closely allied kinds from the Indo-Pacific are known. This genus, which is the only existing type of a separate family, is one of special interest, as similar forms occur in Primary and Secondary strata. The jaws are armed with small obtuse teeth in front, which in young individuals are pointed, and provided with from three to five cusps. The lateral teeth are larger, pad-like, twice as broad as long and arranged in oblique series (fig. 7),—an

FIG. 7.—Upper Jaw of Port Jackson Shark (*Cestracion philippi*). (x 4)

arrangement admirably adapted for the prehension and mastication of crustaceans and hard-shelled animals. The fossil forms far exceeded in size the living, which scarcely attain to a length of 5 feet. The shells of their eggs are not rare in collections, being found thrown ashore like those of our dog-fishes. The shell is pyriform, with two broad lamellar ridges each wound edgewise five times round it (fig. 8).

The Spiny or Piked Dog-Fish (*Acanthias*) inhabits, like the majority of littoral genera of sharks, the temperate seas of both the northern and southern hemispheres. For some part of the year it lives in deeper water than the sharks already noticed, but at uncertain irregular times it appears at the surface and close inshore in almost incredible numbers. Couch says that he has heard of 20,000 having been taken in a sea at one time; and in March 1858 the newspapers reported a prodigious shoal reaching westward to Uig, whence it extended from 20 to 30 miles seaward, and in an unbroken phalanx eastward to Morey, Banff, and Aberdeen. In the deep fjords of Norway, and indeed at every station of which a shoal of these fishes has taken temporary possession, line-fishing has to be suspended during the time of their visit, as they cut the lines with their scissors-like teeth. As expressed by the name, these

fishes are distinguished from the other British littoral sharks by each of the two dorsal fins being armed in front

FIG. 8.—Egg-shell of some fish (x 4). I., external view; II., section; a and b, the two spiral ridges; c, cavity for the germ.

by an acute spine. They do not possess an anal fin. Their teeth are rather small, placed in a single series, with the point so much turned aside that the inner margin of the tooth forms the cutting edge (fig. 9). The spiny dog-fish are of a greyish colour, with some whitish spots in young specimens, and attain to a length of 2 or 3 feet. They are viviparous, the young being produced throughout the summer months. It is stated that in the northern islands of Great Britain they are dried for food, and that their livers yield a large quantity of oil.

FIG. 9.—Teeth of *Acantholat vulgaris*.

Finally, we have to notice among the littoral sharks the "Angel-Fish" or "Monk-Fish" (*Rhina squatina*), which, by its broad flat head and expanded pectoral fins approaches in general appearance the rays. It occurs in the temperate seas of the southern as well as the northern hemisphere, and is not uncommon on sandy parts of the coast of England and Ireland. It does not seem to exceed a length of 5 feet, is not used as food, and is too rare to do any perceptible injury to other fish. It is said to produce about twenty young at a birth.

Pelagic Sharks.—All these are of large size, and some are surpassed in bulk and length only by the larger kinds of cetaceans. Those armed with powerful cutting teeth are the most formidable tyrants of the ocean and dangerous to man, whilst others, which are provided with numerous but very small teeth, feed on small fishes only or marine invertebrates, and are otherwise almost harmless and of a timid disposition, which causes them to retire into the solitudes of the open sea. On this account we know very little of their life; indeed, some are known from a few individuals only which have accidentally come ashore. All pelagic sharks have a wide geographical range, and many are found in all seas within the limits of the equatorial zone,—some being almost cosmopolitan. All seem to be viviparous.

Of the more remarkable forms which we propose to notice here the genus most abundantly represented in species and individuals is *Carcharias*. Perhaps nine-tenths of the sharks of which we read in books of travel belong

to this genus. Between thirty and forty species have been distinguished, all of which are found in tropical seas. They are the sharks which so readily attach themselves to sailing vessels, following them for weeks, and thus exhibiting an endurance of muscular power scarcely found in any other class of animals. Others affect more the neighbourhood of land, congregating at localities where nature or the vicinity of man provides them with an abundant supply of food. One of the most common species, and one of those which extend far into the temperate zones, is the Blue Shark (*Carcharias glaucus*), of which small specimens (4 to 6 feet long) are frequently caught on the south coasts of England and Ireland. Other species of *Carcharias* attain a length of 25 feet. The mouth of all is armed with a series of large flat triangular teeth, which have a sharp, smooth, or serrated edge (fig. 10).

FIG. 10.—Dentition of the Blue Shark (*Carcharias glaucus*). The single teeth are of the natural size.

Galocercus is likewise a large shark very dangerous to man, differing from the preceding chiefly by having the outer side of its teeth deeply notched. It has long been known to occur in the North Atlantic, close to the Arctic Ocean (*G. arcticus*), but its existence in other parts has been ascertained within a recent period; in fact, it seems to be one of the most common and dangerous sharks of the Indo-Pacific, the British Museum having obtained specimens from Mauritius, Kurrachee, Madras, and the west coast of Australia.

Hammerheaded Sharks (*Zippena*) are sharks in which the anterior portion of the head is produced into a lobe on each side, the extremity of which is occupied by the eye. The relation of this unique configuration of the head to the economy of the fish is unknown. Otherwise these sharks resemble *Carcharias*, and are equally formidable, but seem to be more stationary in their habits. They occur in all tropical and subtropical seas, even in the Mediterranean, where *Z. nulleus* is by no means rare. In the Indian Ocean it is common, and Cantor states that specimens of this species may be often seen ascending from the clear blue depths of the ocean like a great cloud.

The Porbeagles (*Lamna*) differ from the preceding sharks in their dentition (fig. 11), the teeth being large, lanceolate in shape, not adapted for cutting, but rather for seizing and holding the prey, which consists chiefly in fish. These sharks are therefore not dangerous

FIG. 11.—Teeth of *Lamna*.

to man; at least, there is no instance known of a person having been attacked by the species common on the British coast (*L. cornubica*). It grows to a length of 10 feet, and ranges to New Zealand and Japan. See vol. xix. p. 518.

To the genus *Carcharodon* particular interest is attached, because the single still existing species is the most formidable of all sharks, as were those which preceded it in Tertiary times. The existing species (*C. rondeletii*) occurs in almost all tropical and subtropical seas, but seems to be verging towards extinction. It is known to attain to a length of 40 feet. The tooth figured here of the natural size (fig. 12) is taken from a jaw much shrunk in drying,

FIG. 12.—Tooth of *Carcharodon rondeletii*.

but still 30 inches wide in its transverse diameter, and taken from a specimen $36\frac{1}{2}$ feet long. The extinct species must have been still more gigantic in bulk, as we may judge from teeth which are found in the crag or which have been dredged up from the bottom of the Pacific Ocean by the naturalists of the "Challenger" expedition, and which are 4 inches wide at the base and 5 inches long measured along their lateral margin. In some Tertiary strata these teeth are extremely abundant, so much so that—for instance, in Florida—the strata in which they occur are quarried to obtain the fossil remains for export to England, where they are converted into artificial manure.

The Fox-Shark or Thresher (*Alopias vulpes*), of which every year specimens

are captured on the British coast, but which is common in all the temperate seas of the northern and southern hemispheres, is readily recognized by its extremely slender tail, the length of which exceeds that of the remainder of the body. Its teeth are small, flat, triangular, and without serrature (fig. 13; the single tooth is of the natural size). It follows the shoals of herrings, pilchards, and sprats in their migrations, destroying incredible numbers and frequently injuring the nets by getting entangled in them. When feeding it uses the long tail in splashing the surface of the water, whilst it swims in gradually decreasing circles round a shoal of fishes which are thus kept crowded together, falling an easy prey to their enemy. Sometimes two threshers may be seen working together. Statements that it has been seen to attack whales and other large cetaceans rest upon erroneous observations; its dentition is much too weak to bite through their skin, although, as Couch says, by one splash of its tail on the water it may put a herd of dolphins or porpoises to flight like so many hares. The same effect may be produced by the splash of an oar. The thresher attains to a length of 13 feet, the tail included.

The Basking Shark (*Selache maxima*), sometimes erroneously called "Sun-Fish," is the largest fish of the North Atlantic, growing to a length of more than 30 feet. It is one of the few types of sharks which up to a very recent time were considered to be peculiar to the North-Atlantic fauna; but Prof. F. McCoy has just recorded its occurrence on the Australian coast, a specimen 30 feet long having been captured in November 1883 at Portland, on the west coast of Victoria. The mouth is of an extraordinary width, and, like the gill-cavity, capable of great expansion, so as to enable the fish to take at one gulp an enormous quantity of the small fish and other marine creatures on which it subsists. Also the gill-openings are of great width. The teeth are very small, numerous, arranged in several series, conical, and probably without use in feeding. This shark is therefore quite harmless if not attacked. On the west coast of Ireland, where it is

FIG. 13.—Basking Shark.

frequently seen during the summer months, generally in companies, at a distance of from three to a hundred miles off the shore, it is chased by the more courageous of the fishermen for the sake of the oil which is extracted from the liver, one fish yielding from a ton to a ton and a half. Its capture is not unattended with danger, as one blow from the enormously strong tail is sufficient to stove in the sides of a large boat. The simple method used at present of harpooning the fish entails much patience and loss of time upon the captors, as the fish generally sinks to the bottom and sulks for many hours before it rises again in a more or less exhausted condition; and the use of more modern appliances could not fail of securing more speedy and better success. The basking shark is gregarious, and many individuals may be seen in calm weather lying

together motionless, with the upper part of the back raised above the surface of the water, a habit which it has in common with the true sun-fish (*Orthogoriscus*), and from which it has derived its name.

A shark similar in many points to the basking shark (which it exceeds in size), and an inhabitant of the Indo-Pacific Ocean, is *Rhincodon typicus*. In fact, so far as our present knowledge goes, it is the largest of all sharks, as it is known to exceed a length of 50 feet, but it is stated to attain that of 70. The captures of only a few specimens are on record, viz., one at the Cape of Good Hope, one or two near the Seychelles, where it is known as the "chagrin," one on the coast of California, and one (quite recently) on the coast of Peru. The snout is extremely short, broad, and flat, with the mouth and nostrils placed at its extremity; the gill-openings very wide, and the eye very small. The teeth are, as in the basking shark, extremely small and numerous, conical in shape. No opportunity should be lost of obtaining exact information on this shark.

The Greenland Shark (*Lamargus borealis*) belongs to the

same family as the spiked dog-fish, but grows to a much larger size, specimens 15 feet long being frequently met

FIG. 14.—Greenland Shark (*Lamna borealis*).

with. The two dorsal fins are small and destitute of spines. The teeth (fig. 11) in the upper jaw are small, narrow, conical in shape; those of the lower flat, arranged in several series, one on the top of the other, so that only the uppermost forms the sharp dental edge of the jaw.

The points of these lower teeth are so much turned aside that the inner margin only enters the dental edge. The Greenland shark is an inhabitant of the Arctic regions, sometimes straying to the latitudes of Great Britain and of Cape Cod in

FIG. 15.—Dentition of Greenland Shark.

the western Atlantic; it is one of the greatest enemies of the whale, which is often found with large pieces bitten out of the tail by this shark. Its voracity is so great that, as Scoresby tells us, it is absolutely fearless in the presence of man whilst engaged in feeding on the carcass of a whale, and that it will allow itself to be stabbed with a lance or knife without being driven away.

The Spiny Shark (*Echinorhinus spinosus*) is readily recognized by the short bulky form of its body, its short tail, and the large round bony tubercles which are scattered all over its body, each of which is raised in the middle into a pointed conical spine. More frequent in the Mediterranean, it has been found also not very rarely on the English coasts and near the Cape of Good Hope. It is always living on the ground, and probably descends to some depth. It does not seem to exceed a length of 10 feet.

Bathybial Sharks.—Sharks do not appear to have yet reached the greatest depths of the ocean; and so far as we know at present we have to fix the limit of their vertical distribution at 500 fathoms. Those which we find to have reached or to pass the 100 fathoms line belong to generic types which, if they include littoral species, are ground-sharks,—as we generally find the bottom-feeders of our littoral fauna much more strongly represented in the deep-sea than the surface swimmers. All belong to two families only, the *Scylliidae* and *Spinaciidae*, the littoral members of which live for the greater part habitually on the bottom and probably frequently reach to the 100 fathoms line. Distinctly bathybial species are two small dog-fishes,—*Spinax granulatus* from 120 fathoms, and *Scyllium canescens* from 400 fathoms, both on the south-west coast of South America; also *Centroscyllium granulatum* from 245 fathoms in the Antarctic Ocean, whose congener from the coast of Greenland probably descends to a similar depth. The sharks which reach the greatest depth recorded hitherto belong to the genus *Centrophorus*, of which some ten species are known, all from deep water in the North Atlantic, Mediterranean, the Molucca and Japanese seas. The Japanese species were discovered by

the naturalists of the "Challenger" on the Hyalonema ground off Inosima in 345 fathoms. Dr E. P. Wright found *C. cololepis* at a still greater depth on the coast of Portugal. The fishermen of Sétúbal fish for these sharks in 400 or 500 fathoms, with a line of some 600 fathoms in length. "The sharks caught were from 3 to 4 feet long, and when they were hauled into the boat fell down into it like so many dead pigs"; in fact, on being rapidly withdrawn from the great pressure under which they lived they were killed, like other deep-sea fishes under similar circumstances. It is noteworthy that the organization of none of these deep-sea sharks has undergone such a modification as would lead us to infer that they are inhabitants of great depths.

One of the most interesting types of the division of sharks is the small family of *Notidontidae*, which is externally distinguished by the presence of a single dorsal fin only, without spine and opposite to the anal, and by having six or seven wide branchial openings. They represent an ancient type, the presence of which in Jurassic formations is shown by teeth extremely similar to those of the living species. Their skeleton is notochordal. Only four species are known, of which one (*Notidontus griseus*) has now and then strayed northwards to the

FIG. 16.—*Chlamydoselache angustius*.

English coast. A member of this family has been recently discovered in Japan, and is so scarce that only two specimens are known—one in the museum at Cambridge, U.S., and the other in the British Museum. It was named by its first describer, S. Gannan, *Chlamydoselache angustius* (fig. 16). It resembles somewhat in shape a conger, and differs from the *Notidont* proper by its elongate body, wide lateral and terminal mouth, extremely wide gill-openings, and peculiarly formed teeth. The teeth are similar in both jaws, each composed of three slender curved cusps separated by a pair of rudimentary points, and with a broad base directed backwards. These teeth resemble some fossils of the Middle Devonian, described as *Cladodus*, and North-American

naturalists regard, therefore, this fish as "the oldest living type of vertebrate." The *Notothen* are very probably ground-sharks, perhaps descending into deep water, and, although nothing positive is known at present of the habits of *Chlamydoselachus*, the fact that this singular type has escaped so long the observation of the numerous collectors in Japan renders it probable that it inhabits depths the exploration of which has been initiated only recently.

A few words have to be added with reference to the economic uses of this group of fishes. Their utility to man is insignificant in comparison with the havoc they commit among food-fishes and at fisheries, and with the loss of life which is caused by the larger kinds. As mentioned above, some of the smaller dog fishes are eaten at certain seasons by the captors, and by the poorer classes of the population. An inferior kind of oil, chiefly used for the adulteration of cod-liver oil, is extracted on some of the northern fishing-stations from the liver of the spiked dog-fishes, and occasionally of the larger sharks. Cabinet-makers make extensive use of shark's skin under the name of "slaugton" for smoothing or polishing wood. This shagreen is obtained from species (such as our dog-fishes) whose skin is covered with small, pointed, cloudy-set, coloured papillæ, whilst very rough skins, in which the papillæ are large or blunt, are useless for this purpose. The dried fins of sharks (and of rays) form in India and China an important article of trade, the Chinese preparing gelatin from them, and using the better sort for culinary purposes. They are assorted in two kinds, viz. "white" and "black." The former consists exclusively of the dorsal fins, which are on both sides of the same light colour, and reputed to yield more gelatin than the other fins. The pectoral, ventral, and anal fins constitute the "black" sort, the caudal are not used. One of the principal places where shark fishing is practised as a profession is Kaurichee, and the principal kinds of sharks caught there are species of *Carcharias*, *Galeorhinus*, and *Ziphius*. Dr Buist, writing in 1850, states that there are thirteen large boats, with crews of twelve men each, constantly employed in this pursuit, that the value of the fins sent to the market varies from 15,000 to 18,000 rupees, and that a boat will capture sometimes as a draught as many as a hundred sharks of various sizes, and that the number of sharks captured annually amounts probably to not less than 40,000. Large quantities are imported from the African coast and the Arabian Gulf, and various parts on the coast of India. In the year 1845-46 8770 cwt. of sharks' fins were exported from Bombay to China. (A. C. G.)

SILAHON, a borough of the United States, in Mercer County, Pennsylvania, 14 miles west of Mercer; is the seat of considerable iron manufacture, with blast furnaces, rolling mills, foundries, and nail factories; and had in 1880 a population of 5684.

SHARP, JAMES (1618-1679), archbishop of St Andrews, was the son of William Sharp, sheriff-clerk of Banffshire, and of Isabel Leslie, daughter of Leslie of Kinnivie, of the family of Malyburtons of Pitcr in Angus, and was born in Castle Banff on May 4, 1618. He was a clever boy, and his early disposition for the church led to his being called in just "the young minister." In 1638 he went to King's College, Aberdeen, and graduated in 1637. He there studied divinity for one or two years, and probably derived his Episcopalian tendencies from the "Aberdeen doctors," Aberdeen being at that time the home of Episcopalian sentiment. On the outbreak of the Covenanting war he went to England (1639) and visited Oxford and perhaps Cambridge, becoming acquainted with the principal English divines. Upon his return he was chosen in 1643 through the influence of Lord Rothes to be one of the "regents" of philosophy in St Leonard's College, St Andrews. He appears to have continually risen in reputation until in December 1647 he went through his ordinary trials for the ministerial office before the presbytery of St Andrews, and was appointed minister of Craib in Fifeshire, on the presentation of the earl of Crawford, on January 27, 1648. In the great schism of Resolutioners and Protestors, he, with the large majority of educated men, took active part with the former; he was the friend of Baillie, Douglas, Dickson, Wood, Blair, and others, and as early as March 1651 was recognized as one of the lead-

ing men of the party. His first public employment was in 1656, when he went to London on their behalf to endeavour to counteract with the Protector the influence of Warriston, who was acting for the Protestors. Here he became acquainted with Calamy, Ash, and other leading London Presbyterian ministers, and letters passed between him and Lauderdale, then prisoner in the Tower. He displayed all his undoubted talents for petty diplomacy and considerable subtlety in argument while on this service, and his mission was decidedly successful. He returned to Scotland in 1659, but upon Monk's march to London was again, in February 1660, sent by the Resolutioners to watch over their interests in London, where he arrived on February 13. He was most favourably received by Monk, to whom it was of great importance to remain on good terms with the dominant party in Scotland. His letters to Douglas and others during this period, if they may be trusted, are useful towards following the intrigues of the time day by day. It must not be forgotten, however, that there is good reason for thinking that Sharp had already made up his mind not to throw away the chances he might have of prominent employment under the Restoration. In the beginning of May he was despatched by Monk to the king at Droghda "to deal that he may be sent with a letter to the London Presbyterian ministers, showing his resolution to own the godly sober party." His letters on this occasion to Douglas show that he regarded himself equally as the emissary of the Scottish kirk. It is to be noticed that he was also the bearer of a secret letter from Lauderdale to the king. He was in fact playing a game admirably suited to his peculiar capacity for dark and crooked ways of dealing. There can be little doubt that while on this mission he was finally corrupted by Charles and Clarendon, not indeed so far as to make up his mind to betray the kirk, but at any rate to decide in no way to imperil his own chances by too firm an integrity. The first thing that aroused the jealousy of his brethren, who, as Baillie says, had trusted him as their own souls, was his writing from Holland in commendation of Clarendon. This jealousy was increased on his return to London (May 26) by his plausible endeavours to stop all coming of Presbyterian commissioners from Scotland and Ireland, though he professed to desire the presence of Douglas and Dickson, by his urgent advice that the Scots should not interfere in the restoration of Episcopacy in England, and by his endeavours to frustrate the proposed union of Resolutioners and Protestors. He informed them that Presbyterianism was a lost cause in England, but as late as August 11 he intimated that, though there had been great danger for the Scottish kirk as well, this danger had been constantly and successfully warded off by his efforts. He returned to Scotland in this month, and busied himself in endeavouring to remove all suspicions of his loyalty to the kirk; but at the same time he successfully stopped all petitions from Scottish ministers to king, parliament, or council. His letters to Drummond, a Presbyterian minister in London, and to Lauderdale, without absolutely committing him, show clearly that he was certain that Episcopacy was about to be set up. How far he was actively a traitor in the matter had always been fairly disputed until the question was at last set at rest by the discovery of his letter, dated May 21, from London, whither he went in April 1661, to Middleton, the High Commissioner, whose chaplain he now was, from which it is proved that he was in confidential communication with Clarendon and the English bishops, that he was earnestly and eagerly co-operating in the restoration of Episcopacy in Scotland, that he had before leaving Scotland held frequent conferences with Middleton on the subject (a fact which he had explicitly and vehemently denied) and was aware that Middleton had

all along intended it, and that he drew up and was directly responsible for the quibbling proclamation of June 10, the sole purpose of which was "the disposing of minds to acquiesce in the king's pleasure." The original of this letter (which is printed in the *Lauderdale Papers* and in the *Scottish Review*) is preserved in the Museum of the Society of Antiquaries, Edinburgh. It should be noticed that as late as the end of April, on the eve of starting on his mission to court with Rothes and Glencarne, he declared to Bailie that no change in the kirk was intended. The mask was at length dropped in August, when Episcopacy was restored, and Sharp was appointed archbishop of St Andrews. He and Leighton, Fairfoul, and Hamilton "were dubbed, first preaching deacons, then presbyters, and then consecrated bishops in one day, by Dr Sheldon and a few others." On April 8th the new prelates entered Scotland, and on the forenoon of April 20, 1663, Sharp preached his first sermon at St Andrews.

Sharp had carefully kept on good terms with Lauderdale, and when the Billeing Plot was concocted in September 1662 against the latter by Middleton, he managed to avoid acting against him, indeed it is probable that, after being appointed under an oath of secrecy to be one of the scrutineers of the billets, he, in violation of the oath, was the cause of Lauderdale receiving timely information of the decision against him, and yet he shortly went up to London to explain the whole affair in Middleton's interest. When Lauderdale's supremacy was established he readily co-operated in passing the National Synod Act in 1663, the first step in the intended subjection of the church to the crown. In 1664 he was again in London, returning in April, having secured the grant of a new church commission. His vanity also had been gratified by his being allowed to take precedence of the chancellor at the council. He harassed the ministers who were with his old friend James Wood when he signed his well-known deathbed confession, he cited and fined others, as well as laymen, for withdrawing from the churches, he urged the thorough prosecution of the arbitrary powers granted to the commission, and complained of the slackness of his fellow commissioners. So oppressive was his conduct and that of others of the bishops that it called forth a written protest from Gilbert Burnet. Sharp at once summoned him before the bishops and endeavoured to obtain a sentence of deprivation and excommunication against him, but was overruled by his brethren. On the death of Glencarne, the chancellor's greatest efforts were made to secure the vacant office for Sharp, and he was not inactive in his own interest; the place was not, however, filled up until 1667, and then by the appointment of Rothes. He was in strict alliance with Rothes, Hamilton, and Dalrymple, and the other leaders of oppression, and now placed himself in opposition to the influence of Lauderdale, attacking his friends, and especially the earl of Kincardine. In 1665 he was again in London, where, through his own folly and mendacity, he suffered a complete humiliation at the hands of Lauderdale, well described by the historian Burnet. With Rothes he now in great part governed Scotland, and the result of their system of violence and extortion was the rising of the Covenanters, during which, being in temporary charge during Rothes's absence, he showed, according to Bellenden, the utmost fear, equalled only by his cruelty to the prisoners after the rout of Pentland. When the convention of estates met in January 1667 he received his first rebuff, Hamilton being substituted for him as president. He now tried to curry favour with Lauderdale, to whom he wrote letters of the most whining contrition, and who extended him a careless reconciliation. The expressions of contempt for him which occur at this time, as previously, in the letters of Robert Moray,

Argyll, and others of Lauderdale's correspondents, are frequent and very amusing. For a time he made himself actively useful, and was instrumental in restraining his brethren from writing to London to complain of the conical policy which for a while Lauderdale carried out, a transaction in which he displayed the utmost effrontery of lying, and, with slight attempts to free himself, he continued faithful in his new service. On July 10, 1668, an attempt was made upon his life by Robert Mitchell, who fired a pistol at him while driving through the streets of Edinburgh. The shot, however, missed Sharp, though his companion the bishop of Orkney was wounded by it, and Mitchell for the time escaped. In August Sharp went up to London, returning in December, and with his assistance, nominally indeed at his suggestion, Tweeddale's tolerant proposals for filling the vacant parishes with some of the "outed" ministers were carried out. In the debates on the Supremacy Act, by which Lauderdale destroyed the autonomy of the church, he at first showed reluctance to put in motion the desired policy, but gave way upon the first pressure. When, however, Leighton, as archbishop of Glasgow, endeavoured to carry out a comprehension scheme, Sharp actively opposed him, and expressed his joy at the failure of the attempt. From this time he was completely subservient to Lauderdale, who had now finally determined upon a career of oppression, and in 1674 he was again in London to support this policy. In this year also Mitchell, who had shot at him six years before, was arrested, Sharp himself having recognized him, and, upon Sharp's promise to obtain a pardon, privately made a full confession. When brought into the justice court, however, he refused to repeat the confession, whereupon the promise of pardon was recalled, the prisoner was sent to the Bass, and was not brought to trial for four years. In 1678, however, the country being again in great disorder, he was tried on his own confession, which, not having been made before judges, could not legally be brought against him. This plea being overruled, he claimed the promise of pardon. Sharp, however, basely denied that any such promise had been given. His falsehood was proved by the entry of the act in the records of the court. Mitchell was finally condemned, but the condemnation was so evidently unfair and contrary to solemn promises that a reprieve would have been granted had not Sharp himself insisted on his death. This, perhaps the basest action of his base life, was speedily avenged. On May 3, 1679, as he was driving with his daughter Isabel to St Andrews, he was set upon by nine men, who were looking for one of the instruments of his cruelty, and, in spite of unusually beseechings and of the appeals of his daughter, was cruelly murdered. The place of the murder, on Magnus Muir, now covered with fir trees, is marked by a monument erected by Dean Stanley, with a Latin inscription recording the deed. It is only right, while recording a career of cold-blooded cruelty and almost unexampled political baseness, to remember that no charge that can be seriously maintained has ever been brought against the morality of Sharp's private life.

Unless otherwise mentioned, the proofs of the statements in this article will be found in vols. I. and II. of the *Lauderdale Papers* (Camden Society) and in two articles in the *Scottish Review*, July 1884 and January 1885. (O. A.)

SHARP, WILLIAM (1749-1824), an eminent linocut engraver, was born at London on the 29th of January 1749. He was originally apprenticed to what is called a bright engraver, and practised as a writing engraver, but, gradually becoming inspired by the higher branches of the engraver's art, he exercised his gifts with surprising success on works of the old masters. Among his earlier plates are some illustrations, after Stothard, for the *Novelists'*

Magazine. He engraved the Doctors Disputing on the Immaculateness of the Virgin and the Ecce Homo of Guido Reni, the St Cecilia of Domenichino, the Virgin and Child of Dolce, and the portrait of John Hunter of Sir Joshua Reynolds. His style of engraving is thoroughly masterly and original, excellent in its play of line and rendering of half-tints and of "colour." He died at Chiswick on the 25th July 1824. In his youth Sharp was a violent republican, and, owing to his hotly expressed adherence to the politics of Paine and Horne Tooke, he was examined by the privy council on a charge of treason. He was also one of the greatest visionaries in matters pertaining to religion. No imposture was too gross for him to accept, no deception too glaring for his eyes to admire. The dreams of Mesmer and the rhapsodies of Brothers found in Sharp a staunch believer; and for long he maintained Joanna Southcott at his own expense. As an engraver he achieved a European reputation, and at the time of his death he enjoyed the honour of being a member of the Imperial Academy of Vienna and of the Royal Academy of Munich.

SHAWL, a square or oblong article of dress worn in various ways dependent from the shoulders. The term is of Persian origin (*shāl*), and the article itself is most characteristic and important in the dress of the natives of north-western India and Central Asia, but in various forms, and under different names, essentially the same piece of clothing is found in most parts of the world. The shawls made in Kashmir occupy a pre-eminent place among textile products; and it is to them and to their imitations from Western looms that specific importance attaches. The Kashmir shawl is characterized by the great elaboration and minute detail of its design, in which the "come" pattern is a prominent feature, and by the glowing harmony, brilliance, depth, and enduring qualities of its colours. The basis of these excellences is found in the raw material of the shawl manufacture, which consists of the very fine, soft, short, fleecy under-wool, called *pashm* or *pashmina*, found on the shawl-goat, a variety of *Ovis montanus* inhabiting the elevated regions of Tibet. There are several varieties of *pashm*, according to the districts in which it is produced, but the finest is a strict monopoly of the maharaja of Kashmir, through whose territory it comes. Inferior *pashm* and Kirman wool—a fine soft Persian sheep's wool—are used for shawl weaving at Amritsar and other places in the Punjab, where colonies of Kashmiri weavers are established, but just in proportion to the quality of the *pashm* used are the beauty and value of the resulting shawl. In Kashmir the shawl wool is sorted with patient care by hand, and spun into a fine thread, a work of so much delicacy, owing to the shortness of the fibre, that a pound of undyed thread may be worth £2, 10s. The various colours, costly and permanent, are dyed in the yarn. The subsequent weaving or embroidering is a work of great labour, and a fine shawl will occupy the whole labour of three men not less than a year. Thus a first-rate shawl weighing about 7 lb may cost at the place of its production £300, made up thus:—material £30, labour £150, duty £70, miscellaneous expenses, £50. In shawl cloth many varieties of dress articles are made; but of shawls themselves, apart from shape and pattern, there are only two principal classes:—(1) loom-woven shawls called *tilliwalla*, *hlikār* or *kāni kār*,—sometimes woven in one piece, but more often in small segments which are sewn together with such precision and neatness that the sewing is quite imperceptible (such loom-woven shawls have borders of silk, the weight and stiffness of which serve to stretch the shawl and make it set properly); and (2) embroidered shawls—*amlikār*,—in which over a ground of plain *pashmina* is

worked by needle a minute and elaborate pattern. A large proportion of the inhabitants of Srinagar, the capital of Kashmir, are engaged in the shawl industry, and there are numerous colonies of Kashmiri weavers settled at Amritsar, Ludhiana, Nurmur, and other towns in the Punjab. Amritsar is now the principal entrepôt of the shawl trade between India and Europe. Imitation Kashmir shawls are made at Lyons, Nîmes, Norwich, and Paisley, and some of the products of these localities are little inferior in beauty and elaboration to Oriental shawls, but owing to the fluctuations of fashion there has been little demand for the finer products of European looms for many years. See also *PENNA*, vol. xviii p. 626.

SHEA BUTTER. See *OILS*, vol. xvii p. 747.

SHEARWATER, the name of a bird first published in Willughby's *Ornithologia* (p. 252), as made known to him by Sir T. Browne, who sent a picture of it with an account that is given more fully in Ray's translation of that work (p. 334), stating that it is "a Sea-fowl, which fishermen observe to resort to their Vessels in some numbers, swimming¹ swiftly to and fro, backward, forward, and about them, and doth as it were *vadere aquam*, shear the water, from whence perhaps it had its name²." Ray's mistaking young buds of this kind obtained in the Isle of Man for the young of the Couleaneb, now usually called *Puffin*, has already been mentioned under that heading (vol. xx. p. 102), and not only has his name *Puffinus anglorum* hence become attached to this species, commonly described in English books as the Manx Puffin or Manx Shearwater, but the barbarous and misapplied word *Puffinus* has come into regular use as the generic term for all birds thereto allied, forming a well-marked group of the Family *Procellariidae* (cf. *PETREL*, vol. xviii p. 711), distinguished chiefly by their elongated bill, and numbering some twenty species, if not more—the discrimination of which, owing partly to the general similarity of some of them, and partly to the change of plumage which others through age are believed to undergo, has taxed in no common degree the ingenuity of those ornithologists who have ventured on the difficult task of determining their characters. Shearwaters are found in nearly all the seas and oceans of the world,³ generally within no great distance from the land, though rarely resorting thereto, except in the breeding-season. But they also penetrate to waters which may be termed inland, as the Bosphorus, where they have long attracted attention by their daily passage up and down the strait, in numerous flocks, hardly ever alighting on the surface, and from this restless habit they are known to the French-speaking part of the population as *anes démanés*, it being held by the Turks that they are animated by condemned human souls. Four species of *Puffinus* are recorded as visiting the coasts of the United Kingdom, but the Manx Shearwater aforesaid is the only one that at all commonly occurs or breeds in the British Islands. It is a very plain-looking bird, black above and white beneath, and about the size of a Pigeon. Some other species are

¹ By mistake, no doubt, for flying or "hovering." The latter the word used by Browne in his *Account of Birds found in Norfolk* (Mus Brit. MS. Sloane, 1696, fol. 5. 23 and 31), written in or about 1692. Edwards (*Observations*, iii. p. 315) speaks of comparing his own drawing "with Brown's old draught of it, still preserved in the British Museum," and thus identifies the latter's "Shearwater" with the "Puffin of the Isle of Man."

² *Lyræ* appears to be the most common local name for this bird in Orkney and Shetland; but *Saash* and *Serader* are also used in Scotland. These are from the Scandinavian *Skræppe* or *Skræfa*, and considering Prof. Skott's remarks (*Etym. Dictionary*, p. 546) as to the alliance between the words *shear* and *scraper* it may be that Browne's hesitation as to the derivation of "Shearwater" had more ground than at first appears.

³ The chief exception would seem to be the Bay of Bengal and thence throughout the western part of the Malay Archipelago, where, though they may occur, they are certainly uncommon.

considerably larger, while some are smaller, and of the former several are almost whole-coloured, being of a sooty or dark cinereous hue both above and below. All over the world Shearwaters seem to have precisely the same habits, laying their single purely white egg in a hole under ground. The young are thickly clothed with long down, and are extremely fat. In this condition they are thought to be good eating, and enormous numbers are caught for this purpose in some localities, especially of a species, the *P. brevicaudus* of Gould, which frequents the islands off the coast of Australia, where it is commonly known as the "Mutton-bird." For works treating of the Shearwaters, see those cited under *PETREL* (vol. xviii p. 712). (A. N.)

SHEATHBILL, a bird so-called by Pennant in 1781 (*Gen. Birds*, ed. 2, p. 43) from the horny case¹ which ensheathes the basal part of its bill. It was first made known from having been met with on New-Year Island, off the coast of Staten Land, where Cook anchored on New Year's eve 1774.² A few days later he discovered the islands that now bear the name of South Georgia, and there the bird was again found,—in both localities frequenting the rocky shores. On his third voyage, while seeking some land reported to have been found by Kerguelen, Cook in December 1776 reached the cluster of desolate islands now generally known by the name of the French explorer, and here, among many other kinds of birds, was a Sheathbill, which for a long while no one suspected to be otherwise than specifically identical with that of the western Antarctic Ocean, but, as will be seen, its distinctness has been subsequently admitted.

The Sheathbill, so soon as it was brought to the notice of naturalists, was recognized as belonging to a genus hitherto unknown, and the older *Trogon* in 1788 (*Philos. Zool.*, p. 37) conferred upon it, from its snowy plumage, the name *Chionis*, which has most properly received general acceptance, though in the same year the compiler Gmelin termed the genus *Pyrrhuloxia*, as a rendering of Pennant's English name, and the species *alba*. It has thus become the *Chionis alba* of ornithology. It is about the size of and has much the aspect of a Pigeon,³ its plumage is pure white, its bill somewhat yellowish at the base, passing into pale yellow towards the tip. Round the eyes the skin is bare, and beset with cream-coloured papillae, while the legs are bluish-grey. The second or eastern species, first discriminated by Dr. Hutton (*Icon Zoologica*, 1811, p. 5, 1812, p. 402, pl. 2)⁴ as *C. minor*, is smaller in size, with plumage just as white, but having the bill and bare skin of the face black and the legs much darker. The form of the bill's "sheath" in the two species is also quite different, for in *C. alba* it is almost level throughout, while in *C. minor* it rises in front like the pediment of a temple. Of the habits of the western and larger species not much has been recorded. It gathers its food, consisting chiefly, as Darwin and others have told us, of sea-weeds and shell-fish, on rocks at low water; but it is also known to eat birds' eggs. There is some curiously conflicting evidence as to the flavour of its flesh, some asserting that it is wholly unpalatable, and others that it is palatable—a difference which may possibly be due to the previous diet of the particular example tested, to the skill of the cook, or

to the need of the taster. Though most abundant as a shore-bird, it is frequently met with far out at sea, and its most northern recorded limit is by Fleuriot (*Voy. de Marchand*, i. p. 19), in lat. 41° S., some 260 miles from the eastern coast of Patagonia. It was uncommon on the Falkland Isles, where it is said to breed (*Ibis*, 1861, p. 154), though confirmation of the report is as yet wanting, and from thence is found at both extremities of the Strait of Magellan, and southward to Louis-Philippe Land in lat. 60° S. On the other hand, thanks to the naturalists of the British and United States expeditions to Kerguelen Land for the observation of the transit of Venus in 1874, especially Mr. Eaton (*Philos. Transactions*, lxxviii, pp. 103-106) and Mr. Kiddle (*Zool. U. S. National Museum*, 1876, No. 3, p. 1-4), much more has been recorded of the eastern and smaller species, which had already been ascertained by M. Laysan (*Proc. Zool. Society*, 1871, p. 57, pl. iv fig. 7) to breed on the Crozet Islands,⁵ and was found to do so still more numerously on Kerguelen, while it probably frequents Prince Edward's Islands for the same purpose. The eggs, of which a considerable number have now been obtained, though of peculiar appearance, bear an unmistakable likeness to those of some Plovers, while occasionally exhibiting a resemblance—at little significance, however—to those of the Tropic-birds.

The systematic position of the Sheathbills has been the subject of much hesitation—almost useless since 1836, when De Blainville (*Ann. Sc. Naturelles*, ser. 2, vi. p. 97) made known certain anatomical facts proving their affinity to the *OYSTER-CATCHERS* (vol. xvii p. 111), though pointing also to a more distant relationship with the *GULLS* (vol. xi p. 274). These he afterwards described more fully (*Poy "Bouite," Zoologie*, i. pt. 3, pp. 107-132, pl. 9), so as to leave no doubt that *Chionis* was a form intermediate between those groups. Yet some writers continued to refer it to the *Gullinae* and others to the *Columbeae*. The matter may now be regarded as settled for ever. In 1876 Dr. Reichenow in Germany (*Jour. f. Orn.*, 1876, pp. 84-89) and in America Dr. Kiddle and Cooper (*Bull. U. S. Nat. Museum*, No. 3, pp. 85-116) published elaborate accounts of the anatomy of *C. minor*, the first, which confirming the view of De Blainville, the last two⁶ agreeing with him in the main, but concluding that the Sheathbills formed a distinct group *Chionomorpha*, in rank equal to the *Cecomorpha* and *Charadriomorpha* of Prof. Huxley (which are, to speak roughly, the *Gallinae* and *Liniroideae* of older systematists), and regarding this group as being "still nearer the common ancestral stock of both." These authors also wish to separate the two species generally; but their proposals are considered needless by Garrod (*P. Z. S.*, 1877, p. 417) and M. Alphonse Edwards (*Ann. Sc. Naturelles*, ser. 6, xiii. art. 1, p. 24). The opinions of De Blainville and Dr. Reichenow are borne out by the observations of Mr. Eaton (*loc. cit.*), and no one knowing the habits of an oyster-catcher can read his remarks without seeing how nearly related the two forms are. Their differences may perhaps justify the separation of each form into what is vaguely called a "family," but the differences will be seen by the comparative anatomist to be of slight importance, and the intimate affinity of the *Gallinae* and *Liniroideae*, already recognized by Prof. Parker and some of the best taxonomers (*cf. ORNITHOLOGY*, vol. xviii. p. 45) is placed beyond dispute.⁷ (A. N.)

SIBERIA. See YEMEN.

SHEBOYGAN, a city of the United States, capital of Sheboygan county, Wisconsin, stands on Lake Michigan,

— a previous announcement of the discovery of its eggs (*Ibis*, 1867, p. 458) was premature, the specimen, now in the possession of the present writer, proving to be that of a Gull—a fact unknown to the American writer named above.

⁶ In some details their memoir is unfortunately inaccurate.

⁷ The little group of very curious birds, having an English name, of the genera *Thimophaga* and *Alcedo*, which are peculiar to certain localities in South America and its islands, are by some systematists placed in the family *Chionididae* and by others in a distinct family *Thimophilidae* (more correctly *Thimacophilidae*). They are undoubtedly Laniinoids, though having much the aspect of Saint-Groums, but their precise position and rank remain at present uncertain. (*cf. Garrod (ut supra)* and Prof. Parker (*Trans. Zool. Soc.*, x. p. 301 sq.).

¹ A strange fallacy arose early, and of course has been repeated late, that this case or sheath was movable. It is absolutely fixed.

² Doubtless some of the earlier voyagers had encountered it, as Forster suggests (*Descr. Australiæ*, i. p. 330) and Lesson asserts (*Man. d'Ornithologie*, ii. p. 343); but for all practical purposes we certainly owe its discovery to the naturalists of Cook's second voyage. By some error, probably of transcription, New Zealand, instead of New Year Island, appears in many works as the place of its discovery, while not a few writers have added thereto New Holland. Hitherto there is no real evidence of the occurrence of a Sheathbill in the waters of Australia or New Zealand.

³ In the Falkland Isles it is called the "Kelp-Pigeon," and by some of the earlier French navigators the "Pigeon blanc antarctique." The cognate species of Kerguelen Land is named by the sailors a "Nora-eyed Pigeon," from its prominent fleshy orbits, as well as a "Puffy-bird"—the last doubtless from its white plumage calling to mind that of some of the smaller *Egrets*, so-called by the English in India and elsewhere.

⁴ Lesson (*loc. cit.*) states a brief but correct indication of this species as observed by Lesprieux (*Expédition Armatoriale*, x. p. 36) on Crozet Island, and not suspecting it to be distinct, was at a loss to reconcile the discrepancies of the latter's description with that given of the other species by earlier authors.

at the mouth of the river of the same name, 43 miles east of Fond du Lac and 52 miles north of Milwaukee. It possesses a good harbour, and, being surrounded by very productive agricultural land, exports annually a large quantity of grain. The manufactures include farming implements, enamelled hollow-ware, and stone-ware, there are a number of tanneries and breweries, and mineral water is exported. Settled in 1836, the city had in 1880 a population of 1714.

SHECHEM, now **NABULUS**, a city of Palestine. Eleven hours from Jerusalem on the great north road the traveller finds himself in the broad upland plain of Makhna (1500 feet above the sea), with Mount Gerizim on his left, and, skirting the base of the mountain, reaches the traditional well of Jacob (John iv 5, 6, cf. Gen. xxxiii. 19), a deep cistern with the ruins of an old church beside it. Here the road divides the caravan route to Damascus continues northward by the village of 'Asker (Sychar of John iv 5f), and so to Beisan (Beth-shan) and Tiberias, but the way to Samaria turns westward into a fertile and well-watered side valley between Gerizim (2849 feet) on the south and Ebal (3077 feet) on the north. This is the Vale of Shechem or Nabulus, and it is in fact an easy pass between the Mediterranean and Jordan basins, and at the watershed (1870 feet), where the city stands, 1½ miles from Jacob's Well, is not more than 100 yards wide. Thence Shechem commands both branches of the great north road, and several routes from the coast also converge here and connect with the ancient road from Shechem eastward to Kerkwā (Archelais) and Al-Salt, the capital of the Bolkā. The name of Shechem (shoulder, back) accords with the position of the town on the watershed, and the native name in Josephus's time (Mabortha, *B. J.*, iv. 8. 1; Phry has Mamortha) means simply "the pass." The situation of Shechem at the crossing of so many great roads must have given it importance at a very early date, and it is still a busy town of 20,000 inhabitants, with soap manufactures and considerable trade. On the other hand, the position is equally favorable for brigandage, to which, under weak governments, the Shechemites were addicted of old (Judges ix. 25; Hosea vi. 9, where "for consent" read "to Shechem"), and the district is still a lawless one.

The ancient inhabitants of Shechem were the Bne Hameor, a Canaanite clan, who were not expelled on the first conquest of Canaan but remained in possession till the events recorded in Judges ix. From the narrative of (Gen. xxiv., which has been spoken of in the article LEVI, it would seem that they entered into friendly relations with the invaders, and that an attack made on them by Simeon and Levi was repudiated by Israel and led to the dispersion of these two tribes. In Judges ix. the "freemen of Shechem" (אֲדָמִי אֲדָמִי אֲדָמִי) appear as a turbulent but cowardly race, who, in spite of their numbers and wealth, had become vassals of Gilead for the sake of protection against the Midianites, and would have continued to serve his sons but for the enterprise of Abimelech, whose mother was of their race. With the aid of mercenaries hired with the treasure of the sanctuary of Baal-Berith or El-Berith, the god of the town, Abimelech destroyed the sons of Gilead, was crowned king of Shechem, and for three years held sway also over the surrounding Israelites. A revolt was led by Gaal, an Israelite who secured to be subject to the exarchs of the despised Canaanites, and, the Shechemites having fallen out with Abimelech about their practice of brigandage, Gaal made a dash at the city in the absence of the king, and the feeble inhabitants recovered him with open arms. Abimelech, however, with his mercenaries proved too strong for his adversaries, and Canaanite Shechem was utterly destroyed. The place was taken by a Hebrew tribe, and the Canaanite sanctuary of El-Berith was transformed into

a Hebrew holy place of El the God of Israel, of which the foundation was afterwards referred to Jacob (Gen. xxxiii. 20) or even to Abraham (Gen. xi. 7). The great stone under the famous sacred tree at the sanctuary (the "tree of the revelation" or "tree of the soothsayers," E. V. "plain of Moriah" or "of Moenunim," Gen. xi. 8, xxxv. 4, 2 Dent. xi. 30, Jud. ix. 6, 37) was said to have been set up by Joshua (Josh. xxiv. 26), and Joseph's grave was shown there.¹ All this indicates that Shechem was once the chief sanctuary of Joseph, and so we understand why Rehoboam went to Shechem to be crowned king of Northern Israel and why Jacobom at first made it his residence (1 Kings x. 25). Politically Shechem was soon supplanted by Tizah and Samaria, but it appears to have been still a sanctuary in the time of Hosea. It survived the fall of Ephraim (Jos. xl. 6) and ultimately became the religious centre of the SAMARITANS (*q. v.*). The Greek name Neapolis, known to Josephus, indicates the building of a new town, which, according to Eusebius and Jerome, was a little way from the old Shechem, or at least did not include the traditional holy sites. The coins give the form Flavia Neapolis. Neapolis was the birth-place of Justin Martyr, and became the seat of a bishopric. Five Christian churches destroyed by the Samaritans in the time of Anastasius were rebuilt by Justinian (Procop., *De Bld.*, v. 7). Remains of one of these seem still to exist in the crusaders' church of the Passion and Resurrection (1167), now the great mosque. Neapolis had much to suffer in the ensue, it was finally lost to the Christians soon after Saladin's great victory at Hittin.

A map of the Shechem valley, with topographical details, &c., will be found in the *Manners of Bal Expt Soc.*, vol. i.

SHEE, SIR MARTIN ARCHER (1770-1850), portrait-painter, and president of the Royal Academy, was born in Dublin on the 23d of December 1770. He was sprung from an old Irish family, and his father, while he exercised the trade of a merchant, regarded the profession of a painter as in no sense a fit occupation for a descendant of the Shees. Young Shee became, nevertheless, a student of art in the Dublin Society, and came early to London, where he was, in 1788, introduced by Burke to Reynolds, by whose advice he studied in the schools of the Royal Academy. In 1789 he exhibited his first two pictures, the Head of an Old Man and Portrait of a Gentleman. During the next ten years he steadily increased in practice, and gradually gained ground among the aristocracy, with whom his suavity and good manners were great recommendations. He was chosen an associate of the Royal Academy in 1798, shortly after the illustrious Flaxman, and in 1800 he was made a Royal Academician.² In the former year he had married, removed to Romney's house in Cavendish Square, and set up as the legitimate successor of that artist. Shee continued to paint with great readiness of hand and fertility of invention, although his portraits were eclipsed by more than one of his contemporaries, and especially by Lawrence, Hoppner, Phillips, Jackson, and Raeburn. In addition to his portraits he executed various subjects and historical works, such as Lavinia, Bolivar, his diploma picture Prospero and Miranda, and the Daughter of Jephthah. In 1805 he published a poem consisting of *Rhymes on Art*, and it was succeeded by a second part in 1809. Although Byron spoke well of it in his *English Bards and Scotch Reviewers*, and invoked a place for "Shee and genius" in the temple of fame, yet, as nature had not originally conjoined these two, it is to be feared that even a poet's invocation could not materially affect their relations. Shee published another small volume of verses in 1814, entitled *The Commemoration of Sir Joshua Reynolds, and other Poems*, but this effort did not greatly increase his fame. He now produced a tragedy called *Alasco*, of which the scene was laid in Poland. The play was accepted at Covent Garden,

¹ Eusebius gives the tree (torebathus) of Gen. xxxv. 4 a place in his *Onomasticon*; and from it probably the bishop Theophilus in Procop., *De Bld.*, v. 7, had his name.

² The Canaanite sanctuary was represented as a mere temporary usurpation by the tradition (in the Elohistic narrative) that Jacob had bought the site of his altar from the Amorites and bequeathed it to Joseph (Gen. xxxiii. 19, Josh. xxiv. 32; in the latter passage read with LXX. יִרְמְיָהוּ יִרְמְיָהוּ).

³ In Judges ix. 25 read לְבָרְכָהוּ (Wellhausen after MSS. of LXX.), and translate "Who is Abimelech or who are the Shechemites (his supporters) that we should be his slaves?" By all means let the son of Jerubbaal and Zebul his officer enslave the men of Hameor father of Shechem; but why should we (Hebrews) be his slaves?" These words cannot have been spoken after the Shechemites had renounced Abimelech, vv. 28, 30 ought to stand immediately after ver. 22. See W. R. Smith, in *Theol. Tijdschrift*, 1886, p. 195 sq.

and in the fertile fancy of the poet the play had already gained for him a great dramatic fame, when Colman, the licenser, refused it his sanction, on the plea of its containing certain treasonable allusions, and Shee, in great wrath, resolved to make his appeal to the public. This violent threat he carried out in 1824, but unfortunately the public found other business to mind, and *Alasco* is still on the list of unacted dramas. On the death of Lawrence in 1830, Shee was chosen president of the Royal Academy, and shortly afterwards he received the honour of knighthood. He was excellently qualified by his gentlemanly manners, business habits, and fluent speech for the position; and in the dispute regarding the use of rooms to be provided by Government, and in his examination before the parliamentary committee of 1836, he ably defended the rights of the Academy. He continued to paint till 1845, and died on the 13th of August 1850 in his eightieth year.

The earlier portraits of the artist are carefully finished, easy in action, with good drawing and excellent discrimination of character. They show an undue tendency to redness in the flesh painting,—a defect which is still more apparent in his later works, in which the handling is less "square," crisp, and forcible.

SHEEP. The animals commonly designated by this name constitute the genus *Ovis* of zoologists, a group belonging to the Artiodactyle or paired-toed section of the *Ungulata* or hoofed mammals (see *MAMMALIA*, vol. xv. p. 432). They are ruminants, and belong to the hollow-horned section, *i.e.*, those having persistent horns composed of conical epidermic sheaths, encasing and supported by processes of the frontal bone. This section includes the various species of Oxen, Goats, and Antelopes, as well as the Sheep, animals all so closely related structurally that it is by no means easy to define the differences between them.

In nearly all wild sheep the horns are present in both sexes, though smaller in the female. They are trigonal in section, having always three more or less distinctly marked surfaces, divided by edges running longitudinally to the axis of the horn, sometimes sharply prominent and sometimes rounded off. They are also marked by numerous transverse ridges and constrictions, and present a strong more or less spiral curve, which varies in direction in different species. The teeth resemble generally those of the other *Bovida*. The upper incisors and canines are entirely wanting, their place being taken by a callous pad against which the lower front teeth bite. These are eight in number, all much alike and in close contact; the outer pair represent the canines, the rest the incisors. On each side of the mouth above and below are six teeth close together, three of which are premolars (replacing milk teeth) and three true molars, all markedly solenodont (the grinding surfaces presenting crescent-like patterns) and hypsodont, or with long crowns and small roots. The dental formula is thus—Incisors $\frac{0}{0}$, canines $\frac{0}{0}$, premolars $\frac{3}{3}$, molars $\frac{3}{3}$, $=\frac{16}{16}$; total of both sides 32. The vertebral formula is—cervical 7, dorsal 13, lumbar 6 or 7, sacral 4, caudal variable. In the feet the hoofs of the two middle toes (third and fourth) only reach the ground, and are equally developed. The outer toes (second and fifth) are very rudimentary, represented only by small hoofs, without bony phalanges, and by the proximal or upper ends of the slender splint-like metacarpal or metatarsal bones. Between the two middle toes, in most species, is lodged a deep sac, having the form of a rotator and with a small external orifice, which secretes an unctuous and odorous substance. This, tainting the herbage or stones over which the animal walks, affords the means by which, through the powerfully developed sense of smell, the neighbourhood of other individuals of the species is recognized. The crumen or suborbital gland, which is so largely developed and probably performs the same office in some

antelopes and deer, is present, but in a comparatively rudimentary form, though varying in different species. The tail, though long in many varieties of domestic sheep, is short in all the wild species, in which also the external covering of the body is in the main hairy,—the fine fleecy coats of wool, or hair so modified as to have the property of "felting" or adhering together under pressure, which give such value to many breeds, having been especially cultivated by selective breeding.

The sheep was a domestic animal in Asia and Europe before the dawn of history, though quite unknown as such in the New World until after the Spanish conquest. It has now been introduced by man into almost all parts of the world where settled agricultural operations are carried on, but flourishes especially in the temperate regions of both hemispheres. Whether our well-known and useful animal is derived from any one of the existing wild species, or from the crossing of several, or from some now extinct species, is quite a matter of conjecture. The variations of external characters seen in the different domestic breeds

Mouflon (*Ovis montanus*). From a living animal in the London Zoological Gardens.

are very great. They are chiefly manifested in the form and number of the horns, which may be increased from the normal two to four or even eight, or may be altogether absent in the female alone or in both sexes; in the form and length of the ears, which often hang pendent by the side of the head; in the peculiar elevation or arching of the nasal bones in some Eastern races; in the length of the tail, and the development of great masses of fat at each side of its root or in the tail itself; and in the colour and quality of the fleece. See *AGRICULTURE*.

The distinction of the various permanent modifications under which wild sheep occur is a matter of considerable difficulty. Trivial characters, such as size, slight variations in colour, and especially the form and curvature of the horns, are relied upon by different zoologists who have given attention to the subject in the discrimination of species, but no complete accord has yet been established. The most generally recognized forms are enumerated below.

The geographical distribution of wild sheep is interesting. The immense mountain ranges of Central Asia, the Pamir and Thian Shan of Turkestan, may be looked upon as the centre of their habitat. Now, at an elevation of 16,000 feet above the sea-level, is the home of the magnificent *Ovis poli*, named after the celebrated Venetian traveller Marco Polo, who met with it in his adventurous travels through this region in the 13th century. It is remarkable for the great size of the horns of the old rams and the wide open sweep of their curve, so that the points stand boldly

out on each side, far away from the animal's head, instead of curling round nearly in the same plane, as in most of the allied species. A very similar if not identical species from the same origin, in which the horns retain their more normal development, has occurred the name of *O. leucurus*. Eastward and southward is found the aigali (*O. ammon*), with a wide and not very well determined range. Still further north, in the Stanovoi Mountains and Kamchatka, is *O. unicolor*, and away on the other side of Behning's Strait, in the Rocky Mountains and adjacent high lands of western North America, is the "bighorn" or mountain sheep (*O. montanus*), the only one of the genus found in that continent and indeed—except the bison, the musk-ox (*Ovibos*), mountain goat (*Aplocos*), and the pongoebuck (*Antilocapra*)—the only hollow-horned ruminant, being like the rest otherwise a straggler from the cradle of its race. Turning southward from the point from which we started, and still a little to the east, in Nepal and Little Tibet, is *O. hodgsoni*, a species with large and strongly curved horns, and another with smaller and more spreading horns, the biruhel, *O. nudoos*. Passing in a south-westerly direction we find a series of smaller forms, *O. vignei* of Ladakh, *O. cyclopterus* of northern India, Persia, and Baluchistan, *O. qumalis* of Asia Minor, *O. cydonus*, confined to the elevated pine-clad Troodos Mountains of the island of Cyprus, and said at the time of the British occupation in 1878 to have been reduced to a flock of about twenty-five individuals, and *O. mussoni*, the mouflon of Corsica and Sardinia (see figure), believed to have been formerly also a native of Spain. Lastly, we have the somewhat aberrant goat-like animal, *O. tragelaphus*, of the great mountain ranges of North Africa.

We thus find that sheep are essentially inhabitants of high mountainous parts of the world, for dwelling among which their wonderful powers of climbing and leaping give them special advantages. No species frequent by choice either level deserts, open plains, dense forests, or swamps. By far the greater number of species are inhabitants of the continent of Asia, one or perhaps two extending into North America, one into Southern Europe, and one into North Africa. No wild sheep occurs in any other part of the world, unless the so-called musk-ox (*Ovibos moschatus*) of the Arctic regions, the nearest existing ally to the true sheep, may be considered as one. Geologically speaking, sheep appear to be very modern animals, or perhaps it would be safer to say that no remains that can be with certainty referred to the genus have been met with in the hitherto explored Tertiary beds, which have yielded such abundant modifications of antelopes and deer. They are apparently not indigenous in the British Isles, but were probably introduced by man from the East in prehistoric times. (W. L. F.)

SHEEPSHEAD is the name of one of the largest species of the genus *Sargus*, marine fishes known on the coasts of southern Europe as "sargo" or "sargu." These fishes possess two kinds of teeth—one, broad and flat, like incisors, occupying in a single series the front of the jaws,

Sheepshead.

the other, semiglobular and molar-like, arranged in several series on the sides of the jaws. For the systematic position of the genus, see vol. xii. p. 689. The sheepshead, *Sargus ovis*, occurs in abundance on the Atlantic coasts of the United States, from Cape Cod to Florida, and is one of the most valued food-fishes of North America. It is said to attain to a length of 30 inches and a weight of 15

pounds. Its food consists of shellfish, which it detaches with its incisors from the base to which they are fixed, crushing them with its powerful molars. It may be distinguished from some other allied species occurring in the same seas by the presence of seven or eight dark cross-bands traversing the body, by a recumbent spine in front of the dorsal fin, by twelve spines and as many rays of the dorsal and ten rays of the anal fin, and by forty-six scales along the lateral line. The term "sheepshead" is also given in some parts of North America to a very different fish, a freshwater Salmonid, *Corvinus oscula*, which is much less esteemed for the table.

SHEERNESS-ON-SEA, a seaport, watering-place, naval establishment, and garrison town in the Isle of Sheppey, Kent, is situated on the Thames at the mouth of the Medway, on the Sittingbourne branch of the London, Chatham, and Dover Railway, 52 miles east of London, and 17 north-east of Maidstone. The older part of Sheerness, containing the dockyard, is called Blue Town, the later additions being known as Miletown, Bankstown, and Mainetown. Mainetown consists chiefly of houses occupied by summer visitors, but although there is a good beach for bathing the presence of the dockyard with its surroundings has militated against the success of the town as a watering-place. The dockyard, erected by the admiralty about 1830, was seriously damaged by fire in 1881. The naval establishment is only of the second-class, the basins being too small to admit vessels of the largest size. The dockyard is 60 acres in extent, and contains naval barracks with accommodation for 1000 men. A fort was built at Sheerness by Charles II., which on the 10th July 1667 was taken by the Dutch fleet under De Ruyter. After this mishap it was strengthened and a dockyard was formed. The fortifications are now of great strength, £100,000 having been spent in adapting them to modern necessities. The town is in the parish of Minster, which possesses the most ancient abbey church in England. The population of the urban sanitary district (area 938 acres) in 1871 was 13,956, and in 1881 it was 14,286.

SHEFFIELD, a municipal and parliamentary borough in the West Riding of Yorkshire, next to Leeds the largest town in the county, and the chief seat of the cutlery trade in England, is situated on somewhat hilly ground in the neighbourhood of the Pennine range, on several rivers and streams, the principal of which are the Don, the Sheaf, the Porter, the Rivelin, and the Loxley, and on the Midland, Great Northern, and various branch railway lines, 39 miles south of Leeds, 37 south-east of Manchester, 172 north of London by the Midland Railway, and 162 by the Great Northern. The borough of Sheffield is coextensive with the parish, and embraces a district 10 miles in length by 3 or 4 miles in breadth. It includes the townships of Sheffield, Brightside, Barlow, Attercliffe-cum-Darnall, Nether Hallam, Heeley, Ecclesall Bierlow, and Upper Hallam, the last two districts being in great part rural, but occupied also by the southern and western suburbs of the borough. The older portions of the town are somewhat irregularly built, and in some districts densely populated, but much has been done of late years to widen and otherwise improve the streets in the central districts by the operation of an Act passed in 1875, the expense amounting in all to about £1,000,000. The suburbs contain a large number of beautiful terraces and mansions, pictuously situated in the neighbourhood of fine natural scenery. A considerable portion of them is occupied by workmen's cottages, many of which are surrounded by well-kept gardens.

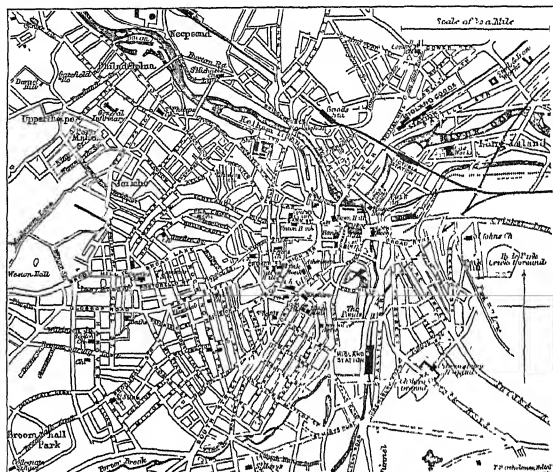

Sheffield in 1845 was divided into twenty-five parochial districts, which have been gradually added to in successive years, and in 1855 it was constituted a deanery. The

only ecclesiastical building of special interest is the old parish church of St Peter, chiefly in the Perpendicular style, originally cruciform, but by various additions now rectangular. The old Norman building is supposed to have been burned down during the wars of Edward III with the barons, and the most ancient part of the present structure is the tower, dating from the 14th century. The church has lately been restored at the cost of about £20,000. It contains a large number of interesting mural monuments.

The free grammar school was founded in 1603 through a bequest of Thomas Smith, a native of Sheffield, practising as an attorney at Crowland, Lincolnshire, and it received the sanction of King James I in 1604, with the title "The Free Grammar School of King James of England." The grammar school building of stone in the Tudor style, erected in 1824, is now (1886) used as a technical school, the grammar school trustees having purchased the collegiate school at Broomhall Park. The other principal educational institutions are the free writing school (1715, rebuilt in 1827), the boys' charity school (founded 1706), the girls' charity school (1786), the Roman Catholic reformatory (1861), the Church of England educational institute, the Firth College, erected by Mark Firth at a cost of £20,000, for lectures and classes in connexion with the extension of university education, the Wesley College, associated with London University, Rammoor College, for training young men for the ministry in the Methodist New Connexion, the mechanics' institute, the school of art, and the St George's Museum, founded by Mr Ruskin, and including a picture gallery, a library, and a mineral, a natural history, and a botanical collection, the special purpose of the institution being the training of art students. The school board was first elected in 1870, and carries on its operations with great energy and success.

The principal public buildings are the town-hall, including the police offices and rooms for the quarter sessions and other courts, erected in 1808, enlarged in 1833, and lately extensively remodelled at a cost of over £10,000; the council hall and municipal buildings, originally used for the mechanics' institute, but purchased by the corporation in 1864; the cutlers' hall, built in 1832 at a cost of £3500, and enlarged in 1857 by the addition of a magnificent banqueting hall, erected at a cost of £9000; the general post office, in the Doric style, opened in 1874; the fine new corn exchange, in the Tudor style, erected at a cost of £80,000; the Albert Hall, opened in 1873 by a joint-stock company for concerts and public meetings; the music hall, erected in 1823, the freemasons' hall, opened in 1877; the temperance halls, 1856; the Norfolk market hall, opened in 1887 at a cost of £40,000; the theatre royal, originally erected in 1793, rebuilt in 1880 at a cost of £8000; the Alexandra theatre, erected 1836-7 at a cost of £8000; the barracks, having accommodation for a cavalry and an infantry regiment and surrounded by grounds 25 acres in extent; and the volunteer artillery drill hall, erected at a cost of £9000. The literary and social institutions include the Athenæum, established in 1847, with a newsroom and library; the

literary and philosophical society, 1822, the Sheffield club, 1862, the Sheffield library, commenced in 1777, and containing 80,000 volumes, and the free library, founded in 1856, with various branches opened in subsequent years. Among the medical or benevolent institutions may be mentioned the general infirmary, opened in 1797, and successively enlarged and improved as requirements demanded; the public hospital, erected in 1858 (in connexion with the Sheffield medical school established in 1792) and extended in 1869; the hospital for women, originally established in 1864, but transferred in 1878 to a new building erected at the expense of Thomas Jessop, and now called the Jessop hospital for women, the hospital for diseases of the skin, 1880, the ear and throat hospital, 1880, the fever hospital, erected by the Town Council at a cost of about £25,000, the school and manufactory for the blind, 1879, the South Yorkshire lunatic asylum, 1872; the Shrewsbury hospital for twenty men and twenty women, originally founded by the seventh earl of Shrewsbury, who died in 1616, but since greatly enlarged by successive

Map of Sheffield.

benefactions; the Hollis hospital, established in 1700 for widows of cutlers, &c.; the Firth almshouses, erected and endowed in 1860 by Mark Firth of Oakbrook at a cost of £30,000; the licensed victuallers' asylum, 1878; the Deakin institution, 1849; Hanley's charity, 1766; and Hadfield's charity, 1860.

The public monuments are neither numerous nor important, the principal being the Montgomery statue, erected to James Montgomery the poet in 1861, chiefly by the Sunday school teachers of the town, the Ebenezer Elliot monument, erected in the market-place in 1854, and removed to Weston Park in 1875, the column to Godfrey Sykes the artist, erected in Weston Park in 1871, the cholera monument 1834-5, and the Crimean monument to the natives of Sheffield who died in the Crimean War.

The town is comparatively well supplied with parks and public gardens. In three of the more populous districts the duke of Norfolk, lord of the manor, presented plots of ground amounting in all to 26 acres, to be used as recreation grounds. In the western suburbs is the

Weston Park and Museum, occupying the grounds and mansion house of Weston Hall, which the town council purchased in 1873. The grounds are about 13 acres in extent, and the museum includes—in addition to the Mappin Art Gallery, now (1886) being erected from the bequest of John Newton Mappin—a picture gallery, a natural history collection, and an extensive collection of British antiquities. The Fifth Park, on the north-east of the town, 36 acres in extent, was purchased by Mark Firth, and presented to the town, the opening ceremony by the prince and princess of Wales taking place 16th August 1875. The Norfolk Park, 60 acres in extent, is granted by the duke of Norfolk for the use of the town, but remains his property. The botanical gardens, 18 acres in extent, situated in the western suburbs, are the property of a company, but on certain days they are open to the public at a small charge. The Biamall Lane cricket ground is the scene of most of the Yorkshire county cricket matches.

The prosperity of Sheffield is chiefly dependent on the manufacture of steel and the application of it to its various uses. The smelting of iron in the district is supposed to date from Roman times, and there is distinct proof of smelting it back as far as the Norman Conquest. The town had become famous for its early by the 14th century, as is shown by allusions in Chaucer. There was an important trade carried on in knives in the reign of Elizabeth, and the Cutlers' Company was incorporated in 1624. In early times cutlery was made of blister or cast steel, afterwards shear steel was introduced for the same purpose, but in 1740 Benjamin Huntsman of Handsworth introduced the manufacture of cast steel, and up to the present time Sheffield retains its supremacy in steel manufacture, notwithstanding foreign competition, especially that of Germany and the United States, its trade in heavy steel having kept pace with that in the other branches. It was with the aid of Sheffield capital that Henry Bessemer founded his pioneer works to develop the manufacture of his invention, and a large quantity of Bessemer steel is still made in Sheffield. The heavy branches of the steel manufacture includes armor plates, rails, tyres, axles, large castings for engines, steel shafts, and steel for rivets. The cutlery trade embraces almost every variety of instrument and tool,—spring and table knives, razors, scissors, surgical instruments, mathematical instruments, edge tools, saws, scythes, sickles, spades, shovels, engineering tools, hammers, vices, &c. The manufacture of engines and machinery is also largely carried on, as well as that of stoves and grates. The art of silver plating was introduced by Thomas Bolsover in 1745, and the manufacture is still of importance. Among the minor industries of the town are tanning, confectionery, cabinetmaking, bicycle-making, iron and brass founding, silver refining, and the manufacture of brushes and combs and of optical instruments. On account of various outrages perpetrated by artisans in workshops against persons obnoxious to them, a Government commission was in 1867 appointed to make inquiries, the result being the exposure and suppression of confederacies in connection with various workmen's unions.

The town trust for the administration of property belonging to the town dates from the 14th century, and in 1681 the number and manner of election of the "town trustees" was definitely settled by a decree of the Court of Chancery. Additional powers were conferred on the trustees by an Act passed in 1874. The annual income of the trust property now amounts to about £5000. Sheffield obtained municipal government in 1848, and was elevated into a city in 1857. The number of aldermen is six. Since 1864 the town council have had control of the police, of the maintenance of the streets, and of the drainage and sanitary arrangements, but the supplies of water and gas are in the hands of private companies. The markets belong to the duke of Norfolk, lord of the manor. The town first returned members to parliament in 1832. In 1886 the representation was increased from two to five members, the parliamentary divisions being Aldcliffe, Brightside Central, Ecclesall, and Hallam. The area of the municipal and parliamentary borough is 10,651 acres. From 45,755 in 1801 the population had increased by 1841 to 110,891, by 1871 to 239,947, and by 1881 to 284,608 (141,208 males, 143,210 females).

Sheffield was the capital of Hallamshire from the Norman Conquest, and it is supposed that the "aula" of the Saxon Lord Waltheof mentioned in Domesday was on the Castle Hill. After the execution of Waltheof for a conspiracy against the Conqueror in 1076 the manor for some time remained in the hands of his countess, but in 1080 was possessed by Roger de Busli. Afterwards it passed to the De Lovetots, barons of Huntingdonshire, one of whom had a castle at Sheffield. A number of people, workers in iron, gathered round the castle and formed the nucleus of the

town. Though an heiress of the De Lovetots it passed in the reign of Richard I to the De Furnivals, one of whom, Thomas de Furnival, strengthened and completed the castle, and obtained from Edward I a charter under the great seal for a market and annual fair. After the extinction of the male line of the Furnivals in 1409, the manor passed to the Talbotts, of whom John, referred to in Shakespeare's *Henry VI.*, was created earl of Shrewsbury in 1442. Cardinal Wolsey, during his disgrace, was for some time placed in Sheffield Castle under the charge of George, fourth earl of Shrewsbury, and Queen Mary remained a prisoner in it under the care of George, sixth earl, from the autumn of 1570 to the autumn of 1584. During the Civil Wars the castle was seized in 1642 by the Parliamentary party, who garrisoned it and threw up entrenchments round the town, but after the capture of Shrewsbury in April 1643 they, on the approach of the earl of Newcastle, left it in panic and fled to Derbyshire. It was, however, recaptured by the party in the following year, and was subsequently demolished. In 1654 the estate passed by marriage to the Howards, dukes of Norfolk.

SHEFFIELD, JOHN See BUCKINGHAMSHIRE, DUKE OF

SHEIL, RICHARD LALOR (1791-1851), Irish political orator, was the eldest son of Edward Sheil, an Irishman who had acquired considerable wealth in Spain, and after the passing of the Act permitting Catholics in Ireland to purchase and transmit property in fee had returned to Ireland, where he purchased the estate of Bellevue, Tipperary. The son was born 17th August 1791, at Drumdowney, Tipperary. He received instruction in French and Latin from the Abbé de Grimeau, a French refugee, and afterwards at Kensington House school, London, presided over by a French nobleman, the Prince de Broglie. In October 1804 he was removed to the college at Stonyhurst, Lancashire, and in November 1807 entered Trinity College, Dublin, where he specially distinguished himself in the debates of the Historical Society. He graduated B.A. in July 1811, and on 13th November of the same year entered Lincoln's Inn, preparatory to being called to the Irish bar. He was admitted a member of the Irish bar at the Hilary term 1814, and meanwhile resolved to support himself by writing plays. His play of *Adelaide, or the Emigrants*, was played at the Crow Street theatre, Dublin, 19th February 1814, with complete success, and on the 23d May 1816 was performed at Covent Garden. The *Apostate*, produced at the latter theatre on 3d May 1817, firmly established his reputation, and encouraged him to continue his dramatic efforts till his legal and political duties absorbed the greater part of his leisure. His principal other plays are *Bellamira* (written in 1818), *Eucadne* (1819), *Zuguenot*, (1819), and *Montana* (1820). In 1822 he began, along with W. H. Curran, to contribute to the *New Monthly Magazine* a series of papers entitled *Sketches of the Irish Bar*, which attracted considerable attention by their recondite and graphic vigour. Those written by Sheil were published in 1855 in two volumes, with a sketch of his life. Sheil was one of the principal founders of the Catholic Association in 1823, and drew up the petition for inquiry into the mode of administering the laws in Ireland, which was presented in the same year to both Houses of Parliament. After the defeat of the Catholic Relief Bill in 1825 he suggested the formation of the New Catholic Association, and, along with O'Connell, was the principal leader of the agitation persistently carried on till Catholic emancipation was granted in 1829. In the same year he was returned to parliament for Melbourne Port, and in 1831 for Louth. He took a prominent part in all the debates relating to Ireland, and his brilliant eloquence gradually captivated the admiration of the House. In August 1839 he became vice-president of the board of trade in Lord Melbourne's

ministry. After the accession of Lord John Russell to power in 1846 he was appointed master of the mint. Being desirous, on account of his wife's health, to obtain diplomatic employment abroad, he was in 1850 appointed minister at the court of Tuscany. He died somewhat suddenly of gout at Florence on May 23, 1851.

See *Memoirs of Richard L. Lolo Sheel*, by W. Torrens M'Cullagh (2 vols., 1855).

SHEKEL. In the system of Babylonian and Assyrian weights the talent (called in Heb. שֶׁקֶל, kikkar) consisted of 60 mana (Heb. מָנָה, maneh) or minas, and the latter again of sixty shekels (Heb. שֶׁקֶל). For the values of these weights see NUMISMATICS, vol. xvii, p. 631, where it is also explained that the Phoenicians and Hebrews modified the system and reckoned only 50 shekels to the maneh, at all events in applying the names to money, *etc.*, to the precious metals,¹ and that the weight of their silver shekel was also probably modified for convenience of interchange between the gold and silver standard. The silver shekels of the Maccabees (NUMISMATICS, p. 650) have a maximum weight of about 224 grains, and correspond to the Phoenician tetradrachm (four drams). Hence in Matt. xvii. 24 the temple tax of half a shekel is called the didrachm (2 drams). In 2 Sam. xiv. 26 we read of shekels "after the king's weight," *etc.*, according to the Assyrian standard, which is called "royal" on weights found at Nineveh. The Hebrews divided the shekel into twenty parts, each of which was a gerah (גֵּרָה).

SHELBURNE, EARL OF. See LANSDOWNE, MARQUIS OF.

SHELD-DRAKE, or, as commonly spelt in its contracted form, **SHELDRAKE**, a word whose derivation² has been much discussed, one of the most conspicuous birds of the Duck tribe, *Anatidae*, called, however, in many parts of England the "Burrow-Duck" from its habits presently to be mentioned, and in some districts by the almost obsolete name of "Bargander" (Dutch, *Berg-vende*, Germ. *Berg-ente*), a word used by Turner in 1544.

The Sheldrake is the *Anas tadornæ* of Linnæus, and the *Tadornæ vulva* or *T. vulpanser* of modern ornithology, a bird somewhat larger and of more upright stature than a ordinary Duck, having its bill, with a beak fleshy protuberance (whence the specific term *cornuta*), pale red, the head and upper neck very dark glossy green, and beneath that a broad white collar, succeeded by a still broader belt of bright bay extending from the upper back across the upper breast. The outer scapulars, the primaries, a median abdominal stripe, which dilates at the vent, and a bar at the tip of the middle tail-quills are black; the inner secondaries and the lower tail-coverts are grey, and the speculum or wing-spot is a rich bronze-green. The rest of the plumage is pure white, and the legs are flesh-coloured. There is little external difference between the sexes, the female being only somewhat smaller and less brightly coloured. The Sheldrake frequents the sandy coasts of nearly the whole of Europe and North Africa, extending across Asia to India, China, and Japan, generally keeping in pairs and sometimes penetrating to favourable inland localities. The nest is always made under cover, usually in a rabbit-hole among sandhills, and in the Frisian Islands the people supply this bird with artificial burrows, taking large toll of its eggs and down. Barbary, south-eastern Europe, and Central Asia are inhabited by an allied

species of more inland range and very different coloration, the *T. casarca* or *Casarca rubra* of ornithologists, the Ruddy Sheldrake of English authors—for it has several times strayed to the British Islands,—and the "Brahmy Duck" of Anglo-Indians, who find it resorting in winter, whether by pairs or by thousands, to their inland waters. This species is of an almost uniform bay colour all over, except the quill-feathers of the wings and tail, and (in the male) a ring round the neck, which are black, while the wing-coverts are white and the speculum shines with green and purple; the bill and legs are dark-coloured.³ A species closely resembling the last, but with a grey head, *T. cana*, inhabits South Africa, while in some of the islands of the Malay Archipelago, and in the northern parts of Australia, there is a fourth species, *T. ratcha*, which almost equals the two Sheldrakes in its highly contrasted plumage, but yet wants some of the lively colours the latter displays—its head, for instance, being white instead of dark green. Further to the southward in Australia occurs another species of more somber colour, the *T. tadornoides*, and New Zealand is the home of a sixth species, *T. cornuta*, still less distinguished by bright hues. In the last two the plumage of the sexes differs not inconsiderably, but all are believed to have essentially the same habits as the *T. cornuta*.⁴

It is not without a purpose that these different species are here particularized. Sheldrakes will, if attention be paid to their wants, breed freely in captivity, crossing if opportunity be given them with other species, and an incident therewith connected possesses an importance hardly to be overrated by the philosophical naturalist, though it seems not to have met with the attention it deserves. In the Zoological Society's gardens in the spring of 1859 a male of *T. cornuta* mated with a female of *T. cana*, and, as will have been inferred from what has been before stated, these two species differ greatly in the colouring of their plumage. The young of their union, however, presented an appearance wholly unlike that of either parent, and an appearance which can hardly be said, as has been said (*P. Z. N.*, 1859, p. 442), to be "a curious combination of the colours of the two." Both sexes of this hybrid have been admirably portrayed by Mr. Wolf (*Ann. Nat. Hist.*, vol. 18, p. 158); and, strange to say, when these figures are compared with equally faithful portraits by the same master (*op. cit.*, 1864, pls. 18, 19) of the Australian and New Zealand species, *T. tadornoides* and *T. variegata*, it will at once be seen that the hybrids present an appearance almost midway between the two species last named—species which certainly had nothing to do with their production. The only explanation of this astounding fact seems to be that afforded by the principle of "reversion," as set forth by Mr. Darwin, and illustrated by him from examples of certain breeds of Pigeons, domestic Fowls, and Ducks (*Anim. and Pl. under Domestication*, i. pp. 197–200, ii. p. 40), as well as, in the matter of domestic Fowls, by Mr. Cambridge Phillips (*Zoologist*, 1884, p. 331). It is a perfectly fair hypothesis that the existing animals of New Zealand and Australia retain more of their ancestral character than do those of countries in which we may suppose the struggle for life to have been fiercer and the action of natural selection stronger. Why it is so we cannot say, yet experiment proves that the most widely different breeds of Pigeons and other poultry, when crossed, produce offspring that more resembles the ancestral wild species from which the domesticated forms have sprung than it resembles either of the immediate parents. This mysterious agency is known as

¹ See Exod. xxxviii. 25, where there are 3000 shekels in the talent.
² Ray in 1674 (*Engl. Words*, p. 78) gave it from the loan "sheel" (=particoloured), which, applied to animals, as a horse or a cat, still survives in East Anglia. This opinion is not only untenable but is confirmed by the bird's Old Norse name *Skeidungr*, from *Skeid*, primarily a patch, and now commonly bestowed on a pebbled horse, just as *Skeidja* (Cassidy's *Irish Diet.*, *sub voce*), from the same source, is a particoloured cow. But some scholars interpret *Skeidungr* by the secondary meaning of *Skeid*, a shield, asserting that it refers to "the shield-like band across the breast" of the bird. If they be right the proper spelling of the English word would be "Shield-drake," as some indeed have it. A third suggested meaning, from the Old Norse *Skeif*, shelter, is philosophically to be rejected, but, if true, would refer to the bird's habit, described in the text, of breeding under cover.

³ This is the Latinized form of the French *Tadornæ*, first published by Belon (1555), a word on which Linné throws no light except to state that it has a southern variant *Tardone*.

⁴ Bonaparte was pleased in 1838 to separate this species from the genus *Tadornæ*, but neither he nor any of his successors has shown any good reason for doing so.

⁵ Jerdon (*D. India*, iii. p. 793) tells of a Hindu belief that once upon a time two lovers were transformed into birds of this species, and that they or their descendants are condemned to pass the night on the opposite banks of a river, whence they incessantly call to one another: "Charkwa, shall I come!" "No, Charkwa!" "Charkwa, shall I come!" "No, Charkwa." As to how, under these circumstances, the race is perpetuated the legend is silent.

⁶ The *Anas scutellata* of the Indo-Malay countries is by several authorities considered to be a *Tadornæ*, but this view is denied by others, among them by Mr. Hume (*Stray Feathers*, viii. p. 168).

the principle of "revision," and the example just cited proves that the same effect is produced in species as well as in "races,"—indicating the essential identity of both,—the only real difference being that "species" are more differentiated than are "races," or that the distinction between them, instead of being (as many writers, some of the first repute, have maintained) qualitative, is merely quantitative, or one of degree.¹

The genus *Tudora*, as shown by its tracheal characters, seems to be most nearly related to *Chenelopex*, containing the bird so well known as the Egyptian Goose, *C. aegyptiaca*, and an allied species, *C. rubata*, from South America. For the same reason the genus *Plectropterus*, composed of the Spur-winged Geese of Africa, and perhaps the Australian *Anseranas* and the Indian and Ethiopian *Sarcularnas*, also appear to belong to the same group, which should be reckoned rather to the Anatine than to the Anserine section of the *Anatida*. (A. N.)

SHELLEY, MARY WOLLSTONECRAFT (1797–1851), the second wife of the poet SHELLEIGH (q.v.), born in London, August 30, 1797 (see vol. x p. 717), deserves some notice on her own account, as a writer of romance, chiefly imaginative. When she was in Switzerland with Shelley and Byron in 1810 (see below), a proposal was made that various members of the party should write a romance or tale dealing with the supernatural. The result of this project was that Mrs Shelley wrote *Frankenstein*, Byron the beginning of a narrative about a vampyre, and Dr Polidori, Byron's physician, a tale named *The Vampyre*, the authorship of which used frequently in past years to be attributed to Byron himself. *Frankenstein*, published in 1818, when Miss Shelley was at the utmost twenty-one years old, is a very remarkable performance for so young and inexperienced a writer, its main idea is that of the formation and vitalization, by a deep student of the secrets of nature, of an adult man, who, entering the world thus under unnatural conditions, becomes the terror of his species, a half-involuntary criminal, and finally an outcast whose sole resource is self-immolation. This romance was followed by others: *Vallperna, or the Life and Adventures of Castoreo, Prince of Lucera* (1823), an historical tale written with a good deal of spirit, and readable enough even now; *The Last Man* (1826), a fiction of the final agonies of human society owing to the universal spread of a pestilence,—this is written in a very suited style, but bears some traces of the imagination which fashioned *Frankenstein*; *The Fortunes of Perkin Warbeck* (1830), *Lucretia* (1835); and *Falkner* (1837). Besides these novels there was the *Journal of a Sic Wechs Tour* (the tour of 1814 mentioned below), which is published in conjunction with Shelley's prose-writings; also *Reminiscences in Germany and Italy* in 1840–42–43 (which shows an observant spirit, capable of making some true forecasts of the future), and various miscellaneous writings. After the death of Shelley, for whom she had a deep and even enthusiastic affection, marred at times by defects of temper, Mrs Shelley in the autumn of 1823 returned to London. At first the earnings of her pen were her only sustenance; but after a while Sir Timothy Shelley made her an allowance, which would have been withdrawn if she had persisted in a project of writing a full biography of her husband. She was a loving and careful mother, and shared the prosperous fortunes of her son, when, upon the death of Sir Timothy in 1844, he succeeded to the baronetcy. She died in February 1851.

SHELLEY, PERCY BYSSHE (1792–1822), was born on

4th August 1792, at Field Place, near Horsham, Sussex. He was the eldest child of Timothy Shelley, M.P. for Shoreham, by his wife Elizabeth, daughter of Charles Pilfold, of Eppingham, Surrey. Mr Timothy Shelley became in 1815 Sir Timothy Shelley, Bart, upon the decease of his father Bysshe, who was created a baronet in 1806. This Bysshe Shelley was born in Christ Church, Newark, North America, and married two heiresses, the former, the mother of Timothy, being Mary Catherine, heiress of the Rev Theobald Michell, of Housham. He was a handsome man of enterprising and remarkable character, accumulated a vast fortune, built Castle Goring, and lived in sullen and penurious retirement in his closing years. None of his talent seems to have descended to Timothy, who, except for being of a rather oddly self-assertive character, was undistinguishable from the ordinary run of commonplace country squires. The mother of the poet is described as beautiful, and a woman of good abilities, but not with any literary turn, she was an agreeable letter-writer. The branch of the Shelley family to which the poet Percy Bysshe belonged traces its pedigree to Henry Shelley, of Worminghurst, Sussex, who died in 1623. Beyond that point the genealogical record is not clear; yet no substantial doubt exists that these Worminghursts or Castle Goring Shelleys are of the same stock as the Michelgrove Shelleys, who trace up to Sir William Shelley, judge of the common pleas under Henry VII., thence to a member of parliament in 1415, and to the reign of Edward I., or even to the epoch of the Norman Conquest. The Worminghurst branch was a family of credit, but not of distinction, until its fortunes culminated under the above-named Sir Bysshe.

In the character of Percy Bysshe Shelley three qualities become early manifest, and may be regarded as innate: impressionableness or extreme susceptibility to external and internal impulses of feeling, a lively imagination or erratic fancy, blurring a sound estimate of solid facts, and a resolute repudiation of outer authority or the despotism of custom. These qualities were highly developed in his earliest manhood, were active in his boyhood, and no doubt made some show even on the borderline between childhood and infancy. At the age of six he was sent to a day school at Warnham, kept by the Rev Mr Edwards; at ten to Sion House School, Breatford, of which the principal was Dr Greenlaw, while the pupils were mostly sons of local tradesmen; at twelve (or immediately before that age, 29th July 1804) to Eton. The headmaster of Eton, up to nearly the close of Shelley's sojourn in the school, was Dr Goodall, a mild disciplinarian, it is therefore a mistake to suppose that Percy (unless during his very brief stay in the lower school) was frequently flogged by the formidable Dr Keate, who only became headmaster after Goodall. Shelley was a shy, sensitive, mopish sort of boy from one point of view,—from another a very unruly one, having his own notions of justice, independence, and mental freedom, by nature gentle, kindly, and retiring,—under provocation dangerously violent. He resisted the odious flogging system, exerted himself little in the routine of school-learning, and was known both as "Mad Shelley" and as "Shelley the Atheist." Some writers try to show that an Eton boy would be termed atheist without exhibiting any propensity to atheism, but solely on the ground of his being mutinous. However, as Shelley was a declared atheist a good while before attaining his majority, a shrewd suspicion arises that, if Etonians dubbed him atheist, they had some relevant reason for doing so.

Shelley entered University College, Oxford, in April 1810, returned thence to Eton, and finally quitted the school at midsummer, and commenced residence in Oxford

¹ It is further worthy of remark that the young of *T. variegata* when first hatched closely resemble those of *T. castranea*, and when the former assume their first plumage they resemble their father more than their mother (*P. Z. S.*, 1866, p. 150).

in October. Here he met a young Durham man, Thomas Jefferson Hogg, who had preceded him in the university by a couple of months, the two youths at once struck up a warm and intimate friendship. Shelley had at this time a love for chemical experiment, as well as for poetry, philosophy, and classical study, and was in all his tastes and bearing an enthusiast. Hogg was not in the least an enthusiast, rather a cynic, but he also was a steady and well-read classical student. In religious matters both were sceptics, or indeed decided anti-Christians, whether Hogg, as the senior and more informed disputant, pioneered Shelley into strict atheism, or whether Shelley, as the more impassioned and unflinching speculator, outran the easy-going jeering Hogg, is a moot point, we incline to the latter opinion. Certain it is that each egged on the other by perpetual disquisition on abstruse subjects, conducted partly for the sake of truth and partly for that of mental exorcitation, without on either side any disposition to bow to authority or stop short of extreme conclusions. The upshot of this habit was that Shelley and Hogg, at the close of some five months of happy and uneventful academic life, got expelled from the university. Shelley—for he alone figures as the writer of the "little syllabus," although there can be no doubt that Hogg was his confidant and coadjutor throughout—published anonymously a pamphlet or flysheet entitled *The Necessity of Atheism*, which he sent round, or intended to send round, to all sorts of people as an invitation or challenge to discussion. It amounted to saying that neither reason nor testimony is adequate to establish the existence of a deity, and that nothing short of a personal individual self-revelation of the deity would be sufficient. The college authorities heard of the pamphlet, somehow identified Shelley as its author, and summoned him before them—"our master, and two or three of the fellows." The pamphlet was produced, and Shelley was required to say whether he had written it or not. The youth declined to answer the question, and was expelled by a written sentence, ready drawn up. Hogg was next summoned, with a result practically the same. The precise details of this transaction have been much controverted; the best evidence is that which appears on the college records, showing that both Hogg and Shelley (Hogg is there named first) were expelled for "contumaciously refusing to answer questions," and for "repeatedly declining to disavow" the authorship. Thus they were dismissed as being mutineers against academic authority, in a case pregnant with the suspicion—not the proof—of atheism, but how the authorities could know beforehand that the two undergraduates would be contumacious and stiff against disavowal, so as to give warrant for written sentences ready drawn up, is nowhere explained. Possibly the sentences were worded without ground assigned, and would only have been produced *in terrorem* had the young men proved more malleable. The date of this incident was 25th March 1811.

Shelley and Hogg came up to London, where Shelley was soon left alone, as his friend went to York to study at Conyngsby. Percy and his incensed father did not at once come to terms, and for a while he had no resource beyond pocket-money saved up by his sisters (four in number altogether) and sent round to him, sometimes by the hand of a singularly pretty school-fellow, Miss Harriot Westbrook, daughter of a retired and moderately opulent hotel-keeper. Shelley, especially in early youth, had a somewhat "priggish" turn for moralizing and argumentation, and a decided mania for proselytizing; his school-girl sisters, and their little Methodist friend Miss Westbrook, aged between fifteen and sixteen, must all be enlightened and converted to anti-Christianity. He there-

fore cultivated the society of Harriet, calling at the house of her father, and being encouraged in his assiduity by her much older sister Eliza. Harriet not unaturally fell in love with him, and he, though not it would seem at any time ardently in love with her, dallied along the flowery pathway which leads to sentiment and a definite courtship. This was not his first love-affair, for he had but a very few months before been courting his cousin Miss Harriet Grove, who, alarmed at his heterodoxies, finally broke off with him—to his no small grief and perturbation at the time. It is averred, and seemingly with truth, that Shelley never indulged in any sensual or dissipated amou, and, as he advances in life, it becomes apparent that, though capable of the passion of love, and unusually prone to regard with much effusion of sentiment women who interested his mind and heart, the mere attraction of a pretty face or an alluring figure left him unenthralled. After a while Percy was reconciled to his father, revisited his family in Sussex, and then stayed with a cousin in Wales. Hence he was recalled to London by Miss Harriot Westbrook, who wrote complaining of her father's resolve to send her back to her school, in which she was now regarded with repulsion as having become too apt a pupil of the atheist Shelley. He repudiated counselling resistance. "She wrote to say" (these are the words of Shelley in a letter to Hogg, dating towards the end of July 1811) "that resistance was useless, but that she would fly with me, and throw herself upon my protection." Shelley therefore returned to London, where he found Harriet agitated and wavering, finally they agreed to elope, travelled in haste to Edinburgh, and there, according to the law of Scotland, became husband and wife on 28th August. Shelley, it should be understood, had by this time openly broken, not only with the dogmas and conventions of Christian religion, but with many of the institutions of Christian polity, and in especial with such as enforce and regulate marriage; he held—with William Godwin and some other theorists—that marriage ought to be simply a voluntary relation between a man and a woman, to be assumed at joint option and terminated at the after-option of either party. If therefore he had acted upon his personal conviction of the right, he would never have wedded Harriet, whether by Scotch, English, or any other law, but he waived his own theory in favour of the consideration that in such an experiment the woman's stake, and the disadvantages accruing to her, are out of all comparison with the man's. His conduct therefore was so far entirely honourable; and, if it derogated from a principle of his own (a principle which, however contrary to the morality of other people, was and always remained matter of genuine conviction on his individual part), this was only in deference to a higher and more imperative standard of right.

Harriet Shelley was not only beautiful; she was amiable, accommodating, adequately well educated and well bred. She liked reading, and her reading was not strictly frivolous. But she could not (as Shelley said at a later date) "feel poetry and understand philosophy." Her attractions were all on the surface; there was (to use a common phrase) "nothing particular in her." For nearly three years Shelley and she led a shifting sort of life upon an income of £400 a year, one-half of which was allowed (after his first severe indignation at the *miscellane* was past) by Mr Timothy Shelley, and the other half by Mr Westbrook. The spouses left Edinburgh for York and the society of Hogg, broke with him upon a charge made by Harriet, and evidently fully believed by Shelley at the time, that, during a temporary absence of his upon business in Sussex, Hogg had tried to seduce her (this quarrel was entirely made up at the end of about a year); moved off

to Keswick in Cumberland, coupled with the company of Southey, and some hospitality from the duke of Norfolk, who, as chief magnate in the Shocham region of Sussex, was at pains to reconcile the father and his too unfilial heir, sailed thence to Dublin, where Shelley was eager, and in some degree prominent, in the good cause of Catholic emancipation, conjoined with repeal of the union, crossed to Wales, and lived at Nant-Gwilt, near Rhayader, then at Lynnmouth in Devonshire, then at Tanyralt in Carnarvonshire. All this was between September 1811 and February 1813. At Lynnmouth an Irish servant of Shelley's was sentenced to six months' imprisonment for distributing and posting up printed papers, bearing no printer's name, of an inflammatory or seditious tendency—being a *Declaration of Rights* composed by the youthful reformer, and some verses of his named *The Devil's Wall*. At Tanyralt Shelley was (to trust his own and Harriet's account, confirmed by the evidence of Miss Westbrook, the elder sister, who continued an inmate in most of their homes) attacked on the night of 26th February by an assassin who fired three pistol-shots. The motive of the attack was undefined, the fact of its occurrence was generally disbelieved, both at the time and by subsequent inquirers. To analyse the possibilities and probabilities of the case would lead us too far; we can only say that we rank with the decided sceptics. Shelley was full of wild unpractical notions, he dosed himself with laudanum as a palliative to spasmodic pains, he was given to strange assertions and romantic narratives (several of which might properly be specified here but for want of space), and was not incapable of conscious fibbing. His mind no doubt oscillated at times along the line which divides sanity from insane delusion. It is difficult to suppose that he simply invented such a monstrous story to serve a purpose. The very enormity of the story tends to dissuade us from thinking so, and the purpose alleged seems disproportionately small—that of decamping from Tanyralt as creditors should become too pressing. Indeed, we decisively reject this supposed motive. On the other hand, nothing could be traced to corroborate Shelley's assertion. This was at any rate the break-up of the residence at Tanyralt; the Shelleys revisited Ireland, and then settled for a while in London. Here, in June 1813, Harriet gave birth to her daughter Fanny Eliza (she married a Mr. Edgale, and died in 1876). Here also Shelley brought out his first poem of any importance, *Queen Mab*; it was privately printed, as its execrably aggressive tone in matters of religion and morals would not allow of publication.

The speculative sage whom Shelley especially revered was William Godwin, the author of *Political Justice* and of the romance *Caleb Williams*; in 1796 he had married Mary Wollstonecraft, authoress of *The Rights of Woman*, who died shortly after giving birth, on 30th August 1797, to a daughter Mary. With Godwin Shelley had opened a volunteered correspondence late in 1811, and he had known him personally since the winter which closed 1812. Godwin was then a bookseller, living with his second wife, who had been a Mrs. Clairmont; there were four other inmates of the household, two of whom call for some mention here—Fanny Wollstonecraft, the daughter of the authoress and Mr. Inlay, and Claire, the daughter of Mrs. Clairmont. Fanny committed suicide in October 1816, being, according to some accounts which remain unverified, hopelessly in love with Shelley; Claire was closely associated with all his subsequent career. It was towards May 1814 that Shelley first saw Mary Wollstonecraft Godwin as a grown-up girl (she was well on towards seventeen); he instantly fell in love with her, and she with him. Just before this, 24th March, Shelley had remarried Harriet in London, though with no obviously cogent

motive for doing so, but, on becoming enamoured of Mary, he seems to have rapidly made up his mind that Harriet should not stand in the way. She was at Bath while he was in London, and for a while she heard nothing of him. They had, however, met again in London and come to some sort of understanding before the final crisis arrived,—Harriet remonstrating and indignant, but incapable of effective resistance,—Shelley sick of her companionship, and bent upon gratifying his own wishes, which as we have already seen were not at odds with his avowed principles of conduct. For some months past there had been bickerings and misunderstandings between him and Harriet, aggravated by the now detested presence of Miss Westbrook in the house, more than this cannot be said, for no more is at present known. It is certain, however, that evidence exists which, while not plainly proving any grave wrongdoing on Harriet's part, excupiates Shelley from the charge of having separated from her without what appeared to himself sufficient cause. The upset came on 28th July, when Shelley aided Mary to elope from her father's house, Claire Clairmont deciding to accompany them. They crossed to Calais, and proceeded across France into Switzerland. Godwin and his wife were greatly incensed. Though he and Mary Wollstonecraft had entertained and avowed bold opinions regarding the marriage-bond, similar to Shelley's own, and had in their time acted upon these opinions, it is not clearly made out that Mary Godwin had ever been encouraged by paternal influence to think or do the like. Shelley and she chose to act upon their own likings and responsibility,—he disregarding any claim which Harriet had upon him, and Mary setting at naught her father's authority. Both were prepared to ignore the law of the land and the rules of society.

The three young people returned to London in September. In the following January Sir Bysshe Shelley died, and Percy became the immediate heir to the entailed property inherited by his father Sir Timothy. This entailed property seems to have been worth £6000 per annum, or little less. There was another very much larger property which Percy might shortly before have seemed to himself, contingently upon his father's death, if he would have consented to put it upon the same footing of entail; but this he resolutely refused to do, on the professed ground of his being opposed upon principle to the system of entail; therefore, on his grandfather's death the larger property passed wholly away from any interest which Percy might have had in it, in use or in expectancy. He now came to an understanding with his father as to the remaining entailed property; and, giving up certain future advantages, he received henceforth a regular income of £1000 a year. Out of this he assigned £200 a year to Harriet, who had given birth in November to a son, Charles Bysshe (he died in 1826). Shelley, and Mary as well, were on moderately good terms with Harriet, seeing her from time to time. His peculiar views as to the relations of the sexes appear markedly again in his having (so it is alleged) invited Harriet to return to his and Mary's house as a domicile, of course this curious arrangement did not take effect. Shelley and Mary (who was naturally always called Mrs. Shelley) now settled at Bishopgate, near Windsor Forest, here he produced his first excellent poem, *Alastor, or the Spirit of Solitude*, which was published soon afterwards along with a few others. In May 1816 the pair left England for Switzerland, together with Miss Clairmont, and their own infant son William. They went straight to Sécheron, near Geneva, Lord Byron, whose separation from his wife had just then taken place, arrived there immediately afterwards. A great deal of controversy has lately arisen as to the motives and incidents of this foreign sojourn.

The clear fact is that Miss Clairmont, who had a fine voice and some inclination for the stage, had soon Byron, as connected with the management of Drury Lane theatre, early in the year, and an amorous intrigue had begun between them in London. *Prima facie* it seems quite reasonable to suppose that she had explained the facts to Shelley or to Mary, or to both, and had induced them to convey her to the society of Byron abroad, were this finally established as the fact, it would show no inconsistency of conduct, or breach of his own code of sexual morals, on Shelley's part. On the other hand it is asserted that documentary evidence of an irrefragable kind exists showing that Shelley and Mary were totally ignorant of the amour shortly before they went abroad. Whether or not they knew of it while they and Claire were in daily intercourse with Byron, and housed close by him on the shore of the Lake of Geneva, may be left unargued. The three returned to London in September 1816, Byron remaining abroad, and in January 1817 Miss Clairmont gave birth to his daughter named Allegra. The return of the Shelleys was closely followed by two suicides,—first that of Fanny Wollstonecraft (already referred to), and second that of Harriet Shelley, who on 9th November drowned herself in the Serpentine. The latest stages of the lovely and ill-starred Harriet's career have never been very explicitly recorded. It seems that she formed a connexion with some gentleman from whom circumstances or desertion separated her, that her habits became intemperate, and that she was treated with contemptuous harshness by her sister during an illness of their father. She had always had a propensity (often laughed at in earlier and happier days) to the idea of suicide, and she now carried it out in act—possibly without anything which could be regarded as an extremely cogent predisposing motive, although the total weight of her distresses, accumulating within the past two years and a half, was beyond question heavy to bear. Shelley, then at Bath, hurried up to London when he heard of Harriet's death, giving manifest signs of the shock which so terrible a catastrophe had produced on him. Some self-reproach must, no doubt have mingled with his affliction and dismay, yet he does not appear to have considered himself gravely in the wrong at any stage in the transaction, and it is established that in the train of quite recent events which immediately led up to Harriet's suicide he had borne no part.

This was the time when Shelley began to see a great deal of Leigh Hunt, the poet and essayist, editor of *The Examiner*, they were close friends, and Hunt did something (hardly perhaps so much as might have been anticipated) to uphold the reputation of Shelley as a poet—which, we may here say once for all, scarcely obtained any public acceptance or solidity during his brief lifetime. The death of Harriet having removed the only obstacle to a marriage with Mary Godwin, the wedding ensued on 30th December 1816, and the married couple settled down at Great Marlow in Buckinghamshire. Their tranquillity was shortly disturbed by a Chancery suit set in motion by Mr Westbrook, who asked for the custody of his two grandchildren, on the ground that Shelley had deserted his wife and intended to bring up his offspring in his own atheistic and anti-social opinions. Lord Chancellor Eldon delivered judgment towards 26th March 1817. He held that Shelley, having avowed condemnable principles of conduct, and having fashioned his own conduct to correspond, and being likely to inculcate the same principles upon his children, was unfit to have the charge of them. He therefore assigned this charge to Mr and Miss Westbrook, and appointed as their immediate curator Dr Hume, an orthodox army-physician, who was Shelley's own nominee. The poet had to pay for the maintenance

of the children a sum which stood eventually at £120 per annum, if it was at first (as generally stated) £200, that was no more than what he had previously allowed to Harriet. This is the last incident of marked importance in the perturbed career of Shelley, the rest relates to the history of his mind, the poems which he produced and published, and his changes of locality in travelling. In March 1818, after an illness which he regarded (rightly or wrongly) as a dangerous pulmonary attack, Shelley, with his wife, their two infants William and Clara, and Miss Clairmont and her baby Allegra, went off to Italy, in which country the whole short remainder of his life was passed. Allegra was soon sent on to Venice, to her father Byron, who, ever since parting from Miss Clairmont in Switzerland, showed a callous and unfeeling determination to see and know no more about her. In 1818 the Shelleys—mostly, not always, with Miss Clairmont in their company—were in Milan, Leghorn, the Bagni di Lucca, Venice and its neighbourhood, Rome, and Naples, in 1819 in Rome, the vicinity of Leghorn, and Florence (both their infants were now dead, but a third was born late in 1819, the present baronet, Sir Percy Florence Shelley), in 1820 in Pisa, the Bagni di Pisa (or di San Giuliano), and Leghorn, in 1821 in Pisa and with Byron in Ravenna, in 1822 in Pisa and on the Bay of Spezia, between Lerici and San Terenzio. The incidents of this period are but few, and of no great importance apart from their bearing upon the poet's writings. In Leghorn he knew Mr and Mrs Gisborne, the latter a once intimate friend of Godwin, she taught Shelley Spanish, and he was eager to promote a project for a steamer to be built by her son by a former marriage, the young engineer Henry Reveley; it would have been the first steamer to navigate the Gulf of Lyons. In Pisa he formed a sentimental intimacy with the Contessa Emilia Viviani, a girl who was pining in a convent pending her father's choice of a husband for her, this impassioned but vague and fanciful attachment which soon came to an end, as Emilia's character developed less favourably in the eyes of her Platonic adorer—produced the transcendental love-poem of *Epipsychidion* in 1821. In Ravenna the scheme of the quarterly magazine *The Liberal* was conceived by Byron and Shelley, the latter being principally interested in it with a view to benefiting Leigh Hunt by such an association with Byron. In Pisa Byron and Shelley were very constantly together, having in their company at one time or another Captain Medwin (cousin and schoolfellow of Shelley, and one of his biographers), Lieutenant and Mrs Williams, to both of whom our poet was very warmly attached, and Captain Trelawny, the adventurous and romantic-natured seaman who has left important and interesting reminiscences of this period. Byron admired very highly the generous, unworldly, and enthusiastic character of Shelley, and set some value on his writings; Shelley half-worshipped Byron as a poet, and was anxious, but in some conjunctures by no means able, to respect him as a man. In Pisa he knew also Prince Alexander Mavrocordato, one of the pioneers of Grecian insurrection and freedom; the glorious cause fired Shelley, and he wrote the drama of *Hellas* (1821).

The last residence of Shelley was the Casa Magni, a bare and exposed dwelling on the Gulf of Spezia. He and his wife, with the Williamses, went there at the end of April 1822, to spend the summer, which proved an arid and scorching one. Shelley and Williams, both of them insatiably fond of boating, had a small schooner named the "Don Juan" built at Genoa after a design which Williams had procured from a naval friend, and which was the reverse of safe. They received her on 12th May, found her rapid and alert, and on 1st July started in her to

Leghorn, to meet Leigh Hunt, whose arrival in Italy had just been notified. After doing his best to set things going comfortably between Byron and Hunt, Shelley returned on board with Williams on 8th July. It was a day of dark, louring, stifling heat. Trelawny took leave of his two friends, and about half-past six in the evening found himself startled from a doze by a frightful turmoil of storm. The "Don Juan" had by this time made Via Reggio, she was not to be seen, though other vessels which had sailed about the same time were still discernible. Shelley, Williams, and their only companion, a sailor-boy, perished in the squall. The exact nature of the catastrophe was from the first regarded as somewhat disputable, but it is only of late years (1875) that it has been keenly debated. The condition of the "Don Juan" when recovered did not favour any assumption that she had capsized in a heavy sea—rather that she had been run down by some other vessel, a felucca or fishing-smack. In the absence of any counter-evidence this would be supposed to have occurred by accident; but a rumour, not strictly verified and certainly not refuted, exists that an aged Italian seaman on his deathbed confessed that he had been one of the crew of the fatal felucca, and that the collision was intentional, as the men had plotted to steal a sum of money supposed to be on the "Don Juan," in charge of Lord Byron. In fact there was a moderate sum there, but Byron had neither embarked nor intended to embark. This may perhaps be the true account of the tragedy; at any rate Trelawny, the best possible authority on the subject, accepted it as true. If it was who laboriously tracked out the shore-washed corpse of Shelley and Williams, and who undertook the burning of them, after the ancient Greek fashion, on the shore near Via Reggio, on the 15th and 16th of August. The great poet's ashes were then collected, and buried in the new Protestant cemetery in Rome. He was, at the time of his untimely death, within a month of completing the thirtieth year of his age—a surprising example of rich poetic achievement for so young a man.

The character of Shelley can be considered according to two different standards of estimation. We can estimate the original motive forces in his character; or we can form an opinion of his actions, and thence put a certain construction upon his personal qualities. We will first try the latter method. It cannot be denied by his admirers and opponents, and is abundantly clear to his enemies, that his actions were in some considerable degree abnormal, dangerous to the settled basis of society, and marked by headstrong and undutiful presumption. But it is remarkable that, even among the censurers of his conduct, many persons are none the less impressed by the beauty of his character, and thus leads us back to our first point—the original motive forces in that. Here we find enthusiasm, fervour, courage (moral and physical), an unbounded readiness to act upon what he considered right principle, however inconvenient or disastrous the consequences to himself, sweetness and indulgence towards others, extreme generosity, and the principle of love for humankind in abundance and superabundance. He respected the truth, such as he conceived it to be, in spiritual or speculative matters, and respected no construction of the truth which came to him recommended by human authority. No man had more hatred or contempt of custom and prescription; no one had a more authentic and vivid sense of universal charity. The same radiant enthusiasm which appeared in his poetry as idealism stamped his speculation with the conception of perfectibility and his character with loving emotion.

In person Shelley was attractive, winning, and almost beautiful, but not to be called handsome. His height was nearly 5 foot 11, he was slim, agile, and strong, with something of a stoop; his complexion brilliant, his hair abundant and wavy, dark-brown but early beginning to grizzle; the eyes, deep-blue in tint, have been termed "stage-eyes"—large, fixed, and beaming. His voice was wanting in richness and severity—high-pitched, and tending to the screechy; his general aspect, though extremely variable according as his mood of mind and his expression shifted, was on the whole uncommonly juvenile.

From this necessarily very slight account of the life of Shelley we pass to a consideration of the poetry, which is equally the power—of his works in poetry. If we except Goethe (and for convenience sake leaving out of count any living writers, whose ultimate value

(cannot at present be assessed), we consider Shelley to be the supreme poet of the new era which, beginning with the French Revolution, remains continuous into our own day. Lord Byron and Victor Hugo come the nearest to Shelley in poetic stature, and each of them might be said to have been a co-laborer of it; even Wordsworth also has his numerous champions. The grounds on which we set Shelley highest of all are mainly three. He excels all his competitors in idealism, he excels them in music, and he excels them in importance. By importance we here mean the direct impact of the work performed, its controlling power over the reader's thought and feeling, the contagious fire of its white-hot intellectual passion, and the long and elaborate treatment of its theme. Shelley is emphatically the poet of the future. In his own day an alien in the world of mind and invention, and in our day scarcely yet a denizen of it, he appears destined to become, in the long vista of years, an informing presence in the innermost shrine of human thought. Shelley appeared at the time when the sublime furies of the French revolutionary movement had exhausted the elasticity of mere thought—at least in England—and it left thought flaccid and stolid, but that movement prepared another in which revolution was to assume the milder guise of reform, conquering and to conquer. Shelley was its prophet. As an iconoclast and an idealist he took the only position in which a poet could advantageously work as a reformer. To outstage his contemporaries was the condition of leading his successors to triumph and of personally triumphing in their victories. Shelley had the stamp of an innovator and a martyr; and in an age when the poetical he hunted speculative keenness and humanitarian zeal in a degree for which we might vainly seek his precursors. We have already named idealism as one of his leading excellences. This Shelleyan quality combines, as its constituents, sublimity, beauty, and the abstract passion for good. It should be acknowledged that, while this great quality forms the chief and most admirable factor in Shelley's poetry, the defects which go along with it may be weak too often—producing at times vagueness, diffuseness, and a pomp of glittering indistinctness, in which excess of sentiment welters amid excess of words. This blemish affects the long poems much more than the pure lyrics, in the latter the rapture, the music, and the emotion are in exquisite balance, and the work has often as much of delicate sympathy as of fragile and flower-like perfection.

In the course of our biographical narrative we have mentioned a few, but only a few, of Shelley's writings, we must now give some brief account of others. Of his early work prior to *Queen Mab*—such romances as *Zastrozzi* and *St Irvyne*, such verse as the *Fragments of Margaret Nicholson*—we can only here say that they are rubbish. *Alastor* was succeeded (1817) by *The Revolt of Islam*, a poem in which Shelley, in the Spenserian strain, preaching bloodless revolution, is at times finely in parts, but as a whole somewhat long-drawn and exhausting. This transcendental epic (for such it may be termed) was at first named *Loon and Cythra*, or *the Revolution of the Golden City*, and the lovers of the story were then brother and sister as well as lovers—an experiment upon British audiences which the publishers would not conive at. In the year 1818 produced *Requiem and Helen*, a comparatively weak poem, and *Julian and Maddalo*, a very strong one—demonstrating in Shelley a singular power of seeing ordinary things with directness, and at once figuring them as reality and unfiguring them into poetry. The next year, 1819, was his culmination, producing as it did the great tragedy of *The Cenci* and the sublime ideal drama *Prometheus Unbound*, which we have no hesitation in calling his masterpiece. It embodies the forms of strongest imagination and beauty. Shelley's deepest and most daring conceptions. Prometheus, the human mind, has invoked with the powers proper to himself Jupiter the god of heaven, who then upon chains and torments Prometheus and oppresses mankind; in other words, the anthropomorphic god of religion is a creation of the human mind, and both the mind of man and man himself are enslaved as long as this god exists; he is degraded but not classed as inferior to man, who is from of old welded to Asia, or Nature, protests against and anathematizes the usurper enthroned by himself. At last the anathema takes effect. Eternity, Demogorgon, dismisses Jupiter to unending nothingness. Prometheus is at once unbound, the human mind is free; he is reunited to his spouse Nature, and the world of man passes from thralldom and its degradation into limitless progression, or (as the phrase goes) perfectibility, moral and material. Thus we regard as in the argument of *Prometheus Unbound*. It is closely analogous to the argument of the juvenile poem *Queen Mab*, but so raised in form and creative touch that, whereas to write *Queen Mab* was only to be an ambitious and obulient tyro, to invent *Prometheus Unbound* was to be the poet of the future. *The Witch of Atlas* (1820) appears to us the most perfect work among all Shelley's longer poems, though it is inferior to the two mentioned. It is the most intense and powerful exercise of roving imagination—guided, however, by an intense sense of beauty, and by its author's exceeding fineness of nature.

The poem has often been deemed as practically unmeaning, we do not subscribe to this opinion. The "with" of this subtle and magical invention seems to represent that faculty which we term "the fancy," using this assumption as a clue, we find plenty of meaning in the poem, but necessarily it is fanciful or volative meaning. The elegy on Keats, *Adonais*, followed in 1821, the *Triumph of Life*, a mystical and impressive allegory, constructed upon lines made out by Dante and by Petrarch, was occupying the poet up to the time of his death. The stately fragment which remains is probably but a small portion of the projected whole. The translations—chiefly from Homer, Euripides, Calpurnius, and Goethe—date from 1819 to 1822, and testify to the poetic endowment of Shelley not less absolutely than his own original compositions. From this list it will be readily seen that Shelley was not only a prolific but also a versatile poet. Works so various in faculty and in form as *The Revolt of Islam*, *Jubilate et Maledite*, *The Cenci*, *Prometheus Unbound*, *Egyptiaca*, and the gaudy effusions of which *Peter Bell the Third* is the prime example, added to the consummate array of lyrics, have seldom to be credited to a single writer—once, moreover, who died before he was thirty years of age. In prose Shelley could be as admirable as in poetry, of late years it has even been pretended—but we regard this proposition as worthy of emphatic rejection—that his best and most enduring work is in the prose form. His letters to Thomas Love Peacock and others, and his uncompleted *Defence of Poetry*, are the chief monuments of his mastery in prose, and certainly no more beautiful prose—having much of the spirit and the aroma of poetry, yet without being distorted out of its proper essence—as is to be found in the English language.

The chief original authorities for the life of Shelley (apart from his own writings which contain a good deal of autobiography, if heedfully sifted and collated) are—(1) the notices by Mrs. Shelley interspersed in her edition of the *Poems*, (2) Dodd's amusing, disarming, and satirical, although in some respects exaggerated, book, (3) *Shelley's Recollections*, (4) the *Life* by Medwin, and (5) the *Autobiography* written by Peacock. Some other writers, especially Leigh Hunt, might be mentioned, but they come less close to the facts among biographical works produced since Shelley's death, by authors who did not know him personally, much the largest is *The Great Shelley*, by G. O. Johnston (1886), it is controversial and not very useful, and there is a mass of gaudy but tasteless far from well adapted (on our opinion) to bring out a light result, is contained, however, in ample stores of solid information and shrewd discussion. The memoir by W. M. Rossetti, published in an edition of Shelley's *Poems* in two forms of publication, 1870 and 1878, was an endeavour to furnish in brief space, out of the then confused and conflicting records, an accurate account of Shelley—apart from his poetry, and to give a valuable material in *Lucy Shelley's Shelley Memorials*, and in Dr. Gannet's *Life of Shelley*, and the memoir written by Sir Symonds, in the series *Portraits of Men of Letters*, is very agreeable, but not more than a mere sketch. Prof. Dowden is engaged upon a life of Shelley, which may be expected to distance all its predecessors in authority and completeness. (W. M. R.)

SHELOMOH IBN GEHROH See AVICENNA.

SHEM. See NOAH. Compare SEMITIC LANGUAGES.

SHEMAHA, a formerly important but now insignificant town in Transcaucasia, in 40° 38' N lat and 66° 19' E. long, on the Zagovorla, an affluent of the Peneus, which falls into the Caspian. It is situated in a mountainous, very picturesque country, covered with luxuriant vegetation, at about 2930 feet above the level of the Black Sea. In 1873 it had 25,087 inhabitants, of whom 18,680 were Tartars and Shakhsevanis, 5177 Armenians, and 1230 Russians. Some 300 Armenian families now profess Lutheranism—the result of a mission first established at Shemaha about twenty years ago. Shemaha was the capital of the khanate of Shirvan, and was known to Ptolemy as Kamachia. Situated as it was on the high road from Europe to India, this old town must at one time have possessed very considerable importance, and evidence of the fact is found in the numerous ruins of large caravanserais, churches, and public buildings. About the middle of the 16th century it was the seat of an English commercial factory, under the well-known traveller Jenkins (compare *Russia*, vol. xxi. p. 93), afterwards envoy extraordinary of the khan of Shirvan to Ivan the Terrible. In 1742 Shemaha was taken and destroyed by Nadir Shah, who, to punish the inhabitants for their Sunni creed, built a new town under the same name about 16 miles to the west, at the foot of the main chain of the Caucasus. The new Shemaha was at different times a residence of the khan of Shirvan, but it was finally abandoned, and in its place there stands now only a village called Akheh, whilst the old town was rebuilt, and under the Russians became capital of the government of Shemaha. In recent times Shemaha has suffered greatly from earthquakes: in 1869

it was shaken to its foundations, and in consequence the seat of the governor was removed to Baku; in 1872 (16th January) there occurred a still more terrible shock, from which the town has never recovered. Silk manufacture is the principal industry in Shemaha. In 1873 there were one hundred and thirty silk-winding establishments, owned mostly by Armenians. The industry has, however, since 1864 considerably declined.

The district of Shemaha (4126 square miles), corresponding to the ancient khanate of Shirvan, lies along the southern slope of the main chain of the Eastern Caucasus. It contains a population of 97,801 inhabitants (1873), of whom 8493 are Russians, 14,888 Armenians, 73,124 Tartars, 693 Jals (old Persian tribes), and 708 Jews. As everywhere in Transcaucasia, the number of males is considerably in excess over the females (100 to 81). The district occupies a sparsely-wooded mountainous region, completely shut up on the north, and open to the dry, large, and mostly desolate valley of Kura on the south. The climate is generally healthy, rather dry and moderately warm, in the lower parts the people suffer from malarious fever. The annual rainfall in Shemaha is 15.42 inches, the mean summer temperature 78° Fahr., winter 37°. The soil, mostly of the Tertiary formation, is very rich and of considerable variety. This district occupies in Transcaucasia a foremost place in vine-growing and in the silk industry. The vine region, in the southwest of the district, is a long strip of land of breadth varying from 4 to 20 miles. The highest level of the soil is about 2000 feet above the sea. The plant is left unprotected in winter, and owing to the abundance of water occasioned by the melting snows and the heavy rains in spring, there is no need of irrigation. According to a general survey made in 1875 there are in the district 3008 vineyards, occupying a total of 1764 acres. The other products are principally wheat, cotton, and rice. In 1875 the annual vintage at Shemaha was calculated at about 62,100 gallons. The chief vine is that of Matzassy. The province of Shirvan, now the district of Shemaha, has been frequently the theatre of terrible struggles and bloodshed. It was conquered by the Persians in 1501 under Shah Ismail I., and it continued with brief interruptions to be a part of the Persian dominions until the fall of the Safawi dynasty.

Shemaha, the capital of Shirvan, was sacked in 1712 by the Lezgians; eight years later the town and the whole province were devastated by a certain Daghistan, Ali ul-Daulah, who was later recognized by Persia as the Khan of Shirvan. In 1721 the khanate was taken by Turkey, but ten years later Nadir Shah of Persia reconquered it after terrible ravages. On the departure of Nadir Shah soon afterwards Shirvan enjoyed independence under the rule of Mahmud Seyyid, who rebuilt Shemaha. The Russians entered Shirvan first in 1723, but soon retired. In 1795 they captured Shemaha as well as Baku, but the country was once more abandoned, and Shirvan was not finally annexed to Russia until November 1806 after the voluntary submission of its last Khan Mustapha.

SHENANDOAH, a borough of the United States, in Schuylkill county, Pennsylvania, 12 miles north of Pottsville, is the centre of a great coal district, more than half the total yield of the Schuylkill region being produced within 3 miles of the town. Among its buildings are fifteen churches, a theatre, and two public halls. It was founded in 1863, and its population (partly Welsh and German), which increased from 2951 in 1870 to 10,148 in 1880, is estimated at over 15,000 in 1886.

Shenandoh is also the name of a well-known tributary of the Potomac.

SHENDY, a town on the right bank of the Nile, about 130 miles south of Berber and 100 north of Khartoum, which, while its present population does not exceed 2500, was previous to its destruction by the Egyptians in 1822 a place of some 50,000 inhabitants and a station on the great caravan route between Semnâr and Egypt and Mecca. The terrible massacre perpetrated by the Egyptians was in revenge for the treacherous assassination by the native chiefs at Shendy of Ismail Pasha and his suite, who were first drugged and then burned to ashes with their huts. Shendy was the capital of a considerable district, and lies only 20 miles south of the ruins of Meroe.

SHENSTONE, WILLIAM (1714-1763), is one of the best-known minor poets of the 18th century. He owes

such distinction as he has at least as much to his choice of subjects and to the peculiarity of his life as to the felicity of his verse. Coming after a generation whose leading poets wrote for fashionable society, he shut himself up in the country, tried to follow the life Arcadian, and wrote in the spirit of a recluse. He inherited the small estate of Leasowes, in the parish of Hales-Owen, Worcestershire. He was born at Leasowes in 1714, and after passing through Pembroke College, Oxford, retired there to realize Pope's ideal in the *Ode to Solitude*, turned his paternal estate into an elaborate landscape garden, and lived there till his death in 1763. From the time that the management of the estate fell into his own hands, "he began," Johnson says, "to point his prospects, to diversify his surfaces, to entangle his walks, and to wind his waters,—which he did with such judgment and such fancy as to make his little domain the envy of the great and the admiration of the skilful." From this it will be seen that he did not anticipate into sentiment in his love of natural scenery, he was a true child of the Queen Anne time in his liking for "Nature to advantage dressed." And it would appear from his letters that he was not a contented recluse, but was weakly desirous of the notice of the world in his Arcadian retreat. Still there is a certain air of sincerity in his references to natural beauty and grandeur. Burns wrote of him in the preface to his first issue of poems as a poet "whose divine elegies do honour to our language." Shensstone practised the elegiac form assiduously, and some of his elegies are not without a certain imposing pomp and dignity of language, but we may safely suppose that it was the sentiments rather than the expression that captivated the peasant poet. His *Pastoral Ballads in Four Parts*, one of his earliest compositions, is also one of his best, and from its use in selections of poetry for the young is much more generally known. The triple rhythm and the simplicity of the language are happily suited to the pastoral fancy, and there is not too much of the artificial diction and imagery of such poetry. Such lines as—

Yet time may diminish the pain
The flower, and the shrub, and the tree
Which I would for her pleasure in vain
In time may have comfort for me—

come nearer Wordsworth's ideal of poetic diction than was common in the serious poetry of Shensstone's time. But his *Schoolmistress*, in the Spenserian stanza (published in 1742, and so relieved from any suspicion of being an imitation of Thomson), is the poem by which he keeps a place in literature.

SHERBORN MALLETT, a market-town of Somersetshire, England, is situated at the eastern extremity of the Mendip Hills, on the Somerset and Devon and the East Somerset Railways, 5 miles east of Wells and 20 south of Bristol. The church of Sts Peter and Paul, consisting of chancel, cloistered nave, and aisles, is specially worthy of notice for its richly carved wooden roof and the ancient monuments of the Malletts and Gournays, formerly possessors of the manor. The grammar school was founded in 1677, and there are also a science and art school in connexion with South Kensington, a literary institute, and a mechanics' institute. The principal public buildings are the court-house (1857), the masonic hall (1861), the prison, and the district hospital (1880). The market cross, one of the finest in the county, 51 feet in height, erected by Agnes and Thomas Buckland in 1500, was restored in 1841. About the end of last century Shopton Mallet had important cloth manufactures, and stocking-knitting was also largely carried on. The brewing of ale and porter is now one of its principal industries, and it has also ropeworks and brick and tile works. In the vicinity there are

granite quarries and marble, asphalt, and lime works. The population of the urban sanitary district (area, 3572 acres) in 1871 was 5149, and in 1881 it was 5322.

Sherpton, previous to the Conquest called Sæpton, was in the possession of the abbots of Glastonbury for four hundred years before it passed to Roger de Coucille. Afterwards it came into the possession of the barons Mallet or Mallet, one of whom was fined for rebellion in the reign of King John. From the Mallets it went to the Gournays, but in 1586 it reverted to the crown, and it was now included in the duchy of Cornwall. The town received the grant of a market from Edward II.

SHERBORNE, an ancient market-town of Dorsetshire, England, on the borders of Somersetshire, is situated on the southern slope of a hill overlooking the river Yeol, on the South-Western Railway, 6 miles east from Yeovil and 118 south-west from London by rail. In 705 Sherborne was made by Ina, king of the West Saxons, the seat of a bishopric, which in 1078 was removed to Old Sarum (Salisbury). Previous to its removal a great Benedictine abbey had been founded by Bishop Roger. The minster or abbey church of St Mary possesses a Norman tower, much altered by later additions, and transepts also originally Norman, but the greater part of the building is Perpendicular. It was restored in 1848–58 at an expense of over £32,000, chiefly contributed by Mr W. Digby and Lord Digby. Ethelbald and Ethelwot, elder brothers of Alfred, were buried behind the high altar of the church, which contains a number of interesting tombs and monuments. Near the minster are the ruins of the castle, originally the palace of the bishops. It was besieged during the wars between Stephen and Maud, and also during those of the Commonwealth, when it was held for the king in 1612 by the marquis of Hatfield, and resisted a five days' siege by the earl of Bedford, but was in 1645 taken by Fairfax, when it was dismantled and reduced to ruins. The older portion of the modern mansion was built by Sir Walter Raleigh. Sherborne grammar school, occupying the site of the abbey, was founded by Edward VI in 1550, and holds a high rank among the public schools of England. Near the abbey close is the hospital of St John, dating from the 15th century. A literary institution, now called the Macready Institution, was established in 1850. The manor of Sherborne went with the bishop's see, till in the reign of Elizabeth it was conferred on Sir Walter Raleigh. After his attainder it was bestowed by James I on his favourite Carr, after which it passed to the Digbys, the present owners. The population of the urban sanitary district (area 411 acres) in 1871 was 5545, and in 1881 it was 5053.

SHERIDAN, the name of an Anglo-Irish family, made illustrious by the dramatist Richard Brinsley, but prominently connected with literature in more than one generation before and after him. We take the family in chronological order.

1. THOMAS SHERIDAN, D.D. (1684–1738), grandfather Thomas of the dramatist, was the first to connect the family with Sheridan literature. He is chiefly known as the favourite companion and confidant of Swift during his later residence in Ireland. But enough is left of his writing to enable us to understand the secret of his attraction for a man not easily pleased. His correspondence with Swift and his whimsical treatise on the *Art of Penning*¹ make perfectly clear from whom his grandson derived his high spirits and delight in practical joking. The *Art of Penning* might have been written by the author of *The Critic*. Swift had a high opinion of his scholarship, and that it was not contemptible is attested by an edition of the *Satires of Persius*, printed at Dublin in 1728. When Swift came to Dublin as dean of St Patrick's, Sheridan was established there as a schoolmaster of very high

¹ Published in Nichols's Supplement to the works of Swift, 1779.

repute,—a fashionable schoolmaster, with a small landed patrimony in Cavan, and a bishop in the family two generations back. He so won upon the dean with his mirthfulness, wit, scholarship, good-nature, and honesty that in a short time no party made for the dean's entertainment was considered complete without Sheridan. Sheridan was his confidant in the affair of *Draper's Letters*; it was at Quilca,¹ Sheridan's country cottage in Cavan, that *Gallus's Travels* was prepared for the press, and this favoured friend was from an early period in their acquaintance one of his most confidential correspondents when at a distance. Through Swift's influence he obtained a living near Cork, but damaged his prospects of further preferment by a feat of unlucky absence of mind. Having to preach at Cork on the anniversary of Queen Anne's death he hurriedly chose a sermon with the text, "Sufficient unto the day is the evil thereof," and was at once struck off the list of chaplains to the lord-lieutenant and forbidden the castle. In spite of this mishap, for which the archdeacon of Cork made amends by the present of a less worth £250 per annum, he "still remained," according to Lord Orrey, "a punster, a quibbler, a fiddler, and a wit," the only person in whose genial presence Swift relaxed his habitual gloom. His latter days were not prosperous, probably owing to his having "a better knowledge of books than of men or of the value of money," and he died in poverty and ill-health in 1738. The biographers of Brinsley Sheridan are disposed to dwell chiefly on the eccentricities of his ancestors, but both his grandfather and his father gave ample proof of more solid qualities than improvidence and wit. The original source of information about the schoolmaster grandfather is the father's *Life of Swift* (pp. 369-395), where his scholarship is dwelt upon as much as his improvident conviviality and simple kindness of nature.

2 THOMAS SHERIDAN (1721-1788), son of the above, born at Quilca in 1721, had a more conspicuous career than his father. This ambitious father sent him to an English school, Westminster; but he was forced by stress of circumstances to return to Dublin and complete his education at Trinity College. Then he went on the stage, and at once made a local reputation. There is a tradition that on his first appearance in London he was set up as a rival to Garrick, and Moore countenances the idea that Garrick remained jealous of him to the end. For this tradition there is little foundation. Sheridan's first appearance in London was at Covent Garden in March 1744, when, heralded in advance as the brilliant Irish comedian, he acted for three weeks in a succession of leading parts, *Hamlet* being the first. He did not appear in London again till ten years afterwards, when he was the leading actor for a season at the same theatre. In the interval he had been manager of a theatre in Dublin, had married a highly accomplished and well-born lady (see next notice), and had been driven from Dublin as a result of taking the unpopular side in politics. After his season in London he tried Dublin again, but after two years more of unremunerative management, he left for England finally in 1758. By this time he had conceived his scheme of British education, and it was to push this rather than his connexion with the stage that he crossed St George's Channel. He lectured at Oxford and Cambridge, and received honorary degrees from both universities in 1768 and 1769. But the scheme did not make way, and we find him in 1760 acting under Garrick at Drury Lane. His merits as an actor may be judged from the description of him in the *Rosciad* (l. 987) at this period. He is placed in the second rank, next to Garrick,

¹ Spelt Quilca; it may be noted, in the second T. Sheridan's *Life of Swift*.

but there is no hint of possible rivalry. Churchill describes him as an actor whose conceptions were superior to his powers of execution, whose action was always forcible but too mechanically calculated, and who in spite of all his defects rose to greatness in occasional scenes. Churchill never erred on the side of praising too much, and his description may be accepted as correct, supported as it is by the fact that the actor eked out his income by giving lessons in elocution. Boswell has some amusing remarks on his success with a distinguished Scotch pupil, who used his influence to get a pension for him from Lord Bute. Sheridan, however, attracted attention chiefly by his enthusiastic advocacy, in public lectures and books, of his scheme of education, in which oratory was to play a principal part. It is generally said that he traced all the evils and perils of the Commonwealth to the neglect of oratory. But this is a caricature. There was more serious substance in his indictment of the established system of education. His main count was that it did not fit the higher classes for their duties in life, that it was uniform for all and profitable for none, and he urged as a matter of vital national concern that special training should be given for the various professions. Oratory came in as part of the special training of men intended for public affairs, but his main contention was one very familiar now,—that more time should be given in schools to the study of the English language. He took his hobby with great enthusiasm, published an elaborate and eloquent treatise on education, and lectured on the subject in London, Oxford, Cambridge, Edinburgh, and other towns. In 1769, after a residence of some years in France, partly for economy, partly for his wife's health, partly to study the system of education there, he published a matured *Plan of Education*, with a letter to the king, in which he offered to devote the rest of his life to the execution of his theories on condition of receiving a pension equivalent to the sacrifice of his professional income. His offer was not accepted; but Sheridan, still enthusiastic, retired to Bath, and prepared a pronouncing *Dictionary of the English Language*, with a prosodial grammar. After his son's brilliant success he assisted in the management of Drury Lane, and occasionally acted. His *Life of Swift*, a very entertaining book in spite of its incompleteness as a biography, was published in 1784. He died at Margate in 1788. The year before his death he had a prospect of realizing his scheme of education in Ireland, but the high official who had sought his advice died just as the old man eagerly reached Dublin, and his hopes were disappointed.

3. FRANCES SHERIDAN (1724-1766), wife of the above, Mrs. Frances Sheridan, and mother of the dramatist, wrote two novels of high repute in their day, *Sir Harry Edwileigh* and *Mary-Judith*, and two plays, *The Discovery* and *The Dupe*. We have it on the authority of Moore that, when *The Rivals* and *The Duenna* were running at Covent Garden, Garrick revived *The Discovery* at Drury Lane, as a counter-attraction, "to play the mother off against the son, taking on himself to act the principal part in it." But the statement, intrinsically absurd, is inaccurate. *The Discovery* was not an old play at the time, but one of Garrick's stock pieces, and Anthony Bromville was one of his favourite characters. It was first produced in 1763. So far from being jealous of the elder Sheridan, Garrick seems to have been a most useful friend to the family, accepting his wife's play—which he declared to be "one of the best comedies he ever read"—and giving the husband several engagements. Mrs. Sheridan's novels and plays were all written in the last six years of her life. She died at Blois in 1766. Her maiden name was Chamberlaine. Her father was a dignitary in the Irish Church, her grandfather an English

baronet. Her marriage with the actor was the result of romantic circumstances, fully detailed in the *Memoirs of Miss Frances Sheridan*, mentioned below.

Richard
Brinsley
Sheridan

4 RICHARD BRINSLEY BUTLER SHERIDAN (1751-1816), second son of Thomas and Frances Sheridan, was born in Dublin in September 1751. Moore records for the encouragement of slow boys that the future dramatist was "by common consent of parent and preceptor pronounced an impenetrable dunce." The plain fact is that the expression occurs in a smart letter about him and his sister, written by his mother to a schoolmaster. Miss Sheridan wrote that she had been the only instructor of her children hitherto, and that they would exercise the schoolmaster in the quality of patience, "for two such impenetrable dunces she had never met with." One of the children thus humorously described was Richard Brinsley, and the age of the "impenetrable dunce" at the time was seven. At the age of eleven he was sent to Harrow. There, to please orthodox biographers, he gave no such sign of future eminence as is implied in taking a high place in school. Dr Parr, who was one of his masters, "saw in him vestiges of a superior intellect," but, though he "did not fail to probe and tease him," by no harassing or tormenting process could he incite the indolent boy to greater industry than was "just sufficient to save him from disgrace." But these facts about young Sheridan's determined indolence in the study of Latin and Greek should be taken in connexion with his father's peculiar theories on the subject of English education. The father's theories possibly did not encourage the son to learn Latin and Greek. Why, with his views on the unprofitableness of these studies, he sent his younger son to Harrow, is not obvious, but it was probably as much for social as for educational reasons. If so, the purpose was answered, for Sheridan was extremely popular at school, winning somehow, Dr Parr confesses, "the esteem and even admiration of all his schoolfellows," and giving a foretaste of his mysterious powers of getting things done for him by making the younger boys steal apples for his own private store and good-humouredly defying the masters to trace the theft home to him.

Sheridan left Harrow at the age of seventeen, having impressed his schoolfellows at least, who are sometimes better judges than their masters, with a vivid sense of his powers. It was probably his father's design to send him afterwards to Oxford, but the family circumstances were too straitened to permit of it, and the educationist, who had just then returned from France, and was about to launch his appeal to the king on behalf of his new plan of education, took his son home and himself directed and superintended his studies. What his plans were for his brilliant son's future we have no means of knowing, but the probability is that, if the projected academy had become an accomplished fact, he would have tried to make Richard Brinsley an upper master in some one of its numerous departments. There are traces of method in the superficially harum-scarum Irishman's courses, and it looks as if he had intended both of his sons to help him in the magnificent project from which his sanguine temperament expected such great things,—the older, who had been with him in France, in what would now be called the modern side, and the classically educated younger in the ancient side. Meantime, pending His Majesty's resolution on the projector's offer, Brinsley, besides being trained by his father daily in elocution, and put through a course of English reading in accordance with the system, received the accomplishments of a young man of fashion, had fencing and riding lessons at Angelo's, and began to eat terms at the Middle Temple. His destination apparently was the bar, if fortune should deny him the more glorious

career of lieutenant in the new academy through which young England was to be regenerated.

As to how young Sheridan, with a cooler head to regulate his hot Irish blood, looked at his father's grand schemes, we have no record. But it is of importance to remember those schemes, and the exact stage they had now reached, in connexion with the accepted view of Sheridan's behaviour at this time, which represents him as a mere idler, hanging on at home like an ordinary ne-do-well, too indolent to work for any profession, simply enjoying himself and trusting recklessly to chance for some means of livelihood. The fact would seem to be that over and above whatever he did in the way of qualifying himself for a regular career—which possibly was little enough—he began from this time with fundamentally steady purpose to follow the bent of his genius. After leaving Harrow he kept up a correspondence with a school friend who had gone to Oxford. With this youth, whose name was Haldie, he had not competed for school honours, but both had dreams of higher things; and now they conjoined together various literary plans, and between them actually executed and published metrical translations of Anaximenes—an obscure Greek or pseudo-Greek author brought to light or invented at the Renaissance, a writer of imaginary amorous epistles. The two literary partners translated his prose into verse which has the qualities of lightness, neatness, and wit, and is in no respect unworthy of being the apprentice-work of Sheridan.

In conjunction with the same young friend he began a farce entitled *Jupiter*. It was not completed, but the fragment is of interest as containing the same device of a rehearsal which was afterwards worked out with such brilliant effect in *The Critic*. Some of the dialogue is very much in Sheridan's mature manner. It would seem indeed that at this time, idle as he appeared, Sheridan was deliberately exercising his powers and preparing himself for future triumphs. Moore's theory is that his seeming indolence was but a mask, and extracts given from papers written in the seven years between his leaving Harrow and the appearance of *The Rivals*—sketches of unfinished plays, poems, political letters, and pamphlets—show that he was far from idle. He was never much of a reader, he preferred, as he said, to sit and think—a process more favourable to originality than always having a book in his hand, but we may well believe that he kept his eyes open, and his father's connexion with fashionable society gave him abundant opportunities. The removal of the family to Bath in 1771¹ extended his field of observation. Anstey's *New Bath Guide* had just been published and had greatly stimulated interest in the comedy of life at this fashionable watering-place.

Presently, too, already a favourite in Bath society from his charming manners and his skill as a writer of graceful and witty verses, the youth played a part in the living comedy which at once made him a marked man. There was in Bath a celebrated musical family—"a nest of nightingales,"—the daughters of the composer Linley, the head of his profession in the fashionable town. The eldest daughter, a girl of sixteen, the prima donna of her father's concerts, was exceedingly beautiful, and very much run after by suitors, young and old, honourable and dishonourable. In the latter class was a Captain Mathews, a married man; in the former, young Sheridan. Mathews had artfully won the girl's affections, and persecuted her with his importunities, threatening to destroy himself if she refused him. To protect her from this second-rate designs the younger lover, who seems to have acted at first

¹ Miss Lefanu corrects Moore's date of 1770, considering the difference important as bearing on Sheridan's education (*Memoirs*, p. 348).

only as a confidential friend, conceived the romantic plan of escorting Miss Linley to a nunnery in France! After performing this chivalrous duty he returned and fought two duels with Mathews, which made a considerable sensation at the time. The youthful pair had gone through the ceremony of marriage in the course of their flight, but Sheridan chivalrously did not claim his wife, kept the marriage secret, and was sternly denied access to Miss Linley by her father, who did not consider the professionless young man an eligible suitor. Ultimately, after a courtship romantic enough to have satisfied Lydia Langshui, they were openly married in April 1773.

Sheridan's daring start in life after this happy marriage showed a confidence in his genius which was justified by its success. Although he had no income, and no capital beyond a few thousand pounds brought by his wife, he took a house in Orchard Street, Portman Square, furnished it "in the most costly style," and proceeded to return on something like an equal footing the hospitalities of the fashionable world. His wife—"the celebrated Miss Linley"—was a most popular singer, but he would not allow her to appear in public. She was to be heard only at private concerts in their own house, and her beauty and accomplishments combined with her husband's wit to draw crowds of fashionable people to their entertainments. Sheridan's conduct may have been youthful pride and recklessness, the thoughtless magnificence of a strong and confident nature, all the same, it answered the purpose of deep-laid and daring policy. When remonstrated with by a friend, and asked how he found the means of supporting such a costly establishment, he is said to have answered—"My dear friend, it is my means." And so it proved, for his social standing and popularity helped to get a favourable report for his first comedy, *The Rivals*, produced at Covent Garden on the 17th January 1775.

The Rivals is said to have been not so favourably received on its first night, owing to its length and to the bad playing of the part of Sir Lucius O'Trigger. But the defects were remedied before the second performance, and the piece at once took that place on the stage which it has never lost. It was the last season but one of Garrick's long career, and the current story preserved by Moore is that the run upon Covent Garden was such as to alarm the veteran of Drury Lane and drive him to extraordinary exertions to counterbalance the attractions of the new play. This seems to be a myth, natural enough in the circumstances, but unfounded in fact, for we have contemporary testimony² that Drury Lane was never more crowded than during the last years of Garrick's management, when it was known that he intended to retire from the stage. There were crowded houses at both theatres. Sheridan, though bearing his brilliant success lightly, proceeded at once to take the tide at the flood. *St. Patrick's Day, or the Scheming Lieutenant*, a lively farce, written it is said at the request of Clinch, in gratitude for his coming to the rescue of Sir Lucius, was produced in May. In the course of the year, with the assistance of his musical father-in-law, he wrote the comic opera of *The Duenna*, and by the end of the year, with an eye to the profits of theatrical management, he was in negotiation with Garrick for the purchase of his share of Drury Lane. *The Duenna* was the great theatrical success of the winter of 1775-76; it ran even longer than *The Beggar's Opera* had done—up to that time the longest run on record. The bargain with Garrick was completed in June 1776. The sum paid for the half-share was £35,000; of this Sheridan contributed £10,000.

None of his letters show where the money came from, and much wonder has been expressed on the subject, but after all it is not so very mysterious that the most brilliant dramatist of his time, in all the credit of unparalleled success, should have been able to borrow such a sum as this with the best theatrical property to offer as security. There is a tradition that Garrick advanced the money or let it lie at interest, anyhow, the loan could not have appeared at the time a very risky speculation. Two years afterwards Sheridan and his friends bought the other half of the property for £45,000.

From the first the direction of the theatre would seem to have been mainly in Sheridan's hands. It was opened under the new management in February 1777, with a purified version of Vanbrugh's *Relapse*, under the title of *A Trip to Scarborough*. This is printed among Sheridan's works, but he has no more title to the authorship than Colley Cibber to that of *Richard III.* His chief task was to remove indecencies, he added very little to the dialogue. Astonishment has been expressed that he should have fallen back on an old play instead of writing a new one. The fact is quoted among the proofs of his indolence. But the new manager, apart from the engagements of a popular man of fashion, probably found work and worry in his novel task of organization sufficient to leave him little leisure for composition. Vanbrugh's play was probably chosen for the simple reason that it suited his company. Possibly also he wished to make trial of their powers before entrusting them with a play of his own. *The School for Scandal* was produced little more than two months afterwards. Miss Abington, who had played Miss Hoyden in the *Trip*, played Lady Tattle, who may be regarded as a Miss Hoyden developed by six months' experience of marriage and town life. The actors who played the brothers Surface had been tried in the *Trip* in opposite characters, Charles playing Towlsey, while Joseph played Tom Fashion. It looks as if shrewd managerial caution was responsible for the delay quite as much as indolence. The former may at least have been in Sheridan's mind the plausible excuse for the latter. There are tales of the haste with which the conclusion of *The School for Scandal* was written, of a stratagem by which the last act was got out of him by the anxious company, and of the fervent "Amen" written on the last page of the copy by the prompter, in response to the author's "Finished at last, thank God!" But, although the conception was thus hurriedly completed, we know from Sheridan's sister that the idea of a "scandalous colloquy" had occurred to him five years before in connexion with his own experiences at Bath. His difficulty was to find a story sufficiently dramatic in its incidents to form a subject for the machinations of the character-slayers. He seems to have tried more than one plot, and in the end to have desperately forced two separate conceptions together. The dialogue is so brilliant throughout, and the action scene and the screen scene so effective, that nobody cares to examine the construction of the comedy except as a matter of critical duty. But a study of the construction brings to light the difficulties that must have worried the author in writing the play, and explains why he was so thankful to have it finished and done with at last. After all, he worried himself in vain, for *The School for Scandal*, though it has not the unity of *The Rivals*, nor the same wealth of broadly humorous incident, is universally regarded as Sheridan's masterpiece. He might have settled the doubts and worries of authorship with Puff's reflexion "What is the use of a good plot except to bring in good things?" The vitality of a play depends mainly on its good things in the way of character, incident, and happy saying, and to a very limited extent on their relevance to any central plan.

² The letter from Miss Linley to a female friend, giving a minute account of her persecution by Mathews and deliverance by Sheridan, is declared by Mrs Norton to be a "foolish forgery."—*Macmillan's Magazine*, iii. 178.

³ See *Blackwood's Magazine*, vol. xx. p. 28.

The third and last of Sheridan's great comedies, *The Critic*, was produced in 1779, *The School for Scandal* meantime continuing to draw larger houses than any other play every time it was put on the stage. *The Critic* is perhaps the highest proof of Sheridan's skill as a dramatist, for in it he has worked out, with perfect success for all time, a theme which, often as it has been attempted, no other dramatist has ever succeeded in redeeming from tediousness by circumstantiality and ephemeral personalities. The laughable infirmities of all classes connected with the stage,—authors, actors, patrons, and audience,—are touched off with the lightest of hands, the fun is directed, not at individuals, but at absurdities that grow out of the circumstances of the stage as naturally and inevitably as weeds in a garden. It seems that he had accumulated notes, as his habit was, for another comedy to be called *Affectation*. But apparently he failed to hit upon any story that would enable him to present his various types of affectation in dramatic interaction. The similar difficulty in his satire against scandal, of finding sufficiently interesting materials for the scandal-mongers, he had surmounted with a violent effort. This other difficulty he might have surmounted too, if he had had leisure to "sit and think" all the happy thought came. But his enmities were now called off in a different direction. His only dramatic composition during the remaining thirty-six years of his life was *Pizarro*, produced in 1790—a tragedy in which he made liberal use of some of the arts included in the person of Mr. Puff. He is said also to have written more of *The Stranger* than he was willing to acknowledge.

He entered parliament for Stafford in 1780. It was not a sudden ambition to shine on a wider stage after having gained the highest honours of the theatre. Ever since leaving Harrow he had dabbled a little in politics, had sketched letters in the manner of Junius, and begun an answer to Johnson's *Taxation no Tyranny*. But he had not made any public appearance as a politician until his acquaintance with Fox led to his appearing on a Westminster platform with the great leader of opposition. Apparently he owed his election for Stafford to more substantial persuasives than the charms of his eloquence. He paid the burgesses five guineas each for the honour of representing them. It was the custom of the time. His first speech in parliament, like the first speech of a great parliamentarian of this century, between whose career and Sheridan's there are many striking points of resemblance and contrast, was a failure. But he persevered, spoke little for a time and chiefly on financial questions, soon took a place among the best speakers in the House, and under the wing of Fox filled subordinate offices in the short-lived ministries of 1782 and 1783. He was under-secretary for foreign affairs in the Rockingham ministry, and a secretary of the treasury in the Coalition ministry. This was rapid promotion for a man who owed everything to his own talents, and yet not an excessive recognition of the services of such a speaker as he is described as having proved himself at this exciting period. In debate he had the keenest of eyes for the weak places in an opponent's argument, and the happy art of putting them in an irresistibly ludicrous light without losing his good temper or his presence of mind. In those heated days of parliamentary strife he was almost the only man of mark that was never called out, and yet he had not his match in the weapon of ridicule.

The occasion that gave Sheridan a chance of rising above the reputation of an extremely effective and brilliant debater into the ranks of great parliamentary orators was the impeachment of Warren Hastings. His speeches in that proceeding were by the unanimous acknowledgment of his contemporaries among the greatest delivered in that

generation of great orators. The first was in 1787, on Burke's proposal that Hastings should be impeached. Sheridan spoke for three hours, and the effect of his oratory was such that it was unanimously agreed to adjourn and postpone the final decision till the House should be in a calmer mood. Of this, and of his last great speech on the subject in 1794, only brief abstracts have been preserved, but with the second, the four days' speech in Westminster Hall, on the occasion so brilliantly described by Macaulay, posterity has been more fortunate. The reader should, however, be cautioned against accepting the version given in a collection of Sheridan's speeches published by a friend after his death. This long passed current as a genuine specimen of Sheridan's eloquence at its best, in spite of Moore's protest that he had in his possession a copy of a shorthand writer's report, and that the two did not correspond. But Gurney's verbatim reports of the speeches on both sides at the trial were published at Sir G. Cornevalle Lewis's instigation in 1859, and from them we are able to form an idea of Sheridan's power as an orator. There are passages here and there of gaudily figurative rhetoric, loose ornament, and declamatory hyperbole such as form the bulk of the incorrect version, but the strong common sense, close argumentative force, and masterly presentation of telling facts enable us to understand the impression produced by the speech at the time.¹

Sheridan's long parliamentary career terminated in 1812. He could not help being to the last a conspicuous figure both in society and in parliament, but from the time of the break-up of the Whig party on the secession of Burke he was more or less an "independent member," and his isolation was complete after the death of Fox. The Begum speech remained his highest oratorical achievement. By it he is fixed in the tradition of the House as one of its greatest names. But his opinions on other great questions were given with a force and eloquence worthy of his position. When Burke denounced the French Revolution, Sheridan joined with Fox in vindicating the principle of non-intervention. He maintained that the French people should be allowed to settle their constitution and manage their affairs in their own way. But when the republic was succeeded by the empire, and it became apparent that France under Napoleon would interfere with the affairs of its neighbours, he employed his eloquence in denouncing Napoleon and urging the prosecution of the war. One of his most celebrated speeches was delivered in support of strong measures against the mutineers at the Nore. When the Whigs came into power in 1806 Sheridan was appointed treasurer of the navy, but was denied the honour of admission to the cabinet. After Fox's death he succeeded his chief in the representation of Westminster, and aspired to succeed him as leader of the party, but this claim was not allowed, and thenceforward Sheridan fought for his own hand. When the prince became regent in 1811 Sheridan's private influence with him helped to exclude the Whigs from power. For his interference on this occasion between the regent and his constitutional advisers Sheridan was severely blamed. To judge fairly as to how far he was justified in his conduct as a matter of private ethics we must take into account his previous relations with the leaders of his party, a point on which Moore, one of the disappointed place-men, is somewhat reticent. Throughout his parliamentary career Sheridan was one of the boon companions of the prince, and his champion in parliament in some dubious matters of payment of debts. But he always resented any imputation

¹ For a comparison of the two versions of the speech and an able exposition of the qualities of Sheridan's oratory see Mr W. Fraser Rae's *Willes, Sheridan, and Fox*, 1874.

that he was the prince's confidential adviser or mouthpiece. A certain proud and sensitive independence was one of the most marked features in Sheridan's parliamentary career. After a coolness arose between him and his Whig allies he refused a place for his son from the Government, lest there should be any suspicion in the public mind that his support had been bought.

His last years were harassed by debt and disappointment. At the general election of 1812 he stood for Westminster and was defeated, and tuned in vain to his old constituency of Stafford. He could not raise money enough to win back their confidence. As a member of parliament he had been safe against arrest for debt, but now that this protection was lost his creditors closed in upon him, and from this time till his death in 1816 the life of Sheridan, broken in health and fortune, discredited in reputation, slighted by old associates, so enfeebled and low-spirited as to burst into tears at a compliment, yet at times vindicating his reputation as the wittest of boon companions, is one of the most painful passages in the biography of great men. Doubtless, in any attempt to judge of Sheridan as he was apart from his works, we must make considerable deductions from the mass of floating anecdotes that have gathered round his name. It was not without reason that his granddaughter, Mrs Norton, denounced the unfairness of judging of the real man from unauthenticated stories about his indolent prostration, his recklessness in money matters, his drunken feasts and sallies, his wild gambling, his ingenious but discreditable shifts in evading and duping creditors. The real Sheridan was not a patron of decorous respectability, but we may fairly believe that he was very far from being as disreputable as the Sheridan of vulgar legend. Against the stories about his reckless management of his affairs we must set the broad facts that he had no source of income but Drury Lane theatre, that he bore from it for thirty years all the expenses of a fashionable life, and that the theatre was twice burnt to the ground during his proprietorship. Enough was lost in those fires to account ten times over for all his debts. His biographers always speak of his means of living as a mystery. Seeing that he started with borrowed capital, it is possible that the mystery is that he applied much more of his powers to plain matters of business than he affected or got credit for. The records of his wild bets in the betting book of Brook's Club date in the years after the loss of his first wife, to whom he was devotedly attached. The reminiscences of his son's tutor, Mr Smyth, show anxious and fidelity family habits, curiously at variance with the accepted tradition of his importunate recklessness. Many of the tricks which are made to appear as the unscrupulous devices of a hunted and reckless debtor get a softer light upon them if we ascribe them to a whimsical, boyish, ungovernable love of fun, which is a well-attested feature of his character. But the real Sheridan, as he was in private life, is irrecoverably gone. Even Moore, writing so soon after his death, had to lament that he could "find out nothing about him." Moore seems to have made an imperfect use of the family papers, and it is on record that Lord Melbourne, who had undertaken to write Sheridan's life, always regretted having handed over his materials to the professional biographer. He died on the 7th of July 1816, and was buried with great pomp in Westminster Abbey.

There is, unfortunately, no complete authoritative biography of Sheridan. Mrs Norton, his granddaughter, questioned the accuracy of Moore's *Life* in many particulars, and announced her intention of writing a history of the Sheridans from the family papers, of which Moore had made very partial use. But she never carried out the project. The current statements about the father and grandfather of the dramatist are inaccurate and misleading in

several important respects. The best account of them—making allowance for a slight bias of family pride—is to be found in the *Memoirs of Mrs Frances Sheridan*, by her granddaughter, the dramatist's niece, Miss Lefanu. There is an excellent sketch of Sheridan's political career in Mr W. Fraser Rae's *William Sheridan, and Fox*, and Mrs Oliphant's *Sheridan*, in the "English Men of Letters" series, which interprets his character with the luminous breadth and sympathy always to be expected from her. (W M.)

SHERIFF, or SHEREEF. See MECCA, vol xv p 672.

SHERIFF. For the office of sheriff in England, see COUNTY. For his jurisdiction in the revision of voters, see REGISTRATION. The position of the sheriff as an executive officer in the United States is very similar to that of the English sheriff. He is usually appointed by popular election. The marshals of the United States and their deputies have in each State the same powers in executing the laws of the United States as the sheriffs and their deputies have in executing the laws of the State.

So far as is known the sheriff, notwithstanding the Saxon etymology of his name (shire grieve or reeve), did not exist in Scotland before the beginning of the Norman period. In the feudal system he became the centre of the local administration of justice, the representative of the crown in executive as well as judicial business, and was always a royal officer appointed by and directly responsible to the king. The earliest sheriffs on record belong to the reigns of Alexander I and David I, and the office was common before the death of Alexander III. In many cases it had become hereditary, the most remarkable instance being that of Selkirk, where a De Sinton held it from 1265 to 1305. The ordinance of Edward I in 1305 recognized most of the existing offices, but rejected the hereditary character of the office by a declaration that the sheriffs were to be appointed and removable at the discretion of the king's lieutenant and the chamberlain. This inveterate tendency of feudalism resuscitated itself, however, notwithstanding various attempts to check it, and an Act of James II. shows that the office had again become hereditary.

One of the consequences was that sheriffs ignorant of law required deputies to discharge their judicial duties. In the course of succeeding reigns, down to that of James VI, the jurisdiction of the sheriffs came to be much limited by grants of baronies and regalties which gave the grantees the right to hold both civil and criminal courts of less or greater jurisdiction to the exclusion of the sheriff.

The civil jurisdiction of the sheriff was originally of very wide extent, and was deemed specially applicable to questions relating to the land within the shire, but after the institution of the court of session in 1532 it became restricted, and all causes relating to property in land, as well as those requiring the action called declarator for establishing ultimate right, and most of those requiring equitable remedies, were withdrawn from it. Nor did it possess any consistorial jurisdiction, as its subjects (marriage, legitimacy, and wills) belonged to the officials of the bishop after the Reformation, when it was transferred to the commissary courts, and at a later period to the court of session. Practically, therefore, the civil jurisdiction of the sheriff fell under the head of actions concluding for payment of money and actions to regulate the possession of land. The criminal jurisdiction of the sheriff was in like manner in its origin of almost universal extent. But this was first limited to cases where the offenders were caught in or shortly after the act, afterwards to cases in which the trial could be held within forty days, and subsequently further restricted as the business of the justiciary court became more organized. The punishment of death, having by long disuse come to be held beyond the power of the sheriff, and the statutory punishments of transportation or penal servitude

never having been entrusted to him, his jurisdiction as regards crimes was usually said to be limited to those punishable arbitrarily, that is, by imprisonment, fine, or admonition.

As a consequence of the suppression of the Jacobite rising of 1745, after 1st March 1748 all heritable sheriffships was extinguished, and no sheriffship was to be thereafter granted either heritably or for life, or for any certain term exceeding one year, but this provision was not taken advantage of, and the office of sheriff-principal practically ceased, though that name is sometimes given to the sheriff-depute, 20 Geo II. c. 43. The Act declared that there should be but one sheriff-depute or steward-depute in every shire or stewartry, who was to be an advocate of three years' standing, appointed by the crown, with such continuance as His Majesty should think fit for the next seven years, and after that period *ad vitam aut culpam*. This period was extended by 28 Geo II. c. 7 for fifteen years, and thereafter (since 1769) the sheriff-depute has held his office *ad vitam aut culpam*. Power was given to him by 30 Geo II. c. 43 to appoint one or more persons as substitutes during his pleasure, for whom he should be answerable. At first no legal qualification was necessary and no salary paid, but gradually the sheriff-depute delegated more legal business to the substitute, and before 1761 it had become customary for the sheriff-depute to give him some allowance. In 1787 he was placed on the civil establishment and paid by the crown, in 1825 a qualification of three years' standing (now five years by 40 and 41 Vict. c. 50) as an advocate or procurator before a sheriff court was required (6 Geo IV. c. 23); in 1838 he was made removable by the sheriff-depute, only with the consent of the lord president and lord justice clerk, and it was made compulsory that he should reside in the sheriffdom, the provision of 20 Geo II. c. 43, which required the sheriff-depute so to reside for four months of each year, being repealed (1 and 2 Vict. c. 119), and in 1877 the right of appointment of the substitutes was transferred from the sheriff-depute to the crown (40 and 41 Vict. c. 50).

While the sheriff-depute has still power to hear cases in the first instance, and is required to hold a certain number of sittings in each place where the sheriff-substitute holds courts, and also once a year a small-debt court in every place where a circuit small-debt court is appointed to be held, the ordinary course of civil procedure is that the sheriff-substitute acts as judge of first instance, with an appeal under certain restrictions from his decision to the sheriff-depute, and from him to the court of session in all cases exceeding £25 in value. An appeal direct from the sheriff-substitute to the court of session is competent, but is not often resorted to.

As regards criminal proceedings, summary trials are usually conducted by the sheriff-substitute; trials with a jury either by him or, in important cases, by the sheriff-depute. The sheriff-substitute also has charge of the preliminary investigation into crime, the evidence in which, called a precognition, is laid before him, and if necessary taken before him on oath at the instance of his procurator-fiscal, the local crown prosecutor.

The duties of the sheriff-depute are now divided into ministerial and administrative and judicial. The ministerial are the supervision of the accounts of the inferior officers of the sheriffdom; the superintendence of parliamentary elections, the holding by him, self or his substitutes of the courts for registration of electors; the preparation of the list of persons liable to serve both on criminal and civil juries; the appointment of sheriff officers and supervision of the execution of judicial writs by them; and the striking of the "fairs." He also has to attend the judges of justice at the circuit courts for the county or counties over which his jurisdiction extends. He is generally responsible for the peace of the county, and supervises the police establishment. He is *ex officio*

a justice of the peace and commissioner of supply. In addition to those general duties of sheriff-depute, particular sheriffs are attached to the Board of Supervision for the Relief of the Poor, the Prison Board of Scotland, the Board of Northern Lighthouse Commissioners, and the Scottish Fishery Board.

The judicial duties of the sheriff-depute are, as regards crimes, the trial of all causes committed by the counsel of the crown for the trial by sheriff and jury, as well as summary trials if he chooses to take them. This now means most crimes for which a maximum of two years' imprisonment (in practice eighteen months is the longest sentence imposed) is deemed sufficient, and which are not by statute reserved for the jury court. His civil jurisdiction is regulated by several statutes too technical for detail, but may be said generally to extend to all suits which conclude for payment of money, whatever may be the cause of action, with the exception of a few whose the payment depends on status, all actions with reference to the possession of land or right in land, and actions relative to the right of succession to movable property. In bankruptcy he has a cumulative and alternative jurisdiction with the court of session, and in the service of writs with the sheriff of chancery. Formerly the jurisdiction of the sheriff was absolutely excluded after the institution of the court of session in four important classes of action—(1) relative to property in lands or rights in lands, (2) requiring the use of peculiar forms of action, *e.g.*, declarator, reduction, and suspension, (3) involving the exercise of the *mobile officium*, a superseding equitable jurisdiction of the court of session, and (4) for the determination of rights of status, as well as in many cases in which the proceedings rest on special statutes which gave an exclusive jurisdiction to the court of session. But large exceptions have been made by recent legislation from this exclusion. By another series of statutes, for the most part connected with local administration, as the Road, Burial Grounds, Lunacy, Public-houses, and General Police and Education Acts, the jurisdiction of the court of session is excluded either as an original court or a court of review, and the sheriff court has exclusive jurisdiction.

The courts which the sheriff holds are (1) the criminal court, (2) the ordinary civil court, (3) the small-debt court for cases under £12 in value (6 Geo IV. c. 48), (4) the debts recovery court for cases above £12 and under £50 in value (30 and 41 Vict. c. 50), and (5) the registration court. His jurisdiction in the summary court is subject to review by the ordinary court of law, and in the ordinary civil court and the debts recovery court by the court of session. In the small debt court it is final, except in certain cases where an appeal lies to the next highest court of justice. The sheriff-substitute may completely exercise all the judicial jurisdiction of the sheriff, subject to appeal in civil cases other than small debt cases. As regards his administrative functions he assists the sheriff generally, and may act for him in the ordinary civil court, and he superintends the preliminary stage of criminal inquiries, consulting with the sheriff if necessary, but the other administrative duties of the office are conducted by the sheriff-depute in person. The salaries of sheriff-deputes vary from £2000 to £500 a year, those of sheriff-substitutes from £1400 to £500.

There is a principal sheriff-clerk appointed by the crown for each county, who has deputy clerks under him in the principal towns, and a procurator-fiscal for the conduct of criminal prosecutions for each county and district of a county, who is appointed by the sheriff with the sanction of the home secretary.

Besides the sheriffs of counties, there is a sheriff of chancery appointed by the crown, whose duties are confined to the service of writs, with a salary of £500. (25 M.)

SHERLOCK, THOMAS (1678–1761), bishop of London, the son of Dr William Sherlock, noticed before, was born at London in 1678. He was educated at Catherine Hall, Cambridge, and in 1704 succeeded his father as master of the Temple. He took a prominent part in the Bangorian controversy against Hoadly, whom he succeeded as bishop of Bangor in 1728; he was afterwards translated to Salisbury in 1734, and to London in 1738. He published against Collins's *Grounds and Reasons of the Christian Religion* a volume of sermons entitled *The Use and Intent of Prophecy in the Several Ages of the World* (1725), and in reply to Woolston's *Discourses on the Miracles* he wrote a volume entitled *The Trial of the Witnesses of the Resurrection of Jesus* (1729), which in a very short time ran through fourteen editions. His *Pastoral Letter* (1750) on "the late earthquakes" had a circulation of many thousands, and four volumes of *Sermons* which he published in his later years (1754–58) were also at one time highly esteemed. He died in 1761. A collected edition of his works in 6 vols 8vo, by Hughes, appeared in 1830.

SHERLOCK, WILLIAM (1641-1707), dean of St Paul's, was born at Southwark in 1641, and was educated at Eton and Cambridge (Peterhouse). In 1669 he became rector of St George, Botolph Lane, London, and in 1681 he was appointed a prebendary of St Paul's. In 1684 he published *The Case of Resistance of the Supreme Powers stated and resolved according to the Doctrine of the Holy Scriptures*, an ably written treatise, in which he drew the distinction between active and passive obedience which was at that time generally accepted by the high church clergy; in the same year he was made master of the Temple. In 1686 he was reproved for preaching against popery and his pension stopped. After the Revolution he was suspended for refusing the oaths to William and Mary, but before his final deprivation he yielded, justifying his change of attitude in *The Case of the Allegiance due to Sovereign Powers stated and resolved according to Scripture and Reason and the Principles of the Church of England* (1691). During the period of his suspension he wrote a *Practical Discourse concerning Death*, which became very popular and has passed through many editions. In 1690 and 1693 he published volumes on the doctrine of the Trinity which involved him in a warm controversy with South and others. He became dean of St Paul's in 1691, and died at Hampstead in 1707.

SHERMAN, a city of the United States, in Grayson county, Texas, 73 miles north of Dallas, is a substantially built and flourishing place, with a court-house and a college. Its population, only 1439 in 1870, was 6093 in 1880 and has since increased to about 8000. The surrounding country is a cotton and grain district.

SHERWIN, JOHN KEYS (1751-1790), engraver and history-painter, was born in 1751 at East Dean in Sussex. His father was a wood-cutter employed in shaping bolts for shipbuilders, and the son followed the same occupation till his seventeenth year, when, having shown an aptitude for art by copying some miniatures with exceptional accuracy, he was befriended by Mr William Mitford, upon whose estate the elder Sherwin worked, and was sent to study in London, first under John Astley, and then for three years under Bartolozzi—for whom he is believed to have executed a large portion of the plate of Clysie, after Annibal Caracci, published as the work of his master. He was entered as a student of the Royal Academy, and gained a silver medal, and in 1772 a gold medal for his painting of Coriolanus Taking Leave of his Family. From 1774 till 1780 he was an exhibitor of chalk drawings and of engravings in the Royal Academy. Establishing himself in St James's Street as a painter, designer, and engraver, he speedily attained popularity, and began to mix in fashionable society. His drawing of the Finding of Moses, a work of but slight artistic merit, which introduced portraits of the princess royal of England and other leading ladies of the aristocracy, hit the public taste, and, as reproduced by his burin, sold largely. In 1785 he succeeded Woollett as engraver to the king, and he also held the appointment of engraver to the prince of Wales. His professional income rose to about £12,000 a year; but he was constantly in pecuniary difficulties, for he was shiftless, indolent, and without method, open-handed and even prodigal in his benefactions,—and prodigal, too, in less reputable directions, for he became a reckless gambler, and habits of intemperance grew upon him. He died in extreme poverty on the 24th of September 1790,—according to Steevens, the editor of Shakespeare, at "The Hog in the Pound," an obscure alehouse in Swallow Street, or, as stated by his pupil J. T. Smith, in the house of Robert Wilkinson, a printseller in Cernhill.

It is as an engraver that Sherwin is most esteemed; and it may be noted that he was ambidextrous, working indifferently with

either hand upon his plates. His drawing is correct, his line excellent, and his textures are varied and intelligent in expression. Such of his plates as the Holy Family after Nicholas Poussin, Christ Bearing the Cross after Murillo, the portrait of the Marquis of Buckingham after Gainsborough, and that of Pitt occupy a high place among the productions of the English school of line-engravers. He also worked after Fine, Dance, and Kaufman.

SHETLAND ISLANDS See ORKNEY and SHETLAND
SHIELD See ARMS and ARMOUR, and HERALDRY
SHIELD, WILLIAM (1748-1829), composer of English operas, was born at Swalwell, near Newcastle, in 1748. His father began to teach him singing before he had completed his sixth year, but died three years later, leaving him in charge of guardians who made no provision whatever for continuing his musical education, for which he was thenceforward dependent entirely upon his own aptitude for learning, aided by a few lessons in the thoroughbass which he received from Charles Avison. Notwithstanding the difficulties inseparable from this imperfect training, he obtained admission into the opera band in 1772, at first as a second violin, and afterwards as principal viola, and this engagement he retained for eighteen years. In the meantime he turned his serious attention to composition, and in 1778 produced his first comic opera, *The Fitch of Bacon*, at the Little Theatre in the Haymarket, with so great success, that he was immediately engaged as composer to Covent Garden theatre, for which he continued to produce English operas and other dramatic pieces, in quick succession, until 1797, when he resigned his office, and devoted himself to compositions of a different class, producing a great number of very beautiful glee, some instrumental chamber music, and other miscellaneous compositions. He died in London January 25, 1829, and was buried in the south cloister at Westminster Abbey.

Shield's most successful dramatic compositions were *Joanna*, *The Mysteries of the Castle*, *The Lock and Key*, and *The Castle of Andalusia*. As a composer of songs he was in no degree inferior to his great contemporary Charles Dibdin. Indeed *The Artisan*, *The Heavens of the Lord*, and *The Post Captain* are as little likely to be forgotten as Dibdin's *Tom Bowling* or *Saturday Night at Sea*. His vein of melody was inexhaustible, though English in character, and always conceived in the purest and most delicate taste, and hence it is that many of his airs are still sung at concerts, though the operas for which they were written have long been banished from the stage. His *Introduction to Harmony* (1791 and 1800) contains a great deal of valuable information; and he also published a useful treatise, *The Rudiments of Thoroughbass*.

SHIELDS, NORTH. See TYNEMOUTH, within which borough the port is included.

SHELDON, SOUTH, a seaport, market-town, and municipal and parliamentary borough of Durham, is situated on the south bank of the Tyne, at its mouth, immediately opposite North Shields and Tynemouth, and on the North-Eastern Railway, 18 miles north-east of Durham and 9 east of Newcastle-on-Tyne. It is connected with North Shields and Tynemouth by steam ferries. The town possesses a spacious market-place, and some of the newer streets are wide and handsome, but the old street running along the shore is narrow and mean. Formerly salt was largely manufactured, but the principal industries now are the manufacture of glass and chemicals, and shipbuilding and ship rofiting and repairing, for which there are docks capable of receiving the largest vessels. The North-Eastern Railway Company possesses extensive docks, and the port has a large trade in coal; but, owing to the fact that in the shipping returns of the United Kingdom it is included under the general title "Tyne Ports," it is impossible to give an accurate statement regarding the number and tonnage of vessels. The number of fishing vessels connected with the port in 1884 was 15, of 204 tons and employing 98 men. At the mouth of the Tyne there is a pier about a mile in length. A townsman of South Shields, William Wouldhave, was the inventor of the life-

boat, and the first lifeboat was built there by Henry Greathead, and first used in a storm in 1789. The principal public buildings are the church of St Hilda, with a picturesque old tower, the town-hall in the market-place, the exchange, the custom-house, the mercantile marine offices, the public library and museum, which includes a large hall for public meetings and a school of science and art in connexion with South Kensington, the high school, the grammar school, the marine school, the master-mariners' asylum, the Ingham infirmary, and the union workhouse. There is a pleasant marine park near the pier. On elevated ground near the harbour are the remains of a Roman station, where numerous coins, portions of an altar, and several sculptured memorial stones have been dug up. The site of the old station was afterwards occupied by a fort of considerable strength, which was captured by the Scots under Colonel Stewart 20th March 1644. The town was founded by the convent of Durham about the middle of the 13th century, but on account of the complaints of the burgesses of Newcastle an order was made in the 43d year of Henry III., stipulating that no ships should be laden or unladen at Shields, and that no "shoars" or quays should be built there. This early check seems to have been long injurious to its prosperity, for until the present century it was little more than a fishing station. It received a charter of incorporation in 1850, and is divided into three wards, governed by a mayor, eight aldermen, and twenty-four councillors. In 1832 it received the privilege of returning a member to parliament. The corporation act as the urban sanitary authority, and the town has a specially good water supply from reservoirs at Cleland. The population of the municipal and parliamentary borough (area 1899 acres) was 45,336 in 1871, and in 1881 it was 56,875.

SILITTES. See **SUNNITES** and **SHĪTES**

SHIKĀRPUŖ, a British district in the province of Sind, Bombay presidency, India, with an area of 10,000 square miles, lying between 27° and 29° N. lat. and between 67° and 70° E. long. It is bounded on the N. by Khelat, Upper Sind Frontier district, and the river Indus, on the E. by the native states of Bahawalpur and Jaisalmer; on the S. by Kharipur state; and on the W. by the Khirthar Mountains. Shikārpur is a vast alluvial plain, broken only at Sukkur and Mohri by limestone hills. The Khirthar range attains an elevation of 7000 feet, and forms a natural boundary between the district and Baluchistan. Extensive patches of salt land, known as *kalār*, are frequently met with, especially in the upper portion of Shikārpur, and towards the Jacobabad frontier barren tracts of clay land and ridges of sand-hills, covered with caper and thorn jungle, form a poor but distinctive feature in the landscape. The desert portion of Rohri subdivision, known as the Registān, is very extensive. The forests (207 square miles) are situated on the banks of the Indus, mostly in the Rohri and Shikārpur subdivisions. The Indus Valley State Railway runs through the district, and the Kandahar railway also goes through a part of it.

In 1881 the population numbered 862,986 (males 461,038, females 391,933), of whom 93,341 were Hindus, 684,275 Mohammedans, and 786 Christians. The chief towns are Shikārpur, Sukkur (population 27,889), Larkhana (13,188), and Rohri (10,224). The cultivated land in 1882-83 amounted to 764,488 acres, of which 108,698 were twice cropped. Cereals—chiefly rice, jowar (millet), and wheat—form the principal crops; but a considerable area is also under pulses and oil-seeds. The chief manufactures are carpets and coarse cotton cloths. The total revenue raised in 1882-83 amounted to £234,729, of which the land contributed £189,869. Passing from the dominion of the caliphs, Shikārpur was overrun by Mahmud of Ghazni in 1026, and a little later was governed by the Sammas, the Sammas, and the Arghuns in succession. The Kalhora dynasty came into prominence in the 18th century, and was followed by the Talpur mirs, who annexed a part of the Durani

territory and incorporated it in the district. In 1843 Shikārpur passed to the British, and in 1852 the greater part of the Rohri subdivision was resumed from the mir of Khairpur, who had acquired it by fraud.

SHIKĀRPUŖ, the chief town of the above district, is situated 18 miles west of the Indus, in a tract of low-lying country annually flooded by the canals from that river. It is a great entrepôt for transit trade between the Bolan Pass and Karachi. The population in 1881 numbered 42,496 (males 22,889, females 19,607).

SHILOH, a town of Ephraim, where the sanctuary of the ark was, under the priesthood of the house of Eli. According to 1 Sam. iii. 15, this sanctuary was not a tabernacle but a temple, with doors. But the priestly narrator of Josh. xviii. 1 has it that the tabernacle was set up there by Joshua after the conquest. In Judges xxi. 19 sq. the yearly feast at Shiloh appears as of merely local character. Shiloh seems to have been destroyed by the Philistines after the disastrous battle of Ebenezer, cf. Jeremiah vii. 12 sq. The position described in Judges, *loc. cit.* (cf. *Onomasticon*, ed. Lagarde, p. 152), gives certainty to the identification with the modern Seilîn lying some 2 miles east-south-east of Lubbin (Lebanon), on the road from Bethel to Shechem. Here there is a ruined village, with a flat double-topped hill behind it, offering a strong position, which suggests that the place was a strong hold as well as a sanctuary. A smiling and fertile landscape surrounds the hill. The name Seilîn corresponds to Σιλοῖν in Josephus LXX. has Σηλῶ, Σηλωῶ. The forms given in the Hebrew Bible (שִׁילֹה, שִׁילֹה) have dropped the final consonant, which reappears in the adjective שִׁילֹנִי. On Shiloh in Gen. xlix. 10 see **JUDAN**.

SHIMOGA, or **SHEEMOGA**, a district in the north-west of the native state of Mysore, Southern India. It forms a part of the Nagar division, and is situated between 13° 30' and 14° 38' N. lat. and between 74° 44' and 76° 5' E. long. It has an area of 3797 square miles, and is bounded on the N and W by the Bombay districts of Dhārwar and N Kanara, and E and S. by the districts of Chitaldroog and Kadur. Its river system is twofold; in the east the Tungra, Bhadra, and Varada unite to form the Tungabhadra, which ultimately falls into the Kistna and so into the Bay of Bengal, while in the west a few minor streams flow to the Shivrâtri, which near the north-western frontier bursts through the Western Ghâts by the celebrated Falls of Gersoppa, said to be the grandest cataract in India. Flowing over a rocky bed 250 yards wide, the river here throws itself in four distinct falls down a tremendous chasm 960 feet deep.

The western half of the district is very mountainous and covered with magnificent forest, and is known as the Malnad or hill country, some of the peaks being 4000 feet above sea-level. The general elevation of Shimoga is about 2000 feet, and towards the east it opens out into the Malnad or plain country, which forms part of the general plateau of Mysore. The Malnad region is very picturesque, its scenery abounding with every class of tropical forests and mountain wilds; on the other hand the features of the Malnad country are for the most part comparatively tame. The mineral products of the district include iron-ore and laterite. On the summits of the Ghâts stones possessing magnetic qualities are occasionally found. The soil is loose and sandy in the valleys of the Malnad, and in the north-east the black cotton soil prevails. Bison are common in the *taluk* of Sagar, where the hill elephants are occasionally seen, while tigers, leopards, bears, wild hogs, *sambhar* and *chital* deer, and jungle sheep are numerous in the wooded tracts of the west. Shimoga presents much variety of climate. The south-west monsoon is full in force for about 25 miles from the Ghâts, bringing an annual rainfall of more than 150 inches, but the rainfall gradually diminishes to 81 inches at Shimoga station and to 25 inches or less at Chennarayana. There is no rainfall in the district, but it is not less than 225 in. of rain. The population in 1881 was 498,728 (males 259,296, females 240,482). Hindus numbered 470,678, Mohammedans 27,574, and Christians 1476. The only place with more than 10,000 inhabitants is Shimoga town, the capital and headquarters, which is situated on the Tungra river, with a population of 12,040. Rice

is the staple food-crop of the district, the next in importance is sugarcane, areca-nuts are also extensively grown, and miscellaneous crops include oil-seeds, vegetables, fruits, pepper, and cardamoms. Of the total area of 3797 square miles only 699 are returned as cultivated and 702 as cultivable. The chief manufactures are coarse cotton cloths, rough country blankets or *kambais*, iron implements, brass and copper wares, pottery, and jaggery. The district is also noted for its beautiful sandal-wood carving.

During the Mohammedan usurpation of Mysore from 1761 to 1799, incessant warfare kept the whole country in constant turmoil. After the restoration of the Hindu dynasty Shimoga district repeatedly became the scene of disturbances caused by the maladministration of the Deshastha Bahlmans, who had seized upon every office and made themselves thoroughly obnoxious. These disturbances culminated in the insurrection of 1880, which led to the direct assumption of the entire state by the British.

SHINTO See JAPAN, vol. xiii, p. 581.

SHIP The generic name (A. S. *scip*, Ger. *Schiff*, Gk. *σκάφος*, from the root *skap*, cf. "scoop") for the invention by which man has contrived to convey himself and his goods upon water points in its derivation to the fundamental conception by which, when realized, a means of flotation was obtained superior to the raft, which we may consider the earliest and most elementary form of vessel. The trunk of a tree hollowed out, whether by fire or by such primitive tools as are fashioned and used with angular patience and dexterity by savage races, represents the first effort to obtain flotation depending on something other than the mere buoyancy of the material. The poets, with characteristic insight, have fastened upon these points. Homer's hero Ulysses is instructed to make a raft with a raised platform upon it, and selects trees "withered of old, exceeding dry, that might float lightly for him" (*Od.*, v. 240). Virgil, glorifying the dawn and early progress of the arts, tells us, "Rivers then first the hollowed alders felt" (*Georg.*, i. 136, v. 451). Alder is a heavy wood and not fit for rafts. But to make for the first time a dug-out canoe of alder, and so to secure its flotation, would be a triumph of primitive art, and thus the poet's expression represents a great step in the history of the invention of the ship.

Primitive efforts in this direction may be classified in the following order: (1) rafts—floating logs, or bundles of brushwood or reeds or rushes tied together; (2) dug-outs—hollowed trees; (3) canoes of bark, or of skin stretched on framework or inflated skins (balsas); (4) canoes or boats of pieces of wood stitched or fastened together with sinews or thongs or fibres of vegetable growth; (5) vessels of planks, stitched or bolted together with inserted ribs and decks or half decks; (6) vessels of which the framework is first set up, and the planking of the hull nailed on to them subsequently. All these in their primitive forms have survived, in various parts of the world, with different modifications marking progress in civilization. Climatic influences and racial peculiarities have imparted to them their specific characteristics, and, combined with the available choice of materials, have determined the particular type in use in each locality. Thus on the north-west coast of Australia is found the single log of buoyant wood, not hollowed out but pointed at the ends. Rafts of reeds are also found on the Australian coast. In New Guinea catamarans of three or more logs lashed together with rattan are the commonest vessel, and similar forms appear on the Madras coast and throughout the Asiatic islands. On the coast of Peru rafts made of a very buoyant wood are in use, some of them as much as 70 feet long and 30 feet broad, these are navigated with a sail, and, by an ingenious system of centre boards, let down either fore or aft between the lines of the timbers, can be made to tack. The sea-going raft is often fitted with a platform so as to protect the goods and persons carried from the wash of

the sea. Upright timbers fixed upon the logs forming the raft support a kind of deck, which in turn is itself fenced in and covered over.¹ Thus the idea of a deck, and that of side planking to raise the freight above the level of the water and to save it from getting wet, are among the earliest typical expedients which have found their development in the progress of the art of shipbuilding.

Whether the observation of shells floating on the water, or of split reeds, or, as some have fancied, the nautilus, first suggested the idea of hollowing out the trunk of a tree, the practice ascends to a very remote antiquity in the history of man. Dug-out canoes of a single tree have been found associated with objects of the Stone Age among the ancient Swiss lake dwellings, nor are specimens of the same class wanting from the bogs of Ireland and the estuaries of England and Scotland, some obtained from the depth of 25 feet below the surface of the soil. The hollowed trunk itself may have suggested the use of the bark as a means of flotation. But, whatever may have been the origin of the bark canoe, its construction is a step onwards in the art of shipbuilding. For the lightness and pliability of the material necessitated the invention of some internal framework, so as to keep the sides apart, and to give the stiffness required both for purposes of propulsion and the carrying of its freight. Similarly, in countries where suitable timber was not to be found, the use of skins or other water-tight material, such as felt or canvas, covered with pitch, giving flotation, demanded also a framework to keep them distended and to bear the weight they had to carry. In the framework we have the rudimentary ship, with longitudinal bottom timbers, and ribs, and cross-pieces, imparting the requisite stiffness to the covering material. Bark canoes are found in Australia, but the American continent is their true home. In northern regions skin or woven material made water-tight supplies the place of bark.

The next step in the construction of vessels was the building up of canoes or boats by fastening pieces of wood together in a suitable form. Some of these canoes, and probably the earliest in type, are tied or stitched together with thongs or cords. The Madras surf boats are perhaps the most familiar example of this type, which, however, is found in the Shants of Magellan and in Central Africa (on the Victoria Nyanza), in the Malay Archipelago and on many islands of the Pacific. Some of these canoes show a great advance in the art of construction, being built up of pieces fitted together with ridges on their inner sides, through which the fastenings are passed.² These canoes have the advantage of elasticity, which gives them ease in a seaway, and a comparative immunity where ordinary boats would not hold together. In these cases the body of the canoe is constructed first and built to the shape intended, the ribs being inserted afterwards, and attached to the sides, and having for their main function the uniting of the deck and cross-pieces with the body of the canoe. Vessels thus stitched together, and with an inserted framework, have from a very early time been constructed in the Eastern seas far exceeding in size anything that would be called a canoe, and in some cases attaining to 200 tons burthen.

From the stitched form the next step onwards is to fasten the materials out of which the hull is built up by pegs or trenails; and of this system early types appear among the Polynesian islands and in the Nile boats described by Herodotus (ii. 96), the prototype of the modern "naggur." The raft of Ulysses described by

¹ The raft of Ulysses described in Homer (*Od.*, v.) must have been of this class.

² See Capt. Cook's account of the Friendly Islands, La Pérouse on Easter Island, and Williams on the Fiji Islands.

Homer presents the same detail of construction. It is remarkable that some of the early types of boats belonging to the North Sea present an intermediate method, in which the planks are fastened together with pins or trenails, but are attached to the ribs by cords passing through holes in the ribs and corresponding holes bored through ledges cut on the inner side of each plank.

We thus arrive, in tracing primitive efforts in the art of ship construction, at a stage from which the transition to the practice of setting up the framework of ribs fastened to a timber keel laid lengthwise, and subsequently attaching the planking of the hull, was comparatively simple. The keel of the modern vessel may be said to have its prototype in the single log which was the parent of the dug-out. The side planking of the vessel, which has an earlier parentage than the ribs, may be traced to the attempt to fence in the platforms upon the sea-going rafts, and to the planks fastened on to the sides of dug-out canoes so as to give them a raised gunwale.¹ The ribs of the modern vessel are the development of the framework originally inserted after the completion of the hull of the canoe or built-up boat but with the difference that they are now prior in the order of fabrication. In a word, the skeleton of the hull is now first built up, and the skin, &c., adjusted to it, whereas in the earlier types of wooden vessels the outside hull was first constructed, and the ribs, &c., added afterwards. It is noticeable that the invention of the outrigger and weather platform, the use of which is at the present time distributed from the Andaman Islands eastward throughout the whole of the South Pacific, has never made its way into the Western seas. It is strange that Egyptian enterprise, which seems at a very early period to have penetrated eastward down the Red Sea and round the coasts of Arabia towards India, should not have brought it to the Nile, and that the Phœnicians, who, if the legend of their migration from the shores of the Persian Gulf to the coast of Canaan be accepted, would in all probability, in their maritime expeditions, have had opportunities of seeing it, did not introduce it to the Mediterranean. That they did not do so, if they saw it at all, would tend to prove that even in that remote antiquity both nations possessed the art of constructing vessels of a type superior to the outrigger canoes, both in speed and in carrying power.

The earliest representations that we have as yet of Egyptian vessels carry us back, according to the best authorities, to a period little short of 3000 years before Christ. Some of these are of considerable size, as is shown by the number of rowers, and by the cargo consisting in many cases of cattle. The earliest of all presents us with the peculiar mast of two pieces, stepped apart but joined at the top. In some the masts are shown lowered and laid along a high spar-deck. The larger vessels show on one side as many as twenty-one or twenty-two and in one case twenty-six oars, besides four or five steering. They show considerable camber, the two ends rising in a curved line which in some instances ends in a point, and in others is curved back and over at the stern and terminates in an ornamentation, very frequently of the familiar lotus pattern. At the bow the stem is sometimes seen to rise perpendicularly, forming a kind of forecastle, sometimes to curve backward and then forward again like a neck, which is often finished into a figure-head representing some bird or beast or Egyptian god. On the war galleys there is frequently shown a projecting bow with a metal head attached, but well above the water. This, though no doubt used as a ram, is not identical with the beak *à fleur d'eau*, which we shall meet with in Phœnician and

Greek galleys. It is more on a level with the proembolion of the latter.

The impression as regards the build created by the drawings of the larger galleys is that of a long and somewhat wall-sided vessel with the stem and stern highly raised. The tendencies of the vessel to "hog," or rise amidships, owing to the great weight fore and aft unsupported by the water, is corrected by a strong transverse beam from stem to stern over crutches. The double mast of the earlier period seems in time to have given place to the single mast furnished with bails or rollers at the upper part, for the purpose apparently of raising or lowering the yard according to the amount of sail required. The sail in some of the galleys is shown with a bottom as well as a top yard. In the war galleys during action it is shown rolled up like a curtain with loops to the upper yard. The steering was effected by paddles, sometimes four or five in number, but generally one or two fastened either at the end of the stern or at the side, and above attached to an upright post in such a way as to allow the paddle to be worked by a tiller.

There are many remarkable details to be observed in the Egyptian vessels figured in Diemichen's *Fleet of an Egyptian Queen*, and in Lepsius's *Denkmäler*. The Egyptian ship, as represented from time to time in the period between 3000 and 1000 B.C., presents to us a ship proper as distinct from a large canoe or boat. It is the earliest ship of which we have cognizance. But there is a noticeable fact in connexion with Egypt which we gather from the tomb paintings to which we owe our knowledge of the Egyptian ship. It is evident from these records that there were at that same early period, inhabiting the littoral of the Mediterranean, nations who were possessed of sea-going vessels which visited the coasts of Egypt for plunder as well as for commerce, and that sea-fights were even then not uncommon. Occasionally the combination of these peoples for the purpose of attack assumed serious proportions, and we find the Pharaohs recording naval victories over combined Dardanians, Teucrians, and Mysians, and, if we accept the explanations of Egyptologists, over Pelasgians, Daimians, Oscans, and Suckians. The Greeks, as they became familiar with the sea, followed in the same track. The legend of Helen in Egypt, as well as the numerous references in the *Odyssey*, point not only to the attraction that Egypt had for the maritime peoples, but also to long-established habits of navigation and the possession of an art of shipbuilding equal to the construction of sea-going craft capable of carrying a large number of men and a considerable cargo besides.

But the development of the ship and of the art of navigation clearly belongs to the Phœnicians. It is tantalizing to find that the earliest and almost the only evidence that we have of this development is to be gathered from Assyrian representations. The Assyrians were an inland people, and the navigation with which they were familiar was that of the two great rivers, Tigris and Euphrates. After the conquest of Phœnicia they had knowledge of Phœnician naval enterprise, and accordingly we find the war galley of the Phœnicians represented on the walls of the palaces unearthed by Layard and his followers in Assyrian discovery. But the date does not carry us to an earlier period than 900-800 B.C. The vessel represented is a bireme war galley which is "aphract," that is to say, has the upper tier of rowers unprotected and exposed to view. The apertures for the lower oars are of the same character as those which appear in Egyptian ships of a much earlier date, but without oars. The artist has shown the characteristic details, though somewhat conventionally. The fish-like snout of

¹ Compare the planks upon the Egyptian war galleys, added so as to protect the rowers from the missiles of the enemy.

the beak, the line of the parodus or outside gangway, the wickerwork cancelli,¹ the shields ranged in order along the side of the bulwark, and the heads of a typical crew on deck (the *προρρη*s looking out in front in the forecastle, an *ἐπιβάτης*, two chiefs by the mast, and, aft, the *κελευστής* and *κυβερνήτης*). The supporting timbers of the deck are just indicated. The mast and yard and fore and back stays, with the double steering paddle, complete the picture.

But, although there can be little doubt that the Phœnicians, after the Egyptians, led the way in the development of the shipwright's art, yet the information that we can gather concerning them is so meagre that we must go to other sources for the description of the ancient ship. The Phœnicians at an early date constructed merchant vessels capable of carrying large cargoes, and of traversing the length and breadth of the Mediterranean, perhaps even of trading to the far Cassiterides and of circumnavigating Africa. They in all probability (if not the Egyptians) invented the bireme and trireme, solving the problem by which increased oar-power and consequently speed could be obtained without any great increase in the length of the vessel.

It is, however, to the Greeks that we must turn for any detailed account of these inventions. The Homeric vessels were *aphrakt* and not even decked throughout their entire length. They carried crews averaging from fifty to a hundred and twenty men, who we are expressly told by Thucydides, all took part in the labour of rowing, except perhaps the chiefs. The galleys do not appear to have been armed as yet with the beak, though later poets attribute this feature to the Homeric vessel. But they had great poles used in fighting, and the term employed to describe these (*ναυμάχαι*) implies a knowledge of naval warfare. The general characteristics are indicated by the epithets in use throughout the *Iliad* and the *Odyssey*. The Homeric ship is sharp (*σφῆ*) and swift (*ἄκτια*); it is hollow (*κοιλὴ, γλαφυρὴ, μεσέσφῆς*), black, vermilion-cheeked (*μυτράτῃρος*), dark-prowed (*κασσέριππος*), curved (*κορυσὶς, ἀμφιέλικτα*), well-timbered (*ἔδωκευος*), with many thwarts (*τολῆυγος, ἑκατόλυγος*). The stems and sterns are high, upraised, and resemble the horns of oxen (*ὀρθόκορπαι*). They present a type parallel in the history of the shipping of the Mediterranean with that of the vikings' vessels of the North Sea.

On the vessels, the earliest of which may date between 700 and 600 B.C., we find the bireme with the bows finished off into a beak shaped as the head of some sea monster, and an elevated forecastle with a bulwark evidently as a means of defence. The craft portrayed in some instances are evidently pirate vessels, and exhibit a striking contrast to the trader, the broad ship of burden (*φορτὴς ἐπέλα*), which they are overhauling. The trireme, which was developed from the bireme and became the Greek ship of war (the long ship, *ναὸς μακρὰ, navis longa, par excellence*), dates, so far as Greek use is concerned, from about 700 B.C. according to Thucydides, having been first built at Corinth by Amintores. The earliest sea-fight that the same author knew of he places at a somewhat later date, —664 B.C., more than ten centuries later than some of those portrayed in the Egyptian tomb paintings.

The trireme was the war ship of Athens during her prime, and, though succeeded and in a measure superseded by the larger rates,—quadrireme, quinquereme, and so on, up to vessels of sixteen banks of oars (*ἰνκλιβίς προπε μαγνιτινὴς*),—yet, as containing in itself the principle of which the larger rates merely exhibited an expansion, a difference in degree and not in kind, has, ever since the revival of letters, concentrated upon itself the attention of

the learned who were interested in such matters. The literature connected with the question of ancient ships, if collected, would fill a small library, and the greater part of it turns upon the construction of the trireme and the disposition of the rowers therein.

During the present century much light has been thrown upon the disputed points by the discovery (1834) at the Piræus of some records of the Athenian dockyard superintendents, which have been published and admirably elucidated by Boeckh. Further researches carried out by his pupil Dr. Giese, who united a practical knowledge of ships and shipbuilding with all the scholarship and industry and acumen necessary for such a task, have cleared up most of the difficulties which beset the problem, and enable us to describe with tolerable certainty the details of construction and the disposition of the rowers in the ancient ship of war.

One point it is necessary to insist on at the outset, because upon it depends the right understanding of the problem to be solved. The ancients did not employ more than one man to an oar. The method employed in mediæval galleys is entirely alien to the ancient system. M. Jal, Admiral Fincati, Admiral Jaurès du la Gravière, and a host of other authorities have all been led to erroneous views by neglect of the ancient texts which overwhelmingly establish this as an axiom of the ancient marine—"one oar and one man."

The distinction between "*aphrakt*" and "*enaphrakt*" vessels must not be overlooked in a description of the ancient vessels. The words, meaning "unfenced" and "fenced," refer to the bulwarks which covered the upper tier of rowers from attack. In the *aphrakt* vessels these side plankings were absent and the upper tier of rowers was exposed to view from the side. Both classes of vessels had upper and lower decks, but the *enaphrakt* class carried their decks on a lower level than the *enaphrakt*. The system of side planking with a view to the protection of the rowers dates from a very early period, as may be seen in some of the Egyptian representations, but among the Greeks it does not seem to have been adopted till long after the Homeric period. The Thians are credited with the introduction of the improvement.

In describing the trireme it will be necessary to deal first with the disposition of the rowers and subsequently with the construction of the vessel itself. The object of arranging the oars in banks was to economize horizontal space and to obtain an increase in the number of oars without having to lengthen the vessel. We know from Vitruvius that the "intercostallum" or space horizontally measured from oar to oar, was 2 cubits. This is exactly borne out by the proportions of an Attic *aphrakt* trireme, as shown on a fragment of a bas-relief found on the Acropolis. The rowers in all classes of hanked vessels sat in the same vertical plane, the seats ascending in a line obliquely towards the stern of the vessel. Thus in a trireme the *thramite*, or oarsman of the highest bank, was nearest the stern of the set of three to which he belonged. Next behind him and somewhat below him sat his *zygitæ*, or oarsman of the second bank; and next below and behind the *zygitæ* sat the *thalamite*, or oarsman of the lowest bank. The vertical distance between these three was 2 feet, the horizontal distance about 1 foot. The horizontal distance, it is well to repeat, between each seat in the same bank was 3 feet (the seat itself about 9 inches broad). Each man had a resting place for his feet, somewhat wide apart, fixed to the bench of the man on the row next below and in front of him. In rowing, the upper hand, as is shown in most of the representations which remain, was with his palm turned upwards towards the body. This is accounted for by the angle at which the oar was worked. The lowest rank used the shortest oars, and the difference of the length of the oars on board was caused by the curvature of the ship's hull. Thus, looked at from within, the rowers antipathically seemed to be using the longest oars, but outside the vessel, as we are expressly told, all the oar-blades of the same bank took the water in the same longitudinal line. The lowest or *thalamite* oar-ports were 3 feet, the *zygitæ* 4½ feet, the *thramite* 5½ feet above the water. Each oar-portal was provided by an *ασκον* of leather bag, which fitted over the oar, closing the aperture against the wash of the sea without impeding the action of the oar. The oar was tied by a thong, against which it was probably rowed, which itself was attached to a thowl (*σκαμνός*). The port-hole was probably oval in shape (the Egyptian and Assyrian pictures show an oblong). We know that it was large enough for a man's head to be thrust through it.

The benches on which the rowers sat ran from the vessel's side to timbers which, inclined at an angle of about 64° towards the ship's stern, reached from the lower to the upper deck. These timbers were, according to Græser, called the *diaphragmata*. In the trireme each *diaphragma* supported three, in the quinquereme five, in the octoneme eight, and in the famous *tessera-*

¹ See Rawlinson, *Ancient Monarchies*, vol. ii, p. 176.

counters forty seats of rowers, who all belonged to the same "complexus," though each to a different bank. In effect, when once the principle of construction had been established in the trireme, the increase in larger rates was effected, so far as the motive power was concerned, by lengthening the diaphanagmata was of about 15 to 24 inches, which gave a space increased to about 3 feet by the inward curve of the prolongation of the ribs to form supports for the decks, for a passage on either side of the vessel. This gangway was planked in along its outer side so as to afford protection to the seamen and marines, who could pass along its whole length without impeding the rowers. Here, in action, the sailors were posted as light-armored troops, and when needed could use the long superannuated oars (*επιπλοοί*) mentioned above. The ribs, prolonged upwards upon an inward curve, supported on their upper ends the oar beams (*σπυρρήρες*) which tied the two sides of the vessel together and carried the deck. In the epantaph class these took the place of the thwarts (*θύρα*) which in the earlier vessels, at a lower level, yoked together the sides of the vessel, and formed also benches for the rowers to sit on, from which the latter had their name (*θύρηται*), having been the uppermost tier of oarsmen in the buxum, while those who sat behind and below them in the hold of the vessel were called *βαλάνται* or *βαλάντες* (from *βάλανος*). In the trireme the additional upper tier was named from the elevated bench (*εβάνος*) on which they were placed (*εβανίται*). On the deck were stationed the *μυρμίδες* (*επιβάται*), fighting men in heavy armor, few in number in the Attic trireme in its palmy days, but many in the Roman quinquagesimo, when the number of them was augmented, and the deck was filled with the battles in the harbor at Syracuse, land tactics took the place of the maritime skill which gave victory to the ram in the open sea. The space occupied by the rowers was termed *εγκαινόν*. Beyond this, fore and aft, were the *παρεμβείρια*, or parts outside the rowers. These occupied 11 feet of the bows and 14 feet in the stern.

In the fore part was the forecastle, with its raised deck, on which was stationed the *παρώνης* with his men. In the stern the decks (*κρημνί*) rose in two or three gradations, the lowest was a kind of deck-house for the captain and a seat for the steerer (*κυβερνήτης*), who steered by means of ropes attached to the tillers fixed in the upper part of the paddles, which, in later times at least, ran over wheels (*τροχιλαί*), giving him the power of changing his vessel's course with great rapidity. Behind the deck-house rose the flagstaff, on which was hoisted the pennant, and from the signal staff a rope was given to the *πρωτοπλοῖ*, the first ship. On either side of the deck ran a balustrade (*κογχή*), which was covered for protection during action with felt (*λίλιον*, *πορφυροῦμα*, *πριχινά*) or canvas (*πλευρά*). Above was stretched a strong awning of hide (*κατάβηγμα*), as a protection against grappling lions and missiles of all kinds. In Roman vessels towes were carried up fore and aft from which darts could be showered on the enemy's deck, the heavy corvus or boarding bridge swung astern of the stern-post, ran all round the vessel hanging at the ends of the yards ready to fall on a vessel that came near enough alongside. But these were later inventions and for larger ships. The Attic trireme was built light for speed and for ramming purposes. Her dimensions, so far as we can gather them from the scattered notices of antiquity, were probably approximately as follows:—length of rowing space (*εγκαινόν*) 98 feet, bows 11 feet; stern 14 feet; total 118 feet; add 10 feet for the beam, the breadth at a chain near the bows, and 14 feet, and above at the broadest part 18 feet, exclusive of the gangways, the space between the diaphanagmata mentioned above was 7 feet. The deck was 11 feet above the water-line and the draught about 8 to 9 feet. All the Attic triremes appear to have been built upon the same model, and their gear was interchangeable. The Athenians had a peculiar system of gridding the ships with long cables (*σπυρρήματα*), each trireme having two or more, which, passing through rings in front of the stern-post, ran all round the vessel hanging immediately under the waling-pieces. They were fastened at the stern and tightened up with levers. These cables, by shrinking as soon as they were wet, tightened the whole fabric of the vessel, and in action, in all probability, relieved the hull from part of the shock of ramming, the strain of which would be sustained by the waling-pieces convergent in the beaks. These rope-griddles are not to be confused with the process of undergirding, a practice which was practiced of the vessel in which St Paul was being carried to Italy. The triremes appeared to have had three masts. The mainmast carried square sails, probably two in number. The foremast and the mizen carried lateen sails. In action the Greeks did not use sails, and everything that could be lowered was stowed below. The mainmasts and larger sails were often left ashore if a conflict was expected.

The crew of the Attic trireme consisted of from 200 to 235 men in all. Of these 174 were rowers—54 on the lower bank (thalamites), 53 on the middle bank (zygites), and 63 on the upper bank (thranites),—the upper oars being more numerous because of the contraction of the space available for the lower tiers near the bow and stern. Besides the rowers were about 10 marines (*επιβάται*) and 20 oarsmen. The officers were the triarch and next

eyes (*ὀφθαλμοί*), answering to our oarwise holes, though which ran the cables for the anchors. On either side the thumae, at about the level of the thranite benches, projected a gangway (*παρόδος*) supported by brackets (*βραχί*) springing from the upper waling-piece, and resting against the ribs of the vessel. This projection was of about 15 to 24 inches, which gave a space increased to about 3 feet by the inward curve of the prolongation of the ribs to form supports for the decks, for a passage on either side of the vessel. This gangway was planked in along its outer side so as to afford protection to the seamen and marines, who could pass along its whole length without impeding the rowers. Here, in action, the sailors were posted as light-armored troops, and when needed could use the long superannuated oars (*επιπλοοί*) mentioned above. The ribs, prolonged upwards upon an inward curve, supported on their upper ends the oar beams (*σπυρρήρες*) which tied the two sides of the vessel together and carried the deck. In the epantaph class these took the place of the thwarts (*θύρα*) which in the earlier vessels, at a lower level, yoked together the sides of the vessel, and formed also benches for the rowers to sit on, from which the latter had their name (*θύρηται*), having been the uppermost tier of oarsmen in the buxum, while those who sat behind and below them in the hold of the vessel were called *βαλάνται* or *βαλάντες* (from *βάλανος*). In the trireme the additional upper tier was named from the elevated bench (*εβάνος*) on which they were placed (*εβανίται*). On the deck were stationed the *μυρμίδες* (*επιβάται*), fighting men in heavy armor, few in number in the Attic trireme in its palmy days, but many in the Roman quinquagesimo, when the number of them was augmented, and the deck was filled with the battles in the harbor at Syracuse, land tactics took the place of the maritime skill which gave victory to the ram in the open sea. The space occupied by the rowers was termed *εγκαινόν*. Beyond this, fore and aft, were the *παρεμβείρια*, or parts outside the rowers. These occupied 11 feet of the bows and 14 feet in the stern.

In the fore part was the forecastle, with its raised deck, on which was stationed the *παρώνης* with his men. In the stern the decks (*κρημνί*) rose in two or three gradations, the lowest was a kind of deck-house for the captain and a seat for the steerer (*κυβερνήτης*), who steered by means of ropes attached to the tillers fixed in the upper part of the paddles, which, in later times at least, ran over wheels (*τροχιλαί*), giving him the power of changing his vessel's course with great rapidity. Behind the deck-house rose the flagstaff, on which was hoisted the pennant, and from the signal staff a rope was given to the *πρωτοπλοῖ*, the first ship. On either side of the deck ran a balustrade (*κογχή*), which was covered for protection during action with felt (*λίλιον*, *πορφυροῦμα*, *πριχινά*) or canvas (*πλευρά*). Above was stretched a strong awning of hide (*κατάβηγμα*), as a protection against grappling lions and missiles of all kinds. In Roman vessels towes were carried up fore and aft from which darts could be showered on the enemy's deck, the heavy corvus or boarding bridge swung astern of the stern-post, ran all round the vessel hanging at the ends of the yards ready to fall on a vessel that came near enough alongside. But these were later inventions and for larger ships. The Attic trireme was built light for speed and for ramming purposes. Her dimensions, so far as we can gather them from the scattered notices of antiquity, were probably approximately as follows:—length of rowing space (*εγκαινόν*) 98 feet, bows 11 feet; stern 14 feet; total 118 feet; add 10 feet for the beam, the breadth at a chain near the bows, and 14 feet, and above at the broadest part 18 feet, exclusive of the gangways, the space between the diaphanagmata mentioned above was 7 feet. The deck was 11 feet above the water-line and the draught about 8 to 9 feet. All the Attic triremes appear to have been built upon the same model, and their gear was interchangeable. The Athenians had a peculiar system of gridding the ships with long cables (*σπυρρήματα*), each trireme having two or more, which, passing through rings in front of the stern-post, ran all round the vessel hanging immediately under the waling-pieces. They were fastened at the stern and tightened up with levers. These cables, by shrinking as soon as they were wet, tightened the whole fabric of the vessel, and in action, in all probability, relieved the hull from part of the shock of ramming, the strain of which would be sustained by the waling-pieces convergent in the beaks. These rope-griddles are not to be confused with the process of undergirding, a practice which was practiced of the vessel in which St Paul was being carried to Italy. The triremes appeared to have had three masts. The mainmast carried square sails, probably two in number. The foremast and the mizen carried lateen sails. In action the Greeks did not use sails, and everything that could be lowered was stowed below. The mainmasts and larger sails were often left ashore if a conflict was expected.

The crew of the Attic trireme consisted of from 200 to 235 men in all. Of these 174 were rowers—54 on the lower bank (thalamites), 53 on the middle bank (zygites), and 63 on the upper bank (thranites),—the upper oars being more numerous because of the contraction of the space available for the lower tiers near the bow and stern. Besides the rowers were about 10 marines (*επιβάται*) and 20 oarsmen. The officers were the triarch and next

to him the helmsman (αὐβερνήτης), who was the navigating officer of the trireme. Each tier of rowers had its captain (στοιχαρχός). There were also the captain of the forecable (πρωμύς), the "kelustes" who gave the time to the rowers, and the ship's piper (τρυπανήτης). The rowers descended into the seven-foot space between the diphemata and took their places in regular order, beginning with the thalamites. The economy of space was such that, as Cicero remarks, there was not room for one man more.

The improvement made in the build of these vessels by the Corinthian and Syracusan shipwrights, by which the bows were so much strengthened that they were able to meet the Athenian attack stem on (προσβολή), caused a change of tactics, and gave an impetus to the building of larger vessels—quadriremes and quinqueremes—in which increased oar-power was available for the propulsion of the heavier weights.

In principle these vessels were only expansions of the trireme, so far as the disposition of the rowers was concerned, but the speed could not have increased in proportion to the weight, and hence arose the variety of contrivances which superseded the ramming tactics of the days of Phormio. In the century that succeeded the close of the Peloponnesian War the fashion of building big vessels became prevalent. We hear of various numbers of banks of oars up to sixteen (ἑκαδύτρητος)—the big vessel of Demetrius Poliorcetes. The famous tesseracontes or forty-banked vessel of Ptolemy Philopator was in reality nothing more than a costly and ingenious toy, and never of any practical use. The fact, however, of its construction shows the extent to which the shipwright's art had been developed among the ancients.

The Romans, who developed their naval power during the First Punic War, were deficient in naval construction till they learnt the art from their enemies the Carthaginians. They copied a quinquereme which had drifted on to the coast, and, with crews taught to row on frames set up on dry land, manned a fleet which we are told was built in sixty days from the time the trees were cut down. After the Punic War, in which the use of boarding tactics gave the Romans command of the sea, the larger rates—quinqueremes, hexiemes, octiemes—continued in use until at Actium the fate of the big vessels was sealed by the victory of the light Liburnian galleys. The larger classes, though still employed as guardships for some time, fell into disuse, and the art of building them and the knowledge of their interior arrangements were lost.

Table of Measurements, &c., after Graenicher

	Trireme	Quinquereme	Tesseracontes
Length, exclusive of beak.	(?) 149 ft. ¹	168 ft.	420 ft.
Beam, greatest	18 "	26 "	76 "
Passage between διαφρήματα.	7 "	11 "	49 "
Draught	8½ "	11½ "	20 "
Tons measurement	(?) 239	534	11,320 (?)
Number of rowers	174	310	4,054
Crew, total complement	225	375	7,500

Medieval Ships.—It is not at present possible to trace in its successive stages the transition from the ancient ship of war to the medieval galley. The sailing vessels of the time of the early Roman empire, such as that in which St Paul suffered shipwreck or the great merchantman described by Lucian, were the direct precursors, not only of the medieval merchant vessels, but also of the large sailing vessels which, after the invention of gunpowder, and the consequent necessity of carrying marine artillery, superseded the long low galleys propelled by oars. The battle of Actium gave the death-blow to the ancient type of vessel with its many banks of oars. The light

Liburnian galleys which, though fully decked, were aphract, and, according to Lucian's testimony (bk. iii.),

Online contents gemino cievasse Liburna,

had only two banks of oars, were buemes. This apparently became the type of Roman war galleys, and, though the old name trireme survived, its meaning became simply "man of war," and did not any longer imply three banks of oars. Light vessels were in vogue, and galleys with single banks of oars are common in the representations on coins and in such fescos as survive, but trireme and quinquereme, &c., have vanished.

A cloud of obscurity rests on these, the dark ages of naval history. We know nothing of the character and composition of the fleet in which Ricimer defeated the Vandals in the 5th century of our era. Nor have we any details of the fleets of the Byzantine empire until the end of the 9th century, when a light is thrown upon the subject by the *Tactica* of the emperor Leo. This emperor, in giving his directions as to the constitution of his fleet, prescribes that dromones (δρομόνες)—that is, tinclines—are to be got ready in the dockyards with a view to a naval engagement. The vessels are not to be too light or too heavy. They are to be armed with siphons for the projection of Greek fire. They are to have two banks of oars, with twenty-five rowers a-piece, on each side. Some of the vessels are to be large enough to carry two hundred men, others are to be smaller, like those called galleys or one-banked vessels, swift and light (ελαττους δρακονταυς ολίγα γαλατας ἢ μονήρεις λεγομένους ταχύνους καὶ διαφρούς). Here we have the name galleys distinctively attached to vessels with one bank of oars. This passage should have saved much of the labour that has been thrown away in attempting to prove that the distribution of rowers in the medieval galleys was upon the same principle as that observed in the ancient linemes or triremes.

The light thrown by the philosophic Byzantine on the naval construction and equipment of his time is but a passing flash. After the 9th century there is darkness again until the 11th and 12th centuries, when the features of the medieval galley first begin to be visible. And here perhaps it is not out of place to say that it is necessary to distinguish between those imaginary representations of the antique in which painters, such as Titoret, give fanciful arrangement to the oars of their galleys, so as to meet their ideas of bireme or trireme, from those that are historically faithful and figure, perhaps in an ungainly and martistic manner, the galleys of Venice and Genoa as they appeared in the Middle Ages. It would exceed the space at our disposal here to enter into details which can be gathered from Jal's *Archéologie Navale* and the *Glossaire Nautique* of the same author, or the later works of Admiral Jurien de la Gravière and Admiral L'encina. It must suffice to indicate here a few of the main characteristics in which the medieval galley differs from the ancient, and exhibits the last development of man-power as applied to motion in vessels larger than the boats of the present day.

These characteristics may be sketched briefly. Upon the medieval galley, which was essentially a one-banked galley (μονόπρωτος), the use of the longer oar or sweep took the place of the small paddling oars of the ancient vessel. The increased length of the oar requiring for its efficiency greater power than one man could employ led to the use of more than one man to an oar. The necessity therefore arose of placing the weight (or point at which the oar, used as a lever, worked against the thowl, and so pressed against the water, which is the fulcrum) at a greater distance from the force or man who moved the lever. This was gained by the invention of the apostis.

¹ Taking the intercolumnium at 4 feet, but this does not agree with Vitruvius, who gives 3 cubits.

$D^2 R_0$. To the speeds of model and ship thus related it is convenient to apply the term "corresponding speeds." For example, suppose two similar ships, the length, breadth, depth, &c. of which were double one of the other. Then, if at a given speed (say 10 knots) the resistance of the smaller ship were estimated, we may infer that at a speed of $\sqrt{2} \times 10 = 14.14$ knots in the longer ship there would be a resistance 8 times as great as in the smaller vessel.

This law is in accordance with the old rule that the resistance varies as the square of the velocity, and also as the area of the surface exposed to resistance. It takes into account both the resistance due to surface friction (subject to some correction) and the formation of deadwater eddies. The passage of the ship through the water creates waves which are dependent for their character upon the proportions and form of the ship. These constitute also an element of resistance. They are due to differences of hydrodynamic pressure inherent in the system of stream-lines which the passage of the ship creates. These wave-configurations should be precisely similar when the originating forms are similar and are travelling at speeds proportional to the square roots of their respective dimensions, because the resulting forces will be in that case as the square of the speeds. For example, if the surface of the water surrounding a ship 160 feet long, travelling at 10 knots an hour, were modelled together with the ship, on any scale, the model would equally represent, on half that scale, the water surface surrounding a ship of similar form 320 feet long, travelling at 14.14 knots an hour, or again, on 16 times that scale, the water surface surrounding a model of the ship 10 feet long, travelling at 2.5 knots. Experiment has abundantly confirmed this proportion as to the similarity of waves caused by similar forms travelling at corresponding speeds. The resistance caused to these forms respectively by the development of the waves would therefore also be proportionate to the cubes of the dimensions of the forms and would follow the law of comparison stated above. It is necessary, however, to observe that, in dealing with surfaces having so great a disparity in length and speed as those of a model and of a ship, a very tangible correction is necessary in regard to surface friction.

The vessel tried by Mr. Froude for confirming the law of comparison was H.M.S. "Greyhound," of 1187 tons. She was towed by H.M.S. "Atalanta," of 8078 tons, from the end of a boom 45 feet long, so as to avoid interference of waves. It was found to be possible to tow her at a speed of nearly 13 knots. The actual amount of tow-ropes for the "Greyhound" was approximately as follows,—at 4 knots, 0.6 ton; at 6, 1.4 tons, at 8, 2.5 tons, at 10, 4.7 tons; and at 12, 9.0 tons.

Comparing the indicated horse-power of the "Greyhound" when on her steam trials and the resistance of the ship as determined by the dynamometer, it appears that, making allowance for the slip of the screw, the legitimate expenditure of power, is only about 45 per cent. of the power carried by the screw, the surplus being employed in propelling the ship, and that the remainder is wasted in friction of engines and screw and in the detrimental reaction of the propeller on the steam lines of the water closing in around the stern of the vessel.

We may describe in Mr. Froude's own words the system of experiment now regularly carried out for the Admiralty, a system which has been successfully copied in other countries and also by a private ship-building firm, Messrs. Denny of Dumbarton.

"That system of experiments involves the construction of models of various forms (they are really fair sized boats of from 10 to 25 feet in length), and the testing by a dynamometer of the resistance they experienced when running at various assigned appropriate speeds. This system may be described as that of determining the scale of resistance of a model of any given form, and from that the resistance of a ship of any given form, rather than as that of searching for the best form, and this method was preferred as the more general, and because the form which is best adapted to any given circumstances comes out incidentally from a comparison of the various results. We drive each model through the water at the successive assigned appropriate speeds by an extremely sensitive dynamometer apparatus, which gives us in every case an accurate automatic record of the model's resistance, as well as a record of the speed. We thus obtain for each model a series of speeds and the corresponding resistances; and, to render these results as intelligible as possible, we represent them graphically in each case in a form which we call the 'curve of the resistance' for the particular model. On a straight base line which represents speed to scale we mark off the series of points denoting the several speeds employed in the experiments, and at each of these points we plant an ordinate which represents to scale the corresponding resistance. Through the points defined by these ordinates we draw a fair curve line, and this curve constitutes what I have called the curve of resistance. This curve, whatever be its features, expresses for the model of that particular form what is in fact and apart from all theory the law of its resistance in terms of its speed; and what we have to do is if possible to find a rational interpretation of the law. Now we can

at once carry the interpretation a considerable way, for we know that the model has so many square feet of skin in its surface, and we know by independent experiments how much force it takes to draw a square foot of such skin through the water at each individual speed. The law is very nearly—and for present convenience we may speak as if it were exactly—that skin resistance is as the area simply, and as the square of the speed. Now, we have so many square feet of immersed skin in the model, and the total skin resistance is a certain known multiple of the product of that number of square feet and of the square of the speed. Now, when we lay off on the curve of resistance a second curve which represents that essential and primary portion of the resistance, then we find that the law is found to be the same as that of resistance when drawn is found to be almost identical with the curve of total resistance at the lower speeds, but as the speed is increased the curve of total resistance is found to ascend more or less, and in some cases to ascend very much above the curve of skin resistance. The identity of the two curves at the lower speeds is the practical representation of a proposition which the highest mathematicians have long been aware of, and which I have lately endeavoured to draw the public attention to, and to render popularly intelligible, namely, that when a ship of tolerably fine lines is moving at a moderate speed the whole resistance consists of surface friction. The old idea that the resistance of a ship consists essentially of the force employed in driving the water out of her way, and closing it up behind her, or, as it has sometimes been expressed, in creating a vacuum, is almost a relic of a time when she inventors of the old idea had no reason to be aware of resistance, though *per se* we know that it was an extremely natural one. We now know that, at small speeds, practically the whole resistance consists of surface friction, and some derivative effects of surface friction, namely, the formation of frictional eddies, which is due to the thickness of the stem and of the sternpost, but this collateral form of frictional action is insignificant in its amount unless the features of the ship in which it originates are so abruptly shaped as to constitute a departure from that necessary fineness of lines which I have described, and we do not attempt to take an exact separate account of it. Thus we divide the forces represented by the curve of resistance into two elements,—one 'skin resistance,' the other which only comes into existence as the speed is increased, and which we may term 'residual resistance,' and we have next to seek for the cause and governing laws of the latter element. Now when the question of the actual laws of the latter element is carefully studied, we observe that the special additional circumstance which becomes apparent as the speed is increased is the train of waves which she puts in motion; and indeed it has long been known that this circumstance has important bearings on the growth of resistance. It is in fact certain that the constant foundation of a given series involves the expenditure of a constant force, and the expenditure of a definite amount of power, depending on the magnitude of those waves and the speed of the model; and, as we thus naturally conclude that the excess of resistance beyond that due to the surface friction consists of the force employed in wave-making, we in a rough way call that residual resistance 'wave-making resistance.'

"Perhaps I had better say a few words more about the nature and character of these waves. The inevitably widening form of the ship at her 'entrance' throws off on each side a series of waves of greater or less size according to the speed and to the obliqueness of the wedge, and these waves form themselves into a series of diverging crests, such as we are all familiar with. These waves have peculiar properties. They retain their identical size for a very great distance with but little reduction in magnitude. But the main point is that they become at once dissipated from the bow, and after becoming fully formed at the bow, they pass clear away into the distant water and produce no further effect on her resistance. But, besides these diverging waves, there is produced by the motion of the model another notable series of waves which carry their crests transversely to her line of motion. These waves, when carefully observed, prove to have the form shown in detail in fig. 1. In the figure there is shown the form of a model which has a long parallel middle body accompanied by the series of these transverse waves as they appear at some one particular spot with the profile and the series of waves against the side of the model; only I should mention that for the sake of distinctness the vertical scale of the waves has been made double the horizontal scale, so that they appear relatively to the model about twice as high as they really are. The profile is drawn from exact and careful measurements of the actual wave features as seen against the side of the model. It is seen that the wave is largest where its crest first appears at the bow, and it reappears again and again as we proceed downwards along the straight side of the model, but with successively reduced dimensions at each reappearance. That reduction arises thus,—in proportion as each individual wave has been longer in existence, its outer end has spread itself farther into the undisturbed water on either side, and, as the total energies of the wave remain the same, the local energy is less and less, and

the wave crest, as viewed against the side of the ship, is constantly diminishing. We see the wave-crest is almost at right angles to the ship, but the outer end is slightly deflected sternward from the

Fig 1

circumstance that when a wave is entering undisturbed water its progress is a little retarded, and it has to deflect itself into an oblique position, so that its oblique progress shall enable it exactly to keep pace with the ship. The whole wave-making resistance is the resistance expended in generating first the diverging bow waves, which, as we have seen, cease to act on the ship when once they have rolled clear of the bow; secondly, these transverse waves, the crests of which remain in contact with the ship's side; and thirdly, the terminal wave, which appears independently at the stern of the ship. This latter wave arises from causes similar to those which create the bow wave, namely, the pressure of the steams which forced into divergence then, here converge under the run of the vessel, and re-establish an excess of pressure at their meeting. The term 'wave-making resistance' represents, then, the excess of resistance beyond that due to surface friction, and that excess we know to be chiefly due to this formation of waves by the ship."

Pursuing these experiments it was found that not only was there a certain length of form necessary in a ship designed to attain a certain speed economically,—a fact which Mr Scott Russell had found, to establish,—but that there was also a considerable increase in wave-making resistance dependent upon the position of the after-body or run of the ship with reference to the wave-system left by the bow. Stating this again in Mr Froude's words:—

"The waves generated by the ship in passing through the water originate in the local differences of pressure caused in the surrounding water by the vessel moving through it, let us suppose, then, that the outlines of a particular form are such that these differences of pressure tend to produce a variation in the water level shaped just like a natural wave, or like portions of a natural wave of a certain length.

"Now an ocean wave of a certain length has a certain appropriate speed at which only it naturally travels, just as a pendulum of a certain length has a certain appropriate period of swing natural to it. And, just as a small force recurring at intervals corresponding to the natural period of swing of a pendulum will sustain a very large oscillation, so, when a ship is travelling at the speed naturally appropriate to the waves which its features tend to form, the stream line forces will sustain a very large wave. The result of this phenomenon is, that as a ship approaches this speed the waves become of exaggerated size, and run away with a proportionately exaggerated amount of power, causing corresponding resistance. This is the case of that very disproportionate increase of resistance experienced with a small increase of speed when once a certain speed is reached.

"We thus see that the speed at which the rapid growth of resistance will commence is a speed somewhat less than that appropriate to the length of the wave which the ship tends to form. Now, the greater the length of a wave is the higher is the speed appropriate to it; therefore the greater the length of the waves which the ship tends to form the higher will be the speed at which the wave-making resistance begins to become formidable. We may therefore accept it as an approximate principle that the longer are the features of a ship which tend to make waves the higher will be the speed she will be able to go before she begins to experience great wave-making resistance, and the less will be her wave-making resistance at any given speed. This principle is the explanation of the extreme importance of having at least a certain length of form in a ship intended to attain a certain speed; for it is necessary, in order to avoid great wave-making resistance, that the 'wave features,' as we may term them, should be long in comparison with the length of the wave which would naturally travel at the speed intended for the ship.

"This view of the matter, then, recognizes the tendency of a ship, when the speed bears a certain relation to the length of her wave-making features, to make large waves and to incur corresponding wave-making resistance. But it does not take account of the possibility of the waves made by one feature of the form so placing themselves with reference to other features as, by the difference of pressure essential to their existence, either to cause an additional resistance, or on the other hand to cause a forward force which partly counterbalances the resistance originally due to their creation. The way in which this may occur we have seen strikingly exhibited in the results of the experiments I have been describing. We see that in the very long parallel-sided form the steams of the train of waves left by the bow has the influence so small that its effect on the stern is almost insensible, and here we find, consequently, the united resistance due simply to the generation of a separate wave-system by each end of the ship. As we gradually reduce the length of middle-body, the stern is brought within the reach of waves large enough to produce a sensible effect, and according as it is brought into conjunction with a crest or hollow, the total wave-making resistance becoming least of all (except at the very highest speed) when the middle-body is reduced to nothing."

The variations in transverse resistance due to these transverse wave-formations are variations of quasi-hydrostatic pressure against the after-body, corresponding with the changes in its position with reference to the phases of the train of waves, there being a compensating excess of pressure (causing a forward force or diminution of resistance) when the after-body is opposite a crest, and the reverse when it is opposite a trough.

It may be proper to introduce here some remarks as to the stream lines which have been referred to in the foregoing considerations. The statement of the case as given by Mr Froude, and derived by him mainly from the investigations of Prof Hanks, is as follows:—

"By a 'perfect fluid' is meant one the displacements of which are governed solely by the laws expressed in the equations of fluid lines. motion, the particles of which therefore are without viscosity, and are capable of gliding smoothly along a perfectly smooth surface or past each other without frictional interference. By an imperfect fluid is meant one in which, as in water, as well as those with which we are practically acquainted, such frictional interference is inevitable.

"During first, then, with the case of steady irrotational motion in a perfect incompressible fluid, infinitely extended in all directions, it is plain that the motion will create differences of pressure, and therefore changes of velocity, in the particles of the surrounding fluid, which thus move in what are called 'stream lines'. At the commencement of the motion of the body the particles of the fluid undergo acceleration in their respective stream-line paths, and these accelerations imply a resistance experienced by the body, but after the motion has become established the differences of pressure satisfy themselves by keeping up the stream-line configuration; the energy which the particles receive from the body while they are being pushed aside by it along then stream-line paths is finally rederived by them to it as they collapse around it, and come to rest after its passage, and the integrals of the + and - pressures on the body are exactly equal at every moment. The manner in which this is effected is governed by the general laws of fluid motion, as expressed by the well-known equations, and, since these equations contain no term which implies a loss of energy, the energy existing in the body, as well as in the stream-line system, remains unaltered, so that, if the motion is steady, or without acceleration or retardation, the body passes through this theoretically perfect fluid absolutely without resistance. Nor must it be thought a paradox (for it is unquestionable) that even a plane moving steadily at right angles to its own surface, in a perfect fluid, would in the manner described experience no resistance. But if the fluid, instead of being infinite in all directions, be bounded by a definite free surface parallel to the line of motion, such as a water level, the existence of this surface cuts off the reactions of all those particles which would have existed beyond the surface had the fluid been unlimited alike in all directions, and which would have given back in the manner described the energy imparted to them. By the absence of these reactions the stream-line motions which would have existed in the infinite fluid are modified, and the differences of pressure involve corresponding local elevations of the surface of the water in the vicinity of the moving body. And since, in consequence of the action of gravitation (the force which controls the surface), a water protuberance seeks immediately to disperse itself into the surrounding fluid in accordance with the laws of wave motion, the local elevation partly changes itself along the surface by waves which carry with them the amount of energy embodied in their production. This energy is, in fact, part of the aggregate energy which was imparted to the particles of fluid while they were being pushed aside, and which, in the infinitely extended fluid, would have been wholly restored to the body during their collapse after its passage, but is now, in fact,

disrupted. The exact equality between the \pm and $-$ pressures no longer exists, and the body experiences a definite resistance which it would not do if the fluid were infinite in all directions.

"It is clear, moreover, that the nearer the moving body approaches the surface the greater are the differences of pressure to be satisfied, the greater will be the waves formed, and the greater the dissipation of energy. Thus, for example, a fish will experience an increase of resistance as its path lies nearer to the surface, the train of waves it creates becoming then a visible accompaniment of its progress. *As for* when the body moves along the surface as a ship does on water, those differences of pressure which would exist during the motion if the fluid were infinite in all directions satisfy themselves in still larger waves, which, in fact, are the waves which accompany the body in its motion. The waves which thus visibly accompany a vessel *en train* form a marked phenomenon in river steaming. Thus we see how, although in a perfect fluid extended infinitely in all directions, a body, when once put in motion, would move absolutely without resistance, yet, when the fluid is bounded by a gravitating surface at or near the line of motion, the body will experience resistance by the formation of waves, notwithstanding that the fluid is a perfect one."

"If the fluid is again supposed to be infinite in all directions, but imperfect, the phenomena previously described undergo appropriate modifications, and the moving body will also suffer a specific resistance,—in the first place by its having to overcome the friction and viscosity of these particles of the fluid with which it is in contact, and next, under the influence of the moving particles *as seen* as they destroy that orderly arrangement of the stream-line configuration which allows of the energy imparted to the particles being returned without loss. If the supposed imperfect fluid is bounded by a free surface, as already described, and the body moves at or near this surface, it will experience resistances depending on fluid friction, almost exactly in the same manner as if the fluid were infinite in all directions. It will also experience very nearly the same resistance in virtue of the wave-making action as in the perfect fluid, and we have seen the two sources of resistance existing independently of each other, and due to totally different causes."

Stability. Important as the question is as to the effect of form upon resistance, that of its effect upon stability or steadiness at sea is even more so.

Before the use of steam for the propulsion of ships the question which could be asked in discussing ships by the mariner was largely a question of stability or power to carry a large spread of canvas without inclining or "heeling" too greatly. Small differences in the form of the transverse sections of the ship in the region of the load water-line and under water were influential in this respect, and naval constructors occupied themselves greatly with such questions. The form of the problem completely changes when the propelling power is no longer an admitting factor. The superficial questions in steam ships are the proportions of length, breadth, and depth, the form of the "entrance" and "run"; the construction of propelling machinery within the ship, and the proportions, form, and number of revolutions of the propeller. But, while this is so, the effect of the stability of the steamship upon her behaviour at sea, as a question of rolling or "labouring," remains very great. These are, moreover, a very large number of seagoing ships still dependent upon sails for their propulsion, and the question of sailing power is very important in vessels employed on our coasts for commerce and for pleasure. The latest and most complete investigation of questions of stability is to be found in Sir Edward J. Reed's recently published work, *The Stability of Ships*. There is a more popular exposition of the subject by Mr. W. H. White, director of naval construction, in his *Manual of Naval Architecture* (1877, 2d ed. 1889), of which it has been made use in the following pages.

A ship floating freely and at rest in still water displaces a volume of water exactly equal in weight to her own weight. The circumstances of the water in which she floats are in fact the same whether the cavity made in the water by the ship is filled by the ship as in fig. 2, or by a volume of water having the same weight as the ship (fig. 3).

When the ship occupies the cavity the centre of buoyancy is the centre of gravity of the whole of her weight may be supposed to be concentrated at the centre of gravity, G, fig. 2, and to act vertically downwards. When the cavity is filled with water of equal weight, called in relation to the ship the "displacement," which has been supposed to be concentrated at B, fig. 3, which is the centre of gravity of the "displacement" or of the displaced water. This centre of gravity is usually known in relation to the ship as the "centre of buoyancy." The weight of this water may be supposed to be concentrated at B, and to act vertically downwards. As this water would remain in the cavity at rest, its downward pressure must be balanced by equal upward

pressures, that is by the buoyancy of the surrounding water. These upward pressures must act in the same way as if there were a single pressure equal and opposite to the weight of the water, and acting through the "centre of buoyancy." In fig. 2 a ship is represented floating freely and at rest in still water. Her total weight may be supposed to act vertically downwards through the centre of gravity G, and the buoyancy vertically upwards through the centre of buoyancy. The second condition which the ship floating freely and at rest in still water will always satisfy is therefore said to be that her centre of gravity will lie in the same vertical line with the centre of gravity of the volume of water which she displaces. So long as the ship rests under the action of these opposing and balanced forces the line joining the centres B and G is vertical and represents the common line of action of the weight and buoyancy. These are of course horizontal fluid pressures acting upon her, but these are balanced among themselves.

The ship may be floating at rest, but under constant, and not freely. These may be the pressure of wind on the sails, or the strain of a rope holding her in a position of rest although the centres B and G are no longer in the same vertical line. Fig. 4 represents such a case.

The vessel is at rest, but there is some external force operating other than that of buoyancy, and the equal and opposite forces of the weight and buoyancy act in different vertical lines, and no longer balance each other. They form a mechanical "couple," tending to move the ship from the position of constant rest in which she is shown. If W represents the total weight of the ship (in tons), and d the perpendicular distance between the parallel lines of action of the weight and buoyancy in feet, then the operative moment of the "couple" is represented by the product of the two quantities W and d , measured in foot-tons. If the constraint is removed, and the vessel is freed from all external forces save those of the fluid in which she floats, she will move under the operation of the "couple" towards the upright position until the consequent alteration in the form of the cavity of the displacement brings the centre of buoyancy into the same vertical line with the centre of gravity of the ship. Wind has been illustrated by reference to true-race inclination of the ship is equally true of oblique or longitudinal inclinations. If the position of the weights in the ship remains undisturbed under such changes of inclination the centre of gravity remains undisturbed. In all calculations it has to be assumed that the centre of gravity is a fixed point in the ship, and that movable weights will be secured in the ship. With this assumption the position of the centre of gravity of a ship can be correctly ascertained by calculation, small disturbances caused by movements of fuel, &c., not being large enough to be appreciable.

The statical stability of a ship may be defined as the effort which she makes when inclined steadily by external forces to overcome the constraint and return to the position in which she floats freely, at or near the upright. This effort, as already explained, depends upon the position of the centre of buoyancy B, or the distance from the vertical line through G (which the altered form of the cavity of the displacement has caused it to assume). It may always be measured by the product of the two quantities W (in tons) and d (in feet) (see fig. 4). This product in foot-tons is known as the "moment of statical stability" for the particular angle of inclination and corresponding position of B which are assumed. A little reflection will show that when large angles of inclination are reached the centre B ceases to recede from the vertical through the centre of gravity of the ship, but will, as the inclination increases, approach this vertical line, and eventually pass to the other side of it.

The moment of statical stability is at its maximum when the distance d is greatest. The angle which the ship has reached when the centre B has reached this point is called the "angle of maximum stability." As the centre B travels backwards from this position with the increasing inclination of the ship the distance d decreases and the righting power of the ship decreases proportionately. When B passes the vertical line through G the moment of stability changes its character and becomes an upsetting force, which will continue to act until the ship reaches a new position of rest, usually bottom upwards. The angle which the ship reaches before this change takes place, i.e., when B passes to the other side of the vertical line through G, is called the "angle of vanishing stability" and it indicates the ship's "range of

Fig. 1

Fig. 2.

Fig. 3.

stability." The change may occur at very small angles if the ship is crank and her sides are low in the water. It may not and sometimes does not occur, on the other hand, until the ship is lying on her beam ends.

If a curve is plotted out showing these positions and indicating also how d first increases and then decreases as the ship is inclined more and more from the upright, the curves known as the curve of stability. A "stiff ship" is one which opposes great resistance to inclination from the upright when under sail or acted upon by external forces. A "crank ship" is one which is very easily inclined, the sea being supposed to be smooth and still. A "steady ship" is one which when exposed to the action of waves keeps nearly upright. Crank ships are usually the steadiest ships. Changes in the height of the point of intersection M (Fig. 4) above the centre of gravity indicate corresponding changes in the stiffness of a ship. Speaking generally, the stiffness of the ship may be considered to vary with the height of M above G. The line BM does not cut GM in the same point at considerable inclinations as it does at a very small inclination. The point of intersection at the smallest conceivable inclination is known as a virtual metacenter. It is M' for the metacenter, and the distance GM is in this condition called the metacentric height. See HYDROMETRIC.

The following table contains particulars of the metacentric heights of different kinds of vessels of war, and the corresponding time of an oscillation in still water —

Names of Ships	Metacentric Height	Period of a Double Roll
	Feet	Seconds
U. S. S. "Sultan,"	25	8.9
U. S. S. "Inconstant,"	28	8.0
U. S. S. "Devastation,"	37	6.78
American monitor (shallow draft), "Inflexible," when rolled in still water in Suda Bay, ..	14.0	2.7
	7.65	10.7

Generally speaking, decrease in metacentric height is accompanied by a lengthening of the period of an oscillation. The ship swings more slowly as she loses stiffness.

Oscillations.

There is no sensible difference in the time occupied by a ship in a swing or roll from side to side, whether she rolls through only three or four degrees in either side of the upright or twelve or fifteen degrees. For larger angles there would be small differences.

The tables which have been given show some remarkable changes in the stability conditions in ships of war within recent years. Sailing ships were formerly made with so little deviation from existing types that it was not found to be necessary to ascertain their exact measure of stability or to lay down rules for regulating it. The position of the centre of gravity was modified by ballast, and as much as nine or ten per cent. of the displacement was allowed for this. Heavy rolling and great unseasiness of ship from excessive stability had often to be endured. In other cases clumsiness or instability to carry and hold to be accepted. When armoured ships were first introduced they had about the same metacentric height (5 feet) as is to be found in the earlier sailing frigates. The "Normandie" in the French navy and the "Prince Consort" in the English navy had from 6 to 7 feet, and they were exceedingly uneasy and seaborning ships. It was soon discovered that a reduction in metacentric height would cure this evil. The later ships in both navies were accordingly designed to have a metacentric height of about 3 feet. The "Magenta" had 2½ feet and the "Hercules" 3 feet. This change altered the period during which the ship made a double oscillation, i.e., from starboard back to starboard, to 14 to 16 seconds instead of 10 to 11 seconds, as it had been in the "Normandie" and "Prince Consort." The effect on the behaviour of the ship in a seaway was most remarkable. These ships with small metacentric height might be put into the trough of a sea, and as the waves crossed them they steadily rose and fell, hardly inclining their masts. The effect on gunnery practice was also valuable, but there is always a peril attending steadiness obtained by such means: vessels having small metacentric height require careful handling under sail or they may be oversteered and lost. There is another defect in this system, viz., that wounds in action will cause the ship to incline sooner and more considerably, and they become more dangerous than they would be in a stiffer ship. Bilge-keels and water-chambers are now employed in the English navy, together with, and as opposing influences to, much greater metacentric height.

These devices were introduced into the "Inflexible" in order to counteract the influence of a metacentric height of 8 feet which was designedly given to her. They have proved very effective, but there is another feature in this vessel which has tended to prevent unseasiness and heavy rolling. The time of an oscillation, or quickness of rolling, depends not only upon the metacentric height but upon the moment of inertia about a longitudinal axis. The time of an oscillation from starboard to starboard may be written thus —

$$2T = 1.1 \sqrt{I/g \cdot m},$$

where T is the ship's period in seconds for a single roll, m is the metacentric height, or height of metacenter above the centre of gravity in feet, and K is the radius of gyration in feet. The moment of inertia is increased by widening the ship, putting heavy armour on her sides, and placing the turrets and guns out towards the sides of the ship. It was seen that these features in the "Inflexible," which were elements in her design, would favour her and tend to counteract the great metacentric height. The event has shown that, while a metacentric height of 6 feet in the "Normandie" gave 10 seconds to 11 seconds period, 8 feet in the "Inflexible" only gives 11 seconds as a period, corresponding with a radius of gyration of 28 feet. The feeling expressed that "in order to provide against the impossible contingency of the loss of stability by complete waterlogging of the ends, we had made an unseizable ship" was not justified. The ship is now so stiff that when the ends are waterlogged the running in and out of all her guns on one side only inclines her 2½ degrees while in the "Magenta" when masts and light the same operation inclines the ship 5 degrees.

The resistance offered by the water to the rolling of the ship consists of three parts:—(1) that due to the rubbing of the water upon the bottom of the ship as she rolls; (2) that due to the oscillating surfaces which are caused through the water, such as outside hull keels and deadwood; (3) the reaction of waves by the rolling ship to replace those which move away from the ship. The creation of these surface waves expends energy and checks the motion of the ship which makes the creative effort.

Mr. White, giving briefly the results of some of the experiments of Mr. Froude made for the Admiralty, says:

"Experiments have been made by Mr. Froude to show how rapidly the rate of extinction may be increased by deepening bilge-keels. A model of the 'Devastation' was used for this purpose, and fitted with bilge-keels, which, on the full-sized ships, would represent the various depths given in the following table. The model was one thirty-sixth of the full size of the ship, and was weighted so as to float at the proper water-line. The centre of gravity in the same relative position as that of the ship, and to oscillate in a plane proportional to the period of the ship. In smooth water it was heeled to an angle of 24 degrees, and was then set free, and allowed to oscillate until it came peacefully to rest, the number of oscillations and their period being observed. The following results were obtained —

Model fitted with	Number of Double Rolls before Model was practically at rest	Period of Double Roll
No bilge keels	31½	seconds, 1.77
A single 21-inch bilge-keel on each side	12½	1.9
36-inch " " "	8	1.9
Two 36-inch " " "	5½	1.02
A single 72-inch " " "	4	1.60

"Not content with obtaining the aggregate value of the resistances for ships, Mr. Froude has separated them into their component parts, assigning values to frictional and keel resistances as well as to surface disturbances. In doing so, he has been led to the conclusion that surface disturbance is by far the most important part of the resistance offered to rolling, as the following figures given by him for a few ships will show:—

Ships	Frictional	Keel, Bilge-keel, and Deadwood	Total Resistance	Surface Disturbance
Sultan ..	354	5,038	20,000	14,610
Inconstant	140	4,060	21,600	17,800
Voltage ..	98	2,944	14,100	11,060
Greyhound ..	120	700	4,700	3,880

"Frictional and bilge-keel resistances in this table have been obtained by calculation from the drawings of the ship, Mr. Froude making use of data as to coefficients for friction and for head resistance which he had previously obtained by independent experiments, and which may therefore be regarded as leading to thoroughly trustworthy results. It will be noticed that in each case the sum of the frictional and keel resistances much exceeds

one-fourth of the total resistance, while it is much less than one-fourth in other cases. The consequence is that surface disturbance must be credited with the contribution of three-fourths or thereabouts of the total resistance, a result which could scarcely have been predicted.

When waves are constantly being created as the vessel rolls, and as constantly moving away, and the mechanical work done in this way results in a reduction of the amplitude of successive oscillations. Very low waves, so low as to be almost imperceptible, owing to their great length in proportion to their height, would suffice to account even for this large proportionate effect. For example, Mr. Frende estimates that a wave 320 feet long and only 1½ inches in height would fully account for all the work created to surface disturbance in the fourth case of the preceding table.

"Another important deduction from the figures in the table is the large proportionate effect of 'keel' resistance as compared with frictional resistance, thus establishing the advantages of deep bilge-keels. Ships of the Royal Navy recently constructed have been furnished with much deeper bilge-keels than were formerly in use, but a limit to the depths that can be fitted is often reached, because the necessity for compliance with certain conditions and extreme dimensions, in order that the vessels may be able to enter existing docks."

Water chambers.

In the Royal Navy advantages have also been taken of the power of loose water within a ship to quell motion. It was first employed in the "Inflexible" in a part of the ship lying above the bomb-proof deck, and at the level of the water-line. Its use resulted from a discussion, when the "Inflexible" was designed, of the probable effect of water entering the region of the ship through shot holes. The matter has since been thoroughly established by experiment, and affords a new and valuable means of preventing heavy rolling in ships having large initial stability. There is now no hesitation in giving a metacentric height of 6 feet, and obtaining all the security against upsetting which this ensures, because it is felt that the violent rolling formerly unsupportable from stiffness could be prevented. The investigation into this matter has been conducted by Mr. Philip Watts, Mr. R. E. Frende, and Mr. W. E. Smith, acting for the Admiralty.

The accompanying memorandum, prepared by the present writer in 1884, gives the general results —

"In investigating the phenomena attending the use of water as a means of quelling the motion of ships, Mr. Frende has not only taken advantage of the experiments made in the 'Edinburgh' by running men across the decks, but he has also studied similar phenomena in a model water-chamber, mounted, not on a model of a ship, but on a large pendulum weighted to the required 'period,' the relative level of the model chamber and the axis of rotation being made to correspond approximately to scale with that in the ship.

"The conclusions, stated in the form of a comparison between the quelling effects of bilge-keels and of moving water, are as follows —

(1) There is a certain depth of water in the chamber which gives the maximum effect, this is dependent upon the width of the chamber and the period of the ship. (2) With this depth of water the growth of resistance to rolling commences almost at zero of angle, whereas with either a greater or less depth there is practically no resistance at all due to the water up to a certain angle, which angle increases with increase of departure from the proper depth. (3) At larger angles of roll the disadvantages of departure from the proper depth of water is not marked. (4) The resistance of water in a chamber does not increase at all uniformly with increase of angle of roll, but increases rapidly at first and at the larger angles becomes more nearly constant for all angles. (5) The best quantity of water for the original chamber in the 'Edinburgh' was 48 tons; the best for the chamber enlarged by removal of cork walls was 79 tons, and the best for the chamber extending to the sides of the ship would be 100 tons. The first-named extension improved the resistance at 10° by 21 per cent, and the further extension by another 22 per cent.

"As compared with bilge-keels the matter is stated as follows:— while 2 feet addition to the breadth of the bilge-keels adds in round numbers two-thirds to the existing extenuating power of hull and bilge-keels on the 'Edinburgh' at all angles of rolling, the fully extended water-chamber adds at 3° of roll about six times, and at 5° about three times that power, at 12° the chamber adds no more than 2 feet of bilge-keel, while at 18° it only adds half as much. It is therefore evident that, while both are valuable, the water-chamber is for most kinds of service much the more valuable of the two.

"Explaining the cause of the phenomena, Mr. Frende says:—

"The extenuating or quelling effect of water depends, *ceteris paribus*, upon the value of the moment represented by the transference of water from side to side, i.e., with a given quantity of water, upon the distance moved, by its centre of gravity. This distance increases with increase of angle of roll, and consequently the extenuation similarly increases up to a certain point, where we appear to have approximately reached the maximum possible effect, and thereafter the extenuation is materially diminished, the maximum of which the quantity of water is capable of with the dimensions of the chamber. This point occurs generally at a moderate angle, and above

this angle the extenuation becomes practically constant. But the extenuating effect of the water of course largely depends also upon the timing of its motion from side to side,—the extenuation being greatest when that motion takes place most nearly at the time of extreme angle of ship, i.e., in such a manner as that the water may be as much as possible running downhill when it is moving across, and as usual as possible upon the rising side of the ship when it is stationary. If, on the other hand, the motion of the water occurs to take place when the ship is quite upright, the extenuation would be almost inoperative. That for the same total degree of

motion or transference of water we may have a very different degree of extenuation, according to the timing of that motion. In the motion of the water energy is necessarily wasted, and it is clear that, if we are dealing with a permanent condition of things, i.e., if the ship is being steadily maintained at a constant angle of roll, this waste of energy in each run of water from side to side must be exactly equal to the energy taken out of the ship in each swing by the extenuation. The motion of the water may be and generally is of a type very wasteful of energy, the water either rushing across in a mass, and consuming its energy by breaking with great violence against the opposite side, as it does at the larger angles of rolling, or, at more moderate angles, running across in a breaking wave or bore, which consumes its energy as it goes in its own internal resistance, and under those circumstances the timing of the motion appears invariably to approach pretty nearly to that giving the maximum extenuation for the degree of motion. But the motion of the water sometimes takes the form of a mere alternating slope of surface, or tidal swing from side to side, and here there is very little waste of energy, the energy of motion of the flow of water in one direction being converted into potential energy in the shape of rise of water at the side, and then given out again to the water flowing back to the other side, and so on. The waste of energy in this form of motion being almost nil, the timing is almost exactly that appropriate to no extinction, the water being in the middle of its passage across and the surface being level when the ship is upright."

"The value of the chamber of course increases as its length in the direction of the keel of the ship increases. This actual area of the chamber we adopted earlier to give valuable results, although its extent was necessarily limited."

In some lectures recently delivered Mr. Smith, assistant constructor of the navy, illustrated the use of water in quelling motion by models as shown below

Fig. 6.

"The models represented the midship sections of the 'Admiral' class, and were both of the same weight and size. Each model was mounted on transoms, marked 7, and both oscillated freely on these transoms in exactly the same time. The models were placed one behind the other, so that the position of the transoms was evident to the audience. The model in fig. 7 was provided with a glass tube into which varying quantities of water could be put. An amount of water representing 1/16 of the total weight of the model, i.e., 16 lbs. in a 10,000 ton ship, was now placed in the water-chamber. The models were started from the same angle as before, and the model with the loose water, instead of keeping up exactly with the other, or rolling more violently, came almost instantaneously to rest."

"The tube was filled with varying quantities of water, and the effect was always to stop the model much sooner than the model with no weight free to move. The two models were always started from the same angle, so that their relative behaviour could be easily seen. When the tube was quite full there was practically no effect. The two models rolled almost together. The same effect resulted from the motion of a marble representing weight 100 tons in a ship of 10,000 tons. The same reduction must always occur in a rolling ship if we have a loose weight of any kind, whether the

weight be water or a gun. If this reduction did not take place we should have something to explain which would be quite inexplicable. For suppose we have two ships alike in all respects as regards size, shape, weight, time of oscillation, &c., and situated on precisely the same seas, but one having all her weights properly secured, and the other with a weight capable of tumbling the deck every time the ship rolls. If the two vessels were to roll to exactly the same extent we should have the sea not only rolling the ship with the loose weight to the same extent as the ship with all her

Fig. 7.

weights fixed, but the sea would, in addition, be doing all the work involved in the tilting of the heavy weight across the deck, which is quite impossible under the circumstances of perfect similarity we have supposed. The sea can only do the same work on both. In the one case that work consists entirely in tilting the vessel, in the other it consists partly of rolling the ship and partly in tilting the weight about. The rolling in the latter must then do inevitably be less than in the former case."

Dynamic stability.

Dynamic stability is the "work" done or energy expended in heeling the ship from the upright to any inclined position. The unit of "work" employed in measuring dynamic stability is a foot-ton. When the vessel is gradually inclined the force inclining her must do work depending upon the amount of the static stability at the successive instantaneous inclinations passed through, and these are given by the curve of stability already described. Dynamic stability is of value as a means of comparing the resistance of ships to upsetting under the action of suddenly applied forces, such as squalls of wind. Illustrating this Mr. White says:

"Roughly speaking, it may be said that a force of wind which, steadily and continuously applied, will heel a ship of ordinary form to a certain angle will, if it strikes her suddenly when she is upright, drive her over to about twice that inclination, or in some cases further still. A parallel case is that of a spiral spring, if a weight be suddenly brought to bear upon it, the extension will be about twice as great as that to which the same weight heaving steadily will stretch the spring. The explanation is simple. When the whole weight is suddenly brought to bear upon the spring, the resistance which the spring can offer at each instant, up to the time when its extension supplies a force equal to the weight, is always less than the weight, and this unbalanced force stores up work which carries the weight onwards, and about doubles the extension of the spring corresponding to that weight when at rest."

Illustration.

The changes which have come about in materials and modes of construction within the last 50 years have been most remarkable. The first steamer built expressly for regular voyages between Europe and America was not built until 1837. Dr. Lardner stated at about this date: "We have as an extreme limit of a steamer's practicable voyage, without receiving a relay of coals, a run of about 2000 miles." The "Great Western," built by Patterson of Bristol and engineered by Maudslay of London under the superintendence of Sir L. K. Brunel, was the first such ship, and she was launched July 19, 1837. She was 212 feet long between the perpendiculars, 35 feet 4 inches broad, and had a displacement of 2800 tons. She was propelled by paddles. Iron vessels were built only in the present century for canal service, then for river service, and later for packet service on the coast. In about the year 1838 iron vessels of small dimensions were built for ocean service. The largest iron vessel built up to 1841 was less than 200 feet long. In 1848 we got for the first time the ocean-going steamship in its present form, built of iron, and propelled by the screw. This was the "Great Britain," 286 feet long, projected and designed by Brunel. Time has abundantly justified these bold enterprises on the part of Brunel, which he had to carry through in the face of great opposition. He entered with equal boldness on another innovation in 1850, viz., the use of very large dimensions on the ground of economy of power. It was not until 1852 that he had the oppor-

tunity to put these views forward in a way to satisfy him. The different sizes of vessels discussed before the design was finally settled for the "Great Eastern" were as follows —

Great Eastern.

No	Length	Breadth	Midship Section	Depth
1	668	79 0	1,646	24
2	634	76 39	1,640	25
3	609	73 5	1,639	26
4	730	87	2,080	28

The dimensions eventually settled were—length, 680 feet, beam, 83 feet, mean draught, about 25 feet, screw engine, indicated horse-power, 4,000, and nominal horse-power, 1800, paddle, indicated horse-power, 2,600, and nominal horse-power, 1,000, to work with steam 15 lb to 25 lb, speed of screw, 45 to 55 revolutions, paddle, 10 to 12.

The "Great Eastern," produced by the joint skill of Brunel and Scott Russell, remains in advance of present practice, although she has served as a model for the best of it. Her great size rendered it possible to give to her an amount of security against fatal injury to her hull which cannot be attained in smaller ships. It is a mistake to suppose that large ships are less secure than small ones. The large ship can receive without inconvenience a wound which would be fatal to a small one, and the possibilities of obtaining high speed increase with the size. Had a higher speed been aimed at in the "Great Eastern," it might have altered the whole current of her history, and changed also the history of ship-building itself.

The question of bulkheads, on which Brunel insisted so much in Bulkhead ship, is one which underlies all questions of construction. If heads the number of bulkheads in ships were increased as they ought to be, the numbers and sizes of the ribs or frames of the ship would be modified, and the system of construction generally would be changed, and become more like that of the "Great Eastern." The question is the one which justifies some further consideration, so that it may be popularly understood.

Iron ships are commonly made with less than half their bulk out of water. If water enters such a ship, and the amount which enters does not exceed in bulk that portion of the bulk of the ship which is out of the water, and which will, when immersed, *displace* the water, then the ship, if she does not turn over, will sink. If, however, the inflow cannot be stopped, but continues, the ship goes down.

Let us suppose the case of a ship 50 feet long, 10 feet wide, and 10 feet deep, divided into five equal parts by four watertight partitions, and floating in water with half its bulk immersed (Fig. 8).

Suppose now that a hole is made in the middle of the ship under the water, so that water can flow freely in, then the part of the ship which is shaded ceases to have floating power. The water in this shaded place is no longer displaced, but is admitted, and if the ship is to continue afloat, the other parts of the ship must displace water to the amount by which this shaded part has ceased to do so. As it is one-fifth of the whole unimmersed bulk which is lost, the remaining four compartments must sink, so as each to support one-fourth of the whole, instead of one-fifth, as before; i.e., the draught of water, or immersion of the whole ship, will be increased, and the ship will, if she has stability enough to keep upright, finally float at rest again at this deeper immersion. The water will rise in the centre compartment to the level of the water outside, and will then cease to flow in. The additional immersion will be only one and a quarter feet, but in an ordinary ship, divided into compartments of equal length, there would be a greater increase of immersion by the injury of a centre compartment, because the end compartments are narrow, and must sink deeper in order to bear their share of the burden imposed by the loss of the buoyancy of the centre division.

Or it may be other than a central compartment which is damaged, and in that case the ship sinks, and finds a new floating line, with the end towards which the damaged division lies depressed more than the other end.

If it should happen that the divisional partitions, or bulkheads as they are called, rise only a few inches above the water level when the ship floats at when undamaged, then, on the occurrence of a bad leak filling one compartment, the tops of the bulkheads are brought, by the unbalanced pressure of the ship, beneath the water-level, the water will run through the hatchways, or openings in the deck, in the damaged compartment, will flow over the entire deck, and the ship will be lost, either by the filling of other compartments by the water passing down into them, or by the capsizing of the ship. This latter event will generally happen, although only one compartment is full, if the sea has free access to

Fig. 8.

Great Western.

Great Britain.

the deck from end to end of the ship, and it becomes wholly immaterial.

In 1869 the president of the Institution of Naval Architects said "The circumstances of the sad event of the loss of the 'London,' accompanied as it was by the simultaneous loss of another ship of still larger size, and of a higher reputed character," the "Annals," "I think, an event so remarkable that I should be very sorry indeed at this annual meeting of this Institution were to pass by without some notice being taken of the extraordinary circumstances of the loss of that ship, and without some discussion upon what we suppose to be the causes of the loss, and the faults, if any, of the construction of those ships." "The passengers who pass to and fro are not judges of this question; they can take no precaution for their own safety, it is to the skill and science of those who build these ships that the passenger trusts, and to the care which the legislature and the Government are bound to take of their fellow-subjects."

Subsequently the council of the Institution arrived at the following conclusions and offered them as recommendations to ship-builders and shipowners—

Recommendations of the Council of the Institution of Naval Architects

"1. No general rule can be safely laid down for regulating the proportions of length and depth to the breadth of a ship, and a great variety of proportions of length and depth to breadth may be safely adopted, and the ship made sound and seaworthy, by judicious form, construction, and loading."

"2. The construction load-water-line of every ship, and her scale of displacement from light to load-water line, should be appended to every design of a ship, showing the extreme danger to which she should be liable, and measures to be taken to ensure that this information be recorded on the ship's papers. It is desirable also that along with a ship's papers, in the possession of the captain, there should always be carried a scale of freeboard, and a plan of the outline plan of the ship, comprising a longitudinal section, and at least four cross sections of the ship. On these plans should be marked the capacity, in tons of cubic feet, of each compartment of the hold. The surplus capacity of each compartment up to the load-water-line, at its power to carry deadweight, should be given in tons deadweight. These papers should always accompany the ship's register, and a copy of them should be lodged in the custom house of the port from which the ship sails."

"3. There is a minimum height of freeboard which cannot be safely reduced in sea-going vessels of ordinary times, and it is desired to fix this minimum height. Freeboard should be understood to be the vertical height of the upper surface of the upper deck (not spar-deck) at the side, amidships, above the load-water-line. The proportion of freeboard should increase with the length. One eighth of the beam is a minimum freeboard for ordinary sea-going ships of not more than five fifths to the length, and $\frac{1}{8}$ of the beam should be added to the freeboard for each additional breadth in the length of the ship, this total give—

For a ship of 22 feet beam and 120 feet long, 4 feet freeboard,

For a length of 120 feet, 5 feet freeboard.

For a length of 22 feet beam, 5 feet freeboard.

For a length of 225 feet, 7 feet freeboard—the beam remaining the same. But, as the addition of a spar-deck on long vessels may be considered an equivalent or substitute for the increased freeboard required for extra length, a complete spar-deck would leave the freeboard of these extra lengths at the original height of 4 feet.

"4. It is not considered desirable to offer any recommendations with regard to poops and forecastles. It must depend entirely upon the professional judgment of the designer of a ship, whether, looking to her proportions, form, and purpose, the addition of poop and forecastle is expedient and safe. In general, where poops and forecastles are adopted, they should be closed and seaworthy, but their weight may be in excess in long ships, and there are cases where a light top-gallant forecastle (as an open forecastle raised above the level of the upper deck) may be useful in keeping heavy seas out of the ship. In general, spar-decks in long ships are preferable to poops and forecastles, no diminution of freeboard should be allowed for a poop or forecastle."

"5. It would add much to the strength and security of steamships if transverse and longitudinal bulkheads, coal bunkers, iron lower decks, and screw allas to form all connected with the hull of the ship and with each other as to form independent cellular compartments, watertight, and having all their openings with the exception of the openings for the weight coals worked from the deck. In proportioning the compartments of a ship (and especially of ships devoted to passengers) it is very desirable so to arrange them that the water-tight bulkheads may be readily closed, in free communication with the sea, the remaining compartments will float the ship. It is considered that no iron passenger ship is well constructed unless her compartments are so arranged, in addition to the bulkheads, by one of them to be fitted with water, or be placed in free communication with the sea. Double bottoms are to be regarded as a great element, both of safety and strength, in the structure of a large iron ship."

"6. It is very desirable that sufficient ventilation should always be provided in passenger ships to admit of closing all side scuttles and battening down, or otherwise rendering all openings to the sea perfectly secure."

"7. In regard to hatches and openings in the deck no limits can be set to their size, but it is desirable to carry the beams of the ship across them without interruption, so that the hatchways may be closed by means of a plate where required, being replaced on going to sea. All coamings over engine and boiler rooms in passenger ships should be as high as practicable, if not, and riveted to the beams and calings. Openings in the deck may be fitted with solid covers, which may be readily closed."

"8. It being considered that all openings in the ends or ends of vessels are subject to accidents that endanger the safety of ships, it is desirable that the side and stern windows, in addition to the side lights, have a hinged dead-light, with a view to their being always in place, and that all cargo ports should be strongly secured by iron cross bars."

"9. It is believed that the arrangement from communications with the sea from engine-room and pipes should be protected by conical, or Kingston, or similar valves, and similar precautions should be taken for all openings through the bottom of the ship, where damage to poop or ship would admit water into the holds."

"10. It is considered that all steam vessels, if of iron, should have a brass-lined hand-pump, or a pump of some other material, as a substitute for these pumps, there should be patent pumps having independent connections to the steam. They should be a donkey engine and pump capable of discharging or pumping from the bilge and from the sea, of feeding the boilers, and of

throwing water on deck. All vessels should have one or more bilge-pumps, worked by the large engines, with bilge injection pipes if the engines have condensers. In large vessels the donkey engine should be a security, and a boiler high above the water-line, and also communication with the main bilge. All vessels should have a set of bilge pipes connecting every hold and the engine compartments with these pumps, and a security, and there should be pumps on the upper deck, fitted as force pumps, and provided with a sufficient length of hose (with the necessary copper delivery jets) to the other extremities of the vessel, and a security, and a set of bilge hose or pipes from the sea. The coils by which the working of the pumps is regulated should be carefully arranged and marked, and great care should be taken that both cocks and paper connections are properly secured. There should accompany the ship's papers, and the crew should be periodically exercised in their use."

"11. The stowage of a ship, whether done by contract or not, should be done under inspection of the captain of the ship, and should be conducted under his own orders only, and he alone should be held responsible for the good stowage of his ship. Ships often very badly loaded, the cargo being sometimes too high, thus causing them to roll with such rapid and violent motions as to carry away the spars, and otherwise endanger the safety of the ship, and at other times too low, thus making the ship croak, and liable to turn over. A ship may, however, generally, whatever her beam, be so stowed as to avoid both dangers. As the character of the ship in these respects varies, so does the number of oscillations she would make per minute. If she were set rolling in still water, by men running across her deck, or other means, and then allowed to come to rest, that is, if the ship be brank the number of oscillations per minute will be few, and if she be too stiff she will be numerous, but under the same conditions of stowage, the number will always be very nearly the same, whatever the amount of the impulse to set her rolling may be. Although this peculiarity has long been known to scientific men, and to experienced seamen, it is a pity that the public should justify any specific rule on the subject. It is, however, most desirable that information should be collected upon it, and that the attention of the owner and captain of vessels should be directed to it."

"12. It is believed that the present rules of the Board of Trade regarding bolts, life-boats, and their tackle are good in principle. The responsibility for keeping all boats in constant readiness and in such a state as to be ready for use, and must fall on him the blame for all neglect and its consequences. Every open boat built of iron or steel should be fitted with sufficient watertight spaces to float her."

"13. The system of proportioning anchors and cables by Lloyd's, and of proving under licence of the Board of Trade at Act of Parliament in so far as the proof-test of cables is concerned, is a good one, and the reputation of the makers must be relied upon."

"14. In order to provide for the rapid clearance of the upper deck from water, which may break over the side, the location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"15. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"16. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"17. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"18. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"19. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"20. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"21. The location of the main hatch, or lower part of the bulwarks, sufficient in number and in area to admit of the rapid escape of the water."

"4. Every screw steamship built of iron, the building of which commences after the passing of this Act, shall, in addition to the above partitions, be fitted with a small watertight compartment inclosing the after extremity of the shaft."

The above law was repealed by the Act dated 29th July 1862, and on the 28th August 1863 the Admiralty applied to the Board of Trade to know whether the Board of Trade officers were empowered under any circumstances to insist on iron vessels having watertight compartments when employed in conveyance of mails and passengers, observing that the Admiralty was still of opinion that the regulations in force prior to the Amendment Act of 1862 in respect of contract packets should not have been relaxed. They considered such vessels should have compartments so arranged that if any one of them became filled with water the loss of buoyancy thereby occasioned should not endanger the safety of the ships, as recommended by them in their communication of the 17th December 1860. To this the Board of Trade replied (3d September 1863) that their surveys no longer had any power to require given watertight partitions to be fitted in passenger steamships—though they agreed with the Admiralty in thinking that steam vessels carrying passengers and mails should be provided with a sufficient number of watertight partitions,—and had no reason to suppose that the Admiralty would not insist on such partitions being fitted in all steamships employed in conveyance of mails. They further say that the enactments in the Act of 1864 were repealed, not because of any doubts as to the necessity of proper and sufficient watertight partitions, but because those enactments which required only two of such partitions for all sizes and classes of ships became practically useless or machinery. It was found that in large vessels more partitions than the Act required were necessary to secure the safety of the ship, and it was thought better to leave builders and designers unfettered in providing extra strength and security to meet the various forms, sizes, and descriptions of ships than to tie them down by general statutory regulations which would not be so framed as to meet the varying wants and circumstances of the shipbuilding trade.

In a return by the Board of Trade to the House of Commons, dated 11th August 1875, setting forth the instructions issued to their surveyors under the Merchant Shipping Acts, 1854 to 1873, clause 26 reads—

"Surveyors should not refuse to grant a declaration for a vessel solely on the ground that bulkheads are not fitted, that the ordinary bulkheads are not watertight, or that the bulkheads are fitted to obviate defects, unless they are of opinion that the want of, or the defective state of, the bulkheads renders the ship unseaworthy, in which case they are fully justified in refusing to grant a declaration. They shall, in all cases in which they refuse to grant a declaration for a vessel in consequence of defects relative to bulkheads, forward to the Board of Trade a full statement of their reasons for thinking that such defects under the hull of the vessel unsatisfactory. In ordinary watertight bulkheads, at least, must be fitted in all seagoing steamships. The surveyors are also to see that an after watertight compartment is fitted to cover the stern tube of the screw-shaft, both in cold and in new vessels."

Inefficient subdivision of iron and steel ships

This regulation has been issued in the latest instructions to Board of Trade surveyors, dated 1884. It thus comes about that the number of bulkheads forming watertight compartments, the number of doors in them, and how they are fastened, are made the subject of consideration by the Board of Trade at their inspections, but the fact is that the great majority of ocean-going steamers are not divided into watertight compartments in any efficient manner, and many losses in collision, grounding, and swamping are due to this. Although all steamships have some bulkheads, and some have many bulkheads, they are as a rule distributed in such a way, or are so stopped below the water-level, that for flotation purposes alone the perfection of the line between the foremost collision bulkhead and the after bulkhead through which the screw shaft passes are practically useless.

With the exception of some four hundred ships, there are no iron steamships afloat which would continue to float were a hole made in the bottom plating anywhere abaft the collision bulkhead and outside the engine-room, or which would not founder were water admitted through breaches made by the sea in weak superstructures and deck openings. Of the four hundred ships referred to as having properly designed bulkheads two hundred are essentially cargo-carriers. They are generally built with five subdivisions, the machinery space being one. *Iron sailing ships are without exception undivided into compartments.* They have by law a collision bulkhead near the bow, and that is all. Between June 1881 and February 1883 there were about one hundred and twenty iron steamships lost of one to two thousand tons each, not one of which was well constructed according to the opinion of the counsel of the Institution of Naval Architects.

It may be said that wooden ships were not divided into watertight compartments, but it must be remembered that in a wooden ship there is far more local resistance to a blow either in collision or by grounding, and that a wooden ship takes a much longer time to settle down than a wooden one. Also, when not used as employed for passenger and trading ships speeds were much lower and traffic and risks of collision very much less.

The shipbuilding registers prescribe rules for the government

of the builder who desires to have their certificate, and these rules have been so carefully framed and so honestly enforced that English-built ships are as a rule well and solidly constructed. The recent (8th June 1883) rule of the London Lloyd's register as to the important subject of division into compartments is as follows, and it may be hoped that it will be effective—

"Screw propelled vessels, in addition to the engine-room bulkheads, to have a watertight bulkhead cut at a reasonable distance from each end of the vessel. In steamers 250 feet long and above an additional bulkhead is to be fitted in the main hold, extending to the main or upper deck, about midway between the collision and engine-room bulkheads, and in steamers of 400 feet long and above an additional bulkhead is to be fitted in the after hold, extending to the same height."

"The foremost or collision bulkhead in all cases to extend from the floor plates to the upper deck. The engine-room bulkheads to extend from the floor plates to the upper deck in vessels with one, two, or three decks, and to the main deck in spar- and awning-decked vessels. The aftermost bulkhead will be required to extend to the upper deck unless the arrangement of bulkheads be submitted to and approved by the committee. In sailing vessels the foremost or collision bulkhead only will be required."

It is not intended by the foregoing remarks, serious as they are, to blot the splendid record of shipbuilding achievement in Great Britain during the last twenty years. The shipwrights, shipbuilders, marine engineers, Lloyd's surveyors, and the Board of Trade have all shared in a development of shipping which, in amount and in general efficiency, is not only without parallel in the history of the world, but, as it still appears to us who have witnessed it, almost incredible. It still is to be regretted that expansion has been thought of and sought more ardently than greater security and efficiency. The more they have striven to improve their structural arrangements because of their love of true and good work, and with no prospect of recognition or reward, have been comparatively very few.

These, it pains, no statute exposed to a greater variety of strains than a ship, and none in which greater risks of life and to which property are incurred. A thorough practical knowledge of the ships and the disturbing forces in action either to injure or destroy the several combinations embraced in its structure is therefore most important. Some of these forces always act, whether the ship be at rest or in motion. She may be at rest floating in still water, and will be at rest if cast on shore, and, when there, she may be resting on her keel as a continuous bearing, with a support from a portion of her side, or she may be supported in the middle way, with both ends for a greater or less length of her body in contact with the ground. She may be resting on the ends with the middle unsupported, or under any other modification of these circumstances, and under all these the strains will vary in their direction and in their intensity.

If the ship be in motion the same disturbing forces may still be in action, with others in addition which are produced by a state of motion. When a ship is at rest in still water, and the upward pressure of the water upon its body is exactly equal to the weight of the ship, it does not necessarily follow that the weight of every portion of the vessel will be equal to the upward pressure of that portion of the water directly beneath it, and acting upon it, on the contrary, the shape of the body is such that their weights and pressures are very unequal.

If the vessel be supposed to be divided into a number of laminae of equal thickness, and all perpendicular to the vertical longitudinal section, it is evident that the after lamina comprised in the overhanging stern above water, and the fore lamina comprised in the projecting head also above water, cannot be supported by any upward pressure from the fluid, but their weight must be wholly sustained by their connexion with the supported parts of the ship. The lamina towards each extremity immediately contiguous to these can evidently carry only a very small portion of their support from the water, whilst towards the middle of the ship's length a greater proportionate bulk is immersed, and the upward pressure of the water is increased.

A ship floating at rest under the view just taken of the relative displacement of different portions of the body, if the weights on board are not distributed so that the different laminae may be supported by the upward pressure beneath them as equal as possible, may be supposed to be in the position of a beam supported at two points in its length at some distance from the centre, and with an excess of weight at each extremity. At sea it would be exposed to the same strain, and if supported on two waves whose crests were so far apart that they left the centre and ends comparatively unsupported, the degree of this strain would be much increased. The more these two points of support are equal as possible, if they come so near each other that the vessel may be looked upon as supported on one wave, or on one point only in the middle of her length, the greater will be the tensile strain on the upper portion, and the crushing strain on the lower portion of the fabric of the ship. A vessel whose weights and displacements are so disposed as to render her subject to a strain of this kind beyond what the strength of her upperworks will enable her to bear, will tend to assume a curved form.

The centre may curve upwards by the excess of the pressure beneath it, and the ends drop, producing what is called "hogging." The main remedy for these evils is in the strength of the deck and

upperworks, and then power to resist a tensile strain. There is seldom a want of sufficient strength in the lower parts of the vessel: to resist the crushing or compressing force to which it is subjected. The decks of vessels should not, therefore, be too much cut up by broad hatchways, and care should be taken to preserve entire as many strakes of the deck as possible. The tensile strength of iron can be brought to bear most beneficially in this respect.

Though these are the strains to which a ship is most likely to be exposed, it by no means follows that there are no circumstances under which strains of the directly opposite tendency, when pitching, or otherwise, may be brought by a heel to act upon the parts. The weights themselves in the centre of the ship may be so great that they may have a tendency to give a hollow in the bottom, and it is therefore equally necessary to guard against this evil. When this occurs, the vessel is technically said to be "sagged" in distinction to the contrary or opposite change of form by being hogged. The weight of machinery in a wooden steam-vessel, or the weight of undisturbed setting up of the main-mast, will sometimes produce sagging. The introduction of additional keelsons tended to lessen this evil, by giving great additional strength to the bottom, enabling it to resist extension, to which, under such circumstances, it became liable, and, as the strain upon the deck and upperworks becomes changed at the same time, they are then called upon to resist compression.

When the ship is on a wind, the lee side is subjected to a series of shocks from the waves, the violence of which may be imagined from the effects they sometimes produce in destroying the bulwarks, tearing away the channels, &c. The lee side is also subjected to an excess of hydrostatic pressure over that upon the weather side, resulting from the accumulation of the waves as they rise against the obstruction offered to their free passage. These forces tend in part to produce lateral curvature. When in this inclined position, the forces which tend to produce hogging when the ship is upright also contribute to produce this lateral curvature.

The strain from the tension of the rigging on the weather side when the ship is much inclined is so great as frequently to cause working in the topmasts, and sometimes even to break the timbers on which the channels are placed. Additional strength ought therefore to be given to the sides of the ship at this place, and, in order to keep them apart, the beams ought to be increased in strength in comparison with the beams at other parts of the ship.

The foregoing are the principal distorting forces to which the fabric of a ship is subjected, and it must be borne in mind that some of these are in almost constant activity to destroy the connexion between the several parts. Whenever any motion or working is produced by their operation between two parts, which ought to be united in a fixed or firm manner, the evil will soon increase, because the disruption of the close connexion between these parts admits an increased momentum in their action on each other, and the disruption proceeds with an accelerated progression. This is soon followed by the admission of damp, and the unavoidable accumulation of dirt, and these then generate fermentation and decay. To make a ship strong, therefore, is at the same time to make her durable, both in reference to the wear and tear of service and the decay of materials. It is evident from the foregoing remarks that the disturbing influences which cause "hogging" are in constant operation from the moment of launching the ship. As this curvature can only take place by the compression of the materials composing the lower parts of the ship and the extension of these composing the upper parts, the importance of preparing these separate parts with an especial view to withstand the forces to which they are each to be subjected cannot be overestimated by the practical builder.

In his *Manual of Naval Architecture*, Mr W H White gives illustrations of the

Curves of strains

H M S "Minotaur"

Fig. 9

In these diagrams the curves B represent the distribution of the buoyancy. The ordinates of the curve are proportionate to the displacement of adjacent transverse sections of the ships.

The curves W represent the distribution of the weight of the ships and their loading. The curves L represent the excesses and defects of buoyancy obtained from the two curves B and W and set off from a new base line. The

Fig. 10

excess of buoyancy above the line is exactly equal to the defect of buoyancy below it. The curves M indicate the bending moments. The ordinates of the curve lying above the base are obtained by summing all the moments, whether upwards or downwards, about the point in the length of the ship where the ordinate is taken. It may happen, as in the case of the "Devastation," that the moments will tend to cause hogging for a portion of the length and will then change about character, and at other portions of the length will tend to cause sagging.

Fig. 11

Where the curve M crosses the base line there is no strain of either hogging or sagging tending to bend the ship there. In the "Minotaur" there is a hogging tendency throughout. The moment at the midship section is very great, being represented by the moment 4 5 feet \times 10 690 tons. After Sir Edward Reed left the Admiralty he strongly expressed his fears that this strain was too considerable for safety in the "Minotaur" and "Agincourt."

Designing

The principal plans of a ship are the "sheer" plan, giving in outline the longitudinal elevation of the ship, the "body" plan, giving the shape of the vertical transverse sections, and the "half-breadth" plan, giving the projections of transverse longitudinal sections. In addition to these the builder is furnished by the designer with elevations, plans, and sections of the interior parts of the ship, and of the framing and plating or planking.

The thicknesses or weights of all the component parts are specified in a detailed specification, in order that the ship when completed may have the precise weight and position of centre of gravity contemplated by the designer. In the case of ships built for the British navy all the building materials are carefully weighed by an agent of the designer before they are put into place by the builder. As each section of the work is completed, the weight is compared with the designer's estimate in the designing office. As soon as the incomplete hull is floated the actual displacement is measured, and compared with the weights recorded as having gone into the ship. It is also the practice in the Royal Navy to ascertain the position of the centre of gravity of the incomplete hull, and its draught of water before it is floated, in order to avoid all risk of upsetting from deficiency in stability at that stage of construction. The ship is usually found to float in precise accordance with the estimate. When completed ships float at a deeper draught than was intended, or are found to be more or less stable than was wished, this is nearly always due to additions and alterations made after the completion of the design. Where the designer is at liberty to complete the ship in accordance with the original intention these ought to be precise correspondence between the design and the ship.

In designing a ship of novel type the designer has to pass all the building details through his mind and assign them their just weights and proportions and positions. Every plate and angle bar and plank, every bar and rod and casing and lagging, and every article of equipment has to be conceived in detail and its effect estimated.

Building

The term "laying off" is applied to the operation of transferring Laying to the mould loft floor those designs and general proportions of a ship which have been drawn on paper, and from which all the preliminary calculations have been made and the form decided. The lines of the ship, and exact representations of many of the parts of which it is to be composed, are to be delineated there to their full size, or the actual or real dimensions, in order that moulds or skeleton outlines may be made from them for the guidance of the workmen.

A ship is generally spoken of as divided into fore and after bodies, and these combined constitute the whole of the ship; they are supposed to be separated by an imaginary athwartship section bodies at the widest part of the ship, called the midship section or dead-flat. The midship body is a term applied to an indefinite length of the middle part of a ship longitudinally, including a portion of the fore-body and of the after-body. It is not necessarily parallel or of the same form for its whole length.

Those portions of a wooden ship which are termed the square and cant bodies may be considered as subdivisions of the fore-bodies and after-bodies. There is a square fore-body and a square after-body towards the middle of the ship, and a cant fore-body and a cant after-body at the two ends. In the square body the sides of the frames are square to the line of the keel, and are athwartship

vertical planes. In the cant bodies the sides of the frames are not square to the line of the keel, but are inclined aft in the fore-body and forward in the after-body. The reason for the frames in these portions of a wooden ship being canted is that, in these parts of the ship, the timber would be too much cut away on account of the fineness of the angle formed between an athwartship plane and the outline or water-line of the ship. The timber is therefore tuned partially round till the outside face coincides nearly with the desired outline, and it is by this movement that the side of a frame in the cant fore-body is made to point aft, and in the cant after-body to point forward.

Timbers. In wooden ships the term "timbers" is sometimes applied to the frames only, but more generally to all large pieces of timber used in the construction. Timbers, when combined together to form an athwartship outline of the body of a ship, are technically called frames, and sometimes ribs.

The keel, in the United States, is almost always made of elm, on account of its toughness, and from its not being liable to split if the ship should take the ground, though pined in all directions by the numerous fastenings passing through it. It is generally composed of as long pieces as can be obtained, united to each other by horizontal scarps. The rabbet of the keel is an angular recess cut into the side to receive the edge of the planks on each side of it. The keel is connected forward to the stem by a scarf, and sometimes also to the stern by another scarf. It is supported by moiries and tenons. The spigot is fitted to the scarf, the aft-scarf of the stem, and is intended to give shift to the stem, the lower end scarfed to the deadwood. The keelson is an internal line of timbers fitted upon the inside of the floors directly over the keel, the floors being thus confined between it and the keel. Its use is to secure the frames and to give shift to the scarps of the keel, and thus give strength to the ship to resist extension lengthwise, and to prevent sagging or sagging. The foremost end of the keelson is called the head, and is intended to give shift to the scarps connecting the stem and keel. The frames or ribs are composed of the strongest and most durable timber obtainable

Floors and the floors in the Government service were carried across the road

Bass: Spoken: And the floor

Alto: Spoken: And the floor

with a short and long arm on either side alternately, so as to break joint, and between the frames the space was filled in solid

Longitudinal pieces of timber are worked round the interior of a Shelves. ship for the purpose of receiving the ends of the beams of the several decks, they are called shelves, and are of the greatest importance, not only for this purpose, but also as longitudinal ties and stunts

The beams of a ship prevent the sides from collapsing, and at the same time carry the decks. The beams are spaced, and their scantling settled upon, according to the strength required to be given to the decks, and to suit the positions of the masts and hatchways, and other arrangements connected with the economy of the ship. All beams have a curve upwards towards the middle of the ship, called the round-up. This is for the purpose of strength, and for the convenience of the run of the water to the scuppers. Wooden beams are single piece, two, three, or four piece beams according to the number of pieces of timber of which they are composed. The several pieces are scamped together, and doweled and bolted, the scamps being always vertical.

The connexion of the ends of the beams to the sides of the ship has been made in various ways. The points to be considered, with reference to this connexion, are—that the beam is required to act as a shore or strut, to prevent the sides of the ship from collapsing, and also as a tie to prevent them falling apart, that the beam shall not rise from its seat, and that it shall not work in a fore-and-aft direction.

from its seat, and that it shall not work in a fore-and-aft direction. That the beam may be an effective shoring, nothing more is necessary than that the abutment of the end against the ship's side may be perfect. In order that it may act as a tie between the two sides, it is generally dovetailed to the upper surface of the shelf on which it rests, and the under surface of the waterway plank which lies upon it is sometimes dovetailed into it. These dovetails, therefore, connect it with the shelf and the waterway, and through this means it is thus connected with the sides of the ship.

From the short outline previously given of the disturbing forces acting on a ship it will be seen that the strain on the ends of the beams to destroy their connexion with the side and loosen the fastenings must be very great when the ship is under sail, either on a wind or before it—that is, either heeled or rolling. The

puncpal action of these forces is to alter the vertical angle made by the beam and the ship's side—that is, to raise or depress the beam, and so alter the angle between it and the side of the ship above or below it. On the lee-side the weight of the weather side of the ship and, if connected with it, and of the stock, will do nothing upon it. On the weather side, the pressure of the water, all tend to diminish the angle made by the beam and the ship's side below it, and consequently increase the angle made between them above it. The contrary effect is produced on the weather side, where the tendency is to close the angle above the beam and open that below it. If the beam is to be raised, the weather side may be considered as a lever, it will be evident that the fastenings to prevent its rising ought to be as far from the side as is consistent with the convenience or accommodation of the ship, and that, while the support should also be extended upwards, the fastening to keep down the beam-end should be as close to the end of the beam, and as near to the side of the ship as possible.

Planking. The plank, or skid, or sheathing of a ship, both external and internal, is of various thicknesses. A strike of planking is a range of planks butting against each other, and generally extending the whole length of the ship. A thick strike, or a combination of several thick strikes, is worked wherever it is supposed that the same requires to be used, as in the case of the main beam over the heads and heels of the timbers, both externally and internally in men-of-war vessels between the ranges of ports, and internally to support the connexion of the beams with the sides and at the same time form a longitudinal keel. The upper strikes are called *deck*, or *upper* strikes, and the lower are called *bottom* strikes. The strike between the two parallel ranges of ribs, between the keel and the lower edge of the ribs, is called the *keel* strike.

run from under the upper-deck ports of a three-decked ship in the British navy, were called the channel wale, the middle wale, and the main wale. The stake immediately above the main wale was called the black stake. The stakes below the main wale diminished in size as they approached the gunwale, and were called the gunwale stakes, the lowest being called the gunwale strake. The lowest strake of the plank of the bottom, the edge of which fits into the rabbet of the keel, is called the guloird stake. Plank is either worked in parallel strakes, when it is called "straight-edged," or in combination of two strakes, so that alternate strakes are worked in parallel strakes, when it is called "diamonds, one of which is called "anchor stake," and the other "top and butt." The difference will be best shown by fig. 13. The difference in the intention is that in the method of working two strakes anchor-stake or plank, the narrow part of one strake is worked in the rabbet of the keel, and the wide part of the other strake is worked in the rabbet of the first strake, and consequently the least possible sudden interruption in longitudinal life, arising from the abutment, is obtained. This description, therefore, of planking is used where strength is especially desirable. In top and butt strakes the intention is, by having a wide end and a narrow end in each plank, to approximate to the growth of the tree, and to prevent the sudden interruption in longitudinal life. Plank is looked upon as a longitudinal line, the advantage of these edges being, as it were, imbedded into each other is apparent, all elongation by one edge sliding upon the other being thus prevented. The shift of plank is the manner of arranging the butts of the planks in the different shings of British navy vessels. It is not allowed to occur in the same vertical line, and the same butt must not be repeated in the same vertical line, and the same butt must not be repeated without the intervention of three or four strakes between them.

Of the internal planking the lowest strake, or combination of strakes, in the hold, is called the *timber-stake*. A *timber* is a passage for water, of which there is one throughout the length of the ship, on each side of the keelson, in order that any leakage may find its way to the pumps.

The whole of the plank in the hold is called the *ceiling*. Those strakes which come under the heads and heels of the timbers are worked thicker than the general thickness of the ceiling, and are distinguished as the *thick strakes* over the several heads. The strakes under the ends of the beams of the different decks in a man-of-war, and down to the ports of the deck below, if there were any ports, were called the clamps of the particular decks to the beams of which they are the support—as the gun-deck clamps, the middle-deck clamps, &c. The strakes which work up to the sill of the ports of the several decks were called the *spricketing* of those decks—as gun-deck spricketing, upper-deck spricketing, &c.

Fastening

The fastening of the plank is either "single," by which is meant one fastening only in each strake as it passes each timber or frame, or it may be "double," that is, with two fastenings into each frame which it crosses, or, again, the fastenings may be "double and single," meaning that the fastenings are double and single alternately in the frames as they cross them. The fastenings of planks consist generally either of nails or trenails, excepting at the butts, which are secured by bolts. Several other bolts ought to be driven in each shift of plank as additional security. Bolts which are required to pass through the timbers as securities to the shelf, waterway, knees, &c., should be taken advantage of to supply the place of the regular fastening of the plank, not only for the sake of economy, but also for the sake of avoiding unnecessarily wounding the timbers.

Decks

The decks of a wooden ship must not be considered merely as platforms, but must be regarded as performing an important part towards the general strength of the whole fabric. They are generally laid in a longitudinal direction only, and are then useful as a tie to resist extension, or as a strut to resist compression. The under strakes of decks at the sides of the ship are generally of hard wood, and of greater thickness than the deck itself; they are called the *waterway planks*, and are sometimes doweled to the upper surface of each beam. Their rigidity and strength is of great importance, and great attention should be paid to them, and care taken that their scarps are well secured by through-bolts, and that there is a proper shift between their scarps and the scarps of the shell.

When the decks are considered as a tie, the importance of keeping as many strakes as possible entire for the whole length of the ship must be evident, and a continuous strake of iron or steel plates beneath the decks is of great value in this respect. The straightness of the deck, or the less the sheer or upward curvature at the ends that may be given to it, the less liable will it be to any alteration of length, the longer will it be. The ends of the different planks forming one strake were made to butt on one beam, and, as the fastenings are driven close to the ends, they did not possess much strength to resist being torn out. The shifts of the butts, therefore, of the different strakes required great attention, because the transference of the longitudinal strength of the deck from one plank to another was thus made by means of the fastenings to the beams. The strakes not being united to each other sideways. The introduction of iron decks or partial decks under the wood has modified this.

Caulking

These fastenings have also to withstand the strain during the process of caulking, which has a tendency to force the planks sideways from the seam, and, as the edges of planks of hard wood will be less crushed or compressed than those of soft wood when acted on by the caulking-iron, the strain to open the seam between them to receive the caulking will be greater in the case of planks of softer wood, and will require more secure fastenings to resist it. It may also be remarked that the quantity of fastenings should increase with the thickness of the plank which is to be secured, for the set of the oakum in caulking will have the greater mechanical effect the thicker the edge.

When the planks are fastened, the seams or the intervals between the edges of the planks are filled with oakum, and this is beaten in, or caulked, with such care and force that the oakum, while undisturbed, is almost as hard as the plank itself. If the openings of the seam were of equal widths throughout their depth between the planks, it would be impossible to make the caulking sufficiently compact to resist the water. At the bottom edges of the seams the planks should be in contact throughout their length, and from this contact they should gradually open upwards, so that, at the outer edge of a plank 10 or 12 inches thick, the space should be about $\frac{1}{4}$ of an inch, that is, about $\frac{1}{8}$ of an inch open for every inch of thickness. It will hence be seen that, if the edges of the planks are so prepared that when laid they fit closely for their whole thickness, the force required to compress the outer edge by driving the caulking-iron into the seams, to open them sufficiently, must be very great, and the fastenings of the planks must be such as to be able to resist it. Bad caulking is very injurious in every

way, as leading to leakage and to the rotting of the planks themselves at their edges.

Ships are generally built on blocks which are laid at a declivity. Launching is of about $\frac{1}{2}$ inch to a foot. This is for the facility of launching them. The inclined plane or sliding plank on which they are launched has rather more inclination, or about $\frac{3}{4}$ inch to the foot for large ships, and a slight increase for smaller vessels. This inclination will, however, in some measure, depend upon the depth of water into which the ship is to be launched.

While a ship is in progress of being built her weight is partly supported by her keel on the blocks and partly by shores. In order to launch her the weight must be taken off these supports and transferred to a movable base, or platform, which must be erected for the movable base to slide on. This platform must not only be laid at the necessary inclination, but must be of sufficient height to enable the ship to be water-borne and to preserve her from striking the ground when she arrives at the end of the ways. For this purpose an inclined plane *a*, (fig. 14), purposely left unplanned to diminish the adhesion, is laid on each side the keel, and at about one-sixth the breadth of the vessel distant from it, and firmly secured on blocks fastened in the slipway. Thus

Fig. 14

inclined plane is called the *sliding-plank*. A long timber, called a *bilge-way* *b*, *c*, with a smooth under-surface, is laid upon this plane, and upon this timber, as a base, a temporary frame-work of shores *e*, *f*, called "poppers," is erected to reach from the bilge-way to the ship. The upper part of this frame-work is against a plank *d*, temporarily fastened to the bottom of the ship, and firmly cleated by cleats *e*, *f*, also temporarily secured to the bottom. When it is all in place, and the sliding-plank and under side of the bilge-way finally greased with tallow, soft soap, and oil, the whole framing is set close up to the bottom, and down on the sliding plank, by wedges *g*, *h*, called *struts* or *slips*, by which means the ship's weight is brought upon the "launch," or sliding plane.

When the launch is thus fixed, the ship may be sent to leave three keels, two of which are temporary, and also secured under her bilge. In consequence of this width of support, all the shores may be safely taken away. Thus being done, the blocks on which the ship was built, excepting a few, according to the size of the ship, under the foremost end of the keel, are gradually taken from under her as the tide rises, and her weight is then transferred to the two temporary keels, or the launch, the bottom of which launch is formed by the bilge-ways, resting on the well-secured inclined planes. The only preventive now to the launching of the ship is a short shore, called a *dog-shore* on each side, with its heel firmly cleated on the immovable platform or sliding-plank, and its head abutting against a cleat secured to the bilge-way, or base of the movable part of the launch. Consequently, when this shore is removed, the ship is free to move, and her weight forces her down the inclined plane to the water. To prevent her running out of her straight course, two ribbands are secured on the sliding-plank, and strongly shored. Should the ship not move when the dog-shore is knocked down, the blocks remaining under the fore part of her keel must be consentively removed, until her weight overcomes the adhesion, or until the action of a screw against her fore-foot forces her off.

A different mode of launching is sometimes practiced in British merchant-yards, and has been long in use in the French dockyards,

Fig. 15

allowing the keel to take the entire weight of the vessel. The two pieces *a*, *c*, which are shown in fig. 15 as being secured to the

ship's bottom, are the only pieces which need be prepared according to this system for each ship, the whole of the remainder being available for every launch. A space of about half an inch is left between them and the bulk timbers placed beneath them, as it is not intended that the ship should lean on these bulk timbers in launching, but merely be supported by them in the event of her heeling over. The ship, therefore, is launched wholly on the sliding-plank, c, fitted under the keel.

If a ship is copped before launching, so that putting her into a dry-dock for that purpose becomes unnecessary, it is then desirable that she should be launched without any cleats attached to her bottom. The two sides of the keel are prevented from being forced apart when the weight of the ship is brought upon them by her passing under the keel. Each portion of frame-work composing the launch has two of these cleats attached to it, and brought under the keel to a bolt which passes slackly through one of the poppets, and is secured by a long toggle, with an iron handle, reaching above the water-line, so that when the ship is afloat it may be drawn out of the bolt. The chain then draws the bolt, and in falling trips the cradle from under the bottom. There should be at least two chains on each side secured to the fore-poppets, two on each side secured to the after-poppets, and two on each side to the stopping-up, and this only for the launch of a small ship, in larger ships the number will necessarily be increased according to the weight of the vessel and the tendency that she may have, according to her form, to separate the bulwarks. This tendency on the part of a ship ship by a rising floor, or by her wedge-shaped form in the fore and after bodies, is great, but there is not much probability of a ship heeling over to one side or the other.

Slop
work

The importance of the work of the designer cannot be too highly estimated. Unfortunately there is, as has been said, "slop work" in designing as well as in putting the structure together. There is often an absence of any attempt at precautions where multiplied accidents have shown them to be necessary, as well as inconceivable carelessness in the details of providing provisions for security, where they exist in principle, useless in practice.

In the *Report of the Royal Commission on Unseaworthy Ships*, dated September 22, 1873, we read as follows:—"Competent witnesses state that many merchant ships are built with bad iron, that they are ill put together, and sent to sea in a defective condition. It is also said that they are frequently lengthened without additional strength, and are consequently weak ships. The number of iron steamers which have been lost in the last few years, many of them having been surveyed and classed under the London or Liverpool registers, raises a question whether the regulations of these registers are sufficiently stringent to insure good ship-building. The directors of the Bureau Veritas have deemed it necessary to revise the rules of their register, and to increase the security. In the race of competition among shipbuilders it is probable that inferior materials and bad workmanship are admitted into ships."

The Commissioners on Unseaworthy Ships, referring to the proposal that the Board of Trade should superintend the construction, the periodical inspection, the repair, and the loading of all British merchant ships, said "We consider it to be a question worthy of serious consideration, whether, in the case of passenger ships, the certificate of the Board of Trade, so far as regards specific approval, should not be expressly confined to the number of passengers to be allowed and to the accommodation for their health, comfort, and general security,—all questions of unseaworthiness of hull, machinery, and equipment being left to the owners, subject only to a general power of interference

in case of danger sufficiently apparent to justify special intervention."

When ships have to meet the stress of battle as well as that of the sea faithfulness of work is even more imperative. It is not only necessary to have perfect work, but there must also be multiplied safeguards and provisions against damage by shot, shell, ram, and torpedo as well as against the enemies which are common to all ships. In the article *NAVY* the peculiarities of the ship of war are described. Regarding them here simply as ships, they may be said to be distinguished neither by size nor speed. They have been far outstripped in size, the longest English ship of war built within the last twenty years being only 325 feet in length, while the *Atlanta* passenger ships 200 feet longer. They have also been outstripped in speed. The highest speed ever attained in a vessel of war is that of the "Hiss" and "Mercury," and as they are only 300 feet long it is easy in vessels of greater length to get higher speeds with less engine power, and easy also to maintain it in a seaway both as a question of form and power, and also as a matter of coal endurance. The following table gives the relative dimensions of large 14-knot ships:—

Ship's Name	Length divided by Breadth (on Water Line)	I H P	Depth in Tons	(Depth) ²
"Adriatic," (White Star Line)	$\frac{417}{41.7} = 10.46$	3,800	8,250	408.8
H M S "Dreadnought,"	$\frac{323.6}{32.4} = 5.42$	8,000	10,386	461.2
H M S "Sultan,"	$\frac{350}{35.0} = 5.64$	8,000	9,238	441.8
H M S "Inflexible,"	$\frac{324.0}{32.4} = 4.82$	8,000	11,500	500.5
H M S "Neptune," late "Independence,"	$\frac{304.0}{30.4} = 5.01$	8,500	9,083	484.7

The difference between the amount and complexity of fitting out in the ship of war and the merchant ship are represented by the greatly increased cost per ton weight of hull. It must, however, be remembered that the war ship has the weight of hull kept down to a very low standard to enable her to carry her offensive and defensive equipment,—far lower than is usual in the merchant ship. The first-class merchant ship costs £28 per ton weight of hull and about £18 per indicated horse-power for the engines. The ship of war built by the same builders under contract with the Government costs from £60 to £85 per ton weight of hull for unarmoured ships, and from £70 to £75 or more for armoured ships. In the case of an unarmoured vessel, having a protecting deck over machinery and magazines, recently ordered, the prices were as follows:—

General average	£60 10 0	per ton weight of hull
Average of three London firms	66 0 0	" "
Accepted tender	67 6 0	" "

The engines for the same vessel were —	£15 8 0	per I H P.
General average	17 6 0	" "
Average of three London firms	17 6 0	" "
Accepted tender	11 8 0	" "

In the case of a large armoured ship the rates were —	
Average price per ton weight of hull	£81 2 0
Accepted tender	71 5 0
Average price per I H P of engines ¹	11 1 0
Accepted tender	10 7 0

The use of heavy ordnance in recent times as the sole weapon for naval warfare brought about a marked distinction between the merchant vessel and the war ship, which had not previously existed. The revival of the ram and the adoption of the torpedo tend to abolish this distinction and to bring about an approximation again.

It is difficult to say what, in the very near future, will be the

distinguishing characteristics of the ship of war. They will not characterize speed or size or coal endurance, or the power of striking with torpedoes, the ram, the torpedo, or the gun. It will be quite easy to arm a war merchant ships with these weapons, and obtain by these ships ships.

¹ The indicated horse-power referred to here is that obtained by natural draft.
² Of this the vertical armature (costing before it is worked up, £70 to £80 per ton) is nearly 2000 tons.
³ Average of six vessels built by Elder.

already outstrip the war vessel in the important advantages of size and fleetness and carrying power. It is apparently in protective advantages that the essential difference will lie.

The merchant ship is badly provided against fatal damage by collision, or by a blow delivered in any manner by which water is admitted into the ship. The propelling machinery of these ships and their steering apparatus are also dangerously exposed to artillery fire. Excepting torpedo boats, the ship of war of any size has its propelling machinery either under water or under cover of armour, and in a great number of cases there is either protection for the steering apparatus or there are two propellers. The approximation towards war-ship arrangements which is needed in the merchant ship is the adoption of these three, on a scale of greater breadth than that of the defenses round machinery may be created in time of war. Both these changes in merchant-ship practice are demanded also by mercantile interests. The increase in breadth amidships would greatly reduce the risk of foundering in collisions and give more spacious accommodation amidships. Such increase when accompanied by fine ends is also favourable to speed.

The use of two screws is economical of power, and is a much-needed security against the evil results of an accident to an engine, a shaft, or a propeller. The time will doubtless come when a single propeller in a large passenger ship will be regarded as an unpardonable fault, and when the division into compartments now common will be held to be no better than a delusion and a snare.

The protection given to the regular ship-of-war by side armour, or by a protecting deck, at or near the water-line, will probably become a definite and indispensable feature in them, many, perhaps, be their most distinguishing characteristic, apart from their outfit and equipment.

If this should prove to be the issue of events, then course will have been very indirect. In the ships-of-war of the last century no attempt was made to employ armour on the sides or to prevent the passage of projectiles and water into the holds by means of a protecting deck. There was a deck just below the water-line, but it had no protective qualities. It served, among other things, to furnish passage ways in action for the carpenter and his crew to get at the inner side of the wooden walls of the ship at and near the water-line, so that when shot entered there the holes might be immediately plugged. When screw propulsion was introduced into these ships, and it was found practicable to keep the engines and boilers under water, it would have been possible to place a deck over the machinery, and thus to make a water-line which would have greatly added to the security of the engines, boilers, and magazines. The space above this deck might also have been so subdivided into compartments as to have protected the buoyancy and stability of the ship against the immediately fatal results of the invasion of water.

The protection of the buoyancy and stability by these means would not have been absolute, in the sense of making the ship safe, but it would have been the utmost value so compared with ships, otherwise safe, but having no such protection.

Thirty years passed between the date when screw-propeller engines were placed beneath the water-level in ships of war and that at which a committee on designs, under the presidency of Lord Dufferin, proposed to place such a covering deck over them, or to construct a water-line raft-body. The proposal of the main body of the committee was to associate such a raft-deck for the protection of the buoyancy and stability of the ship against artillery with a central armoured citadel. That of the minority was to suppress the armour in the region of the water-line entirely, and to protect buoyancy, stability, machinery, and magazines by a raft-deck alone. In 1878 the plan as indicated by the main body of the committee was put into practice nearly simultaneously in the "Dulno" and "Dandolo" in Italy and in the "Inflexible" in England. In 1878 the system as conceived in principle by the minority of the committee of 1871, although not in the manner they recommended, was adopted in much smaller vessels in the British navy. A raft-deck was introduced into the "Comus" class of corvettes of 2,380 tons displacement, a class which was regarded as unarmoured. Since that date the raft-deck has been adopted in a more or less complete form in nearly all classes of unarmoured ships in the English navy. So it has come about that, out of some 850 unarmoured ships of war built and building in Europe, of which such unarmoured ships as these 32 are English. There can be no doubt that all unarmoured ships of war will eventually be protected in this manner. The number of so-called ironclads built and building in Europe is 270. Of these, 84 are based on the recommendation of the committee on designs, 18 of them are English. There are six other English ships with central citadels and under-water protecting decks, built more than twenty years ago, but the raft-body principle is absent in them.

If the passage from the water-line-of-battle ship of 1840-1860 to the "Admiral" class of 1884 has been made under the guidance of the principles of the committee of 1871, European nations would not find themselves possessed of large fighting ships covered from end to end, or over large areas of their sides, with thin armour, penetrable to a very large proportion of the guns brought against them. But the sailors of 1840-1860 did not take the view that

buoyancy and stability, and machinery and magazines, were the vital parts, needing defence by armour or by a raft-deck. They deemed the effects of shell exploding between decks, setting fire to the ships, and converting the decks, crowded with men, into slaughter-houses. Their demand was, "Keep out the shells." So it came about that now a mount-plating thick enough to keep out the most powerful shell of the time, were worked upon the sides of the ships, and the guns were fought through ports cut in this armour. This feeling was so strong that the English Admiralty built the "Hector" and "Valiant" with armoured batteries overlapping by many feet at each end the armour beneath them, which protected the buoyancy, stability, machinery, and magazines. Guns increased in power, and the armour was generally thickened to resist them, until from 41 inches of armour, through which broadside ports were cut, 9 inches and 10 inches were reached. But this thickening of the armour had so reduced the possible number of the guns in a ship of moderate size, and the guns required for beaching such armour had so increased in weight, that the broadside ship had to give way to the turret or habette ship, in which about four such guns were all that could be carried, and these had to be worked on a central line of action in or near the central line of the ship.

The point now reached in all navies is that the broadside unclad with ports cut through an armoured side, as invented by Ponce by M. Dupuy de Lôme, and copied by every power, is obsolete. Guns must be worked singly or in pairs on revolving turn-tables, each turn-table being surrounded by an armoured tower, forming the loading chamber or protecting mechanism. The side armour protecting the buoyancy, stability, machinery, and magazines, although not introduced for that purpose originally, is retained in France for very large ships, is given up in Italy in favour of a raft-body, and is retained partially in England and Germany in conjunction with a raft-body.

The use of armour has arrested the development of the shell. But it is not inconceivable that its abandonment in front of the long batteries of guns in the French and Italian ships will invite shell attack, and make existence in such battles, if they are at all crowded, once more intolerable. It remains to be seen whether in that case exposure will be accepted, or a new demand made for armour, at least against the magazine gun and the quick-firing gun. If exposure is accepted, it will be on the ground that the number of men at the guns is now very few, that the gun positions are numerous and the fire rapid, and that, if the guns had once more the side armour through ports in a central line of action, it would be reduced, and the fragments of their own walls, when struck by heavy projectiles, would be more damaging than the projectiles of the enemy.

Intenal armour for the protection of the heavy armour-breaching guns must be retained so long as such guns are used, and if they were abandoned an enemy could cover himself with armour invulnerable to light artillery. Thus the French attempted to do in inaugurating the system. They have been driven back, it is the growth of the gun. Abandon the heavy gun, and complete armour-plating might again be adopted.

We must conclude that the buoyancy, stability, machinery, and magazines must be protected as far as possible against fatal damage from a single blow of these armour-breaching guns. The tendency will be to come to the lightest form of such protection. That lightest form appears to be a protecting deck a little above the water-level throughout the greatest part of its face, but sloping down at the sides and at the ends, so as to meet the side walls of the ship under the water-line. However the armour is arranged (apart from a complete covering with invulnerable plating),—whether as a belt with its upper edge 3 feet out of the water, as in the French ships, as a central armoured citadel and a raft-body at the ends, like the English and German ships; or as a raft-body throughout, like the Italian ships,—not holes in action will admit water and gradually reduce the necessary stability of the ship. In the French ships the assistance of the unarmoured upper parts is as necessary to prevent them from upsetting in anything but smooth water as is the assistance of the unarmoured raft ends in the English and German ships. In the intact condition the English ships have far greater stability than those of France. In the English ships a reserve of stability is provided, against the contingency of loss by injuries in action, which the French ships no more provide than is required for the intact condition. The French have not accepted the position taken up in England that much greater initial stability may be given to heavily-armoured broad ships than is usually given, without causing heavy rolling. Nor have they accepted the further incontrovertible truth that the free passage of water in the raft-body from side to side of the ship in rolling is rapidly effective in quelling the motion and bringing the ship to rest in the upright position.

Propulsion.

The propulsion of ships by sails differs from the drifting of Sails bodies in the air before the wind in a most important respect. Ships may drift or sail in the direct course of the wind, and they

Changes

merchant
ships

Armour

Com-
mittee
designs

will then differ from air-borne bodies only in the comparative slowness imposed by the resistance of the water. Ships having the same length as breadth, or rather opposing the same form and area to side progress as to forward progress could never do other than sail before the wind. The disposition of canvas could make them deviate to the right or left of their course to leeward. But by an alteration of form giving them greater length than breadth, and greater resistance to motion sideways than to motion endwise, they came to possess the power of being able not only to sail to the right or left of the course of the wind, before the wind, but also to sail towards the wind. The wind can be made to impel them towards the point from which it is blowing by means of the lengthened form acted on by the assistance of the water.

Motion directly towards the wind cannot be maintained, but by sailing obliquely towards it first to one side and then to the other progress is made in advance, and the vessel "beats to windward." The action is like that which would be required to blow a railway car to the eastward by the action of an easterly wind. If the line of sails were due east and west, and the wind were always direct from the east, the thing could not be done. But with a wind to the south or north of east, by setting a sail in the car so that its surface lies between the course of the wind and the direction of the sail, it would then receive the impulse of the wind on its back and would drive the car forwards. There would be a large part of the force of the wind ineffective because of the obliquity of the sail, and of the part which is effective a large portion would be tending to force the car against the sails sideways, but there would be progression to windward. In the case of the ship the resistance to side motion is due to the unsuitability of the proportions and form for progress in that direction as compared with progress ahead, but still there is motion transversely to the line of keel. This motion is called *leeway*. As the ship moves to leeward and ahead simultaneously there is a point of balance of the forces of the fluid against the immersed body—a centre of fluid pressure. The object of the constructor is to place the mast in the ship in such positions that the centre of pressure of wind upon the sails shall fall a little behind or astern of this centre of resistance of the fluid. In that case there is a tendency in the ship to turn round under the action of these two forces, and to turn with her head towards the wind. This tendency is corrected by the action of the rudder. If the tendency to turn were the other way, although that could also be corrected by the rudder, yet there would be danger of the vessel being driven into the wind by a squall, and the ship would then come broadside to the wind. In that case, while she might have been quite capable of bearing the pressure of the wind blowing obliquely upon her sails, she might have her sails blown away, or her masts broken, or be herself carried by the direct impulsion of the wind upon the sail and upon the hull of the ship.

Many examples of disposition of sails might be given. Their disposition is always made to satisfy the conditions that as much sail as possible is returned, but if the vessel is small it must be capable of being instantly let go in a squall, or when the wind is gusty. Otherwise, where it cannot be readily let go, its area should be capable of reduction in quality weather, still retaining its efficiency, so that no pressure of the wind should be capable of upsetting the ship. If a sudden violent squall should strike the ship she should find relief, not by a large inclination, but by the blowing away of the sails out of the bolt-ropes, or the carrying away of the masts. One or other of these must of course happen if the area of canvas and the strength of the sails and of the spars are so proportioned at the moment the squall strikes the ship as to be less than the resistance offered by the stability of the ship to a large inclination. Ships as sometimes, when struck by a squall, blown over on to their sides, the sails being in the water. The sails or spars are then cut away or otherwise got rid of the ship may right herself.

In the *Transactions* of the Institution of Naval Architects for 1881, Mr W. H. White says—

"Any investigation of the behaviour of sailing ships at sea must take account of the conditions belonging to the discussion of their rolling when no sail is set, and must superpose upon those conditions the other and no less difficult conditions resulting from the action of the wind upon the sails, the influence of heaving motions upon the stability, and the steady effect of sail spread.

"It may fairly be assumed that the labours of the late Mr W. Froude have made it possible to predict, with close approximation to truth, the behaviour of a ship whose qualities are known and which has no sails set, when rolling among waves of any assumed dimensions. By a happy combination of experimental investigation and mathematical procedure, Mr Froude succeeded in tracing the motion from instant to instant, and checked the results thus obtained by comparison with the actual observations made in a sea way on the behaviour of the 'Devestation.' The details of his method, and examples of its application, will be found in the *Transactions* for 1875, and in the appendix to the report of the 'Inflexible' committee.

"The conclusion I have reached, after a careful study of the subject, is that we need very considerable extensions of our knowledge of the laws of wind-pressure before more exact investigations will be possible so as to enable us to pronounce with any degree of accuracy the effect of a sailing ship. We must it be overlooked that sailing ships are not to be treated as machines worked under certain fixed conditions. Their safety depends at least as much upon seamanship and management as upon the qualities with which they are endowed by their designers. Moreover, it is able to present

that, in determining what sail-spread can be safely given to a ship, the naval architect proceeds in accordance with exact or purely scientific methods. It is largely influenced by the results of experiment, but the data thus proceeds by comparison rather than by direct investigation from first principles. Certain scientific methods are employed, of course, in making these results to be compared with the apparent effect of the different angles of inclination is usually compared with the corresponding 'sail-moment,' but even here certain assumptions have to be made as to the amount of sail to be taken into the calculation, and as to the effective wind-pressure per unit of sail-area. Between ship and ship these assumptions are unobjectionable, but they are not therefore to be regarded as strictly true.

"The calculations of curves of atmospheric stability of the ranges of stability for ships form important extensions of earlier practice. But, even when possessed of this additional information, the naval architect has to resort to experience in order to appreciate fully the influence of seamanship and the relative manageability of ships and sails of different sizes. There can be no question but that a good range and large area of a curve of stability denote conditions very favourable to the safety of a ship, and that a ship capable of being so sailed is a ship of great value. But, in practice, it frequently happens that such favourable conditions can scarcely be secured in association with other important qualities, and a comparatively moderate range and area of the curve of stability have to be considered when the designer attempts to decide whether sufficient stability has been provided. Under these circumstances experience is of the greatest value, a *proven* reasoning cannot take the place of experience, because (as remarked above) the worst combination of circumstances cannot be fixed, and because some important conditions in the problem are yet unsettled. Certain arbitrary standards may be set up, and ships may be pronounced safe or unsafe, but this is not the solution of the problem. There are classes of ships in existence which have been navigated in all weathers, under sail, and in all parts of the world, which might be pronounced unsafe if tested by some of the standards that have been proposed, but it is true that not a single vessel of that class has been captured or lost at sea during many years will probably be accepted, in most quarters, as sufficient evidence of the seaworthiness of these classes, and as an indication of the solid authority of the proposed standards."

For the different kinds of sails, and for sailmaking, see *Sails*.

The "Comet" was the first steam-totral built in England. She was built

plished with success in any river or open sea. She was built in Scotland in 1811-12 for Mr Henry Bell, of Helensburgh, having been designed as well as built by Mr John Wood, at Port-Glasgow. The little vessel was 42 feet long and 11 feet wide. Her engine was of about four horse-power, with a single vertical cylinder. She made her first voyage in January 1812, and plied regularly between Glasgow and Greenock at about 5 miles an hour. There had been an earlier canoe, but it was not built with a steam vessel in the United States, for a steamer called the "Clement" was built in 1807, and plied successfully on the Hudson River. This boat, built for Fulton, was engaged by the English firm of Boulton & Watt. The reason for this choice of engineers by Fulton appears to have been that Fulton had seen a still earlier steamboat for towing in canals, also built in Scotland, in 1801, for Lord Dundas, and having seen it, he was struck by the acting principle, working by means of a connecting rod and crank and single steam wheel. This vessel, the "Charlotte Dundas," was successful so far as propulsion was concerned, but was not regularly employed because of the destructive effects of the propeller upon the banks of the canals. The engine of the canal boat was made by Mr William Symington, and he had previously made a marine engine for Mr Patrick Miller, of Dalveny, in 1788. This last-named engine, made in Edinburgh in 1788, marks, it is said, the first really satisfactory attempt at steam navigation in the world. It was employed to drive two central paddle-wheels in a twin pleasure-boat (a sort of "Castalia") on Dalveny Loch. The cylinders were only 4 inches in diameter, but a speed of 5 miles an hour was attained in a boat 25 feet long and 7 feet broad. The first steam vessel built in a royal dockyard was also called the "Comet." She appeared to the world in 1812, and was engaged by Boulton & Watt. This ship had two engines of forty horse-power each, to be worked in pans on the plan understood to have been introduced by the same firm in 1814. In 1838 the "Strus" and "Great Western" commenced the regular Atlantic passage under steam. The latter vessel, proposed by I. K. Brunel, and engaged by Messrs Pons & Field, made the passage at about 8 or 9 knots per hour. One year earlier the "Great Western" had been towed by a screw tug, still among us (1886), towed the Admiralty barge with their pro-lorships on board from Somerset House to Blackwall and back pellers, at the rate of 10 miles an hour in a small steam vessel driven by a screw.

The screw did not come rapidly into favour with the Admiralty, and it was not until 1842 that they first became possessed of a screw vessel. This vessel, first called the "Mermaid" and afterwards the "Dwarf," was designed and built by the late Mr Ditchburn, and engaged by Messrs Renne. In 1841-3 the "Rattler," the first ship-of-war propelled by a screw, was built for and by the Admiralty under the general superintendence of Brunel, who was also superintending at the same time the construction of the "Great Britain," built of iron. The engines of the "Rattler," of 200 nominal horse-power, were made by Messrs Maudslays. They were consisting of two vertical cylinders, each of which, at that day, with vertical cylinders and overhead crank-shaft, with wheel gearing to give the required speed to the screw. The next screw engines made for the Royal Navy were those of the "Amphion," 300 nominal horse-power, made in 1844 by Miller and Ravenhill. In these the cylinders took the horizontal

position, and they became the type of screw engines in general use. This ship had a screw well and hoisting gear for the screws. In 1846 the importance of the screw propeller for ships of war became fully recognized, and designs and tenders were invited from all the principal marine engineers in the kingdom.

The Government of that day then took the bold step of ordering at once nineteen sets of screw engines. Six of these had wheel gearing, in all the rest the engines were direct-acting. The steam pressure in the boilers was from 5 to 10 lb only above the atmosphere, and if the engines indicated twice the nominal power it was considered a good performance. The most successful engines were those of the "Arrogant" and "Encounter" of Messrs Penn. They had a higher speed of piston than the others, and the air-pumps were worked direct from the pistons, and had the same length of stroke. These engines developed more power for a given amount of weight than other engines of their day, and were the forerunners of the many excellent engines on the double-trunk plan made by this firm for the navy. The engines with wheel-gearing to the screws were heavier, occupied more space, and were not so successful as the others, and no more of that description were ordered for the British navy.

Economical engines

Up to 1830 neither surface-condensers nor superheaters were used in the navy. The consumption of fuel was about 45 lb per one horse-power per hour. In that year (1860) three ships, the "Athusa," "Octavia," and "Constance," were fitted respectively by Messrs Penn, Messrs Maudslay, and Messrs Elder, with engines of large cylinder capacity to admit of great expansion, with surface-condensers and superheaters to the boilers. Those of the "Athusa" were direct-acting, with two cylinders, those of the "Octavia" were three-cylinder engines, and those of the "Constance" were compound engines with six cylinders, the first two were worked with steam of 25 lb pressure per square inch, and the last with steam of 32 lb pressure. All these engines gave good results as to economy of fuel, but those of the "Constance" were the best, giving one indicated horse-power with 25 lb of fuel. But the engines of the "Constance" were excessively complicated and heavy. They weighed, including water in boilers and fittings, about 54 cwt per maximum indicated horse-power, whereas ordinary engines varied between 34 and 45 cwt.

For the next ten years engines with low-pressure steam, surface-condensers, and large cylinder capacity were employed almost exclusively in the ships of the Royal Navy. A few compound engines, with steam of 30 lb pressure, were used in this period with good results, but they gave trouble in some of the working parts. Compound engines with high-pressure steam (55 lb), were first used in the Royal Navy in 1867, on Messrs Maudslay's plan, in the "Sphinx." These have been very successful. In the Royal Navy as well as in the mercantile marine, the compound engine is now generally adopted. They have been made either heavier than the engines which immediately preceded them, but indicated about 25 per cent more economical in fuel, and, taking a total weight of machinery and fuel together, there is from 15 to 20 per cent gain in the distance run with a given weight.

Reduction in weight of engines

Wrought-iron is largely used in the framing in the place of cast-iron, and hollow propeller shafts made of Whitworth steel. By these means the weight is being reduced, and it is to be hoped that still further reduction may yet be made by the use of high-class materials.

Mr. Thompson, of Chiswick, and others, by means of high rate of revolution, forced combustion, and the judicious use of steel, have obtained as much as 455 indicated horse-power with a total weight of machinery of 11½ tons, including water in boilers. The ordinary weight of a seagoing marine engine of large size, with economical consumption of fuel, excepting a few of very recent construction, would be six or seven times as great. By closing in the stroke-holes and employing fans to create a pressure of air in them, capable of sustaining from one to two inches of water in the gauges the consumption of coal per square foot of fire-grate per hour may be raised to 130 lb and upwards. The indicated horse-power which can be obtained in ordinary cases with the steam-blast in the chimney to quicken combustion does not exceed ten. But by the forced draft above described it can be raised with ordinary boilers to 17 to 18 indicated horse-power per square foot of fire-grate. In torpedo boats with locomotive boilers over 28 horse-power per foot of fire-grate is attainable.

Efficiency

The following observations on efficiency are taken from the work of Mr. Sennett on *The Marine Steam Engine*—

"In every machine there are always certain causes acting that produce waste of work, so that the whole work done by the machine is not usefully employed, some of it being expended in overcoming the friction of the mechanism, and some wasted in various other ways. The fraction representing the ratio that the useful work done bears to the total power expended by the machine is called the efficiency of the machine, or—

$$\text{Efficiency} = \frac{\text{Useful work done}}{\text{Total power expended}}$$

In the marine steam engine, in which the useful work is measured by its propelling effect on the ship, there are four successive stages, in each of which a portion of the initial energy is wasted, and these four causes all tend to decrease the efficiency of the engine as a whole.

"In the first place, only a portion of the heat yielded by the combustion of the coal in the furnaces is communicated to the water in the boiler, the remainder being wasted in various ways. The fraction of the total heat evolved by the combustion of the coal, that is, transmitted to the water in the boiler, is in ordinary cases not more than from $\frac{1}{10}$ to $\frac{1}{8}$. This fraction is called the efficiency of the boiler.

"Secondly, the steam, after leaving the boiler, has to perform mechanical work on the piston of the engine, but this work, in consequence of the narrow limits of temperature between which the engine is worked, is only a small fraction of the total heat contained in the steam—say from $\frac{1}{2}$ to $\frac{3}{4}$, according to the kind of engine and rate of expansion employed. This fraction, representing the ratio of the mechanical work done by the steam to the total amount of heat contained in it, is called the efficiency of the steam.

"Thirdly, in the engine itself a part of the work actually performed by the steam on the pistons is wasted in overcoming the friction of the working parts of the machinery and in working the pumps, &c. The remainder is turned into useful work in driving the propeller. The fraction representing the ratio that this useful work bears to the total power expended by the pistons is called the efficiency of the mechanism.

"Fourthly, the propeller, in addition to driving the ship ahead, expends some of the power transmitted to it in agitating and churning the water in which it acts, and the work thus performed is wasted,—the only useful work being that employed in overcoming the resistance of the ship and driving her ahead. The ratio of this useful work to the total power expended by the propeller is called the efficiency of the propeller.

"The resultant efficiency of the marine steam engine is made up of the four efficiencies just stated, and is given by the product of the four factors representing respectively the efficiencies of the boiler, the steam, the mechanism, and the propeller. Any improvement in the efficiency of the marine steam engine, and, consequently, in the economy of its performance, is therefore due to an increase in one or more of these elements."

Under Sir John Eason's name will be found a discussion of the first three of the efficiencies enumerated above. Propulsion and propellers have to be considered here.

"The principle upon which nearly all marine propellers work," says Mr. Sydney Barnaby, "is the projection of a mass of water in pellers.

A direction opposite to that of the required motion of the vessel. When a vessel is in motion at a regular speed the reaction of the mass of water projected backwards by the propeller is exactly equal to the resistance experienced by the vessel. When it is desired that propulsion is obtained by the reaction of a mass of water projected sternwards with a velocity relative to smooth water, the absurdity is at once seen of attempting to get a propeller to work without slip. If there is no slip there is no resultant propelling reaction except in the limiting case where the mass of water acted upon is infinite. The whole problem therefore resolves itself into this—What is the best proportion between the mass of water projected sternwards and the velocity with which it is projected, that is, if the screw propeller is under consideration, the ratio between its diameter and its pitch?"

"There are four different kinds of propellers apart from sails—the one, the paddle-wheel, the screw, and the water jet.

"The first and oldest of them—the car—may be used in two ways. The action may be intermittent, as in towing, when water is drawn astern during half the stroke and the instrument brought back above the water; or its action may be continuous, as in sailing. When used as in towing it is exactly analogous to a paddle-wheel, while the action of the screw closely resembles that of the screw. It is supposed that in the ancient galleys, which were propelled by a large number of oars in several tiers or banks, the oars hung vertically and worked inwards and outwards with a sculling action. They were not removed from the water, but served as props when the vessel was aground. The oars were always propelling the vessel, in both parts of the stroke. The rowers generally sat with their faces outwards and forwards. There was great overhauling of the sides to allow of several tiers of rowers one above another. The art as used for rowing is a very efficient instrument. To obtain the maximum efficiency out of it a constant pressure should be maintained upon the oar, so that the water is started gradually from rest, and the acceleration uniformly increased throughout the whole of the stroke. A glance at a university crew will show that the stroke is kept up with a uniform pressure and without any jerk."

Speaking of the screw propeller, Mr. S. Barnaby says—"The speed with which water can follow up the blades of a screw depends upon the head of water over it, but when the immersion is suffi-

cent to exclude air a head of water equivalent to 30 feet is supplied by the atmosphere, as has been pointed out by Prof Osborne Reynolds. Experiments on the model of the *Thoune* screw have shown that the efficiency, which is as much as 70 per cent when properly motion, falls to about 50 per cent, when breaking the surface of the water. As a result of a change from a diameter of 5 feet 10 inches to 4 feet 6 inches the speed of the first-class torpedo boat was raised from 18 to 20 knots, other conditions remaining the same.

"There is no doubt that the stern is the best position for the screw. As a vessel passes through the water the friction imparts motion to the layer of water in contact with the screw. This layer increases in thickness towards the stern, so that, after the vessel has passed through, a considerable quantity of water is left with a motion in the same direction as the vessel. If the screw works in this water it is able to recover some of the energy which has been expended by the ship in giving it motion. The speed of this water, which Rankine estimates may be as much as one-tenth of the speed of the vessel, does not depend upon the form, but upon the nature and extent of the surface. As it is a necessity that there should be such a wake, it is a distinct advantage to place the propeller in it and allow it to utilize as much as possible of the energy it finds there. It is important not to confound this water, which has had motion given to it by the side and bottom of the ship, with the wave of replacement, that is, the water filling in behind the ship, which would be the most disadvantageous position possible with this motion, as such interference augments the resistance of the ship very considerably, even in well-formed ships. The propeller should therefore be kept as far away from the stern as possible.

"In the small high-speed stern launchers the propeller has been kept outside the rudder, with advantage to the speed. What is required is that the screw and the water shall have been given out upon the stern of the ship the energy put into it by the bow. If a screw propeller is placed behind a blunt stern so that its supply of water is imperfect it will draw in water at the centre of the diving face, and throw it off round the tips of the blades, like a centrifugal pump, thus producing a loss of pressure upon the stern of the vessel. For very high speed vessels several propellers would enable the length of the machinery to be kept down. The use of an engine of given type, the indicated horse-power varies inversely as the number of revolutions per minute, that is, the greater the number of revolutions the less the weight per indicated horse-power.

"There is a certain quantity of work which must be lost with any propeller, and it is equal to the actual energy of the discharged water moving astern of the propeller with a velocity relative to the still water. As the velocity varies as the weight is multiplied by the square of the velocity, if we double the quantity of water acted upon we double the loss from this cause, but if we double the velocity with which the water is discharged we increase the loss fourfold. This shows the advantage of acting upon a large column of water, and leaving it with as small a speed as possible relative to still water. For this reason the screw is a more efficient instrument than a paddle-wheel, and the jet propeller, with its small area of jet, is so much inferior to the screw. From the above considerations it would appear that the larger the diameter of a screw and the smaller the slip the greater the efficiency would be. There is, however, another element of loss which has to be considered, which imposes a limit to the size of a screw in order to obtain the best efficiency. This element is the friction of the screw blades. The effect of the element may be shown by the case of H.M.S. *Invicta*. This ship was originally fitted with two four-bladed propellers, 18 feet in diameter, and with 18 feet pitch or velocity of advance per revolution. She obtained a speed with these propellers of 15½ knots with an expenditure of 6369 horse-power. Two blades were then taken from each propeller, reducing the total number from eight to four. The indicated horse-power then required for the same speed was 4969, or a saving of 1400 horse-power. This amount had been lost in driving the four additional blades."

Causes of inefficiency. "The causes of loss of work incidental to propellers of different kinds may be summed up as follows—(1) Suddenness of change from velocity of foil to velocity of discharge. Propellers which suffer from this cause are the radial paddle-wheel and the common uniform pitch screw, while those which in varying degrees avoid it are the gun-like and the screw, the feathering paddle-wheel, Rathven's form of centrifugal pump, and the one. (2) Transverse motion impressed on the water. Propellers which lose in efficiency from this cause are ordinary screw-propellers, which impart rotary motion, radial wheels, which give both downward and upward motion on entering and leaving the water, and oars, which impart outward and inward motion at the commencement and end of the stroke respectively. (3) Loss in energy reduced in the guide propeller, as the guides take the rotary motion out of the water and utilize it in no doing. (3) Waste of energy of the feed water. This is experienced in the jet propeller as generally applied."

The present condition of the ease of screw steamship propulsion appears, according to M. Froude's estimate, to be that, calling the effective horse-power (that is, the power due to the net resistance) 100, then at the highest speeds the horse-power required to overcome the induced negative pressure made by the water consequent on the thrust of the screw is 40 more, the friction of the screw in the water is 10 more, the friction in the machinery 67 more, and air-pump resistance perhaps 18 more, add to this 28 for slip of screw, and we find that, in addition to the power required to overcome the net resistance=100, we need 40+10+67+18+23, making in all 258, i.e., at maximum speeds the indicated power of the engines needed to be more than two-and-a-half times that which is directly effective in propulsion. (N.B.)

Boatbuilding

The foregoing article may be supplemented by a brief account of boatbuilding. The distinction between this and shipbuilding is not of a marked character and cannot be simply defined. But for all practical purposes the builder of a vessel without a deck, or but partially decked, and propelled partly by sails and partly by oars, or wholly by oars, may be defined as a boatbuilder.

The boats in general use at present may be classified as racing boats, pleasure boats, or boats used for commercial purposes. Racing boats (compare *Rowing*) are generally built of mahogany, and are the most perfect specimens of the boatbuilder's art. The outrigger racing boat consists from 30 to 35 feet long, 12 to 14 inches in breadth, and 9 inches in depth, being only 10 inches high, and the eight-oared outrigger, being from 55 to 65 feet long by 2 feet 2 inches to 2 feet 5 inches in breadth, weighs about 800 lb. Pleasure boats vary in form and dimensions, from the 16-foot rowing boat used on the east-coast to the gondola type found principally on the canals of Venice and used occasionally on the Thames, &c., for domestic and regatta purposes. Boat-building purposes embrace fishing, canal, and ships' boats. Fishing boats (compare *Fishing*) are gradually passing from the sphere of the boatbuilder to that of the shipbuilder, the open boats of former years being in many cases replaced by large, strong, decked craft more able to withstand the gales of the British coast. Canal boats are generally long, narrow, and shallow, from 50 to 70 feet long by 8 to 10 feet in breadth, and from 4 to 5 feet in depth. The smaller vessels are required by statute to be covered with boats fully equipped for use, not fewer in number nor less in their cubical contents than what is specified for the class to which the ship belongs. The boats vary considerably in form and dimensions as well as in material and construction, according to the service intended. The number of boats a passenger steamer of 1000 tons and upwards is required to carry is six or seven, according to the service intended. The boats are divided into two classes, larger boats must be fitted with lifeboats. If the smaller number is omitted, the set will consist of two lifeboats, one launch, two cutters or punices, and one gig.

Lifeboats are built both ends alike, having a sheer or rise from midships towards stern and stem of 2 inch to 2½ inch per foot of length. They have air-cases of copper or yellow metal fitted in the ends and along the sides of the boat, of sufficient capacity to give each person carried in the boat one and a half cubic feet of strong enclosed air-space (compare vol. xiv p. 577). Cutters are similar in form but of smaller dimensions than lifeboats, punices are about the same dimensions as cutters, but have square sterns. Gigs are of lighter construction and finer form than punices. A service boat called a dingy is also carried, for the conveyance of light stores between the shore and the vessel. Boats, when carried on the deck, are stowed in the funnel of a stack, and are supported by the heat therefrom, have of late years been built of zinc, iron, or steel. Those built of steel have plates $\frac{1}{4}$ inch thick and galvanized, the keel, stem, stern, and deadwood knees being of wood, to which the plating is attached.

The following is an outline of the method of construction. The designer lays down on paper the lines and body-plan of the craft, which are afterwards traced full size on the timber of the stem and keel. From these full size sections moulds are made. The stem and stern posts, having been cut out to the shape designed, are tenoned into mortises in the keel. Two knees overlap, and bind the stem and stern posts to the keel, and are bolted with through bolts and clenched outside over a ring or washer. A stout batten of wood is then nailed between the stem and sternpost heads to connect them together, and a line of oak is stretched from stem to sternpost to represent the water-line. The keel, stem, and stern posts being in position on the stocks, the stem and stern posts are then plumbed and secured by stays of wood. The rabbets in the keel, stem, and stern posts are then cut out with a chisel, after which the moulds are put into their proper places, plumbed with the water-line, and kept in position by stays. The planking is then proceeded with, stroke after stroke, and when the stem is planked up to the top stavolet the keel and stern timbers are put in. The floor extends across the keel and up to the turn of the bilge. They are fastened through the keel with copper or yellow metal bolts and to the planking with copper nails.

The timbers generally are about 1 inch by $\frac{3}{4}$ inch, and are sawn out of a clean piece of American elm, then planed and rounded. After being steamed they are fitted into the boat, and as soon as each is in position, and before it cools, it is nailed fast with copper nails. The gunwale is next fitted, a piece of American elm about 2 inches square, a breast-block is fitted forward, lashing the gunwale, top-stake, stern, and apron together, and aft the gunwale and top-stake are secured to the transom by either a wooden or iron knee. A waring or stringer, about 3 inches by $\frac{3}{4}$ inch, of American elm, is then fitted on both sides of the boat, about 8 to 9 inches below the gunwale, on the top of which the thwarts or seats rest. The thwarts are secured by knees, which are fastened with clench bolts

through the gunwale and top stake and also through the thwart and knee. The boat generally receives three coats of paint and is then ready for service.

The following are the dimensions of boats in the British merchant service—

	Length	Breadth	Depth
Lifeboat	25 ft 6 in	8 ft 6 in	3 ft 6 in
Cutter	36 ft	7 ft	3 ft
Foremast	34 ft	6 ft 6 in	2 ft 8 in
Sloop	18 ft	5 ft 6 in	2 ft 3 in
Drum	16 ft	6 ft 6 in	2 ft 3 in

SHIPLEY, a town of England, in the West Riding of Yorkshire, is situated on the south bank of the Aire, in the neighbourhood of a picturesque pastoral country, at the junction of the Leeds and Bradford Railway with the Bradford, Skipton, and Colne line, 3 miles north of Bradford. The church of St Paul, an elegant structure in the Gothic style erected in 1820, was altered and improved in 1876. The manufacture of worsted is the principal industry, and there are large stone quarries in the neighbourhood. A local board was established in 1853. The population of the urban sanitary district (area 1406 acres) in 1871 was 11,787 and in 1881 it was 15,093.

SHIPPING. The island of Britain (to the shipping of which the present historical notice is mainly restricted) is well fitted to serve as a commercial depot, both by the number of its natural harbours and the variety of its products. There is evidence that Phœnician traders visited it for tin, and in after times it served as one of the granaries of the Roman empire. On the other hand raw wool was the staple article of commerce in the Middle Ages, while the supremacy of English manufactures in modern days has contributed to the development of British shipping till it has grown out of all comparison with anything in ancient or mediæval times.

Britain must have been one of the most distant points that was visited by Phœnician or Carthaginian ships. Adventurous as their sailors were when compared with those of other races, and ready as they were to carry on trading on behalf of neighbouring states, it is not clear that they ever sailed across the Indian Ocean or ventured beyond the Persian Gulf, even in the service of the Egyptians (Brugsch). Their coasting habits led to the settlement of a chain of colonies along the Mediterranean shores, and that sea was wide enough to form a convenient barrier between the Greek and the Carthaginian settlements. When their empire was at length destroyed the Romans became the heirs of their enterprise, but do not appear to have pushed maritime adventure much further or opened out many new commercial connexions.

Though the Angle and Saxon tribes were doubtless skilled both in shipbuilding and in the management of their vessels at the time when they conquered Britain, these arts had greatly decayed during the four centuries that elapsed before the time of Alfred, who endeavoured to improve on existing models (*Eng Chron*, 837). Hence the necessity of resisting the Danes, with the subsequent fusion of Danish and other elements in our nationality, may be taken as marking the period when English shipping had its rise. Apart from incidental notices of communication with other lands, there is clear evidence, from the early English laws, of efforts to encourage commerce, particularly in the status which was accorded to traders and the protection afforded to merchant ships. The whole of these arrangements seem to imply that the merchant was the owner of the vessel, who "adventured" with his cargo, and sailed in his ship himself, but these voyages were probably undertaken for the most part to ports on the

other side of the Channel, as it does not appear that English ships penetrated to the Mediterranean till the time of the crusades.

The steady development of English shipping during the Norman and early Plantagenet reigns may be inferred from the more frequent intercommunication with the Continent and the many evidences of the increasing importance of the commercial classes and trading towns. In the time of Edward III. the shipping interest suffered a temporary check from the removal of the staple to England, a step which was taken with the view of attracting foreign merchants to visit England (1353). This policy, however, was soon reversed, and the reign of that monarch was on the whole favourable to the development of shipping. He was himself fond of the sea, and commanded in person in naval engagements, and by taking possession of Calais and enforcing his sovereignty over the narrow seas he rendered the times more favourable for the development of commerce. More than one of the noble families of England have descended from the merchant princes of the 14th century. By this time also the compass, which had been introduced in a rude form as early as the 12th century, had been improved and had come into common use. But many years were to elapse before the enterprise of the 15th and 16th centuries made the most of the new facilities for undertaking long voyages, and the fortunes of English shipping, as depicted by a contemporary (*Libell of Englyshe Policy*, 1436), continued to vary according to the state of political connexions with the Continent and the success of English monarchs in "keeping the narrow seas" free from the ravages of pirates. During this century, too, we hear far more of organizations of merchants to foreign parts, and of struggles between different bodies of traders. The "Merchants of the Staple" dealt in raw wool and the other staple commodities of the realm, which they exported to Calais, the "Merchant Adventurers," a powerful association which had developed out of a religious guild, dealt chiefly in woollen cloths, but they traded with any port where they could get a footing. This brought them into frequent collision with the "Merchants of the House," who had had a footing in London since before the Conquest. The chief attempt at accommodation took place in the time of Edward IV. (1474), but the quarrels and refusals continued till the discovery of the New World had revolutionized trade, and the Hansa League, expelled by Elizabeth, were unable either to injure or to compete with English shipping.

Considering the interest which all the Tudor monarchs showed in developing shipping,¹ and the proverbial boldness and enterprise of the Cabots, Raleigh, Drake, and other sailors, it is remarkable that England obtained so little footing at first in the new lands which were discovered by Columbus (1492) or along the route that was

¹ The establishment of Trinity House by Henry VIII. for looking after pilots, buoys, &c., in 1512, is the most important result of his care for shipping.

opened up by Vasco da Gama (1496). Eventually she inherited much of the commercial empires of Spain, Portugal, Holland, and France, but there was still comparatively little permanent acquisition, or establishment of trading factories, at the close of the 16th century. The fact was that such undertakings were beyond the power of private traders, and that Elizabeth was too penurious to make an attempt on such a scale as to command success. It was by the formation of companies that the difficulty was at length overcome, and that associated traders, or traders working on a joint stock, were able to establish factories in foreign parts, and thus to give a new impetus to English shipping. The African Company and others were failures, but there were many which had a long and successful career. The Levant Company was established in 1581, and had factories at Smyrna. The Eastland Company traded with the Baltic, it was established in 1579, and had factories in Prussia. The Hudson's Bay Company is much more recent, and only dates from 1670. But by far the greatest of these undertakings was the East India Company, which was founded in 1600, and which, after a long struggle with commercial rivals at home and Dutch competitors abroad, attained at length to the sovereignty of a large empire. The chief cause of complaint against this company in the early stages of its existence lay in the fact that it was a joint-stock company, and that therefore the proprietors had a monopoly of a valuable trade, the greater part of the other companies were regulated companies, and membership was open to any British subject who liked to pay the entrance fees and join with other merchants. The merchants thus associated agreed to abide by certain specified conditions, so as not to spoil the markets for one another, but develop the trade in which all were interested in a manner which should be advantageous to all. The Levant Company and Merchant Adventurers were regulated companies, and they led the attack on the East India Company as the monopoly of a few which injured the trade of other merchants. The controversy raged during the reigns of James I and Charles I, and many of the leading merchants of the time—Mun, Malynes, Misselden, as well as Wheeler, the secretary of the Merchant Adventurers—took part in it. The advocates of the East India trade argued that, owing to the immense distance of their factories and the special difficulties of maintaining their position abroad, it was impossible to carry on their trade except on the joint-stock principle, and then plea prevailed in the long run.

The Merchant Adventurers and the whole system of regulated companies is less familiar to us in the present day, and it may be worth while to indicate the sort of regulations which were imposed on the members. One series of rules was directed at regulating the total export trade of certain classes of goods to the chief Continental ports, so that the markets abroad might not be overstocked, and that they might always be able to get remunerative prices. Other regulations allotted the proportion of goods which each member of the company should export, and the terms as to credit and so forth on which he should deal. Each factory was carefully regulated so as to secure a respectable and orderly life among the merchants resident abroad; none of them were to do business during the times of public preaching or on fast-days; and there was a curious administrative system by which the compliance of the members with these regulations was enforced.¹

Those English merchants who traded to towns where the Adventurers had a factory, but did not comply with their regulations, were stigmatized as "interlopers," and they were greatly disliked by the regular traders, as they

were accused of spoiling the market in various ways and, generally speaking, trading on any terms for an immediate advantage without regard to the steady and regular development of commerce. At a later time, there were interlopers within the East India Company's territories also.

The formation of these large companies for the purpose of undertaking long voyages marks a great revolution in the shipping of the country. The differentiation of the mercantile and defensive navy became more complete. There had of course been a certain number of royal ships from a very early time (see NAVY), but the fleet had not been regularly maintained in the 15th century, and the defence of the realm was practically left to individuals or associations. As late as the time of Elizabeth we find that the same thing was the case, and that the fleet which harassed the Armada consisted very largely of merchant ships. In the time of the naval wars with Holland, however, this is greatly changed, and the navy was much more effectively organized and regularly maintained. But even when the royal navy was thus organized it was felt that its continued effectiveness must depend on the maintenance of merchant shipping. The two were still interconnected, and just because special importance was attached to this arm as a means of defence there was a great deal of legislation for the purpose of indirectly promoting shipping and providing seamen. This was one of the aspects in which the prosperity of British fisheries was specially attended to, the consumption of fish was stimulated by insisting on the observance of Lent and of weekly fasts on Wednesdays and Fridays, when "the eating of fish was required politically and not spiritually" 5 Eliz c 5, § 13, 1 Jas I c 29, and this was principally done as a means of inducing men to take to a seafaring life, and so to fit themselves for the defence of the country and for the manning of our merchant ships.

Considerable progress had also been made both in the art of sailing and in the building of ships. The vessels which composed the fleets of the crusaders appear to have been for the most part galleys, provided with a double row of oars; the huge prows which gave a superiority in hand-to-hand fighting with a grappled vessel were of no advantage when the use of cannon had revolutionized naval warfare. We thus find that the ships of this period were built on a different model, and many inducements were held out to those who built large ships. Both Elizabeth and Charles offered bounties for the building of larger craft (100 and 200 tons), in 1597 800 tons was the largest vessel that an English yard turned out. The legislature also was most assiduous in endeavouring to encourage this industry. The importation of naval stores of all kinds, the growth of hemp for cordage and of timber, were matters of constant care, both in England itself and in the policy which was dictated to her colonies.

It is easy enough to see that in these cases the encouragement of shipping was undertaken as an indirect means of increasing the power of the country, and the same thing is true of the complicated arrangements that were made for giving special inducements to trade in particular articles or with particular countries. Every one is of course familiar with the fact that during the 17th and 18th centuries efforts were made to regulate trade so that gold and silver might be brought into England. It is unnecessary to enumerate the expedients that were adopted at different times, or to discuss the vexed question as to how far those who advocated the system were in error. There can be no doubt that the possession of a treasure was vastly important for political purposes, and that trade was the only means by which a state which possessed no mines could procure treasure, and it is of course possible that some of the mercantilists had too much stress on the desirability for political purposes of amassing wealth in this form. But the fundamental principle of this system of commercial policy lay in the connexion which was felt to exist between trade and industry. Trade, it was said, stimulated industry by providing a new market for its products. If two countries trade together, each will stimulate the trade of the other to some extent, but, if England

¹ Wheeler in Brit. Mus. Add. MS. 18913

buys raw products from Portugal and Portugal buys manufactured cloth from England, then the operation of trade between them is such that Portugal stimulates English industry and sets English labour in motion to a far larger extent than English consumption stimulates that of Portugal, it was believed that this relative stimulus might be detected by examining the balance of trade, and that, if by an ingenious adjustment of duties the balance could be kept in her favour, the nation would be benefiting England more than it stimulated the progress of her possible rivals. In the present day we look at the volume of trade and trust that both sea-gamers, in those centuries they looked at the kind of gain that accrued and tried to ensure that England gained more than her possible enemies. Thus it was generally held that by commercial intercourse between England and France the French gained relatively more than the English, to the legislators of the time it seemed desirable to impose such conditions as should alter this state of affairs, or, if no agreement could be come to on the terms of a treaty, the trade should be stopped altogether, lest by continuing to overbalance England in trade the French should be enabled to overbalance her in power. These ideas of commercial policy dominated the whole of British legislation for shipping from the beginning of the 17th century till after the Napoleonic wars, the preference which was given to English ships, the English bulk and English manner, was regulated in a manner that was prejudicial to the development of the colonies by the Navigation Act of 1651, and was subsequently embodied in the orders in council. But these ideas are expressed most clearly in such discussions as those regarding the Methren treaty with Portugal. Without attempting to advocate a system of which the wisdom has become patent on our own day, it may yet be worth while to note the time during this régime that England maintained her position as the great shipping nation of the world, and passed the Dutch and French in the struggle for naval supremacy. Napoleon gave unconscious testimony to the effectiveness of the commercial policy for building up the strength of the nation when he sought to humble England, not by direct attack, but by destroying the trade and shipping by means of which she had raised herself to power.

This policy of subsidizing the interests of shipping as a trade and means by which merchants acquired wealth to the policy and power of the nation as a whole had another side. Revenue for war expenses was furnished almost entirely by the mother country, neither Ireland nor the colonies contributed at all largely to the burden of maintaining the national struggle with Continental rivals. Hence it was undesirable that these dependencies should develop at the expense of the mother country, as by so doing they would reduce the resources of which parliament drew for the expenses of the realm. Hence, while England was always willing to develop resources or industries—like the linen trade in Ireland—which did not compete with and could not undersell existing English manufactures, her politicians were unwilling to allow her dependencies to become her competitors in trade so long as they did not co-operate in maintaining power. Hence the galling restrictions to which the Irish and the colonists were subjected, both with regard to the development of some of those resources and the carrying on of profitable trade with other colonies or foreign countries. But it must not be forgotten that English merchants suffered in the same sort of way, as changes of political relations at once brought about changes in the conditions of trade, and that in at least one case the interests of enterprising farmers at home were set aside in favour of the interests of an established industry in the colonies. The subordination of the craftsman and trader intent to the public policy of the realm brought about a system of galling regulations which pressed hardly on many persons, though they were most obviously harmful to Ireland and the colonists, who had not so much interest in the political objects for which their wealth was sacrificed.

It is unnecessary to attempt to illustrate in detail the application of these principles, only enough to add that, whether in spite of these regulations or because of them, the shipping of England increased vastly during the 18th century. This was partly due to the greater facilities which were granted for procuring capital for trading ventures. In medieval times a merchant could hardly obtain the command of additional capital, unless by means of a temporary partnership, or loans on bottomry, but the objection to usury was fast giving way, and the public was willing to lend capital and to share in the profits of trading. The practice of trading on borrowed capital, and of obtaining temporary loans from goldsmiths, was common enough all through the 17th century, but the development of the banking system and the new forms of credit which thus became available gave still greater scope to the enterprising shipper. The full fruits of the new power were only shown, however, in the beginning of the 18th century, when the rivalry of the Old and New East India Companies and the story of

the Danish expedition and the South Sea Bubble show how willing the British public were to pour their capital into trading undertakings. Among the companies which were started about this period there were two which have exercised a most salutary influence on British shipping. The Royal Exchange Assurance Company (6 Geo. I. c. 18) and the London Assurance: revolutionized the whole system of marine assurance, and did so much to relieve shippers from the losses they suffered through the risks of commerce as to give considerable encouragement to the business. The plantations were developing into important settlements, the British merchant had outdone his Dutch rivals, and the East India Company was pursuing its course of progress in the East. There can be no wonder that, with so many opportunities for trading, and such new facilities for obtaining capital and assuring against risk, the shipping of the country developed during the 18th century. It is unnecessary to dwell on the shocks it received at the time when the American colonies asserted their independence (27 and 28 Geo. III. c. 11) or in the life and death struggle of the Napoleonic wars. The difficulty of recasting the restrictive system under which British merchants plied their trade was very great, and when it broke down in regard to America and Ireland (20 Geo. III. c. 6, 10) it was becoming apparent that its days were numbered. The doctrines preached by Adam Smith soon began to bear fruit, the practical difficulty of regulating commerce rendered politicians more willing to let it regulate itself, and the controversy between the exclusive companies and the interlopers or independent merchants once more came to the front. It was during the reign of George IV. that the old system was practically abandoned, and that the gates part of the old companies were dissolved, and trade to all parts of Africa, to the Levant, and to China became open to all British subjects. The East India Company maintained its position in part despite its many critics for another half century, and the peculiar conditions of the trade of the Hudson's Bay Company have made it desirable to maintain that privileged corporation till the present time.

It became still more obvious that the old policy of regulating the commerce of the country in the supposed interests of its power was being abandoned when Haskisson reformed the tariff in 1825. The measure he succeeded in carrying was not so thoroughgoing as the one he proposed, but its principle was that the customs duties should be levied for revenue objects only, and not with the view of maintaining British manufactures in one particular employment or of their capital. Later the repeal of the corn law (1846) and navigation laws (1849) removed the last vestiges of the old commercial policy which had ruled over the development of British shipping almost from the earliest times, but which had been steadily and systematically pursued for three thousand years.

It was thus that Adam Smith's criticisms worked so effectively as to realize his dreams at great intervals of time. His deeper reasons for objecting to the commercial system of the 18th century lay in the fact that the colonial trade and shipping altogether seemed to him to have received an unhealthy stimulus, and that the country would be in a sounder economic position if capital were employed at home in developing native resources, and foreign trade built upon a foundation of highly developed native industry. But the removal of the stimulus did not have the effect he anticipated, or restore the "balance" between industry and shipping. England is far more dependent than ever before on her relations with foreign countries, and therefore on her shipping, for the materials of her manufacture and her food, as well as for markets for her products. She is further removed than ever from that condition of "opulence" which has, according to Adam Smith, the greatest promise of stability and progress.

This has undoubtedly been due to the immense developments in manufacturing in which England, with her wealth of coal and iron, led the way. The reason on shipping was that, as more and more trade came to be the workshop of the world, and her shipping was freighted with soft goods from Lancashire and Yorkshire, and with hardware and machinery, to be conveyed to the most distant parts of the globe. But not only were the opportunities for trading immensely increased, the application of the steam engine to transport by water has accelerated communication, and rendered it so regular and certain as to give it extraordinary stimulus to foreign trade. The first steamer built that was more than a mere toy made its trial in 1807, and since that time steam shipping has been more and more substituted for the old sailing vessels. Still more recently there has been a considerable change in the construction of ships, from the success which has attended iron shipbuilding. The first experiment, which was generally deemed exceedingly rash, was made in 1861.

It is impossible to get satisfactory data for a comparison of the relative importance of English and foreign shipping for a long period, but it may be assumed that the shipping of the Italian republics and of the Hanse League excelled that of England during the Middle Ages, that in the 16th century Spain was far ahead of her when she could send such fleets to the West and fit out a Spanish Armada, and that in the 17th and 18th centuries respect-

¹ It was pursued, but less systematically, all through the Tudor reigns or even earlier. Compare 1 H. VII. c. 8, 32 H. VIII. c. 14, 1 El. c. 13, also the *Assize of Arms* in 1151.

ively England was much in the same position as the great rivals—Holland and France—with which she had to compete so keenly. We may compare the present position and the relative growth of tonnage during the last century, so far as figures are available for the purpose—

	1790	1850		1790	1850
England	1,511,411	6,574,513	France		989,128
Spain		1,657,120	Holland		319,000
Italy		1,000,000	United States	502,146	4,000,000

SHIRÁZ, a celebrated city in Persia, capital of Fars, from its site and thoroughly Iranian population may be considered the central point, as it were, of Fars or Pars (other wise Persian) nationality. Owing to the pasture land in its vicinity some derive the name from the native word *sher*, "milk," others again, asserting the number and physical powers of its inhabitants, accept the same word in its sense of "lion," or take the whole dissyllable as an obsolete word meaning the "lion's punch." To this effect is cited a local saying to the effect that, "like the lion, it devours all they bring into it." Shiráz is situated in 29° 36' 30" N lat and 52° 32' 9" E long, in a high plain or valley more than 20 miles long and less than half as broad, and is approached on the south from the sea—a distance of 170 miles!—through lofty mountain passes reaching some 7000 feet above the level of the waters of the Persian Gulf. On the north the approach is also through chains of mountains separating the plains of Shiráz from the valley of the Marv Dasht, intersecting which is the Band Anfir river, more poetically than accurately described in *Lalla Zookh*. At Kodiyán, a few miles to the north-west of Shiráz, is the source of another river, which, crossing the high road south of the town under the name of the "Kára Agatch," falls into the sea about 70 miles below Bushahr (Bushure), after a tortuous course of 300 miles. The city has a handsome bazaar and some good private residences, but its unattractive streets are narrow, and though not so crowded with beggars as Isphahan, contain many living objects distressing to the eye. The mosques and minarets, albeit of local repute, look more picturesque to the stranger in the distance than under close inspection. One fine view of the town is that on the north, at the pass between the mountains called "Allah Hu Akbar"—so named, it is conceived, because this would be the traveller's exclamation of delight when the landscape first opened out upon him. The country in this direction is studded with pleasant gardens. Besides these there are the tombs of the poets Hafiz and Sa'di—both within easy reach of the city. The first—a fine marble monument with a beautifully inscribed ode and other writings upon it—is not a mile from the gate, and is situated in an enclosure bearing the name Háfiya. The most noted product of Shiráz is its wine, on the merits of which, however, there is much difference of opinion from outside judges. Dr Willis gives an original account of an experiment of his own in making the wine of Shiráz. Its cost in the production was 5½d a bottle, and it sold a year after at more than three times that amount. Shiráz is moreover famous for inland work (wood and metal) called *khdtam banda* (from *khdtam*, a seal). The population of the city is estimated under 30,000. The ordinary diseases are intermittent fever, diarrhoea, dysentery, typhoid, guinea-worm, cholera, diphtheria, small-pox, and ophthalmia.

¹ As the crow flies, it is only 115 miles N E by E of Bushahr.

Although the praises of Shiráz, its produce, inhabitants, climate, and surroundings of every kind, have been sung by poets for centuries, and are never disputed by Persians who are not Shirázis, yet it is impossible for the sober European traveller to deny that the reality falls far below the picture. "We may feel thankful for the wine and the water, the gardens and the mountains, the fruits and the flowers (abundant here as in many other oases in the Shah's dominions), we may sympathize with the national pride in the possession of a Hafiz and a Sa'di, we may believe that the ladies of yore had "eyes brighter than the antelope's, hair clustering like their own dark grapes, and forms fairer and sweeter than the virgin rose," and that those of the present day would, if unveiled, strike the spectator with wonder, but our feelings, as the modern town of Shiráz is not a paradise for those whose personal experience enables them to compare it with the ordinary cities of Europe.

According to Eastern authorities, Shiráz was founded (or re-founded, for some accounts ascribe to it a fabulous antiquity) by a brother of the famous Hajji about the beginning of the 8th century, or rather by a cousin of Hajji called Abūhammed b. Kasim b. Abū 'Omal. Six hundred years later it was the capital of the Muzaddi dynasty of princes, when it fell to the arms of Timur. But it attained its greatest reputation in the reign of Karim Khan, who embellished the city greatly and made it the special object of his care. On the downfall of this monarch it was sacked and laid waste by the cruel Agha Mahomed.

Shiráz has been often described by native geographers and European writers of travel. Among the latter we may mention Pietro della Valle, Herbelot, Tavernier, Deslaines, and Chardin, in the 17th century, and in the present century Ouseley, Porter, Momei, Scott-Waring, Foster, Binning, and many quite recent travellers. Neither in his serious history nor lighter sketches does Sir John Malcolm give any detailed account of Shiráz as a city, but his notes on its climate may be cited. On one of the hottest days of June 1800 the thermometer registered 84° F in the house and 100° in a tent. In May 1810 it never rose at noon above 85° nor fell below 74°. In the morning, at eight o'clock, it generally stood about 60°. In autumn the heat continued, but in winter it was seen to fall considerably below the freezing point. As late as March there is often a hoar frost on the ground. April, he adds, is a delightful month, the thermometer at sunrise being generally from 50° to 65°, at two P.M. 80° to 84°, and at nine P.M. about 64°.

SHIRE. See County

SHIRLEY, a town of Hampshire, consists chiefly of comfortable houses occupied by persons in business in Southampton (2 miles south-east), of which it is practically a suburb. Within its limits are the Baulow home (1840), the Eliyet home (1879), and the children's hospital and dispensary for women (1884). The urban sanitary district of Shirley, formed in 1853, was extended by an Act which came into operation 29th September 1881, the name being also changed to Shirley and Freemantle. The population of the old district (area 1198 acres) in 1871 was 5339 and in 1881 it was 7856. The population of the new district (area 1392 acres) in 1871 was 9909 and in 1881 it was 12,939.

SHIRLEY, JAMES (1596–1666), dramatist, belonged to the great period of our dramatic literature, but, in Lamb's words, he "claims a place among the worthies of this period, not so much for any transcendent genius in himself, as that he was the last of a great race, all of whom spoke nearly the same language and had a set of moral feelings and notions in common." His career of playwriting extended from 1625 to the suppression of stage plays by parliament in 1642. Born in London in 1596, he had been educated for a profession—at Merchant Taylors' school, St John's College, Oxford, and Catherine Hall, Cambridge. The church was his destination, but he turned Roman Catholic, and made a living for two years as a schoolmaster. His first play, *Love Tricks*, seems to have been accepted while he was teaching at St Albans, and for eighteen years from that time he was a prolific writer for the stage, producing more than thirty regular plays, tragedies, and comedies, and showing no sign of exhaustion when a stop was put to his occupation by the Puritan edict. He turned again to teaching for a livelihood and prospered, publishing some educational works under the Commonwealth. Besides these he published

during the period of dramatic eclipse three small volumes of poems and masques, in 1646, 1653, and 1659. He survived into the reign of Charles II, but, though some of his comedies were revived, he did not again attempt to write for the stage. It is said that he and his second wife died of the fright caused by the great fire of 1666.

There is little original force but much stage-craft and manipulative dexterity in Shirley's plays. He was born to great dramatic wealth, and he handled it finely. It has been remarked that he did not, like some of his great predecessors, base his plots on narrative fiction or history, but constructed them for himself. This is true, but he constructed them out of the abundance of materials that had been accumulated by more originaive men during thirty years of unexampled dramatic activity. He did not strain after novelty of situation or character, but worked with confident ease and buoyant copiousness on the familiar lines, contriving situations and exhibiting characters after types whose effectiveness on the stage had been proved by ample experience. He spoke the same language with the great dramatists, it is true, but this grand style appears in him as the mechanical knack of an able and clever workman. It is often employed for the artificial elevation of commonplace thought. "Clear as day" becomes in this manner "day is not more conspicuous than this cunning", while the proverb "Still waters run deep" is ennobled into—

The shallow rivers glide away by noise—

The deep are silent

But it cannot be denied that he uses the poetic diction of his predecessors with ease, spirit, and judgment. His scenes are ingeniously conceived, his characters boldly and clearly drawn, and he never falls beneath a high level of stage effect.

His chief plays were—*Love Tricks*, a comedy, 1625, *The Maid's Revenge*, a tragedy, 1626, *The Boethius*, a comedy, 1628, *The Witty Banquet*, a comedy, 1628, *The Wedding*, a comedy, 1628, *The Grateful Servant*, a tragedy-comedy, 1629, *The Chances*, or *Love in a Maze*, 1632, *The Gleaner*, a comedy, 1633, *The Example* (containing an imitation of Ben Jonson's *Humours*), 1634; *The Opportunity*, 1634, *The Tractor*, a tragedy (perhaps Shirley's best), 1635, *The Lady of Pleasure* (perhaps the best of his comedies), 1635, *The Cardinal*, a tragedy (an attempt to compete with Webster's *Duchess of Malfi*), 1641. An edition of his works in six volumes, with notes by Dyce and Gifford, was published in 1833.

SHODDY. See Wool.

SHOEMAKING. The simplest foot-protector is the sandal, which consists merely of a sole attached to the foot, usually by leather thongs. The use of this the archaeologist can trace back to a very early period, and the sandal of plated grass, palm fronds, leather, or other material still continues to be the most common foot-covering among Oriental races. Where climate demanded greater protection for the foot, the primitive races shaped a rude shoe out of a single piece of untanned hide, this was laced with a thong, and so made a complete covering. Out of these two elements—sole without upper and upper without sole—arose the perfected shoe and boot, which consist of a combination of both. A collection illustrating the numerous forms and varieties of foot-covering, formed by M. Jules Jacquemart, is now in the Cluny Museum in Paris. It embraces upwards of 300 specimens of ancient, mediæval, and modern times, with a special series illustrating the artistic and historical side of the subject in France from the 15th century, and contains examples of the many varieties of foot-covering in use, especially in the East, at the present day. (Compare **COSTUME**.)

Wooden Shoes.—The simplest foot-covering, largely used throughout Europe, is the wooden shoe, made from a single piece of wood roughly cut into shoe form. The towns of Mende and Villefort (dep. Lozère) are the headquarters of the wooden shoe trade in France, about 1700 persons there finding employment in the manu-

facture. Analogous to this industry is the clog-making trade of the midland counties of England. Clogs, known also as pattens, are wooden soles to which shoe or boot uppers are attached. Sole and heel are made of one piece from a block of maple or ash two inches thick, and a little longer and broader than the desired size of shoe. The outer side of the sole and heel is fashioned with a long chisel-edged implement, called the clogger's knife or stock, a second implement, called the groove, makes a groove about one-eighth of an inch deep and wide round the side of the sole, and by means of a hollow the contour of the inner face of the sole is adapted to the shape of the foot. The uppers of heavy leather, machine sewed or riveted, are fitted closely to the groove around the sole, and a thin piece of leather—binding or mallet—on all round the edges, the mallet being placed very close, so as to give a firm durable fastening. These clogs are of great advantage to all who work in damp sloppy places, keeping the feet dry and comfortable in a manner impossible with either leather or india-rubber. They are consequently largely used on the Continent by agricultural and forest labourers, and in England and the United States by dyers, bleachers, tanners, workers in sugar-factories, chemical works, provision packing warehouses, &c. There is also a considerable demand for expensive clogs, with finely turned soles and fancy uppers, for use by clog-dancers and others on the stage.

Manufacture of Leather Shoes.—There are two main divisions of work comprised in ordinary shoemaking. The minor division—the making of "turn shoes"—embraces all work in which there is only one thin flexible sole, which is sewed to the upper while outside in and turned over when completed. Slippers and ladies' house-boots are examples of this class of work. In the other division the upper is united to an insole and at least one outsole, with a raised heel. In this are comprised all classes, shapes, and qualities of goods, from shoes up to long-top or riding boots which reach to the knee, with all their variations of lacing, buttoning, elastic-web side gussets, &c. The accompanying cuts (figs 1 and 2) show the parts and trade names of a riding boot, which is the supreme product of the craft.

'Till within recent times shoemaking was a pure handicraft; but now machinery effects almost every operation in the art. On

the factory system all human feet are treated alike, in the handicraft, the shoemaker deals with the individual foot, and he should produce a boot which for fit, comfort, flexibility, and strength cannot be approached by the product of machinery.

The shoemaker, after measuring the feet, cuts out upper leathers according to the size and pattern. These parts are fitted and stitched together by the "boot-closers",

but little of this closing is now done by hand. The sole "stiff" is next cut out and assembled, consisting of a pair of minor soles of soft leather, a pair of outer soles of firmer texture, a pair of welts or bands about one inch broad, of flexible leather, and lifts and top-pieces for the heels. Those the "maker" malleys by steeping in water. He then wedges the insoles to the bottom of a pair of wooden lasts, which are blocks the form and size of the boots to be made, fastens the leather down with lasting tacks, and, when dried, draws it out with pinners till it takes the exact form of the last bottom. Then he "rounds the soles," by paring down the edges close to the last, and forms round these edges a small channel or feather cut about one-eighth of an inch in the leather. Next he pores the insoles all round with a bent awl, which bites into, but not through, the leather, and comes out at the channel or feather. The boots are then "lasted," by placing the uppers on the lasts, drawing their edges tightly round the edge of the insoles, and fastening them in position with lasting tacks. Lasting is a crucial operation, for, unless the upper is drawn smoothly and equally over the last, leaving neither crease nor wrinkle, the form of the boot will be bad. The welt, having one edge pared or chamfered, is put in position round

the sides, up to the heel or "seat," and the maker proceeds to "in-seam," by passing his awl through the holes already made in the insole, catching with it the edge of the upper and the thin edge of the welt, and sewing all these together in one flat seam, with a waxed thread. He then pares off inequalities and "levels the bottoms" by filling up the depressed part in the centre with a piece of tanned felt, and, that done, the boots are ready for the outsoles. After the leather for them has been thoroughly condensed by hammering on the "lay stone," they are fastened through the insole with steel tacks, then sides are paled, and a narrow channel is cut round their edges, and through this channel they are stitched to the welt, about twelve stitches of strong waxed thread being made to the inch. The soles are then stamped into shape, the heel lifts are put on and attached with wooden pegs, then sewed through the stitches of the insole, and the top-pieces, similar to the outsoles, are put on and nailed down to the lifts. The finishing operations embrace pinning up the edge of the heel, pading, rasping, scraping, smoothing, blacking, and burnishing the edges of soles and heels, scraping, sand-papering, and burnishing the soles, withdrawing the lasts, and cleaning out any pegs which may have passed through the inner sole. Of course, there are numerous minor operations connected with so finishing and finishing in various materials, such as punching lace-holes, inserting eyelets, applying heel and toe irons, hob-nailing, &c. To make a pair of common stout lacing boots occupies an expert workman from fourteen to eighteen hours.

The principal difficulties to overcome in applying machinery to shoemaking were encountered in the operation of fastening together the soles and uppers. The first success in this important operation was effected when means other than sewing were devised. In 1809 David Meade Randolph obtained a patent for fastening the soles and heels to the inner soles by means of little nails, &c. The lasts he used were covered at the bottom with plates of metal, and the nails, when driven through the inner soles, were turned and clinched by coming against the metal plates. To fix the soles to the lasts during the operation the metal plates were each perforated with three holes, in which wooden plugs were inserted, and to these the insoles were nailed. This invention may be said to have laid the foundation of machine boot-making. In the following year (1810) the inventor M. I. Brunel patented a range of machinery for fastening soles to uppers by means of metallic pins or nails, and the use of screws and staples was patented by Richard Woodman in the same year.

Apart from sewing by machine or hand, these principal methods of attaching soles to uppers and of pressing the sides of the "pegging" with small wooden pins or pegs driven through outsole and insole, catching between them the edges of the upper. The points of the pegs which project through the insole are cut away and smoothed level with the leather either by hand or by a machine (pegging rasp). The second is the system of "riveting or clinching" with iron or brass nails, the points of the nails being turned or clinched by coming in contact with the iron last used. The third method, screwing, has come into extensive use since the standard sewing machine was introduced in America by the Mackay Association of Boston, Massachusetts, and in Europe by the Blake & Goodyear Company of London. The standard screw machine, which is an American invention, is provided with a reel of stout screw-threaded brass wire, which by the revolution of the reel is inserted into and screwed through outsole, upper edge, and insole. Opposite the upper a heavy, square, adjustable screw is placed, the point of the screw, and the instant screw and heel are forced the wire is cut level with the outsole. The screw, making its own hole, fits tightly in the leather, and the two soles, being both compressed and screwed firmly together, make a perfectly water-tight and solid shoe. The surface of the insole is quite level and even, and as the work is really screwed the screws are steady in their position, and they add materially to the durability of the soles. The principal disadvantage in the use of the standard screwed sole is the great difficulty met with in removing and leveling down the remains of an old sole when repairs are necessary.

The various forms of sewing-machine by which uppers are closed, and their important modifications for uniting soles and uppers, are also principally of American origin. But the first suggestion of machine sewing was an English idea. The patent secured by Thomas Saint in the English Patent Office in 1790, while it foreshadowed the most important features of the modern sewing-machine, indicated more particularly the devices now adopted in the sewing of leather. After the introduction of the sewing-machine for cloth work its adaptation to stitching leather both with plain thread and with heated waxed thread was a comparatively simple task. The first important step in the more difficult problem of sewing together soles and uppers by a machine was taken in the United States by Lyman R. Blake in 1858. Blake's machine was ultimately perfected as the Mackay sole-sewing machine, one of the most successful and lucrative inventions of modern times. Blake secured his first English patent in 1859, his invention being thus described: "This machine is a chain-stitch sewing-machine. The hooked needle works through a rest or supporting surface of the

upper part of a long curved arm which projects upwards from the table of the machine. This arm should have such a form as to be capable of entering a shoe so as to enter the rest into the toe part as well as any other part of the interior of it, it carries at its front end and directly under the rest a looper, which is supported within the end of the arm so as to be capable of rotating on a centrally rotating wheel by the shoe is moved along the curved arm during the process of sewing is supported by a slider extending downwards from the block, and applied thereto so as to be capable of sliding up and down therein. The shoe is placed on the arm with the sole upwards. The feed wheel is made to rest on the sole." Blake's original machine was very imperfect and was incapable of sewing round the toe of a shoe, but a principal interest in it coming into the hands of Gordon Mackay, he in conjunction with Blake effected the most important improvements in the mechanism, and they jointly in 1860 procured United States patents which secured to them the monopoly of wholly machine-made boots and shoes for twenty-one years. On the outbreak of the Civil War in America a great demand arose for boots, and, there being simultaneously much labour withdrawn from the market, a profitable field was opened for the use of the boots and shoes which were now carried out by the rigid rule. The machines were leased out to manufacturers by the Mackay Company at a royalty of from 1 to 3 cents on every pair of shoes sewed, the machines themselves registering the work done. The income of the association from royalties in the United States alone increased from \$38,746 in 1868 to \$589,973 in 1878, and continued to rise till the main patents expired in 1881, when there were in use in the United States about 1800 Blake-Mackay machines sewing 50,000,000 pairs of boots and shoes yearly. The monopoly secured by the Mackay Company lasted for the time the progress of invention, notwithstanding which many other sole-sewing machines were patented. Among the most important of these is the Goodyear & Mackay machines for welted shoes,—the first mechanism adapted for sewing soles on lasted boots and shoes. These machines originated in a patent obtained in 1865 in the United States by August Desford for a curved-needle machine for sewing outsoles to welts, the machine being a successful trial taken in hand by Charles Goodyear, son of the well-known inventor in india-rubber fabrics. The Goodyear & Mackay Company make two machines for welted goods, one for sewing the insole and the second for stitching on the outsole. A large number of the latter form of machine are in use, many manufacturers preferring to secure the welt or a midsole by the standard screw machine, sewing to that the outsole with the Goodyear-Mackay machine. The same company adapt a circular-needle machine to the sewing of turn shoes, and this, with other similar machines, is an extensive use.

The range of machinery used in a well-equipped shoe-factory is very extensive, embracing machines for cutting leather, pressing rollers for sole leather, and presses with cutting-dies for stamping out sole and heel pieces. There are also, in addition to many kinds of sewing-machine, blocking or curving appliances for moulding uppers, various machines, namely, folding machines, eyeletting, lasting machines, turning and pairing machines for planing and smoothing the edges of soles and heels. For finishing there are scouring, sand-papering, and burnishing machines for the soles, and stamping machines for marks and monograms, with peg-cutting and nail-rasping machines for smoothing, cleaning out, and dressing the surface of the insole. In short, there is not a single operation necessary in shoemaking, however insignificant, for which machinery has not been devised.

The manufacture of india-rubber goloshes, shoes, and fishing-boots, &c., forms an important branch of the india-rubber industry rather than a department of shoemaking (see INDIA-RUBBER, vol. xii p. 842). A very considerable trade exists in boots and shoes with outer soles of gutta-percha (see vol. xi p. 339) in place of leather, the headquarters of that trade being in Glasgow. (J. P. L.)

SHOES, HORSE. The horny casing of the foot of the horse and other Solidungulates, while quite sufficient to protect the extremity of the limb under natural conditions, is found to wear away and break, especially in moist climates, when the animal is subjected to hard work of any kind. This, however, can be obviated by attaching to the hoof a rim of iron—a simple device which has been probably not surpassed in its beneficial effects by the introduction of steam-power locomotion. The animal itself has been in a very marked manner modified by shoeing, for without this we could have had neither the fleet racers nor

the heavy and powerful cart-horses of the present day shoeing does not appear to have been practised by either Greeks or Romans, but there is evidence that the art was known to the Celts, and that the practice became common after the overthrow of the Western empire towards the close of the fifth century. It is only recently that horse-shoeing was introduced in Japan, where the former practice was to attach to the horse's feet shippers of straw, which were renewed when necessary. In modern times much attention has been devoted to horse-shoeing, with the result of showing that methods formerly adopted caused cruel injury to horses and serious loss to their owners. The evils as summarized by Mr George Fleming, army (British) veterinary inspector, were caused by (1) paring the sole and frog, (2) applying shoes too heavy and of faulty shape, (3) employing too many and too large nails, (4) applying shoes too small and removing the wall of the hoof to make the feet fit the shoes; and (5) rasping the front of the hoof. According to modern principles (1) shoes should be as light as compatible with the wear demanded of them, (2) the ground face of the shoe should be concave, and the face applied to the foot plain, (3) heavy draught horses alone should have toe and heel calks on their shoes to increase foothold, (4) the excess growth of the wall or outer portion of horny matter should only be removed in re-shoeing, care being taken to keep both sides of the hoof of equal height; (5) the shoe should fit accurately to the circumference of the hoof, and project slightly beyond the heel, (6) the shoes should be fixed with as few nails as possible, six or seven in fore-shoes and eight in hind-shoes, and (7) the nails should take a short thick hold of the wall, so that old nail-holes may be removed with the natural growth and paring of the horny matter. Horse shoes and nails are now made with great economy by machinery. In rural districts, where the art of the farrier is sometimes combined with blacksmith work, too little attention is, in general, given to considerations which have an important bearing on the comfort, usefulness, and life of the horse.

SHOLAPUR, a British district of India, in the Deccan division of the Bombay presidency, with an area of 4521 square miles, lying between 17° 13' and 18° 35' N lat and 74° 39' and 76° 11' E long. It is bounded on the N by Ahmadnagar district, on the E by the mizam's territory and Alakot state, on the S by Kalkdgi district and some of the Patwardhan states, and on the W by Satara and Poona districts and the states of Phaltan and Panth Purnidhi. Except in Karmala and Barsi subdivisions, situated in the north and east, where there is a good deal of hilly ground, the district is generally flat or undulating, but it is very bare of vegetation, and presents everywhere a bleak treeless appearance. The chief rivers are the Bhima and its tributaries—the Man, the Nira, and the Sina—all flowing towards the south-east. Besides these there are several smaller streams. Lying in a tract of uncertain rainfall, Sholapur is peculiarly liable to seasons of scarcity, much, however, has been done by the opening of canals and ponds, such as the Ekrik and Ashta tanks, to secure a better water-supply. The Great Indian Peninsular Railway enters the district at Ponalvadi in the north-west corner and crosses it in a south-easterly direction, a distance of nearly 150 miles. Sholapur has recently been connected with a branch of the Southern Mahratta Railway.

The population of Sholapur district in 1881 was 582,487 (294,814 males and 287,678 females). Hindus numbered 530,121, Mohammedans 43,967, and Christians 695. There are three towns with populations exceeding 10,000 each, viz. SHOLAPUR (*see*), Pandharpur (16,910), Bas (16,126). In 1883-84 there were 1,768,840 acres under cultivation, of which 22,282 were twice cropped, besides 325,987 acres of fallow or grass land. Jowar, which forms the staple food of the people, occupied 923,706 acres, bajra 298,239, wheat 55,504, rice 25,027, pulses 185,528, and oil-seeds 147,914 acres. The produce of the district finds an easy outlet by the railway to

Poona and Bombay. The chief exports are cotton, which comes from the mizam's dominions, oil, oil-seeds, gini, turmeric, and cotton cloth, imports include salt, piece-goods, yarn, gunny bags, and iron wire. The chief industries are spinning, weaving, and dyeing. The silks and finer sorts of cotton cloth prepared in Sholapur bear a good name. Blankets are also woven in large numbers. The gross revenue of the district in 1883-84 amounted to £129,429, of which the land-tax yielded £98,963.

Sholapur district passed from the Bahman to the Bijapur kings and from them to the Marathas. In 1818, on the fall of the Peshwa, it was ceded to the British, when it formed part of the Poona collectorate, but in 1838 it was made a separate collectorate. Since then its progress has been rapid.

SHOLAPUR, chief town and administrative headquarters of the above district, is situated in 17° 40' 18" N lat and 75° 56' 38" E long, on the plain of the Sina. Its convenient situation between Poona and Haidarabad (Hyderabad), with a station on the Great Indian Peninsular Railway, has made it the centre for the collection and distribution of goods over a large extent of country. The town contained in 1881 a population of 59,890 (males 30,410, females 29,480).

SHOOTING for sporting purposes requires in the use of firearms two fundamental principles on which rests the attainment of dexterity. These are, first, that the weight of the weapon be such that the sportsman can carry and of gun wield it with ease, and, secondly—of still greater importance—that the weapon be so adapted to his chest, arm, and eye that when it is raised and levelled in the act of taking aim it may be as part of his own body. An over-heavy gun may be virtually lightened by being carried by an attendant and only handed to the sportsman when required, but a gun not exactly "fitting the shoulder," cannot possibly serve its user with accuracy. The reason is plain. The slight divergence of his line of aim from the axis of the barrel, due to the shape of the gun not permitting the coincidence of the two when the weapon is used rapidly, creates a far from slight divergence of the pellets at any range beyond a few yards, and the object fired at, if struck at all, is only struck by the outer and weaker pellets. The increasing wildness of game-birds, in Great Britain at least, especially of partridges, through the modern system of cutting grain close to the ground and so leaving no sheltering stubble, demands rapid aim and discharge of the gun, and in consequence the efforts of gun-makers have been directed to the production of weapons of great lightness combined with power and precision. How different were the conceptions of our immediate predecessors is exemplified in such statements as "a few additional pounds in the weight of a gun makes a deal of difference," and "the most approved guns" are those "weighing, according to the fancy of the shooter, from six to nine pounds." The most approved guns now vary in weight by a few ounces only, and their configuration not by inches, but by eighths and even sixteenths of an inch. There are also fine lines in their modelling which, while of great consequence, are imperceptible to the eye, and can only be demonstrated by the application of exact and delicate instruments. Yet each of these lines has an important purpose, and their combination produces the perfect weapon. An experienced gunsmith who has studied this branch of his business can catch the salient lines of a sportsman's figure with the eye of an artist, and by the further aid of tests and measurements can construct for him a proper gun, and thus lay the foundation of a correct style of shooting. On the other hand, an unsuitable gun can only be aimed correctly with slowness, and by some straining of the muscles of the neck. Under such conditions correct and rapid shooting is at least improbable, the spread of the shot alone prevents a complete miss. It is the correct configuration of the gun which brings into full effect the elaborate boring of the barrel, and gives

those long shots of which sport-men are so proud, and which are due to the central pellets flying straight to a very considerable distance, much beyond that of the outer pellets.

Balance The next point in a gun is balance, that is, the metal in the barrels must be so apportioned and the general construction be so arranged that there is no tendency in the muzzle to droop at the moment of discharge, just when the faculties of the sportsman are absorbed in taking aim and his muscular energies are in abeyance. The gun should balance at a point a little in front of the trigger-guard. The centre of gravity should also be low, so that there may be nothing of what may be called "top-hammer,"—in other words, that his gun may not roll in his hand, but may keep on an even keel, as it were, while he is taking aim. If we weigh in the scales two guns of nearly the same weight, the one well the other ill balanced, the former, although feeling quite light in the hand, will generally be found to be really heavier than the latter,—a fact which is frequently the cause of much surprise to sportsmen. When properly balanced, a gun can be carried with much less fatigue.

Calibre The calibre—a much disputed point—is, within the bounds commonly used, a question more of the capability of the sportsman to carry weight than one touching his effectiveness in the field. It has been plausibly argued that it matters little how narrow the calibre of a fowling-piece is, and that even gauge "35" (510 inch) is wide enough. It certainly would throw a few pellets of swan-shot effectively, especially if the barrel was not less than 40 inches long. But for all common purposes the most useful calibre is the twelve-bore, if the weight is not under 6½ lb., or somewhat less for hammerless guns. When a less weight is required, "16" gauge (which in breech-loaders is really "15") is preferable. Calibre "20" belongs to toy-weapons, such guns being also uncertain in their delivery, and, as strong and effective "16" double-barrelled guns can now be made weighing only 6 lb., a smaller calibre can hardly be required, except under peculiar conditions. Against the advantage of less weight has to be set the important matter of recoil, and one cause of recoil is the elongation of the body of the shot (and especially of the small-sized shot used in such guns) when placed in the barrel or cartridge. The longer that body, and the smaller the shot, the greater the difficulty in stating it, hence, to bring a "20" as regards recoil to an equality with a "12," the weight of the charge of shot must be unduly reduced, with a more than proportionate reduction of the probability of killing, save in the exceptional cases where the size is not larger than snipe-shot. The shot in a "12" has no part at any appreciable distance from the wadding over the powder, and every pellet may fairly be said to receive a direct impetus from the explosion. An exceedingly light gun has also the fault of causing unsteadiness when the sportsman takes aim.

Length of barrel The length of the barrels need not exceed 30 inches. If a sportsman possesses a remarkably correct eye, he may safely go down to 26 inches or even less; but it must be borne in mind that the shorter the barrel the greater the necessity for a perfectly correct aim. Any divergence on a barrel under 26 inches is vastly increased at 30 or 40 yards. On the other hand, aim is more quickly taken with short barrels. Thirty inches is a sound medium.

Bore. Of late years there has been a run on what are termed "choke-bores" (see GUNMAKING, vol. xi. p. 281). But unless the choking is most mathematically true the flight of the shot will not be coincident with the axis of the barrel or the line of aim, but will "train off" in some oblique direction; and this obliquity will also be more or less affected by any required modifications of the charge. A

choke-bore, therefore, restricts its user to narrow conditions in loading it. The velocity of the shot is also considerably reduced, the killing power depending less on that than on the object aimed at being struck with a greater number of pellets. Neither do all the pellets fly with equal velocity, so that, as was proved several years ago by ingenious experimentation (first announced by the present writer), these advances, as it were, in a narrow and prolonged column, whereas a properly bored "friction and relief" barrel throws its shot in the figure of a broad disk, with all the pellets travelling practically at the same rate,—the inner or central ones having, however, more sustained killing power, their "quality of motion" being of a higher degree and greatly prolonging the range. A weapon bored on the friction and relief method certainly puts the sportsman in a better position for all kinds of common game at fair sporting ranges, but since the introduction of breech-loaders barrels so bored have (undeservedly) fallen so greatly into disuse that the delicate art of friction and relief boring has nearly been lost. A purely cylindrical barrel only shoots well when perfectly clean,—a condition that every discharge impairs.

With a weapon that suits him, the sportsman will find that, on aiming, lifting it quickly to his shoulder, keeping both eyes open, and fixing them on any small object at some distance off, the barrels will be directly pointed towards that object without his having taken any slow or exact aim. To verify this, let him lay the gun in position and shut his left eye, when he will find still more plainly that his aim is true. The gun has been so constructed as to bring the rib between the barrels (for double-barrelled guns are always understood) right in front of his line of vision. In other words, the barrels and stock have been so constructed, inclusive of the fine lines already referred to, that, so far as the required purpose is concerned, the whole piece may be said to have but just as much of its own body. A few minutes' daily practice in so pointing a gun at any small object, although in a room, will give the sportsman dexterity in its use even before he has begun powder in it. How the shutting of one eye (unknown in bullfights and similar games) in taking aim came to be practised in using firearms seems inexplicable to those who know how detrimental it is. The keeping of both eyes open was formerly not quite so much a rule as it is now, but it is a fact that, when the present writer took the matter up some fifty years ago and publicly advocated it, he was looked upon as being quite in error, but now his correctness is acknowledged, and what is termed the "two-eye" system is coming more and more into use. There are still many uncertain "shots" who are not aware that their frequently unaccountable misses are caused by the scientific fact that shutting one eye deprives them of the power of measuring distances, and also of watching the movement of a running or flying object. As a rule, whilst the right eye is actually taking aim, the left is acting subliminally and showing the right whether or not it is taking it correctly. It may be noted that almost all exceptionally good shots have the eyes set wide apart, and so take their observation from a broader base.

The attitude in taking aim should be as firm as upright, with the left foot somewhat advanced. The right elbow and hand never be raised to a horizontal level with the shoulder,—a common but bad practice. The gun should be lifted directly upwards, the butt-end just grazing the right front of the chest when reaching its final position, the eyes all the while looking fixedly upon the object. To illustrate this by way of contrast, there is another bad style of throwing the gun forward, the shooter all the while trying to look along the rib (which causes the neck, and then the butt, to be back against the shoulder before firing). Thus, however, is a waste of muscular power and quite throws out the adaptation of the stock to the shoulder, because it is impossible to bring back the gun quite correctly, and it has therefore to be readjusted (which can hardly be accomplished) before firing. Besides, all this consumes time, for which game will not tarry. In military phrase, these "motious" are required; with the proper style there is only one.

The question how far the left hand should be extended in taking use of aim is much disputed, but is really of secondary consequence. Left hand Pigeon-shooters extend it as far as they will can, because their great object is to prevent the muzzle from drooping at the moment of discharge, but from this, and also from their custom of planting their feet firmly and squarely upon the ground, so as to stand with their feet full to their right probable line of aim, no lesson in shooting game need be taken. Good game shots are not unfortunately good shots at pigeons, and *vice versa*, to be expert at the former depends upon the acquisition of a certain knack, and above all calculation in time, &c., of the power of estimating the average time from the

shooter's eye of the word "pull" to the opening of the trap and flight of the bird. This is so much the case that not unfrequently the gun is held solely by calculation of time, and before a single bird has flown. In grouse-shooting the bird may rise in front or at either side of the shooter, or even behind him. Very rapid lateral movement of the gun may therefore be required, and it appears not only probable in itself but experimentally true that this can best be made by the left arm when it has to describe a circle of the shortest diameter. For this the best and safest position is when the left hand grasps the gun immediately in front of the trigger-guard. In pulling the trigger the finger should be well cocked, so that the pressure may be directly backwards, and no lateral disturbance may interfere with the aim at the most critical moment.

Stock of gun. If the eye takes in all the rib of the gun when raised to the shoulder in position for firing, so that the full length of its surface is seen, the stock is too straight. If the rib is not seen at all, the stock is too cocked. When a stock is of the proper curve, the eye will catch the rib about one-third of its length from the muzzle, i.e., all the rib in front of that point will be visible, and all behind it out of sight. A straight stock is, however, preferable to a cocked one, which makes the gun shoot low,—a bad fault. It is of first-rate importance that the delicate lateral setting of the stock, as distinguished from the perpendicular curve, should bring the centre of the rib exactly into the line of sight. This fine desideratum may be arrived at conjointly by the sportsman and the maker of the gun, the latter can be guided by information as to the sportsman's height, length of arm, and breadth of chest. If this point is satisfactory it is immaterial whether a bird flies to the right hand or to the left, and the neglect of it is the reason why some sportsmen are good when they use only these directions.

Treatment of guns. In cleaning hatchlocks, including the inside of the barrels, neither oil nor water should be used, but solely spirits of turpentine. The gun should never be laid aside on full-cock, as this weakens the main springs. As hammerless guns are necessarily on full-cock when taken down, the triggers should be drawn, but with the careful proviso that the points of the hammers strike upon a block of hard wood held firmly in front of them. The lock should never be snapped unless the hammer is discharged, or a "dummy" embrace in the barrel. No hammer can be made, of any metal or form of construction, that will not probably crack if it falls without something in front less trying than the hard and unresponsive breech. On sea voyages and in damp climates the barrels should be kept from the atmosphere by inserting into them wooden rods covered with woollen cloth, and in such cases the fire-embroidery of turpentine will be almost unobtainable. In these rods, each end may be closed with wadding or corks. For aiming the locks the finest chronometer oil should be used, and only applied in minute quantities to the points of friction, not over all oil dries up and if applied copiously frustrates the desired purpose. Raw linseed oil, frequently rubbed into a stock, hinders and preserves it. Explorers and travellers, whose lives may depend on their firearms, may usefully strengthen the weakest part of every gun, the handle of the stock, by wrapping it tightly round with whipcord.

Shooting Gears.—Space forbids entering at length on the modes of shooting the several varieties of game. All that is here possible is briefly to touch upon some of the salient points in the pursuit of the more common varieties.

Rabbits. Rabbits, on which young sportsmen generally first essay their "artificial hunt," die off the nearest shelter with great rapidity, and should be instantaneously met at, the aim being taken slightly in advance. If a rabbit has disappeared among bushwood, it may be not unavailing to fire right in front of the line it was seen to take. In "ferreting" the sportsman should stand clear of the burrow (over which he should never tread), and never fire at a rabbit until it is well away from the "bolt-hole." Hares are less tenacious of life than rabbits, and, as it is an object not to mangle the body and so cause the loss of blood, the eyes of the sportsman should be fixed solely on the tips of the ears in whatever direction the animal is going, when the shot is instantaneously fatal. A hare coming straight towards a sportsman should not be fired at, he should stand quite motionless until it comes within 80 yards, when on his making a slight sound or movement it will turn aside and give an easy shot. No other direction need be given on assuming a ridge, over which it may be running, than when it is descending from the crown to the furrow, seeing that the one principle of firing solely at the ears involves everything.

Roeders. Roeders are usually killed with buckshot—although a small rifle is preferable—the "guns" being posted at the likely passes. The neck or shoulder should be fired at. They are easily killed when within fair distance, but are exceedingly clever in keeping out of range and in detecting the presence of the lurking sportsman. They also have the trick, in common with the elephant, of doubling back and passing round any knoll, coming out on its other side and then continuing their untended course. Of this instinctive habit the sportsman should avail himself.

Grouse. Success in grouse-shooting, probably the finest of all sports from

every point of view, depends mainly on vigilance and careful attention to the movements of the dogs, and following them well up as soon as there are indications of game being in front. Save that a cunning old cock will after using immediately lay down to nearly the level of the heather and go off with wondrously baffling speed, there is no hesitancy in the flight of grouse calling for special remark. Like partridges, they generally fly straight and nearly horizontally. As the season advances, their waimness and the natural strength of the young birds make them pursue more difficult, but otherwise they afford fair shots. "Driving" is now quite a recognized branch of grouse-shooting. The "guns" being posted in artificial places of concealment in the line of flight, known to be usually taken by the birds on being disturbed by beaters, the shots are taken as the birds are coming overhead. Their speed is so great that it is needless to fire if they have once passed the shooter, seeing that the aim must be taken some feet in front.¹ It has been found useful for the sportsman to crouch without motion until the birds are coming within distance, when, suddenly showing himself, they are startled and throw their heads up, thus breaking their flight and giving the gun a fair chance. Perhaps the easiest and most fatal shots are at single birds coming straight towards the sportsman, taken at about 80 yards. The aim should be high, and it is aided by the recoil of a gun when fired, which throws the muzzle up in the line of flight. The pellets also strike the head and neck, and with such force that, when meeting the bird, No. 7 shot is most deadly than so discharged. The recoil of a gun when fired "high" is also useful in shooting with a rifle any large bird passing overhead, the shooter should brace the bird. Driving is a serious work if thoroughly carried out, as the sportsman, as soon as one beat is over, have to find their way rapidly to the next position. It is therefore not an effeminate sport, and it probably indirectly maintains the number of the stock-birds by killing off the old leading cocks (which virtually are vermin). Setters as the proper dogs for grouse-shooting, then rarely feel being well protected from the heather, hence to maintain vigour they require to drink water frequently and even to squat in shallow pools. Pointers are preferable for dry moors, particularly in wet weather.

Partridge-shooting is akin to grouse-shooting in respect of the timidity of pursuit, the difference lying in its being carried on mostly tides upon cultivated or enclosed land. Both in partridge-shooting and in grouse-shooting one bird only ought to be singled out and shot at, no success will follow trying to shoot at a whole flock. Old sportsmen suggest that shooter should use dogs (pointers being preferable to the stiver and more dashing setter) is going out of practice, but the close cutting of the gun crops now in vogue leaves so little stubble that the approach of the dogs is soon by the birds, which, generally rising wild, afford few "shots to points." Hence the system of sportsman walking in line (with no dogs save retrievers) and taking what birds rise before them, and so driving them into turnips or other covert, or of having guns "drive" by beaters, is almost universal. When driven into such coverts the birds are apt to run before the shooters and take them flight from the far end of the field. This may be prevented by the sportsman not advancing directly, but in a series of circuits, thus the birds, becoming uncertain as to which way they should run, sit close and only rise on his very near approach. Of course this excellent but almost unknown system can only be well carried out by a single shooter, or by two at the most. In "driving" the "guns" are posted in a line at some distance from each other, under the concealment of a hedge some 20 yards in their front. Towards the beaters (with a fugleman on horseback, if necessary) drive the birds. The shots are generally very difficult, the birds flying with remarkable speed, and the shooter being also often bewildered by the number of smaller birds, such as the various kinds of thrushes, which peckle on accompany the partridges, their sudden appearance being common over the hedge is also trying whereas the approach of grouse can be seen. These two systems—"driving" and the familiar progression in covert—are of recent introduction. The former has developed greater skill in shooting.

The art of shooting pheasants depends upon the fact that, unlike *Theraptides* or grouse, the birds generally steadily ascend in their starts flight, hence the tendency is to shoot under them. This upward flight is greatest in coverts, until it sometimes becomes perpendicular, birds using in this way being called "cocketers." The inexperienced shooter is also misled by the manner in which the tail is spread out like a fan, concealing the body, and thus diverting the aim from the body upon the tail feathers. To aim high, therefore, is the golden rule. The shooter should face birds which fly rapidly overhead, in the way described above.

To kill ampe well one must hunt down the wind—an exceptional *Supra* practice—and on the bird rising fire at once, or, failing that, give it time to change its low preliminary zigzag motions into a steady flight.

¹ A carrier pigeon can fly a little over 4 miles 6 furlongs in four minutes, an average of nearly 102 feet a second. Assuming the distance to be 40 yards (40 shots), the aim taken at a bird flying across the shooter at this speed should be more than 6 feet in advance, the flight of the shot to a distance of 40 yards requiring one-tenth of a second.

As the least touch of shot brings a snipe down, it is very unlikely to have passed out of range before the direct line of flight is assumed. This is the only spot followed on land "down wind." Shot No 9 or 10 should be used.

Black-cock and wood-cock may be well coupled together as being essentially in their movements. The former are more easily shot very early in the season, especially over a steady old pointer, when the broods are yet on the more open ground, under the maternal charge, like so many domestic chickens, but, when they have broken up the family ties, congregated, and betaken themselves to the coppices, they become so irregular in their habits and uncertain in their mode of taking flight that no exact rule can be laid down for their pursuit. The sportsman, using one steady old pointer and a retriever, had best be guided by an experienced attendant, who should take care to beat out any bird lurking in a thick bush from the opposite side and towards the gun. A few shots may also be got at the dawn of day on the edges of stubble-fields, but black-game shooting is generally disappointing. The female birds, "grey hens," are not shot at; the young males, which greatly resemble them, are distinguished from them by the white feathers in the tail. A solitary blackcock may often be seen to take up a prominent position, usually in the centre of one of the small fields to be found on the side of hilly ground, where he maintains a vigilant watch. With some experience in shooting matters, the present writer knows no pursuit more interesting and invigorating than stalking such a bird without causing undue fatigue, it exercises one's patience, vigilance, and coolness of nerve. Shot for this purpose should not be of a smaller size than No 4. Blackcock newly arrived may be easily killed, especially near the sea-coast. After recirring, they frequently betake themselves to heathery moors if there are such near at hand, where they frequent the sides of rivulets and gorges. These they may be readily brought down, but in woods they have a knack of twisting, as it were, round the younger trees, in the branches of which they are mostly found, and so disconcert the aim. Being of nocturnal habits, their eyes are weak in the full glare of day, and they are fond of the sheltering shade of thickly foliaged trees, such as the holly. The only advice that can be given on this sport is to ask the shot at the merest glimpse of the bird through the branches, and trust to the spread of the pellets to kill, for the woodcock, like its congener the snipe, will fall with a touch, and even (apparently) though mere fright on being fired at, without being touched at all. The best shot to use is No 8.

Ammu-
nition
Conservation.—In former times sportsmen carefully adjusted their charges of powder and shot to suit the weather (which affected the strength of the fumes) and the sport in hand. Now, almost everything is left to the puzze of cartridges, which are usually charged on average proportions. The sportsman should be careful, therefore, to ascertain the charge best suited to his weapon, and to have his cartridges so loaded. When a gun recoils the charge of shot—not of powder, as is generally supposed—should be relaxed, and it is always safe to use a light charge of shot. Breechloaders require large-grained powder, Messrs Olin & Harvey's No 6 being the typical size. Pyroxyline explosives, of which Schultze powder is the normal type, are now largely used, especially in the first barrel, the other being charged with black powder. For almost all regular sport No 6 shot is the best size, and it is better to use No 7 in a smaller quantity than No 5 for grouse and partridges. For pheasants and for game birds, No 5 or No 4, or in very wet weather, with a somewhat reduced charge of powder. One or at most 14 oz. of No 6 is ample, the former will travel with marvellous and far-reaching velocity. Any excess of shot merely falls to the ground, as may be seen by firing over a sheet of smooth water. For duck-shooting (for which the barrels should be of "10" gauge and 32 inches long) No 4 shot is a good size; and for this sport it is well to reduce the weight of the shot and increase very considerably that of the powder, velocity being everything.

Rule-
shooting.—The propriety of shooting with both eyes open, if possible, more imperative in rifle-shooting than in shooting game, if rapidity is valued, as it must be. Firearms immediately followed the long bow and the cross-bow, and it has never been supposed that the archer discharged these with one eye closed. With both eyes open the "back sight" virtually becomes transparent, and forms no obstacle to the aim, while with one eye closed it certainly does, for, as the head and eyes must be kept fairly up in firing a shot gun, they must be kept well down in firing a rifle. The "express" rifle is the *chef-d'œuvre* of modern weapons, and when properly made will throw its bullet up to 200 yards without perceptible curve from one sight. This result is attained mostly by

an inordinately large charge of powder to a light and partly hollow bullet (see GUNMAKING, vol xi p 282). The "pull" on the trigger should rather be a pinch than a direct backward pull, i.e., the trigger should be pinched between the forefinger and the thumb which grasps the handle of the stock. If the sportsman has the presence of mind to inflate his chest with a long inhalation he will shoot all the better. There is a popular opinion that a single-barrelled "express" shoots more truly than a double-barrelled one. This is quite a mistake, unless the barrel of the former is made so thick and heavy at the muzzle (to prevent the metal quivering when the bullet leaves it) as to destroy the balance. In double-barrelled rifles the one barrel braces up the other, and they are also so adjusted as to shoot parallel. This common error has probably arisen from confounding "express" with long-range match rifles, which are quite another thing. The .450 calibre is best adapted for deer and antelopes, 500 for mixed shooting, and 577 for dangerous animals. But for these and the great pachyderms a "12" gauge, throwing an explosive shell, is the most effective of all firearms, the large "area" of the wound telling at once.

All really useful information on the subject of shooting is contained in J. D. DOWDALL'S *Shooting, its Appliances, &c.* (London, 2d ed. 1881), General W. Hutchinson's *Dog Training* (London, 1876), and W. SCOPE'S *Deer Shooting* (London, 1846). (J. D. D.)

SHORE, JANE, mistress of King Edward IV., would have been unknown by name even to the studious antiquary but for the events which took place after the death of her royal paramour. She was the first of three concubines whom he described respectively as the merriest, the wilest, and the holiest harlot in his realm. A handsome woman of moderate stature, round face, and fair complexion, she was more captivating by her wit and conversation than by her beauty, yet Sir Thomas More, writing when she was still alive, but old, lean, and withered, declares that even then an attentive observer might have discerned in her shrivelled countenance some traces of its lost charms. She was born in London, and married before she was quite out of girlhood to a citizen named William Shore, who, though young, handsome, and well-to-do, never really won her affections; and thus she yielded the more readily to the solicitations of King Edward. Her husband on this abandoned her, and after Edward's death she became the mistress of Lord Hastings, whom Richard III., then duke of Gloucester, as protector during the minority of Edward V., suddenly ordered to be beheaded on 13th June 1483. According to the report given by More, Richard had accused Hastings at the council table of conspiring against him along with the queen-dowager and Shore's wife, who by sorcery and witchcraft had given him a withered arm. So having got rid of Hastings he caused Jane Shore to be committed to prison and spoiled her house, containing property to the value of 2000 or 3000 marks, equivalent to a sum of £20,000 or £30,000 at the present day. But having sought in the first place to charge her with conspiracy—a charge which apparently he could not substantiate—he thought better afterwards to get the bishop of London to put her to open penance at Paul's Cross for her vicious life. She accordingly went in her kirtle through the streets one Sunday with a taper in her hand, her beauty really enhanced by the blush which her humiliation called up in her usually pale cheeks, and many who detested her mode of life could not but pity her as the victim of a hypocritical tyranny. The penance certainly did not induce her to reform, for she immediately afterwards became the mistress of the marquis of Dorset; and, what is still more extraordinary, next year, having been taken again into custody, and her husband, it may be presumed, being by that time dead, she so captivated the king's solicitor, Thomas Lynm, that he actually entered into a contract of marriage with her. Thus we know from a letter of King Richard to his chancellor on the occasion, desiring him to dissuade Lynm from the match, as far as he could, by argument, but, if he found him determined, then, provided it was not against the laws of the church, he might convey the king's consent and meanwhile deliver Jane out of prison to her father's custody. Conduct so

¹ This explosive is the invention of Colonel J. F. B. Schultze, of the Prussian artillery service, and was introduced about 1869 into the United Kingdom by Mr J. D. Douall. It is now being manufactured in Great Britain as well as on the Continent. The advantages claimed for it are that it does not require any special loading, such as hard ramming, there is a smaller recoil than with black gunpowder, and it has great propulsive power, with little or no fouling of the firearm.

unlike his previous severity shows that Richard knew how to be gracious as well as despotic. Whether the marriage actually took place is not known. Jane certainly lived to the year 1613, when More wrote his history of Richard III., but how much later we cannot tell.

SHORTHAND, or STENOGRAPHY, TACHYGRAPHY, &c., is a term applied to all systems of brief handwriting which are intended to enable a person to write legibly at the rate of speech. (For the ancient Latin and Greek tachygraphy, see the last part of the article on PALÆOGRAPHY.) In the 10th century all practical acquaintance with the shorthand systems of Greece and Rome faded completely away, and not till the beginning of the 17th can the art be said to have revived. But even during that interval systems of writing seem to have been practised which for speed approximated to modern shorthand.¹

Shorthand in English-speaking Countries—England was the birthplace of modern shorthand, and at the present time there is no country in Europe, except perhaps Germany and German Switzerland, where the art is so extensively practised as in England. The first impulse to its cultivation may possibly be traced to the Reformation. When the principles of that movement were being promulgated from the pulpit, a desire to preserve the discourses of the preacher naturally suggested the idea of accelerated writing. It is certainly striking that in the early systems so many brief arbitrary signs are provided to denote phrases common in the New Testament and Protestant theology. Up to the present time (1886) not less than 433 professedly distinct systems of English shorthand have been published, and doubtless many more have been invented for private use. It is impossible here to notice even by name more than a very few of them. Indeed, if we reject all those systems which are imitations or reproductions of earlier ones, and systems which are so impractical as to be little better than elegant toys, and a multitude of utterly worthless catchpenny publications, only a few remain. In Dr Timothy Bright's *Character* (1588) and Peter Bales's *Arte of Brachygraphie*, contained in his *Writing Schoolemaster* (1590), almost every word in the language is provided with an arbitrary sign. Only with gigantic memory and by unremitting labour could one acquire a practical knowledge of such methods. The first shorthand system worthy of the name which, so far as is known, appeared in England is that of John Willis, whose *Art of Stenographie* (London, 13 editions* from 1602 to

1644) is substantially based on the common alphabet; but the clumsiness of his alphabetic signs, and the confused laborious contrivances by which he denotes prefixes and terminations, involving the continual lifting of the pen, would seem to render his method almost as slow as long-hand. Of the 201 systems which intervene between J. Willis's and Isaac Pitman's phonography (1837) nearly all are based, like Willis's, on the alphabet, and may be called a, b, c systems. But seven are, like phonography, strictly phonetic, viz., those by Tiffin (1780), Lyle (1762), Holdsworth and Aldridge (1766), Roe (1802), Phineas Bailey (1819), Towndrow (1831), and De Stams (1839). Of the 281 systems which have appeared since phonography a very large proportion are merely imitations of that system, or proceed on the same lines.

A few general remarks apply largely to all the a, b, c, a, b, c systems. Each letter is designated by a straight line or by a curve (vertical, horizontal, or sloping), sometimes with the addition of a hook or loop. C and q are rejected, h being substituted for hard c and g, s for soft c. Signs are provided for ch, sh, th. G and j are classed under one sign, because in some words g is pronounced as j, as in *giant*, *gem*. Similarly each of the pairs f, v and s, z has only one sign. A few authors make the signs for j, v, z heavier than those for g, f, s. Some class p and b, t and d, each under one sign. The stenographic alphabet is therefore—a, b, d, c, f, g, h, i, k, l, m, n, o, p, r, s, t, u, v, w, x, y, z, ch, sh, th. Letters which are not sounded may be omitted. Gh, ph may be counted as f in such words as *cough*, *Phalp*, but the th in *thing* is never distinguished from the th in *them*. Thus the a, b, c systems are largely phonetic with respect to consonant-sounds, it is rather with regard to the vowels that they disregard the phonetic principle. No attempt is made to provide adequately for the many vowel-sounds of the language. Thus the signs for *lake* and *lact*, for *vate* and *at*, &c., are the same. In the case of vowel-sounds denoted by two letters, that vowel is to be written which best represents the sound. Thus in *meat* the e is selected, but in *great* the a. In some a, b, c systems, including the best of them (Taylor's), a dot placed anywhere does duty for all the vowels. This practice is, of course, a fruitful source of error, for *pauper* and *paper*, *gas* and *goose*, and hundreds of other pairs of words would according to this plan be written alike. In the early systems of Willis and his imitators the vowels are mostly written either by joined characters or by lifting the pen and writing the next consonant in a certain position with respect to the preceding one. Both these plans are bad, for lifting the pen involves expenditure of time, and vowels expressed by joined signs and not by marks external to the word cannot be omitted, as is often necessary in swift writing, without changing the general appearance of the word and forcing the eye and the hand to accustom themselves to two sets of outlines, vocalized and unvocalized. In the better a, b, c systems the alphabetic signs, besides combining to denote words, may also stand alone to designate certain short common words, prefixes, and suffixes. Thus in Harding's edition of Taylor's system the sign for d, when written alone, denotes *do*, *did*, the prefixes *de*, *des*, and the terminations *-dom*, *-end*, *-ened*, *-ed*. This is a good practice if the words are well chosen and precautions taken to avoid ambiguities. Numbers of symbolical signs and rough word-pictures, and even wholly arbitrary marks, are employed to denote words and entire phrases. Symbolical or pictorial signs, if sufficiently suggestive and not very numerous, may be effective; but the use of "arbitrariness" is objectionable because they are so difficult to remember. In many shorthand books

¹ For instance, see *Zeug's Geschichte u. Lit. der Geschwandschreibkunst* (Dresden, 1873), p. 67-79. For John of Thibury's system (c. 1175), see especially *Shorthand*, No. 5, and *Homes*, viii, p. 303.

² The Bodleian Library contains the only known copy of Bright's book. For a description of the system, see *Phonetic Journal*, 1884, p. 86. *Circulars of Information of the Bureau of Education* (Washington), No. 2, 1884, p. 8, and *Notes and Queries*, 2d ser., vol. ii, p. 894. A is represented by a straight line, the other letters of the alphabet by a straight line with a hook, circle, or tick added at the beginning. Each alphabetic sign placed in various positions, and having some additional mark at the end, was used to indicate arbitrarily chosen words beginning with a, b, c, d, &c. There were four slopes given to each letter and twelve ways of varying the base, so that forty-eight words could be written under each letter of the alphabet if necessary. Thus the sign for b with different terminal marks and written in four different directions signified a number of words commencing with b, 397 such signs had to be learned by heart. By adding certain external marks these signs were applied to other words, thus by writing a dot in one of two positions with respect to a sign the latter was made to represent either a synonym or a word of opposite meaning. Under *air* are given as synonyms *breath*, *exhalation*, *musk*, *reek*, *steam*, *vapour*. The best account of Bright is given in the *Dictionary of National Biography*, vol. vi (1886).

³ Bales's method was to group the words in *dozens*, each dozen headed by a Roman letter, with certain common, periods, and other marks to be placed about each letter in then appropriate situations, so as to distinguish the words from each other. For an account of Bales, see Wood's *Athen. Oxon.*, vol. i col. 655, and the *Dict. of Nat. Bio.*, vol. iii (1885).

⁴ The first edition, published anonymously, is entitled *The Art of*

Stenographie whereunto is annexed a very easy Direction for Stenographie, or Secret Writing, printed at London in 1602 for Cuthbert Burbie. The only known copy is in the Bodleian Library.

the student is recommended to form additional ones for himself, and so of course make his writing illegible to others. The *raison d'être* of such signs is not far to seek. The proper shorthand signs for many common words were so clumsy or ambiguous that this method was resorted to in order to provide them with clearer and easier outlines. For the purpose of verbatim reporting the student is recommended to omit as a rule all vowels, and decipher his writing with the aid of the context. But, when vowels are omitted, hundreds of pairs of words having the same consonant skeleton (such as *munster* and *monastery*, *frontier* and *furniture*, *libel* and *liblel*) are written exactly alike. This is one of the gravest defects of the a, b, c systems.

John Willis's system was largely imitated but hardly improved by Edmond Willis (1618), T. Shelton (1620), Witt (1630), Dix (1633), Mawd (1635), and Theophilus Metcalfe (1635). T. Shelton's system, republished a great many times down to 1687, was the one which Samuel Pepys used in writing his diary.¹ It was adapted to German, Dutch, and Latin.² An advertisement of Shelton's work in the *Mercurius Politicus* of 3d October 1660 is one of the earliest business advertisements known. The book of *Psalms* in metre (206 pages, $2\frac{1}{2} \times 1\frac{1}{2}$ inches) was engraved according to Shelton's system by Thomas Cross. Metcalfe's *Radio-Stenography, or Short-Writing*, was republished again and again for about a hundred years. The 35th "edition" is dated 1693, and a 55th is known to exist. The inefficiency of the early systems seems to have brought the art into some contempt. Thus Thomas Heywood, a contemporary of Shakespeare, says in a prologue³ that his play of *Queen Elizabeth*

"Dull through the seats, the boxes, and the stage
So much that some by stenography drew
A plot, put it in print, scarce one word true."

Shakespeare critics would in this manner explain the badness of the text in the earliest editions of *Hamlet*, *Romeo and Juliet*, *Taming of the Shrew*, *Merry Wives of Windsor*, and *Henry V*. Perhaps a study of J. Willis's system and of E. Willis's (which, though not published till after Shakespeare's death, was practised long before) may shed light on corrupt readings of the text of these plays.⁴ Rich's system (1616, 20th edition 1792) was reproduced with slight alterations by many other persons, including W. Addy, Stringer, and Dr Philip Doddridge (1799 and three times since). The New Testament and *Psalms* were engraved in Rich's characters (1669, 596 pages, $2\frac{1}{2} \times 1\frac{1}{2}$ inches, 2 vols.), and Addy brought out the whole Bible engraved in shorthand⁵ (London, 1687, 396 pp.). Locke, in his *Treatise on Education*, recommends Rich's system; but it is encumbered with more than 300 symbolical and arbitrary signs. In 1847 it was still used by Mr Plowman, a most accomplished Oxford reporter.

In 1673 William Mason, the best shorthand author of the 17th century, published his *Pen pluck'd from an Eagle's Wing*. The alphabet was largely taken from Rich's. But in his *Art's Advancement* (1682) only six of Rich's letters are retained, and in his *Plume Volante* (1707) further changes are made. Initial vowels are written by their alphabetic signs, final vowels by dots in certain positions (*a, e* at the beginning; *i, y* at the middle; *o, u* at the end), and medial vowels by lifting the pen and writing the next consonant in those same three positions with respect to the preceding one. Mason employed 423 symbols and

arbitraries. He was the first to discover the value of a small circle for *s* in addition to its proper alphabetic sign. Mason's system was republished by Thomas Gurney in 1740, a circumstance which has perpetuated its use to the present day, for in 1737 Gurney was appointed shorthand-writer to the Old Bailey, and early in the 18th century W. B. Gurney was appointed shorthand-writer to both Houses of Parliament. Gurney reduced Mason's arbitraries to about a hundred, inventing a few specially suitable for parliamentary reporting. The Gurneys were excellent writers of a cumbrous system. Thomas Gurney's *Trachygraphy* passed through at least eighteen editions, but the sale of the book has now almost ceased.

In 1767 was published at Manchester a work by John Byrom, sometime fellow of Trinity College, Cambridge, entitled *The Universal English Shorthand*, distinguished for its precision, elegance, and systematic construction. Byrom had died in 1763. Having lost his fellowship by failing to take orders, he made a living by teaching shorthand in London and Manchester, and among his pupils were Horace Walpole, Lord Conway, Charles Wesley, Lord Chesterfield, the duke of Devonshire, and Lord Camden. Shorthand, it is said, procured him admission to the Royal Society. He founded a stenographic club, to the proceedings of which his journal,⁶ written in shorthand, is largely devoted. In the strangers' gallery of the House of Commons in 1798 Byrom dared to write shorthand from Sir R. Walpole and others. In 1731, when called upon to give evidence before a parliamentary committee, he took shorthand notes, and, complaints being made, he said that if those attacks on the liberties of shorthand men went on he "must have a petition from all counties where our disciples dwell, and Manchester must lead the way." Thomas Molyneux popularized the system by publishing seven cheap editions between 1793 and 1825. Modifications of Byrom's system were issued by Palmer (1774), Nightingale (1811), Adams (1814), Longmans (1816), Gawtress (1819), Kelly (1820), Jones (1832), and Roffe (1833). Byrom's method received the distinction of a special Act of Parliament for its protection (15 Geo. II. c. 23, for twenty-one years from 24th June 1742). To secure inequity in the writing and facility in consonantal joinings he provided two forms for *b, h, g, u, x, sh, th*, and three for *i, A, e, z, o, u*, he represented by a dot in five positions with respect to a consonant. Practically it is impossible to observe more than three (beginning, middle, and end). With all its merits, the system lacks rapidity, the continual recurrence of the loop seriously retarding the pen.

In 1786 was published *An Essay intended to establish a Taylor Standard for a Universal System of Stenography*, by Samuel Taylor (London). This system did more than any of its predecessors to establish the art in England and abroad. Equal to Byrom's in brevity, it is simpler in construction. No letter has more than one sign, except *io*, which has two. Considering that five vowel places about a consonant were too many, Taylor went to the other extreme and expressed all the vowels alike by a dot placed in any position. He directs that vowels are not to be expressed except when they sound strong at the beginning and end of a word. Arbitraries he discarded altogether; but Harding, who re-edited his system in 1823, introduced a few. Each letter when standing alone represents two or three common short words, prefixes and suffixes. But the list was badly chosen, thus *m* represents *my* and *many*, both of them adjectives, and therefore liable to be confounded in many sentences. To denote *m* and *on* by the same sign is evidently absurd. Taylor's system was republished again and again. The

Willis

Rich.

Mason

latest editions are those of J. H. Cooke (London, 1865) and A. James (London, 1882). In Harding's edition (1823 and at least twelve times since) the vowels are written on an improved plan, the dot in three positions representing *a*, *e*, *i*, and a tick in two positions *o*, *u*. Several other persons brought out Taylor's system, in particular G. Odell, whose book was re-edited or reprinted not less than sixty-four times, the later republications appearing at New York. The excellence of Taylor's method was recognized on the Continent: the system came into use in France, Italy, Holland, Sweden, Germany, Portugal, Roumania, Hungary, &c. In England at the present day no method excepting Pitman's phonography is more popular than Taylor's, although the systems which have appeared since Taylor's are far more numerous than those which preceded it.

Mavoi. The *Universal Stenography* of William Mavoi (1780 and nine times since) is a very neat system, and differs from Taylor's in the alphabet and in a more definite method of marking the vowels. *A*, *e*, *i*, are indicated by commas, *o*, *u*, *y*, by dots, in three places with respect to a letter, namely beginning, middle, and end. Other systems by J. H. Lewis (1812) and Moat (1833) are still used to a small extent.

The vast mass of *a*, *b*, *c* systems are strikingly devoid of originality, and are mostly imitations of the few that have been mentioned. Nearly all may be briefly described as consisting of an alphabet, a list of common words, prefixes and suffixes expressed by single letters, a list of arbitrary and symbolical signs, a table showing the best way of joining any two letters, a few general rules for writing, and a specimen plate.¹

Pitman's phonography. Pitman's phonography, on account of its enormous diffusion in Great Britain and the colonies, and in America, is highly organized and original construction, and its many inherent advantages, merits a more extended notice than has been given to the systems already mentioned. In 1837 Isaac Pitman, then teacher of a British school at Wotton-under-Edge and an excellent writer of Taylor's system, composed at the invitation of Samuel Bagster a short stenographic treatise of his own, which Bagster published under the title of *Stenographic Sound-Hand*. The price was fixed at fourpence, for the author had determined to place shorthand within the reach of everybody. He had won the friendship of the Bible publisher by voluntarily verifying the half a million references in the *Comprehensive Bible*, and Mr Bagster for nine years published Mr Pitman's shorthand books. In 1840 a second edition appeared in the form of a penny plate bearing the title *Phonography*, the principal feature of the system being that it was constructed on a purely phonetic basis. The name of Bagster helped the enterprise, and the author was indefatigable in spreading the knowledge of his system by lectures and gratuitous teaching through the penny post, then just established. In December 1841 the first number of what is now known as the *Phonetic Journal* appeared at Manchester in a lithographed form. It was then called the *Phonographic Journal*, and subsequently in turn the *Phonotypic Journal*, the *Phonetic News*, and the *Phonetic Journal*. The chief instruction books issued by the author at the present time from his press at the Phonetic Institute, Bath, are the *Phonographic Teacher*, a little sixpenny book for beginners, of which 1,030,000 copies have been published; the *Manual of Phonography* (470th thousand), in which the art is sufficiently developed for the purpose of correspondence, private memoranda, and easy reporting, and the *Phonographic Reporter* (133d thousand). The weekly circulation of the *Phonetic Journal* is about 20,000 copies. A part of it is printed in the

¹ For early English systems, see especially some careful papers by Mr A. Peterson in *Phonetic Journal* (1836).

phonographic character from movable types. The system has been warmly taken up in America, where it has been republished in more or less altered forms, especially by the author's brother Benn Pitman, and by Messrs A. J. Graham, J. E. Munson, E. Longley, and Eliza B. Burns. A large number of periodicals lithographed in phonography are published in England and America. The *Shorthand Magazine*, monthly, has existed since 1864. Of standard English books printed or lithographed in phonography may be mentioned, besides the Bible, New Testament, and Prayer Book, *The Pilgrim's Progress*, *The Vicar of Wakefield*, *Pickwick Papers*, *Tom Brown's School-Days*, *Macaulay's Essays and Biographies*, *Gulliver's Travels*, *Blackie's Self-culture*, *Bacon's Essays*, and a long list of tales and selections. Numerous societies have been formed in all English-speaking countries for the dissemination of phonography. The largest is the Phonetic Society with 3350 members, who have all certificates of a knowledge of the art and engage to teach through the post gratuitously. Most important towns in the United Kingdom have a phonographic association. London has three. Phonography has been adapted to several foreign languages, but not so successfully as Gabelsberger's German system. Mr T. A. Reed's *French Phonography* (1882) is intended only for English phonographers who wish to report French speeches. Other adaptations to French are by A. J. Lawson and J. R. Bruce. A society for the adaptation of phonography to Italian was organized at Rome in 1883 by G. Francini, who has published his results (Rome, 1883, 1886). Phonography adapted to Spanish by Faedoy (Buenos Ayres, 1884) is purchased by half the stenographers employed in the senate and chamber at Buenos Ayres. It has been adapted to Welsh by R. H. Morgan (Wrexham, 1876), and to German by C. L. Drieslein (Chicago, 1884). Phonography is steadily driving all other English systems out of the field. Mr T. A. Reed stated in the *Phonetic Journal*, 1883, p. 62, that of the 61 writers employed by the *Times*, *Standard*, *Telegraph*, *Morning Post*, and the Press Association 31 were using phonography, 18 Taylor's, 5 Gurney's (i.e., Mason's), 4 Lewis's, and 3 other systems, of the 67 members composing the Institute of Shorthand Writers, chiefly practitioners in the law courts, 26 were using phonography, 29 Taylor's, 7 Gurney's (i.e., Mason's), 3 Mavoi's, and 2 Lewis's, while of the 80 members of the London Shorthand Writers' Association, chiefly employed in business offices, at least five-sixths were phonographers. According to a recent (1882) history of shorthand, of 291 professional stenographers in London 134 used phonography, 89 Taylor's, 35 Gurney's, 8 Lewis's, 8 Mavoi's, and 17 other systems (Byrom's, Grahaun's, Moat's, &c.).

The main features of Pitman's system must now be described. Pitman's The alphabet of consonant sounds is *p*, *b*, *t*, *d*, *k*, *g*, *ch* (as in *chip*), system. *j*, *k*, *g* (as in *gay*), *f*, *v*, *th* (as in *thing*), *dh* (as in *them*), *z*, *s*, *zh* (as in *vision*), *m*, *n*, *ng* (as in *thing*), *l*, *r*, *y*, *h*, *w*. The sounds *p*, *t*, *k*, *ch*, *g* are represented respectively by the four straight strokes  and the corresponding voiced sounds *b*, *d*, *g*, *j* by exactly the same signs respectively written heavy. *P*, *th* (as in *thing*), *s*, *zh* are indicated by  respectively, the same signs written heavy and tapering to the ends are used for *v*, *dh*, *z*, *zh* respectively. *M*, *n*, *l*, *r* are denoted by  respectively. *W* is also represented by  written upwards and in a more slanting direction than the sign for *ch*. The signs for *sh* and *z* may be written up or down when in combination, but standing alone *sh* is written downwards and *z* upwards. The signs for *u*, *y*, *h* are  all written upwards. *H* has also  down. *Ny*, *mp* (or *mb*), *wh* (or *fr*) are represented by the signs *m*, *n*, *t*, *r* respectively written heavy. Signs are provided for the Scotch guttural *ch* (as in *loch*), the Welsh *ll*, and the French nasal *u*. *S* is generally written by a small circle. The long-vowel sounds are thus classified—*a* (as in *balan*), *e* (as in *beat*), *ee* (as in *feed*), *aw* (as in *law*), *o* (as in *cod*), *oo* (as in *boat*). The vowels *a*, *e*, *ee* are marked by a heavy dot placed respectively at the beginning, middle, and end of a consonant.

[illegible]

$\begin{matrix} \nearrow f_1 & \nearrow p_1 \\ \nwarrow i_f & \nwarrow v_f \end{matrix}$ Hooks applied to a curve denote the addition of f , respectively, thus $\begin{matrix} \nearrow f_1 & \nearrow f_2 \\ \nwarrow i_f & \nwarrow v_f \end{matrix}$ are $f_1 + f_2$, $\begin{matrix} \nearrow f_1 & \nearrow m_1 \\ \nwarrow i_f & \nwarrow v_m \end{matrix}$ Vowel-placed after i , in the following horizontal slots, under) a consonant having the vowel i , v hook are read between the consonant and the n or f , thus $\begin{matrix} \nearrow cough \\ \nwarrow i_c \end{matrix}$ $\begin{matrix} \nearrow juar \\ \nwarrow i_j \end{matrix}$ but $\begin{matrix} \nearrow covr \\ \nwarrow i_c \end{matrix}$ $\begin{matrix} \nearrow pray \\ \nwarrow i_p \end{matrix}$. A large hook at the commencement of a curve signifies the addition of l , as $\begin{matrix} \nearrow fl \\ \nwarrow i_f \end{matrix}$. The hooks combine easily with the arele s , thus $\begin{matrix} \nearrow sp_2 \\ \nwarrow i_s \end{matrix}$ $\begin{matrix} \nearrow spn \\ \nwarrow i_s \end{matrix}$ (where the hook i is implied or included in the

ence), *∞ spl*, *∞ pas* (the hook *n* being included), *∞ pfs*, &c. The halving principle is one of the happiest devices in the whole history of shorthand. The halving of a light stroke—that is, writing it half length—implies the addition of *l*, the halving of a heavy stroke that of *d*, the vowel placed after (*or* under) the halved stroke being read between the consonant and the added *l* or *d*, thus— *saw*,

thus means very brief signs are provided for hosts of syllables ending in *t* and *d*, and for a number of verbal forms ending in *ed*, thus—

ended. The halving of a heavy stroke may, if necessary, add *h*, and that of a light stroke *l*, thus—*h beauty*. By combining the hook, the circle, and the halving principle, two or three together, exceedingly brief signs are obtained for a number of consonantal series consisting of the combination of a consonant with one or more of the sounds *s, i, z, n, f, t*, thus—*sp, spr, spt, sps, spl, spli, splz, spln, spft, spnt, spntz, spntn, spntf, spntt*.

ſnt, ſnts, ſfin, ſfrnd, &c. As a vowel-mark cannot conveniently be placed to a hook or circle, we are easily led to a

way of distinguishing in outline between such words as *cough* and *coffee*, *pen* and *penny*, *race* and *racy*, &c. This distinction limits the number of possible readings of an unvoiced outline. A large hook at the end of a stroke indicates the addition of *-shon* (as in *fashion*, *action*, &c.). This hook easily

combines with the circle *s*, as in *actions*, & *positions*. The circle *s* made large indicates *ss* or *sz*, as in *pieces*, *losses*. The vowel between *s* and *s* (·) may be marked inside the circle, as in *assess*, & *substance*. The circle *s* lengthened to a large *s* indicates *ss* or *sz*.

in *exercise*, *sub**istence* The circle is lengthened to a loop signifies *st*, as in *step*, *post*, while a longer loop indicates *str*, as in *muster*, *mon**ster* The loop may be continued through the consonantal stroke and terminate in a circle to denote *sts* and

stres, as in  *boasts*,  *minsters* The loop written on the left or lower side of a straight stroke implies the *n* hook and so signifies *next*, as in  *against*,  *danced* A curve (or a straight stroke with a final hook) written double length implies the addition of *tr*, *dr*, or *th*, as in  *father*,  *letter*,  *kinder*,  *fender*.

render This practice is quite safe in the case of emives, but a straight stroke should not be lengthened in this way when there is danger of reading it as a double letter. The lueal consonant-signs may stand alone to represent certain short and common words as in many of the old a, b, e systems, with this difference,

that in the old systems each letter represents several words, but in modern phonography, in almost every case, only one. By writing the horizontal strokes in two positions with respect to the line (above and on) and the others in three positions (entirely above, resting on, and passing through the line) the number is nearly trebled, and very brief signs are obtained for some seventy or eighty common short words (e.g., *be, by, in, of, at, it, my, me, &c.*) A few very common monosyllables are represented by their vowel-marks, as

A certain number of longer words which occur frequently are contracted, generally by omitting the latter part, sometimes a middle part of the word, as in (lsp) *example*, (dy) *danger*, (h.k. sk) *characteristic*, (ad ft) *unfathomable*. The connective phrase of the *is* intimated by writing the words between which it occurs near to each other. *The* is often expressed by a short slanting stroke or tick joined to the preceding word and generally struck downwards, thus *in the*, *for the*.

Three principles which remain to be noticed are of such importance and advantage that any one of them would go far to place phonography at the head of all other systems. These are the principles of positional writing, similar outlines, and phraseography. (1) The first slanting stroke of a word can generally be written so as either to lie entirely above the line, or rest on the line, or run through the line, thus —  In the case of

words composed wholly of horizontal strokes the last two positions (on and through the line) coincide, as . These three positions are called first, second, and third respectively. The first is specially connected with first-place vowels (*ā, ē, au, ō, ī, ō, u*), the second with second-place vowels (*ē, ē, ā, ō*), and the third with third-place vowels (*oe, ī, oo, ū, ou*). In a fully vocalized style the position is not employed, but in the repeating style it is of the greatest use. Thus the outline (*fm*) written above the line

(b) must be read either *tunc* or *Tom*, when written resting on the line (c) *tome* or *tame*, when struck through the line (d) *teem*, *tean*, or *tomb*. By this method the number of possible readings of an unvocalized outline is greatly reduced. That word in each positional group which occurs the most frequently need not be vocalized, but the others should. In the case of dissyllables it is the accented vowel which decides the position, thus *methought* should be written:

first position () *methoud* second position () (2) Another way

of distinguishing between words having the same consonants but different vowels is to vary the outline. The possibility of varying the outline of a word is that many consonant-sounds here, by duplicating or even tripling signs, as we have seen. For instance *cat* has two linal signs and a hook sign, and so each of the words *catin*, *curator*, *catatic*, and *creator* obtains a distinct outline. A few simple rules direct the student to a proper choice of outlines, but some difference of practice obtains among phonographers in this respect. Lists of outlines for words having the same consonants are given in the instruction books, the *Repetto's Assistant* contains the outline of every word written with not more than three strokes, and the *Phonographic Dictionary* gives the realized outline of every word in the language. Aided by a true phonetic representation of sounds, by occasional vocalization, variety of outline, and the context, the phonographic verbain repertoire should never mislead a word. (8) Lastly, phonography has been found to be a harmless, easy to learn, and useful way of writing, and should be taught to all children. A word may be written, and then left, the student may use this practice with words, syllables, and lines of verse, as you can see.

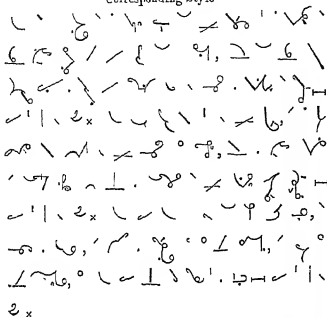

ward joinings avoided. Such phrases are *I am,* *I have*
you are, *you may,* *it would,* *it would not,* *no one*

we have, we have not, we have never been
my dear friends, in a very short time, as far as
possible, for the most part, and many thousands of others

For the sake of obtaining a good phraseogram for a common phrase it is often advisable to omit some part of the consonant outline. Thus the phrase *you must recollect that* may very well be written *(you must recollect that)*. Lists of recommended phraseograms are given in the *Phonographic Phrase Book*, the *Legal Phrase Book*, and the *Easyway Phrase Book*.

1. Phonography is legitimate because the experiment of turning the shorthand notes to phonographic compositors has often been tried with complete success. A speech of Richard Cobden, on the Corn Laws, delivered at Bath on 22nd March 1846, was written by a shorthand reporter, and was afterwards written out by a phonographer, and the notes, with few vowels left in, handed to the compositor. The compositor, without any other aid, wrote out the speech, and the result of the operation appeared the next day in the *Bath Journal*, and was printed. It was transferred to the *Standard*, and the next day appeared in the *Standard*. The same experiment was tried on several occasions; the notes being handed to the compositor in their original state (*Phonetic Journal*, vol. 1848, p. 387). In the copy taken from longhand. Of course it is generally undesirable to print the notes in shorthand, and the notes are usually written in shorthand, and the copy taken from longhand. Of course it is generally undesirable to print the notes in shorthand, and the notes are usually written in shorthand, and the copy taken from longhand. Of course it is generally undesirable to print the notes in shorthand, and the notes are usually written in shorthand, and the copy taken from longhand.

Specimens of Phonography
Corresponding Style

KEY.—If all the feelings of a patriot glow in our bosoms on a perusal of those eloquent speeches which are delivered in the senate, or in those public assemblages where the people are frequently convened to exercise the rights of citizens—we owe it to show them. If new favours be asked to our devotion, and an additional stimulus be imparted to our exertions as Christians, by the eloquent appeals and encouraging exhortations made at the anniversary of our various religious societies—we owe it to show them. If we have an opportunity in interesting public cases, of examining the evidence, and forming the proceedings with as much accuracy, and quickness as such minutiae, as if we had been present on the occasion—we owe it to show them.

Reporting Style

KEY (the phonograms being indicated by type).—CHARACTERISTICS OF THE SYSTEM.—The peculiar and distinguishing characteristics of the present age are in every respect remarkable. Unquestionably an extraordinary and universal change has commenced in the internal as well as the external world—in the mind of man as well as in the habits of society, the one indeed being the necessary consequence of the other. A rational consideration of the circumstances in which mankind are at present placed must show us that influences of the most important and wonderful character have been and are operating in such a manner as to long ago to have effected a thorough revolution in the organization of society. Never in the history of the world have so momentous and so important influences for the relief of domestic and public affliction, societies for the promotion of manufacturing, commercial, and agricultural interests, associations for the instruction of the masses, the advancement of literature and science, the development of true political principles, for the extension in short of every description of knowledge and the bringing about of every kind of reform—been so numerous, so efficient, and so intelligible in their operation as at the present day.

Systems
subse-
quent to
Pitman's

Of the numerous systems published since the invention of phonography the principal are A. M. Bell's *Steno-phonography* (Edinburgh, 1852), Professor J. D. Everett's (London, 1877), Pocknell's *Legible Shorthand* (London, 1881), and J. M. Sloan's adaptation of the French system of Duployé (1882). Of these Professor Everett's must be pronounced much the best. The author claims to have adhered to the phonetic principle more strictly than Mr Pitman. Thus he distinguishes the *o* in *home*, *comb*, from that in *so*, and treats *ur*, *er* as a diphthong. The alphabet is very like Mr Pitman's in construction, light and heavy sounds being represented by light and heavy strokes. The chief feature of the system is that all vowels are marked in. This is done by joined signs, by lengthening the preceding consonant, by separating the preceding from the following consonant, by lifting the pen and writing the one consonant attached to the other, and by intersection. Mr Pocknell, in his somewhat bewildering system,

seeks (like Mr Melville Bell) to provide a method of indicating whether a consonant is preceded or followed by a vowel or vowels. To this end he gives to each consonant three linear signs (two curves and a straight line), the requisite number of signs being made up by using three lengths of stroke. The selection of the right sign is determined by the *length* and *class* of the words represented. Much energy is devoted to indicate where a vowel stands, but not to what it is. The vowels, when expressed, are disjoined, as in phonography and most systems. Though Mr Bell's too elaborate classification of vowels is adopted, the phonetic method of representing consonants is frequently discarded in favour of the alphabetic. Thus, no sign is provided for *h* (as in *vision*), and the barbarous *gh* (as in *bright*) is often retained "for the sake of legibility." Mr Pocknell goes back to the antiquated device of pictorial and arbitrary signs. The Sloan-Duployan system has been vigorously propagated, but it does not provide alphabetic characters for all the vowels and consonants in the language, contents itself with representing not actual but "approximate" sounds, does not always indicate the order in which the characters should be read, recommends the frequent omission of consonants and syllables at the "discretion" of the student, avoids angles, and introduces three slopes, instead of one, between the perpendicular and the horizontal, and therefore is not likely to meet with general acceptance.

A considerable number of American systems, as well as American systems based on Taylor's and Gurney's, were issued during the early days of the republic. Since the introduction of phonography into the States in 1843, the dissemination of the art has gone steadily forward, and its use since 1880 has been greatly on the increase, shorthand being now taught in a large number of schools. From elaborate statistics given in Mr Rockwell's *Cyclopaedia of Information* it appears that during 1882 10,197 persons received instruction in schools and classes and 2273 by correspondence. But these figures probably bear no proportion to the number of persons studying without a teacher. In almost every case phonography, or a modification of it, was selected for instruction. American shorthand societies are very numerous, most of them having been formed since 1880. Two are devoted to the Stenoian system. Of the fourteen shorthand magazines which Mr Rockwell enumerates eleven are phonographic.

In nine cases out of ten phonography will be found admirably adapted to the purposes of verbatim reporting. But to be legible it must be written with care. This necessity arises from its brevity and its use of light and heavy, halved and double-length strokes. Hence a clumsy scribe may find a longer system, such as Gurney's, answer his purpose better. A theoretical knowledge of most systems may be gained in a few hours. Pitman's method is not so easily acquired, but an intelligent person can master its details in a few weeks. Shorthand writing is, however, mainly a matter of practice. Few can make any considerable use of it with less than six months' assiduous practice. The average rate of public speaking is very slightly over 120 words a minute. Some speakers average 150. The slowest utterance is now and then exchanged for a rapid flow of words, and 180 or 200 words a minute is no uncommon speed in certain styles of speech such as the conversational,—a speed which many persons would never acquire.¹ Most persons of average intelligence may

¹ Phenomenal rates of speed are recorded in the *Phonetic Journal* for 1885, p. 838. Mr T. A. Reed, the veteran phonographer, had been engaged to report a well-known American divine preaching at Westminster Abbey. The sermon was carefully noted, and the words in the printed report counted. The average came out at 213 words a minute. A photographed specimen page of Mr Reed's notes on this occasion is given in the *Reporter's Magazine*, September 1885.

by perseverance write with certainty at 150 words a minute. The best method of practice in the early period is to write at dictation from a book, in public speaking the frequent pauses help the writer to regain lost time. The student should write on ruled paper, which checks the tendency to a large sprawling hand when following a rapid speaker. Taylor's, Gurney's, and Lewis's systems can be written without lines, but Pitman's only at a disadvantage. Ink is preferable to pencil.

Parliamentary
reporting

Shorthand was first employed officially in the service of Parliament in 1802, when a resolution was passed that "the evidence given before all committees inquiring into the election of members should or might be reported by a person well skilled in the art of writing shorthand," and shortly afterwards W. B. Gurney was appointed shorthand-writer in this capacity to both Houses of Parliament. In 1813 a further resolution was passed by both Houses that the official writer "should attend by himself or sufficient deputy when called upon to take minutes of evidence at the bar of this House or in committees of the same." The lucrative office of shorthand-writer to both Houses of Parliament is still held by the Gurney family. Of course most of the work is done by deputy. Some of the most efficient members of Messrs Gurney's staff are phonographers, others use Taylor's system. The amount of evidence given in the course of a tolerably long day's sitting may amount to 400 or 500 folios (72 words make a folio), which would occupy from 12 to 15 columns of the *Times* in small type. The whole must often be transcribed and delivered to the printers in the course of the night, and copies, damp from the press, are in the hands of the members and "parties" at the beginning of the sitting on the following day. Since parliament abolished election-committees and committed to judges the duty of inquiring into petitions against the return of a member, an official shorthand writer has to be in attendance upon the judge appointed to hear any particular case. He has often a small staff of assistants. Messrs Gurney or their representatives are also required to attend the sittings of the House of Lords as a court of appeal to take the judgments of the law lords. Finally, Government shorthand-writers are often employed in taking notes of important state-trials and inquiries conducted by the various departments of Government, as well as of the proceedings of Royal Commissions, whenever the evidence of witnesses is taken. The transcription of the notes may be accomplished in several ways, as by dictating from different parts of the notes to several longhand-writers simultaneously.¹ Not all the newspaper parliamentary reporters can take a perfect note, and cases occur in which the reporter enters the gallery without being able to write shorthand at all.

FOREIGN SHORTHAND SYSTEMS.

Foreign systems. *German*.—C. A. Ramsey's *Tachygraphia* (Frankfurt, 1879, and several times afterwards until 1743) was an adaptation of T. Shelton's English system. Mosengel (1797) first practically introduced short-

hand writing into Germany in an adaptation of the Taylor-Bettin method. Kersch's (1808) is a modification of Mosengel's. On Hostig's (1797) are based those of an anonymous writer (Nutenberg, 1798), Heum (1820), Thom (1825), an anonymous author (Tübingen, 1830), Nowack (1830), Inchen (1831), an anonymous author (Munich, 1832), and Bräuer (1835). Mosengel's system had a second system (1819) in which Hostig's alphabet is used. On the Mosengel-Hostig system are based Herthold's (1819) and Stark's (1822). On Danze's (1800), a close imitation of Taylor's, is based that of Ellison v. Nölle (1820). Other systems are those of Leuchten (1819), J. Breile (1827), Nowack (1834), a system in which the ellipse is employed as well as the circle, Billman (1838), Cammeke (1848), and Mosengel's *Shorthand-phonography* (1847), Schmitt (1850), Fischback (1857), a reproduction of Taylor's, and that of an anonymous author (1872), based on Hostig, Mosengel, and Heum. Nowack, in his later method of 1834, makes a new departure in avoiding right or oblique angles, and in endeavouring to approximate to ordinary writing. This system Gabelsberger considered to be the best which had appeared down to that date. P. X. Gabelsberger's *Shorthand zur deutsch. Rechtschreibkunst* (Munich, 1834) is the most important of the German systems. The author, an official attached to the Bavarian ministry, commenced his system for private purposes, but was induced to perfect it on account of the summoning of a parliament for Bavaria in 1819. Submitted to public examination in 1829 it was pronounced satisfactory, the report stating that pupils taught on this system executed the task of writing, with the required speed, and read what they had written, and even what others had written, with ease and certainty. The method is based on modifications of geometrical forms, designed to suit the position of the hand in ordinary writing. The author considered that a system composed of simple geometrical strokes forming determinate angles with each other was unsuited to rapid writing. It does not recognize all the nuances of sound, and makes slight distinctions which are merely orthographical. Soft sounds have small, light, and round signs, while the hard sounds have large, heavy, and straight signs. The signs too are derived from the current alphabet, so that one can find the former contained in the latter. Vowels standing between consonants are not literally inserted, but symbolically indicated by either position or shape of the surrounding consonants, which are never separated by intervening white lines. The proceedings of the chambers in Austria, Bavaria, Baden, Württemberg, Saxony, Saxe-Weimar, Coburg-Gotha, Silesia, and the Rhine provinces are reported solely by this method, and half the stenographers in the German reichstag use it. There are in Germany and Austria more than 640 societies containing over 20,000 members devoted to it. It is officially taught in all the middle class schools in Austria, Prussia, and Austria. It has been adapted to foreign languages to such an extent that legislative proceedings are reported by it in Prague, Agram, Pesth, Sophia, Athens, Copenhagen, Christiania, Stockholm, and Helsingfors. On Gabelsberger's system is based that of W. Stolze (1840). There are nearly 400 Stolzean associations with over 8000 members. The system is officially used in the Prussian, German, and Hungarian parliaments, in the last two along with Gabelsberger's. Paulmann (Vienna, 1875) attempted in his *Phonographie* to combine the two methods. While Gabelsberger's system has remained unchanged in principle, Stolze's has split into two divisions, the old and the new. These contain many smaller factious, e.g., Veltzer's (1876) and Adler's (1877). Aisen's (1860) is copied from the French system of Fayet. Rollet's (1874) and Ledemann's (1876) are official systems in Austria. Many other methods have appeared and as rapidly been forgotten. The schools of Gabelsberger and Stolze can boast of a very extensive shorthand literature. Gabelsberger's system has been adapted to English by A. Gagen (Dresden, 1860 and 1875), who adhered too closely to the German original, and more successfully by H. Richter (London, 1836), and Stolze by G. Michaels (Berlin, 1863).

¹ *Proced.*—The earliest French system worthy of notice is that of Collet de Croton (1777), in which the vowels are disjoined from the consonants. The methods purchased at the present day may be divided into two classes, those derived from Taylor's English system, translated in 1791 by T. P. Batin, and those invented in France. The latter are (a) Collet de Croton's, (b) systems founded on the principle of the inclination of the usual writing—the best known being those of Fayet (1852) and Shoeny (1842), and (c) systems derived from the method of Collet de Croton, the best known being those of 1833. Prévost, who till 1870 directed the stenographic service of the senate, produced the best modification of Taylor. Many authors have copied and spoilt this system of Prévost. The best known are Planter (1844) and Tondeur (1849). Zang thinks well of A. Delaunay's improvements on Prévost's system. On Collet's are based those of Aimé-Pais (1822), Cudré-Marnet (1828), Fotel (1828), the Duployé brothers (1848), and G. Duployé. Anthoniour writes the Duployé method is best known, owing largely to vigorous pushing, but the profession class it among the least efficient of all. Of the forty writers in the official service of parliament

Cetaceans) that beset both maxilla and mandible, has been thought sufficient to remove the species from the Linnean genus *Anas*. Except for the extraordinary formation of this feature, which carries with it a clumsy look, the male Shoveler would pass for one of the most beautiful of this generally beautiful group of birds. As it is, for bright and variegated colouring, there are few of his kindred to whom he is inferior. His golden eye, his dark green head, surmounting a throat of pure white and succeeded by a breast and flanks of rich bay, are conspicuous; while his deep brown back, white scapulars, lesser wing-coverts (often misnamed shoulders) of a glaucous blue, and glossy green speculum bordered with white present a wonderful contrast of the richest tints, heightened again by his bright orange feet. On the other hand, the female, excepting the blue wing-coverts she has in common with her mate, is habited very like the ordinary Wild-Duck, *A. boscas* (see vol. vii. p. 505). The Shoveler is not an abundant species, and in Great Britain its distribution is local; but its numbers have remarkably increased since the passing of the Wild-Fowl Protection Act in 1876,¹ so that in certain districts it has regained its old position as an indigenous member of the Fauna. It has not ordinarily a very high northern range, but inhabits the greater part of Europe, Asia, and America, passing southwards, like most of the *Anatidae* towards winter, constantly reaching India, Ceylon, Abyssinia, the Antilles, and Central America, while it is known to have occurred at that season in New Granada, and, according to Gould, in Australia. Generally resembling in its habits the other freshwater Ducks, the Shoveler has one peculiarity that has been rarely, if ever, mentioned, and one that is perhaps correlated with the structure of its bill. It seems to be especially given to feeding on the surface of the water immediately above the spot where Diving Ducks (*Fuligulinae*) are employing themselves beneath. On such occasions a pair of Shovelers may be watched, almost for the hour together, swimming in a circle, about a yard in diameter, their heads turned inwards towards its centre, their bills immersed vertically in the water, and engaged in sifting, by means of the long *lamellæ* before mentioned, the floating matters that are disturbed by their submerged allies and rise to the top. These gyrations are executed with the greatest ease, each Shoveler of the pair merely using the outer leg to impel it on its circular course, and to the observer the prettiest part of the performance is the precision with which each preserves its relative distance from its comrade.

Four other species of the genus *Spatula*, all possessing the characteristic light blue "shoulders," have been described:—one, *S. platatas*, from the southern parts of South America, having the head, neck, and upper back of a pale reddish brown, freckled or closely spotted with dark brown, and a dull bay breast with interrupted bars; a second, *S. casentis*, from South Africa, much lighter in colour than the female of *S. chrysolata*; a third and a fourth, *S. rhynchotis* and *S. variegata*, from Australia and New Zealand respectively,—these last much darker in general coloration, and the males possessing a white crescentic mark between the bill and the eye, very like that which is found in the South-American Blue-winged Teal (*Querquedula cyanoptera*), but so much resembling each other that their specific distinctness has been disputed by good authority. In these last two the sexual difference is well marked by the plumage; but in the South-American and South-African species it would seem that both male and female have much the same appearance, as is the case with so many species of the restricted genus *Anas*, though this cannot yet be asserted with certainty. (A. N.)

SHREVEPORT, a city of the United States, capital of Caddo parish, Louisiana, on the west bank of Red River and near to Sodo Lake, is the eastern terminus of the

Texas Pacific Railroad, 327 miles by rail north-west of New Orleans, with which it has regular steamboat communication. Situated in the heart of a very fruitful cotton-growing region, it is one of the principal cotton-markets in the south-west of the United States, and is the second commercial city in the State. It exports annually about 125,000 bales of cotton, and carries on a trade likewise in hides, wool, and tallow. It has factories for carriages, cotton gins, cotton-seed oil, soap, ice, sashes and blinds, and spokes and hubs, also foundries, machine-shops, a planing mill, saw-mills, and breweries. The town possesses among public buildings a handsome court-house and a cotton exchange. Red River is spanned by an iron bridge 20 feet wide and 1200 long. Shreveport, which was incorporated in 1839, had a population of 4607 in 1870 and of 8009 in 1880; in 1886 the population was estimated at 15,000.

SHREW, a general term applied to the species of the family *Soricidae*, order *Insectivora* (see vol. xv. p. 403), but in the British Isles more particularly to the common and to the lesser shrew (*Sorex vulgaris*, L., and *S. pygmaeus*, Pall.).

The common shrew is, in England at least, by far the commoner of the two. It is a small animal about the size of the common mouse, which it somewhat resembles in the shape of its body, tail, and feet. But here the resemblance ends, for, unlike the mouse, it possesses a remarkably long and slender muzzle, with prominent nostrils, which project far beyond the lower lip; the eyes are very small and almost concealed by the fur; the ears are wide and short, scarcely rising above the long hairs surrounding them, and are provided internally with a pair of deep folds, capable, when laid forward, of closing the entrance; the tail, which is slightly shorter than the body (without the head), is quadrangular in shape and clothed more or less densely with moderately long hairs, terminating in a short pencil (in old individuals these hairs become worn away, so that in some specimens the tail is almost quite naked); the feet are five-toed, the toes terminating in slender, acutely pointed, non-retractile claws. The dentition is very peculiar and

Common Shrew (*Sorex vulgaris*, L.).

characteristic: there are in all thirty-two teeth, tipped with deep crimson; of these twelve only (the number is characteristic, with one exception only, of the family) belong to the lower jaw; of the remaining twenty ten occupy each side of the upper jaw, and of these the first three, as they are implanted in the premaxillary bone, are termed incisors. The first incisor is a large tooth with a long anterior canine-like cusp and a small posterior one; then follow two small unicuspidate teeth; these are succeeded by three similar progressively smaller teeth, whereof the first has been called a canine and the other two premolars; the next tooth, also a premolar, is a large multicuspidate tooth; and this is followed by three molars, of which the third is small with a triangular crown. In the lower jaw we find on each side anteriorly three teeth corresponding to the seven anterior teeth above, of which the first is almost horizontal in direction, its upper surface being marked by three notches, which

¹ Prior to that year there was perhaps only one district in England wherein the Shoveler could be said to breed regularly, and thereto only a few pairs resorted. In 1885 there must have been a dozen counties in which it nested, and in some of them the pairs breeding might be reckoned by the score.

receive the points of the three upper front teeth with which they come in contact when the jaws are closed, then follow two small teeth and three molars. The body is clothed with closely set uniformly long fur, very soft and dense, varying in colour from light reddish to dark brown above, rarely speckled over or spotted or even banded with white. The under surface of both the body and the tail is greyish, the basal four-fifths of all the hairs above and beneath are dark bluish grey, the hairs of the tail are less densely set and coarser. On each side of the body, at a point about one-third of the distance between the elbow and the knee, may be found, especially in the rutting season, a cutaneous gland covered by two rows of coarse imbricated hairs. This gland secretes a peculiar fluid, on which the unpleasant cheesy odour of the animal depends, and which is evidently also protective, rendering it secure against the attacks of many predaceous animals.

The lesser shrew (*S. pygmaeus*) is much less abundant in England and Scotland, but comparatively common in Ireland, where the common shrew has not yet been found. It appears at first sight to be a diminutive variant of that species, which it closely resembles in external form. It was said to differ in having the tail longer than the body (without the head), whereas in the common shrew the body (without the head) is longer than the tail, and in the last unicuspidate upper molar tooth being comparatively larger and more external than in the other species. But the present writer has found these characters so exceedingly liable to variation as to be almost worthless, he has therefore discovered reliable points of distinction as follows—in *S. pygmaeus* the third upper incisor (when the teeth are unworn) is shorter, or at least not longer than the next following tooth, whereas in *S. vulgaris* it is always longer, and the length of the forearm and hand combined is very constantly 13 mm. in the former species, while in the latter it is 17 mm.

The habits of both the common and the lesser shrew correspond. They live generally in the neighbourhood of woods, making their nests under the roots of trees or in any slight depression, occasionally even in the midst of open fields, inhabiting the disused burrows of field-mice. Owing to their very small size, dark colour, rapid movements, and chiefly nocturnal habits they easily escape observation. They seek their food, which consists of insects, insect larvae, small worms, and slugs, under dead leaves, fallen trees, and in grassy places. Like the mole, they are very pugnacious, and if two or more are confined together in a limited space they invariably fight fiercely, the fallen becoming the food of the victorious. They also, like the mole, are exceedingly voracious, and soon die if deprived of food, and it is probably to insufficiency of food in the early dry autumnal season that the well-known immense mortality amongst these animals at that time of the year is due. The breeding season extends from the end of April to the beginning of August, and five to seven, more rarely ten, young may be found in their nests; they are naked, blind, and toothless at birth, but soon run about snapping at everything within reach, the anterior pair of incisors in both jaws quickly piercing the gum, followed by the last pair of upper premolars, which at birth form prominent elevations in the gum.

The alpine shrew (*S. alpinus*, Schinz), restricted to the alpine region of Central Europe, is slightly longer than the common shrew and differs from it conspicuously in its much longer tail, which exceeds the length of the head and body, in the colour of the fur, which is dark on both surfaces, and in the large size of the upper antepenultimate premolar.

The water-shrew (*Crossopus fodiens*, Pall.), the third and last species inhabiting England, differs from the common shrew in being considerably larger with a shorter and

much broader muzzle, comparatively smaller eyes, and larger feet adapted for swimming,—the sides of the feet and toes being provided with comb-like fringes of stiff hairs. The tail is longer than the body (without the head) and possesses a well-developed swimming fringe of moderately long regularly ranged hairs, which extend along the middle of its flat under surface from the end of its basal third to its extremity. The fur of the body is long and very dense, varying much in colour in different individuals, and this has given rise to descriptions of many nominal species, the prevailing shades are dark, almost black, brown above, beneath more or less bright ashy tinged with yellowish, occasionally, sometimes in the same brood, we find some individuals with the under surface more or less dark coloured. In the number as well as in the shape of the teeth the water-shrew differs from the common shrew: there is a premolar less on each side above, the bases of the teeth are much more prolonged posteriorly, and their cusps are much less stained brown, so that in old individuals with worn teeth they often appear altogether white. This species resembles the otter in its aquatic habits, swimming and diving with great agility. It frequents rivers and lakes, making its burrows in the overhanging banks, from which when disturbed it escapes into the water. Its food consists of the different species of water-insects and their larvae, small crustaceans, and probably the fry of small fishes. It is generally distributed throughout England, is less common in Scotland, but as yet it has not been recorded in Ireland.

The geographical range of the common shrew is exceedingly wide, extending eastwards through Europe and Asia (north of the Himalayas) to North America. The lesser shrew extends concurrently through Europe and Asia to Saghalin Island, and specimens of the water-shrew have been brought from different parts of Europe and from Asia as far east as the Altai range. In Siberia the common shrew is abundant in the snow-eaten wastes about the Ob and Yenisei within the arctic circle. Indeed the hardness of this little animal, as well as of other species of red-toothed shrews, is very remarkable. In Dr C. H. Merriam's *Mammals of the Alaska District*, Region we find the following note on the habits of a common North American species (*Blarina brevicauda*) of an allied genus:—"The rigours of our northern winters seem to have no effect in diminishing its activity, for it scampers about on the snow during the severest weather, and I have known it to beat out the thermometer indicated a temperature of -20° Fahren. It makes long journeys over the snow, burrowing down whenever it comes to an elevation that denotes the presence of a log or stump, and I am inclined to believe that at this season it must feed largely upon the chrysalides and larvae of insects that are always to be found in such places." Other species of red-toothed shrews are so restricted chiefly to North America, where they are found in much greater variety than in the Old World, though *C. septentrionalis* is not represented. Its place is taken by two species of the genus *Sorex* (*S. palustris*, Richardson, east of the Rocky Mountains, and *S. hyalodromus*, Dobson, from Unalaska Island), provided, like the water-shrew, with pedal swimming fringes, but with the unfurred tail and dentition of the common shrew,—the first named being about as large as the water-shrew, while the Unalaska species scarcely exceeds the size of the lesser shrew. Of the American forms *S. bendirii*, Merriam, is by far the largest known species of the genus. In it, as in many others inhabiting North America, the female shows a tendency to diminish in size, which is more pronounced in *S. richardsoni*, Bachman, and in *S. vagrans*, Cooper; in *S. hoyi*, Baird, it is rudimentary, and in *S. crassifrons*, Baird, altogether absent. The diminutive *S. personatus*, Geoff., widely distributed throughout temperate North America, resembles *S. pygmaeus* in its small size. Other red-toothed shrews belonging to the allied genus *Blarina*, distinguished from *Sorex* by their dentition and by the remarkable shortness of the tail, are very common on and characteristic of the North American continent. All the red-toothed shrews (except the aquatic forms) closely resemble one another in habits, and Dr Merriam has made the highly interesting discovery that the common short-tailed North American shrew supplements its insectivorous fare by feeding on beech-nuts, which will account for the generally very worn state of the teeth in this species. In destroying great numbers of slugs, insects, and insect larvae they greatly aid the farmer in the preservation of his crops and merit protection. Although their penetrating odour renders them in a great measure safe from the attacks of rapacious mammals, they are destroyed in large numbers by nocturnal birds of prey. (G. E. D.)

SHREWSBURY, an old market-town, a municipal and parliamentary borough, and the county and assize town of Shropshire, England, is situated on a slightly elevated peninsula formed by a bend of the Severn, and on various railway lines, 30 miles south of Chester, and 163 north-west of London by the London and North-Western Railway, the distance by the Great Western being 171 miles. The Severn is crossed by three stone bridges,—the English bridge (re-erected 1774), on the east, consisting of seven semicircular arches, the Welsh bridge (re-erected 1795), of five arches, on the west, and the Kingsland bridge (opened in 1882), of iron on the bow and girder principle. The streets are hilly and irregular, but strikingly picturesque from their number of antique timber houses, among which may be mentioned that in Butcher Row formerly the town residence of the abbot of Lilleshall, and the old council-house overlooking the Severn, erected in 1502 for the presidents of the council of the Welsh marches. Of the town ramparts built in the reign of Henry III. the principal remains are a small portion on the north side called the Houshill walls, and another portion on the south-west, used as a public walk, on which stands a square embattled tower. The castle built by Roger de Montgomery was dismantled in the reign of James II, but there still remain the archway of the interior gateway, the walls of the inner court, and two large round towers of the time of Edward I. Roger de Montgomery also founded in 1083 the abbey of St Peter and St Paul, which was of great extent and very richly endowed. At the dissolution it was destroyed, except part of the nave and the western tower of the church, which have been converted into a parish church, under the name of the church of the Holy Cross. The other churches of special interest are St Mary's, founded in the 10th century, a fine cruciform structure with a tower and spire 222 feet in height, displaying examples of various styles of architecture from Early Norman to Perpendicular,—the base of the tower, the nave, and the doorways being Norman, the transept Early English, and the aisles 15th century, while the interior is specially worthy of notice for its elaborate details, its stained glass, and its ancient monuments. St Julian's, originally built before the Conquest, but rebuilt in 1748, except the tower, the older portion of which is Norman and the upper part 15th century, St Alkmund's, also dating from the 10th century, but rebuilt towards the close of the 18th century, with the exception of the tower and spire, and St Giles's, dating from the time of Henry I, much altered at various periods, but still retaining its ancient nave and chancel. The old church of St Chad, supposed to have occupied the site of a palace of the princes of Powis, was destroyed by the fall of the tower in 1788, and of the ancient building the bishop's chancel alone remains. The new church of St Chad was built on another site in 1792. There are still slight remains of the abbey of Greyfriars founded in 1291, and of the Augustinian friary founded in 1255. The old buildings completed in 1630 for the free grammar-school of Edward VI, founded in 1551, are now occupied by the county museum and free library, the school having been removed in 1882 to new buildings at Kingsland. Among the principal secular buildings of the town are the fine market-house in the Elizabethan style (completed according to an inscription upon the northern arch in 1595), the shire hall (rebuilt in 1837, and again, after a fire, in 1883), the music-hall buildings (1840), the general market and corn exchange (1869), the working-men's hall (1863), the drapers' hall (an old timbered structure dating from the 16th century), the theatre (1834), and the post-office (1877). The principal benevolent institutions are the county infirmary (1747), Millington's hospital (1734), and the eye, ear, and throat

hospital (1881). A monument to Lord Chive was erected in the market-place in 1860, and a Dedicatory memorial pillar to General Lord Hill in 1816 at the top of the Abbey Foregate. The town racecourse occupies a portion of the "Soldiers' Piece," where Charles I. addressed his army in 1642. To the south-west of the town is a fine park, 23 acres in extent, known as the Quarry, adorned by a beautiful avenue of lime trees. Formerly Shrewsbury was one of the principal marts for Welsh fannel, but this trade has now in great part ceased. Glass-staining, the spinning of flax and linen yarn, iron-founding, brewing, malting, the preparation of brawn, and the manufacture of the well-known Shrewsbury cakes are now the principal industries. The population of the municipal and parliamentary borough (area, 3674 acres) in 1871 was 23,406, and in 1881 it was 26,478.

Shrewsbury, anciently called Pengwern, was founded in the 5th century as a defence against the incursions of the Saxons, and became the seat of the princes of Powis. After its conquest by the Saxons its name was changed to Scioebessyng, altered gradually into Stoppesbury, Shrewsbury, and Salop. It became one of the principal cities of the Saxon kingdom, and a mint was established there by Athelstan about 925. After the Norman Conquest it was included in the earldom of Shrewsbury bestowed by William I. on Roger de Montgomery, who erected a strong castle on the site of the ancient Saxon fortress. But in 1067 it was besieged by Owen Gwynedd, prince of Wales, till relieved by William, who marched specially to its assistance from York. On the rebellion of Robert de Belesme, son of the first earl of Shrewsbury, the castle and town were attacked by Henry I. and surrendered in 1102. During the wars of the next two centuries the town was frequently attacked and plundered by the Welsh, being captured by Llewelyn in 1215, surrendered to the English in 1221, plundered by the earl of Pembroke in 1223, burnt by Llewelyn ap Iorwerth in January 1284, taken by Simon de Montfort in 1264, and restored to the crown in 1265. In 1267 Henry III. assembled his army there, to threaten the Welsh, but peace was restored without bloodshed, after which he strengthened its fortifications. Edward I. in 1277 made it the seat of his government, and removed to it the Court of Exchequer and King's Bench. In 1293 he held a parliament there for the first time, the last of the royal princes of Wales, who was dragged through the streets of the town and afterwards hanged and quartered. At a parliament held in Shrewsbury in January 1398 Richard II. assumed the title of Earl of Chester. Near the town was fought, 28d July 1403, the battle of Shrewsbury, described in Shakespeare's *Henry IV.*, when the king defeated the earl of Northumberland, with great slaughter. Hotspur, the earl's son, being among the slain. It became the headquarters of Charles I. 20th September 1642, but was taken by the Parliamentarians in February 1645. The town from the reign of William I. to that of James II. received no less than thirty-two charters, its first governing charter being obtained from Richard I. It returned two members to parliament from the reign of Edward I. until 1885, when it was allowed only one.

SHREWSBURY, EARLS OF. See TALBOT

SHRIKE, a bird's name so given by Turner (1544), but solely on the authority of Sir Francis Lovell, for Turner had seen the bird but twice in England, though in Germany often, and could not find any one else who so called it. However, the word¹ was caught up by succeeding writers, and, though hardly used except in books—for Butcher-bird is its vernacular synonym—it not only retains its first position in literary English, but has been largely extended so as to apply in general to all birds of the Family *Laniidae* and others besides. The name *Lanius*, in this sense, originated with Gesner² (1555), who thought that the birds to which he gave it had not been mentioned by the ancients. Sundevall, however, considers that the *Malacocoryphæus* of Aristotle was one of them, as indeed Turner had before suggested, though repelling the latter's

¹ Few birds enjoy such a wealth of local names as the Shrikes. M. Rolland (*Faune Pop. de la France*, n. pp. 146-151) enumerates upwards of ninety applied to them in France and Savoy, but not one of these has any affinity to our word "Shrike."

² He does not seem, however, to have known that Butcher-bird was an English name, indeed it may not have been so at the time, but subsequently introduced.

supposition that Aristotle's *Tyrannus* was another, as well as Belon's reference of *Cyllorion*.

The species designated Shrike by Turner is the *Lanius excubitor* of Linnæus and nearly all succeeding authors, nowadays commonly known as the Greater Butcher-bird, Ash-coloured or Great Grey Shrike, a bird which visits the British Islands pretty regularly, though not numerously, in autumn or winter, occasionally prolonging its stay into the next summer, but it has never been ascertained to breed there, though often asserted to have done so. This is the more remarkable since it breeds more or less commonly on the Continent from the north of France to within the Arctic Circle. Exceeding a Song-Thrush in linear measurements, it is a much less bulky bird, of a pearly grey above with a well-defined black band passing from the forehead to the ear-coverts, beneath it is nearly white, and this is particularly observable in Eastern examples—barred with dusky. The quill-feathers of the wings, and of the elongated tail, are variegated with black and white, but are mostly of the former, though what there is of the latter shows very conspicuously, especially at the base of the wing, where it forms either a single or a double patch.¹ Much smaller than this is the Red-backed Shrike, *L. collurio*, the best-known species in Great Britain, where it is a summer visitor, and, though its distribution is rather local, it may be seen in many parts of England and occasionally reaches Scotland. The cock is a slightly bird with his grey head and neck, black cheek-band, chestnut back, and paler breast, while the hen is a ordinary of a duller plumage based on the lower plumage. A more highly coloured species is called the Woodchick, *L. aviculatus* or *ridulus*, with a bright bay crown and nape, and the rest of its plumage black, grey, and white. This is an accidental visitor to England, but breeds commonly throughout Europe. All these birds, with many others included in the genus *Lanius*, which there is no room here to specify, have, according to their respective parts, the very remarkable habit (whence they have earned their opprobrious name) of catching insects, frogs, lizards, or small birds and mammals, and of putting them on a thorn or of fixing them in a forked branch, the more conveniently to tear them in pieces and eat them.

The limits of the Family *Laniidae* have been very variously regarded, and agreement between almost any two systematists on this point seems at present out of the question. The latest synopsis is that by Dr Gadow (*Cat. B. Brit. Museum*, viii pp 88-321), who frankly states that it is "quite impossible to give a concise diagnosis of what we are to understand by" the Family. For his purpose he makes it to include about 250 species and divides it into five sub-families—*Gymnorhininae*, *Malacothrininae*, *Pachycephalinae*, *Laniinae*, and *Viduae*. Of these doubts may be entertained as to the affinity of the first and especially of the last. He, but for the crude plan to which he was compelled to conform, would not have separated *Strepera* from *Gymnorhinus*, but the former had

¹ According to Willughby, Rae, and Charleton, it was in their day called in many parts of England "Wantage" (Gen. *Virengeni* and *Wu per*, the Strangler), but it is hard to see how a bird which few people in England could know by sight should have a popular name, though Chaucer had used it in his *Assembly of Foules*.

² On this character great store has been laid by some recent writers, who maintain that the birds presenting only a single patch, with some other minor distinctions, as the barred breast above mentioned, come from the far East and deserve specific recognition as the *Lanius major* of Faller. But it is admitted that every intermediate form occurs, and Prof. Collett has now shown (*Ibis*, 1886, pp 80-40) that the typical *L. excubitor* and typical *L. major* may be found in one and the same brood, and also that this occasional divergence is due neither to age nor sex. That it does depend to some extent on locality is allowed, for, though examples with the single patch (e.g. *L. major*) occasionally reach Great Britain, it is asserted that nearly all the specimens from Eastern Siberia are so marked. But it is also found that by almost insensible degrees other (and sometimes more important) distinctions are manifested, and the extreme terms of the several series have been exalted to the rank of "species"—or at least local races. These are too many to be here enumerated, but it may be mentioned that the Great Grey Shrike of North America, which ordinarily has the lower plumage strongly barred, and is usually known as *L. borealis*, seems to be only one of these divergent forms, though perhaps the most divergent, as might be expected from the fact that it occupies a more northern and occasionally examples occur in the Old World, which there is no reason to suppose have an American origin, indistinguishable from the typical *L. borealis*, and an uninterrupted series from one extreme to the other can be found. The differences when compared with those observable in other animals are, as a whole, too slight to justify the epithet "polymorphic" to *L. excubitor* as a species, but enough has been said to show that it indicates a tendency in that direction.

been already included, to the exclusion of the latter, among the *Corvidæ*, and even placed among the normal *Corvinæ*. The need of exercising reserve on this matter has been before stated (Crow, vol vi p 617), but the number of ornithologists who think that these two genera should be placed in different Families must be small. The view taken by Prof. Parker seems to be the most reasonable—these genera—with others doubtless and most of them Australian—are morphologically inferior to the *Corvidæ*, and perhaps deserve some such designation as that of "*Noto-Coracomorpha*" suggested by him (*Trans. Zool. Society*, ix p 327). At the same time their relationship to the *Laniidae* appears to be evident, and they may perhaps be best regarded as the less-altered descendants of an old type, whence both the true Crows and the true Shrikes have sprung, each to develop into higher morphological rank, and by the way to throw out numerous other branches. As to the *Vireos* it would seem almost certain that they have little or no connexion with the *Laniidae*. (A N)

SHRIMP, the name applied to two species of Crustaceans commonly used as food in Great Britain. One kind after boiling is brown in colour, the other bright red. The brown kind belongs to the species *Crangon vulgatus*, the red to the species *Pandalus annulicornis*. Both these species belong to the sub-order *Decapoda*, and to that division of it which is distinguished by a well-developed abdomen or tail, and called *Macrura*. The Crustaceans placed in this division have five pairs of limbs adapted for crawling on the sea-bottom, usually the anterior one or more pairs of these five are chelate or pincer-formed. In front of the ambulatory limbs are six pairs of limbs whose function is to assist in the conveyance of food to the mouth, three pairs of maxillipeds, two pairs of maxillae, and a pair of mandibles. In front of these, again, are two pairs of antennae and a pair of eyes. The latter are held by some naturalists to represent a pair of limbs, but evidence exists which is in opposition to this view. Behind the ambulatory limbs are six segments of the body, each bearing a pair of limbs adapted for swimming. The sixth pair of these abdominal limbs are larger than the rest and expanded, extending backwards in the same plane as the flattened terminal segment of the body or telson, and the three together form a powerful organ of locomotion by which a rapid backward movement of the whole body in the water is produced. The genus *Crangon* is the type of a family, the *Crangonidae*. The most conspicuous characteristic of the genus is the shape of the first pair of ambulatory limbs. These differ less from the rest than is usually the case, and the terminal pincer apparatus is but slightly developed. The terminal joint is small, and the projection of the second joint against which it acts is still smaller, so that the cutting edges of the pincer are transverse to the rest of the limb. The second pair of limbs have also a terminal pincer apparatus, and both the second and the third are slender. The fourth and fifth pairs are short and thick. The rostrum, the median projection of the anterior part of the carapace, is rudimentary. The line joining the attachments of the two pairs of antennae are transverse to the axis of the body. The abdomen is large. There are seven branchiae on each side.

The specific characters of *C. vulgatus*, Fabr., are the smoothness of the dorsal surface, the carapace presenting only three small spines, one median in the gastric region and one on each side on the branchiostegite. The second pair of ambulatory limbs are nearly as long as the third. The size of the adult animal is about 2½ inches. The species is abundant on sandy shores at nearly all parts of the British and Irish coasts, and is captured by nets which have a semicircular mouth, and are attached to a pole welded by a fisherman wading in the water at ebb-tide. The common shrimp is an exception to the general rule that the cuticle of Crustaceans is either red in the living animal or becomes so on boiling. The cuticle of *C. vulgatus* in the living state is light brown or almost white, and the animal

is somewhat translucent. The colour closely approximates to that of the sand on which the animal is found. After boiling the cuticle assumes its well-known brown colour. Several other species of *Cinogona* are known on the British shores, but none of them are as abundant as *C. vulgata*, and they are not captured as food. *C. vulgata* is common on the east coast of North America from North Carolina to Labrador, in the neighbourhood of New York it is used as food. The species also occurs on the west coast of America from San Diego to Alaska, and is commonly eaten at San Francisco, as also is another species, *Cinogona franciscana*, Stimpson.

The genus *Pseudosquilla*, first defined by Leach in his *Malacologie Britannica*, is chiefly distinguished by the great length of the second pair of antennae, which are longer than the whole body, the presence of a long spiny rostrum curved upwards, the total absence of pincers on the first pair of ambulatory limbs, and the great length of the second of these limbs on the left side. The ambulatory limbs are all long and slender, and the first pair are not thicker than the rest. The second pair are provided with a very small pincer apparatus. The third somite of the abdomen is large and projects upwards, so that the body has a hump-backed appearance. The serrated upper edge of the rostrum extends backwards into the median line of the carapace, half way to its posterior border. The specific characters of the species *sinuicornis* are that the rostrum is equal in length to the carapace, and that its anterior half is destitute of teeth above, with the exception of one small tooth near the apex. This species is not so abundant as *C. vulgata* and is an inhabitant of deeper water. It is taken usually for the market on the east and south coasts of Britain, and is widely distributed, occurring in Scotland, Ireland, Shetland, and Iceland. In colour it is when alive of a reddish grey with spots of deeper red, when boiled it is of a uniform deep red. This species is sometimes confounded with the common prawn, but it never reaches the size of the prawn, its adult length being 2 to 2½ inches. *P. sinuicornis* is the only species of the genus occurring in Great Britain. The common prawn when adult is above 4 inches in length. It belongs to the species *Palaemon setiferus*. In *Palaemon* the second pair of antennae are long, as in *sinuicornis*, but the first pair are much larger in the former than in the latter. In *Palaemon* both of the first two pairs of ambulatory limbs are didactyle or pincer-formed, the second pair are stronger than the first, and the left not longer than the right. Some of the smaller species of *Palaemon* are used as food and sometimes called shrimps. At Poole in Dorsetshire, according to Prof. Bell's *British Crustaceans*, *Palaemon squilloides*, Fabi., *P. varians*, Leach, and *P. leachi*, Bell, are all taken, and sold as cup shrimps.

VIII

SHROPSHIRE, or SALOP, an inland county of England, on the borders of Wales, lies between 52° 20' and 53° 4' N lat and 2° 17' and 3° 14' W long, and is bounded N by Cheshire and an interpolated portion of Flint, E by Stafford, SE by Worcester, S. by Hereford, SW by Radnor, W by Montgomery, and N.W. by Denbigh. The total area in 1880 was 844,665 acres, or about 1519 square miles.

Towards the west Shropshire partakes of the hilly scenery of the neighbouring Wales, from which several ranges are continued into it. South of the Severn on the borders of Montgomery the Breidden Hills of Lower Silurian formation rise abruptly in three peaks, of which Cefn-y-Castell, about 1300 feet high, is in Shropshire, and in the south-west there is a broad range of rough rounded hills known as Clun Forest, extending from Radnor. South and west of the Severn there are four other principal chains of hills extending from south-west to north-east—the Long Mynd (1674 feet), to the west of Church Stretton, of Cambrian formation; the Caudeo Hills, a little to the north, which cross the Severn, terminating in the isolated sugar-loaf peak of the Wiclen (1320 feet), the Wenlock Edge, to the east of Church Stretton, a sharp ridge extending for 20 miles, and in some places rising above 1000 feet, and the Cleve Hills, near the south-eastern border (Brown Cleve Hill, 1805 feet, Titterstone Cleve Hill, 1750 feet). The remainder of the county is for the most part pleasantly undulating, finely cultivated, and watered by numerous rivulets and streams. It may be said to be in the basin of the Severn, which enters the county near its centre from Montgomery, and flows eastwards to Shrewsbury, after which it turns south-eastwards to Ironbridge, and then continues in a more southerly direction past Bridgnorth, entering Worcester near Bewdley. It is navi-

gable to Shrewsbury and has connexion with the Donington, the Shropshire Union, the Shrewsbury, the Birmingham and Liverpool, and the Chester and Ellesmere Canals. Its principal tributaries within the county are—from the north the Meol (which receives the Rea), the Count, the Moel, and the Bole, and from the left the Vynny (dividing Shropshire from Montgomery), the Peaty, the Tern (which receives the Roden), the Bell, and the Wort. The Dee touches the north-western boundary of the county with Denbigh. In the south the Teme, which receives the Cin, the Onny, and the Corve, flows near the borders of Hereford, which it occasionally touches and intersects. Of the numerous lakes and pools the largest is Ellesmere (116 acres) near the borders of Denbigh. The Severn forms the boundary between the Old and the New Red Sandstone formations, which constitute the principal strata of the county. The Old Red Sandstone rocks lying to the south and west of the river are bounded and deeply interpenetrated by Cambrian and Silurian strata. There are five separate coal-fields within the county,—the Forest of Wyre, Coalbrookdale, Shrewsbury, Cleve Hills, and Oswestry. The Forest of Wyre field on the borders of Worcester rests directly on the Devonian rocks, and has a great thickness of measures, but comparatively few workable seams. The Coalbrookdale embraces an area of 28 square miles, and is triangular in form, with its base resting on the Severn and its northern apex at Newport. On its western side it is bounded partly by a great fault, which brings in the New Red Sandstone, and partly by the Silurian strata, on its eastern side it passes beneath the Feinian strata, and it is supposed that the productive measures are continued towards South Staffordshire. Its general dip is eastwards, and the strata have a vertical thickness of over 1000 feet. The organic remains include fishes, crustaceans, and molluscs. Mingled with the coal strata are several valuable courses of onestone. The original quantity of coal in the field is estimated to have been about 43 million tons, of which there are about 12 millions now remaining. Neither the Shrewsbury nor the Cleve Hills fields are of much value. The Oswestry field is small, but has some workable seams adjoining the extensive field of Denbigh. In 1884 850,000 tons of coal, valued at £286,000, were raised in Shropshire from fifty-five collieries, while 168,700 tons of iron were obtained valued at £109,285. Iron-casting forms one of the most important industries of the county. Lead mining is carried on with some success on the Shperrstones, 3788 tons of lead are being raised in 1884. The other principal minerals are iron pyrites (500 tons in 1884, valued at £250), barytes (4939 tons, worth £7395), and fire-clay (56,000 tons, worth £8475). There are also a large number of stone and lime quarries.

Manufactures—With the exception of iron, the manufactures of the county are comparatively unimportant. Bricks and tiles, earthen and china ware, and tobacco pipes are largely made in various districts. At Shrewsbury there are linen, yarn, and thread mills, and in several districts small paper-mills.

Agriculture—There is much fertile land suitable for all kinds of culture, the richest soil being that in the vicinity of the Severn, including the Vale of Shrewsbury. Much of the hilly ground, including Wenlock Edge and the Cleve Hills, admits of tillage, but a portion of the western mountainous region is of comparatively small value even for the pasturage of sheep. Out of a total area of 844,665 acres there were 716,699 in 1885 under culture, of which 150,085 were under corn crops, 61,101 under green crops, 426,859 under permanent pasture, 71,470 under rotation grasses, and 6978 fallow. The area under woods in 1881 was 45,641 acres, and in 1885 the area under orchards was 4015. Of corn crops the areas under wheat and barley were in 1885 nearly equal, 53,131 and 53,900 acres respectively, while that under oats amounted to 34,445 acres, rye to 848, beans 4645, and pease 3633. Nearly five-sixths of the area under green crops were occupied by turnips and swedes, which covered 47,119 acres, the area under potatoes being 6874, and that under mangold wurzel 4365. Horses in 1885 numbered 32,323, of which 19,377 were used solely for purposes of agriculture, cattle

(chiefly Herefords) 162,932, of which 60,976 were cows and heifers in milk or in calf and 69,865 animals between two years old, sheep (mainly Shropshire) 438,664, pigs 61,007, and poultry 369,890. In the northern districts Cheshire cheese is largely made. According to the latest *Leadenhall's Return for England* Shropshire was divided among 12,119 owners, possessing 781,341 acres at an annual value of £1,484,838, or an average value of about £1, 16s. 8d. per acre. There were 7281 proprietors or about 60 per cent who possessed less than 1 acre, and 19,675 acres were common land. The following possessed over 5000 acres each—Earl of Powis, 26,986; Duke of Cleveland, 25,604; Earl Brownlow, 20,233; Duke of Sutherland, 17,495; Lord Hill, 16,290; Lord Forester, 14,891; Lord Windsor, 10,846; Earl of Bradford, 10,515; Sir V. R. Conbet, 9459; W. O. Foster, 8547; W. L. Childs, 8490; Lord Boyne, 8424; I. Conbet, 8181.

Administration and Population.—Shropshire comprises 14 hundreds and the municipal boroughs of Bridgnorth (population, 5885 in 1881), Ludlow (5095), Oswestry (7847), Shrewsbury (26,478), and Wenlock (18,442). For parliamentary purposes the county, which was formerly shared between North and South Shropshire, was in 1885 divided into four separate divisions—North (Walsingham), North (Newport), South (Ludlow), and West (Oswestry), each returning one member. At the same time the boroughs of Bridgnorth, Wenlock, and Ludlow were merged in the county divisions to which they severally belong, but Shrewsbury continues to return one member. Shropshire contains also the following urban sanitary districts—Shrewley (population, 4468 in 1881), Dawley (9200), Ellesmere (1875), Maudley (9212), Much Wenlock (2821), Newport (2044), Wellington (6217), and Wem (10,000 in 1881). The county has one court of quarter sessions, and is divided into nineteen special sessions divisions. All the boroughs have separate courts of quarter sessions and commissions of the peace. The county contains 253 civil parishes with parishes of 87 others. Ecclesiastically it is in the dioceses of Hereford, Lichfield, and St. Asaph. The population (240,959 in 1881) in 1881 was 248,014 (124,157 males and 123,857 females). The number of persons on an acre was 0.29 and of acres to a person, 3.41.

History and Antiquities.—The British tribes inhabiting Shropshire at the time of the Romans were named by them the *Ordovices* and the *Conanvi*. It was within its boundaries that Caractacus (Caradoc) struggled against Vespasian in 51 A.D. A connected chain of military works was erected by him over the southern and western districts of the county, the most important fortresses being Caer Caradoc (where the battle was here made just stand), occupying a commanding position in the forest of Clun, and the earthwork of Hen Dunes at Old Oswestry, consisting of four or five concentric circles, still well marked. The Roman Watling Street entered Shropshire near Weston-under-Lizard in Stafford and passed in an oblique line to Leintwardine in Hereford. Various other Roman roads diverged from it in different directions. Wroxeter, a little to the west of the town, occupies the site of the ancient Roman city *Uconium*, of which a portion of the wall, originally 3 miles in circumference, still remains. Explorations made on the site of the city have revealed many interesting features of its construction, and have led to the discovery of an immense variety of remains. By some authorities the Roman *Mediolanum* is placed near Dayton and Rattumum near Wem, but the evidence in both cases is doubtful. Throughout Shropshire there are many remains of Roman camps. Under the Romans it was included in the province of *Flavia Caesariensis*. After their depauper it was annexed to the kingdom of the Saxons by Offa, who about 765 caused Watt's dyke to be erected to guard against the incursions of the Welsh, and later erected parallel with it, 2 miles to the west, the entrenchment known as Offa's dyke, which, extending from the Wye near Hereford to the parish of Mole in Flintshire, forms in some places a well-defined boundary between Shropshire and Montgomery. The greater part of the history of Shropshire is included under that of *SHREWSBURY* (q.v.). There are several important old ecclesiastical towns, including Wenlock Priory, once very wealthy, said to have been founded by St. Milburg, grand-daughter of Penda, king of the Mercians, as a college for secular priests, and changed into a priory for Clunian monks by Roger de Montgomery about 1080. Llesallish abbey, for Augustinian monks, founded in the reign of Stephen, Shrewsbury abbey, founded in 1083 in honour of St. Peter and St. Paul, Buldwas abbey, one of the finest ruins in the county, founded in 1135 for Cistercians by Roger de Clinton, bishop of Chester, and Hamglood abbey, for Augustinian canons, founded by William Fitzalan about 1138. Other remains of less consequence are those of the convent of White Ladies on St. Leonard's, a Norman structure, said to have been founded in the reign of Richard I. or John, slight traces of Wombourne priory, for Augustinian canons, founded before the reign of Henry I., Alberbury priory, for Benedictines, founded by Fulk Fitzwinn between 1220 and 1230, and Chirbury priory, founded towards the close of the 12th century. The castles of Bridgnorth (see *BRIDGNORTH*), Ludlow, and Shrewsbury are referred to in the notices of these towns, and in addition to these may be mentioned Clun Castle, which after a long siege was taken

and burnt by the Welsh prince Rees about 1196, and Boscobel House, near which Charles II. is said to have been sheltered in an oak tree. See Hartshorne, *Salopina*, 1841; Epton, *Antiquities of Shropshire*, 13 vols., 1850; Anderson, *History of Shropshire*, 1860; Blackway, *Notes of Shropshire*, 1860; *Antiquities of Shropshire* (T. F. H.).

SHROVE TUESDAY, the day preceding Ash Wednesday, or the first day of Lent, was so called as the day on which "shrift" or confession was made. Compare **CARNIVAL**. **SHUMLA** (Bulg. *Shumen*, Turk. *Shumna*), a fortified town of Bulgaria, 58 miles south-west of Silistra and in that pashalic and 50 west of Varna. The town is built within a cluster of hills which curve round it on the west and north in the shape of a horse-shoe. A rugged ravine intersects the ground longitudinally within the horse-shoe ridge. From Shumla roads radiate northwards to the Danubian fortresses of Rustchuk and Silistra and those in the Dobrudja, southwards to the passes of the Balkans, and eastwards to Varna and Balchik. Shumla is therefore one of the most important military positions to the north of Turkey, while it ranks as the third largest town in Bulgaria. Spread over a large extent of ground, each house mostly isolated in the midst of its own stables and cow-houses, Shumla has the appearance of a vast village. A broad street and *uvulet* divide the military or upper quarter, Gorn-Mahlé, from the lower quarter, Dolu-Mahlé. The latter, dirty and unhealthy, intersected by a labyrinth of lanes, is inhabited mostly by Christians and Jews. The Armenians possess a small church, and each of the two Bulgarian quarters has its temple. The houses of the Gorn-Mahlé, occupied chiefly by Turks, stand pleasantly embowered each in its flower and fruit garden. Gorn-Mahlé has preserved the old church of the Resurrection. In the Dolu-Mahlé is the new church of St. Cyril, a fine basilica adorned with a peastyle. The Bulgarian community possesses two boys' and two girls' schools, giving instruction superior to that obtainable at the primary Turkish school. In the upper part of the town is the magnificent mausoleum of Jézani Hassan Pasha, who in the 18th century enlarged the fortifications of Shumla. The principal mosque, with a cupola of very interesting architecture, forms the centre of the Moslem quarter. At the farther end of the town, isolated on a hill, is a large military hospital. The population of Shumla in 1881 was 23,093, exclusive of the garrison. The town is renowned for its manufacture of red and yellow shippers, ready-made clothes, richly embroidered dresses for females, and its copper and tin wares. It also rears silk-worms, spins silk, and carries on an important trade in grain and wine. The branch railway from Shumla to Kasapjan, 9½ miles, to connect the town with the Rustchuk-Varna Railway, though commenced in 1870, was not finished in 1886.

In 1811 Shumla was burned by the emperor Nicholas, and in 1087 was besieged by Alexius. In 1388 the sultan Murad I. forced the castle to surrender, and thence till the 17th century Shumla disappears from history. In the 18th century it was enlarged and fortified. Three times—1774, 1810, and 1828—it was unsuccessfully attacked by Russian armies. The Turks consequently gave it the name of *Gaz* ("Victorious"). But on 22d June 1878 Shumla capitulated to the Russians. The treaty of Berlin stipulated the demolition of the fortifications, but this article has not been executed, and Bulgarian troops garrison the fort.

See F. Kautz, *La Bulgarie pendant* (1882); II. C. Barclay, *Bulgaria in 1878*; *The War* (1877), and *Between the Danube and Black Sea* (1876); J. C. B. and C. A. St. Clair, *Readings in Bulgaria* (1880); J. L. Fawcett, *New Bulgaria* (1880); and J. G. Munchin, *Bulgaria since the War* (1885).

SHUSHA, a town, formerly a fortress, of Russia, in the Caucasian government of Elisabethopol, lies in 39° 46' N. lat. and 46° 25' E. long., 230 miles south-east of Tiflis, on an isolated rocky eminence, 3860 feet high. The town, which is accessible only on one side, occupies but a small part of the plateau, whence there is a splendid view over the surrounding mountain gorges and defiles. In 1873 the population was 24,552 (males 13,666, females 10,886), of whom 13,504 were Armenians and 10,804

Tatars. Instead of flat earthen roofs, as in most other towns of Transcaucasia, the houses have very high steep roofs, covered with shingle. The streets are sinuous, and are intersected by ravines. Shusha was formerly the capital of the Khanate of Karabagh. The town is locally renowned for its carpet manufactures, and the district for its excellent breed of Karabagh horses.

The fortress, founded in 1759 by Fatah Khan has a wall on one side, and is defended naturally on the other three sides. In 1795 Shusha successfully withstood a siege by Agha Mohammed of Persia, but was constrained to surrender two years afterwards. In 1805 Ibrahim Khan of Karabagh invoked the protection of Russia, but the annexation was completed only in 1822. The present district of Shusha (2934 square miles) forms only a part of the former Khanate of Karabagh. In 1873 it had (exclusive of Shusha) a population of 80,913 (males 45,169, females 35,750). Armenians numbering 43,562 and Tatars 37,351. Agriculture and cattle-breeding are almost the sole occupations of the inhabitants. General culture is very low; there is no enterprise, and but inadequate security for his and property.

SHUSTAR, or SHUSTAR, SHUSHTAR (Arab. *Tostan*), once a flourishing provincial capital of Persia, is now a comparatively unimportant town of 6000 inhabitants,—exclusive, however, of the Bakhtiārs, who during the winter months encamp with their flocks and herds in the immediate vicinity. It is situated (32° 3' 30" N lat and 48° 52' E long.) at the foot of an offshoot of the Bakhtiān Mountains in the north-west of Khuzistān, and just below the point in the Kārdn (Dojāl or Little Tigris) where—the main stream running westwards—a cutting of 70 feet deep has been made through the natural rock for an easterly branch. Thence the two streams, enclosing a wide alluvial tract, of which Shustar is the crown, follow independent courses until they reunite some 40 miles to the south. According to Lieutenant Selby, I.N., who ascended the Kārdn from Muhāmrah (Mohammara) in 1842 by the Shutat (or main stream on the west) to within 6 miles, and further tested the navigation of the Ab-i-Gargar (or eastern channel) to within 1 mile, of Shustar, the town is built on a small hill which rises gradually from the south-west and increases in elevation to the citadel, which presents on the north-eastern side an abrupt face of about 150 feet in length, leaving the river immediately beneath. Mr Loftus, who visited Shustar some eight years after Lieutenant Selby, gives an account of the two great dams thrown across the river,—the "Band-i-Mizān" over the natural course, the "Band-i-Kansar" over the artificially diverted branch. About a mile below the latter is a similar work of more recent and more solid and substantial construction, called the "Pāi," or bridge of Delatā. Legend ascribes these ancient works to Shāhpūr I and his captive the emperor Valerian. In 1875, and again in 1878, Mr Mackenzie visited Shustar, he speaks of the town as being in a wretchedly decayed and filthy condition. The houses are of stone, some few good, with underground rooms (*sardābs* or *sh' zamān*) excavated to a depth of two stories below the ground level. In these relief is obtained from the intense summer heat. The traffic of the bazaar, which is a poor one, seemed to depend chiefly on the Ilyāts or wandering tribes. The inhabitants—for the most part Arabs and Sāyids—have a reputation for hospitality.

Some writers have identified Shūshār with Susa (Shushan of the Bible), the capital of Susiana and a residence of the Achemenid kings. The true site of the latter, however, as Loftus's explorations showed, is at Shīsh, a walled square run 30 or 40 miles to the north-west. On the other side of Shustar is the locally classic ground of Bām Roimuz. In fact, of the whole neighbourhood Sir H. Rawlinson writes that it "still requires elaborate exploration, and would well repay any traveller who would devote six months to examining the ruins and carefully copying the inscriptions."

The river Kārdn, which rises in the Bakhtiān Mountains and passes down the broad Shattir-i-'Arab, joins the Tigris and Euphrates. It has been declared by many and trustworthy authorities to be well adapted for steam navigation—save as regards one obstacle at Ahwaz, removable at little cost—from its mouth to the near

neighbourhood of Shusta. Thence to Isfahan the land journey would be shorter than from Bushahr (Bushine) to that city by 200 miles.

SHUYA, one of the chief centres of the cotton industry in middle Russia, is a district town in the government of Vladimir, 68 miles north-east of the town of Vladimir. A branch railway connects it with the Novki station of the railway from Moscow to Nijni-Novgorod. The town is built on the high left bank of the navigable Teza, a tributary of the Klamza, with two suburbs on the right bank. Annals mention prices of Shuya in 1403. Its first linen manufactures were established in 1755, but in 1800 its population did not exceed 1500. Its growth began only with the development of the cotton industry in central Russia, and since then has been rapid; in 1882 it had 19,560 inhabitants, as against 10,440 in 1870. Of these about 10,000 live by the manufactures, and only a few keep to agriculture and gardening. In 1881 the output of twelve cotton-mills was valued at £442,160 for various cotton stuffs and £48,000 for cotton yarn. Tanneries, especially for the preparation of sheep-skins—widely renowned throughout Russia—still maintain their importance, although this industry has migrated to a great extent to the country districts. The products of its manufactures are chiefly sent to Moscow and Nijni-Novgorod. The town is mainly built of wood. Its cathedral (1799) is a large building, with five gilt cupolas. Shuya has also two gymnasia, for boys and girls, besides a progymnasium for girls, and several secondary and primary schools.

The surrounding district is also important for its manufactures. The village of Ivanovo-Voznesensk, north of Shuya, with a population of more than 19,000 inhabitants, employed 11,329 workmen in its 39 manufactures in 1881, and showed a return of £1,989,950 (£1,700,000 for cottons and the remainder for chemicals and machinery). Tekovo and Kokhma are two other centres of manufacture,—the whole production of the manufactures within the district (exclusive of Shuya and Ivanovo) being estimated at £430,000. These figures, of course, do not include any statistics of the petty trades earned on side by side with agriculture. Nearly every village has a specialty of its own,—bucks, pottery (Menshchikovo), wheels, toys, packing-boxes, looms and other weaving implements, house furniture, shoes, combs, boots, gloves, felt goods, candles, and so on. The manufactures of linen and cotton in villages, as well as the preparation and manufacture of sheepskins and furs, occupies about 40,000 peasants. The Shuya merchants carry on an active trade in these products all over Russia, and in coin, spirits, salt, and other food stuffs, which are imported to a great extent. In 1880 the imported goods reached 1,618,000 cwt. (£1,208,000 by rail), and the exports 1,818,000 cwt., chiefly by the Teza.

SHWE-GYENG, a district of British Burma, in the Tenasserim division, containing an area of 5567 square miles, and lying in the valley of the Tsai-toung (Stoung) river. It is bounded on the N. by Toung-gut district, on the E. by the Pong-loung Hills and the Salwin Hill Tracts, on the S. by Amherst district, and on the W. by the Pegu Yoma Hills. The boundaries have more than once been altered, the last change having taken place in 1877. The aspect of the country is mountainous, especially in the north. The Tsai-toung is navigable throughout its entire length in the district by large boats and steam-launches. Shwe-gyeng has never been accurately surveyed from a geological point of view, but it is supposed to be rich in minerals. Gold is found in most of the affluents of the river Shwe-gyeng, copper, lead, tin, and coal also exist, but are not worked. Except in the hills, the climate is generally healthy, the average annual rainfall at Shwe-gyeng station is 144 inches.

In 1881 the population of the district was 171,144 (89,687 males and 81,457 females), of whom Hindus numbered 968, Mohammedans 856, Buddhists 158,149, and Christians 1250. The only town with more than 5000 inhabitants is Shwe-gyeng, the capital and headquarters of the district, which was founded during the 18th century, before the Burmese conquest, by Alompra. It is situated at the junction of the Shwe-gyeng with the Tsai-toung, and had a population of 7519 in 1881. Only 187 square miles of the district were cultivated in 1883-84, the cultivated area is, however, gradually

extending, and there are some 3474 square miles capable of cultivation. The principal crop is rice, of which twenty-five different kinds are grown; other products are cotton, betel-nuts, tobacco, and sugar-cane. The only industries are potteries, salt-making, and silk-spinning. In 1883-84 the total revenue amounted to £38,378, of which the land-tax contributed £15,367.

SIALKOT, or SEALKOTE, a district of British India, in the Amritsar division of the lieutenant-governorship of the Punjab, with an area of 1959 square miles. It lies between $31^{\circ} 44'$ and $32^{\circ} 50'$ N lat and $74^{\circ} 19'$ and $75^{\circ} 3' E$ long, and is bounded on the N.E. by the Jammu state of Kashmir, on the N.W. by the Chenab, on the E. by Gurdaspur, on the S.E. by the Ravi, and on the W. by Lahore and Gujranwala. Sialkot is an oblong tract of country occupying the submontane portion of the Rechna (Ravi-Chenab) Doab, and is fringed on either side by a line of fresh alluvial soil, above which rise the high banks that form the limits of the river-beds. The Degh, which rises in the Jammu Hills, traverses the district parallel to the Ravi, and is likewise fringed by low alluvial soil. The north-eastern boundary of Sialkot is 20 miles distant from the outer line of the Himalayas, but about midway between the Ravi and the Chenab is a high dorsal tract, extending from beyond the border and stretching far into the district. Sialkot is above the average of the Punjab in fertility—three-fourths of its area have already been brought under the plough, and a third of the remainder is reported to be capable of improvement. The upper portion of the district is very productive, but the southern portion, farther removed from the influence of the rains, shows a marked decrease of fertility. The district is also watered by numerous small torrents, and several swamps or *jhils*, scattered over the face of the country, are of considerable value as reservoirs of surplus water for purposes of irrigation. Sialkot is reputed to be healthy, it is free from excessive heat, judged by the common standard of the Punjab, and its average annual rainfall is about 37 inches.

The district possesses a total length of 760 miles of road, and a branch line of the Punjab Northern State Railway, from Wazirabad in the north-west corner of the district to Sialkot town (23 miles), was opened in January 1884. In 1881 the population was 1,012,148 (males 539,861, females 472,487), of whom Mohammedans numbered 669,712, Hindus 299,811, Sikhs 40,195, and Christians 1585. The only town of any importance is SIALKOT (*q.v.*). The principal agricultural products of the district are wheat, barley, rice, maize, millets, pulses, oil-seeds, sugar-cane, cotton, and vegetables. The local commerce centres in the town of Sialkot, which gathers into it hazards more than half the raw produce of the district. Its surplus stock finds a ready outlet in the markets of Lahore and Amritsar, while the great rivers on either side form natural channels of communication with the lower parts of the Punjab. The native manufactures comprise silk, saddlery, shawl-edging, coarse chintzes, pottery, brass vessels, country cloth, cutlery, and paper. The gross revenue of the district in 1883-84 amounted to £146,531, of which the land-tax contributed £111,718.

The early history of Sialkot is closely interwoven with that of the rest of the Punjab. It was annexed by the British after the Second Sikh War in 1849, since then its area has been considerably reduced, assuming its present proportions in 1867. During the mutiny of 1857 the native troops stationed in the cantonments of Sialkot besieged the European residents in the fort, and remained masters of the whole district; they also plundered the treasury and destroyed all the records.

SIALKOT, the capital and administrative headquarters of the above district, is situated in $32^{\circ} 31'$ N lat and $74^{\circ} 36'$ E long, on the northern bank of the Aik torrent. It is an extensive city with handsome and well-built streets, and contains several shrines and buildings of historical interest. In 1881 its population was 39,613.

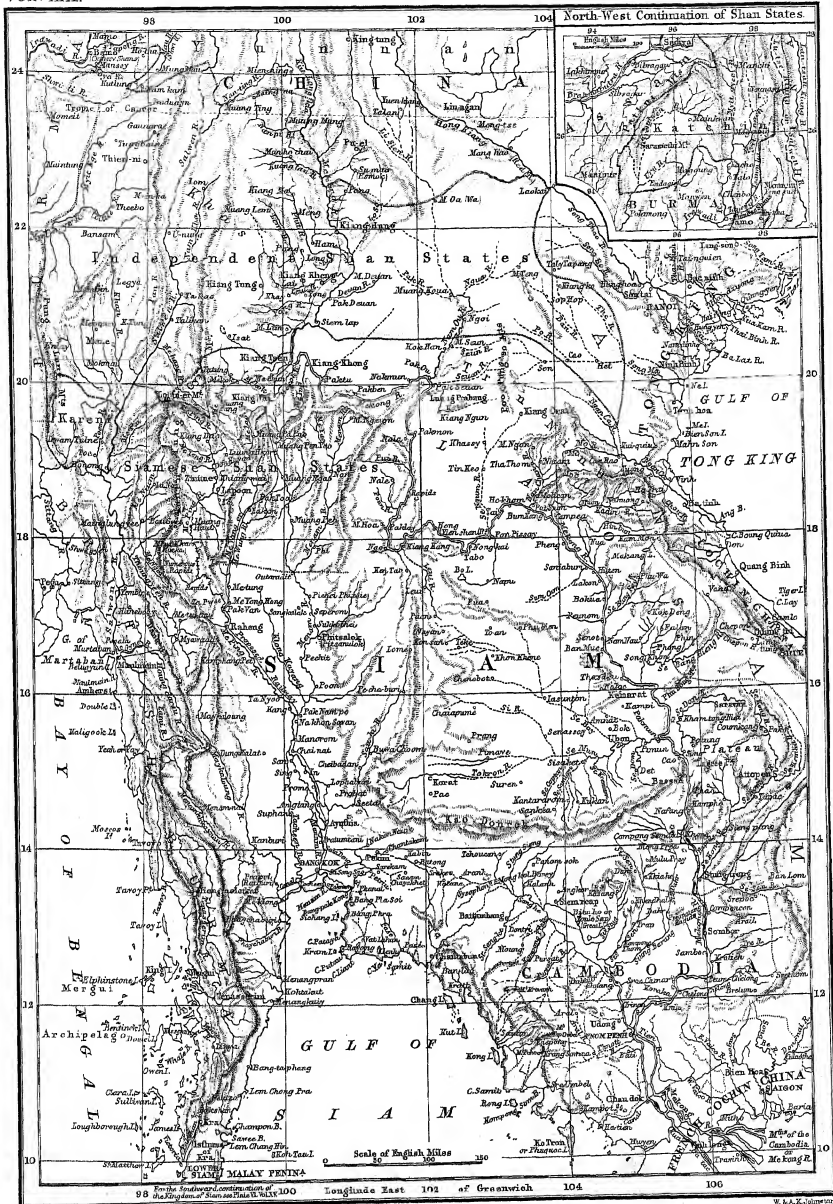

SIAM¹ The kingdom of Siam embraces the greater part of the Indo-Chinese and part of the Malay peninsula. On the north-west the river Salween separates it from Kae-n-see, southwards thence the river Toon-gyeen; then, from the Three Pagodas in $18^{\circ} 15'$ N lat, down to the Pak-cha river in 10° N lat, the principal watershed

separates it from Pegu and Tenasserim. Its seaboard on the Bay of Bengal extends from the Pak-cha river to Wellesley Province in $5^{\circ} 30'$ N lat, but the islands along the coast are British. On the other (east) side of the peninsula the territory extends to $4^{\circ} 35'$ N lat, or, if the vassal state of Pahang is included, to Johore in about $2^{\circ} 30'$ N lat. On the east side of the Gulf of Siam the frontier line (according to the Siamese authorities, in *cl. Plate IX*) starts from the Bay of Compang Som in $103^{\circ} 20'$ E long, and runs north inland to Mount Pang-chak, thence, after crossing Tonle-sap Lake, east across the Mekong to the crests of the range which separates the Mekong valley from Anam. It then follows this range north, including the country north-east of Luang Prabang, to the frontiers of Tongking. Thence it runs west-south-west, separating the tributary from the independent or Burmese Shan states, and meets the Salwin in about 20° N lat.

The great natural and economical centre of Siam is the River delta of the Me-ma river, which is annually flooded between June and November, the waters attaining their greatest height in August. The inundation covers several thousand square miles, so that the capacity for production of rice, which furnishes two-thirds of the entire exports, is almost unlimited, but is very partially developed both from scarcity of population and want of means of transport, mills, and better cultivation. Irrigation channels are, however, cut above the point where the creeks naturally cease by some of the small Chinese settlers. The bas formed at the mouth of this and of the other converging rivers—the Tachin, the Me-kong, and the Pechaburi on the west, and the Khaiyok on the east—extends right across the upper end of the gulf, and has 12 or 13 feet of water at high water. The yearly encroachment of the land on the sea is considerable, and the entire delta from Chem-nat in $15^{\circ} 20'$ N lat downwards has probably been formed in comparatively recent times. At Bangkok sea-shells are found 20 feet below the surface. The Tachin, the first great branch of the Me-ma, joins its right bank above Chem-nat, below this the main stream anastomoses naturally or by canals freely, the banks of the different channels being densely populated. Above Chem-nat the Me-ma continues deep and navigable up to the junction of the Pak-nam Pho, its east branch being formed by several important affluents from the north-east. The west branch of the Me-ma is formed mainly by two affluents, the Me-wang and the Me-ming, which flow down through the west Laos states, some of whose chief towns are situated on their banks. In this more elevated region the hill ranges, with a general north-south direction, ramify widely, using in places to from 6000 to 8000 feet, while the valleys between them widen out into great fertile plains, having the appearance of former lake-basins—a view which coincides with ancient local traditions. On the west frontier the rapid and broken stream of the Toon-gyeen, whose tributary valleys on the Siamese side produce valuable teak and cinnamon, flows from a mass of latite, south of which the central range consists of granite, with syenite and quartzose rocks. Its spurs (6000 feet high) extending in every direction, of sandstones, Carboniferous limestones, and other Secondary formations, are clothed with sappan and other forest trees, and contain probably gold, besides argentiferous lead, tin, coal, and iron, the latter in nodules of clay oxide and brown hematite. On the west of the Gulf of Siam, as far south as 11° N lat, is a dry barren region, enclosed between two ranges which intercept the rainfall on either side, but farther south are luxuriant damp forests containing *Hopea* (wood-oil), iron-wood, &c., with occasional clearings for cultivation, and many rivers with wide mouths, but becoming mere streams higher up.

In about $10^{\circ} 30'$ N lat the Malay peninsula is narrowed

¹ Compare MALAY PENINSULA, also SHAN, LAOS, and CAMBODIA.

by a river at either side to a width of only 27 miles, and there a survey for a canal has been made, the maximum height of the section is 250 feet, the mean 130, the amount of excavation is estimated at 84 million cubic feet, mostly through hard rock, and the cost at £20,000,000. But the approaches by the river-mouths on both sides are intricate and bad. Thus has lately been the chief route across the peninsula, but there are other breaks in the range which form the backbone of the peninsula, and the Buddhist propaganda is said to have crossed by the isthmus of Ligor. Here, however—perhaps, properly speaking, in Junk Ceylon Island—is the real termination of the great range which comes down unbroken from Yun-nan, separating the Salwin and the Me-nam valleys.

Eastern Siam. East from the plan of the Me-nam, and separating it from the Me-kong valley, a plateau rises with very gradual ascent, clothed to a width of from 30 to 50 miles with forest. From its east side several large and partly navigable rivers flow towards the Me-kong through a sandy and for the most part arid plain, with stunted growth of scabrous trees and bamboos, brushwood and grass, but on the lower courses of some of these streams are rich irrigated tracts, producing rice, bananas, sugar, maize, and the usual tropical vegetables. The whole region is very unhealthy, especially in the wet season. Traveling would hardly be possible without elephants, of which some are kept in every village. The rocks are mostly calcareous or sandstone, and at the south edge of the plateau conks and recent shells at a slight depth show the former limits of the land. Farther north the mountains of Puchaboun and Lom are rich in magnetic iron ore, argenticiferous copper, antimony, and tin. Only the first-named is worked to any extent, and, though by very primitive methods, a large quantity of tools and weapons are manufactured. From the south of the plateau a range sweeps round to the south-east into Cambodia, outliers from which are the two peaks north and east from Chantaboun, the latter noted for its emeralds, topazes, and sapphires. Isolated hills, apparently volcanic, occur, as the sacred Mount Phrabat, to the north-east of Ayuthia, where there are hot springs and a famous footpath of the Bhuddists, and the conical hills at Pechaburi in the south-west, consisting of lavas, scoria, and trachytic rocks, abounding in caverns elaborately fitted as temples.

Mienmek. Tin is extensively distributed, especially throughout the Malay peninsula, where it is worked at Bang-ta-phang in the province of Chumphon, at Chaya and Chalang, also on the Me-kong, at Kan-bun, and at Haysa. Gold is found pretty extensively in Tringnam and Phalang, there are mines at Bang-ta-phang, and it is extracted in the Me-kong valley by washing or with mercury. Most of it is consumed in trinkets and presents given by the king,—gold leaf being imported from China for gilding pagodas, &c. Iron abounds in the east, as at Lom and Mula Peta, antimony at Rapi, lead at Pak-jiruk and Suiphan, silver in the Me-pik valley. Both the lead and copper ores are often argentiferous.

Climatic. Much of the natural rainfall in Siam is intercepted by the high lands of the Malacca peninsula and by the mountains on the north-west and north, while the proximity of the Gulf of Siam tempers the heat. The rainfall at Bangkok on an average of ten years is 67.04 inches, of which 50.69 inches fall from May to October inclusive.¹ The mean annual temperature is 80° F., varying from 71° S. in December to 83° F. in April; the lowest recorded absolute minimum was 67° F. in December 1866, the highest recorded absolute maximum 97° F. in May 1867. The north-east monsoon begins to blow early in November, preceded by a month of variable weather. It has lost half its force in January, and by March strong south and south-east winds have set in, the south-west monsoon blowing then steadily and strongly till September. Thus there are three seasons of four months each,—the hot, rainy, and cold.

Fauna. As to general features, the fauna of Siam is identical with that of Burmah and of southern China, and is one of the richest in the world. Elephants are very numerous in the south and east, but

are not found so far north as in India. They are as intelligent as the Indian, but usually less highly trained. White (alino) monkeys are sacred, as are the elephant, an iguana which lives in the house and kills rats and other vermin, and the crow, white ants' nests are respected as resembling pagodas, so that libraries are often kept in tanks to escape the ants' ravages.

The flora is very similar in character to that of Burmah and has flora much in common with the Chinese, the transition, however, is almost insensible. The coast region is characterized by mangroves, pandanus, rattans, and similar palms with long flexible stems, and the middle region by the great rice-fields, the cocoa-nut, and areca palms, and the usual tropical plants of culture. In the temperate uplands of the interior, as about Luang Prabang, Himalayan and Japanese species occur,—oaks, pines, chestnuts, peach and great apple trees, isophorus, myrica, honeysuckle, waxes, stagfoss, *Culcas acer*, artemesias, and *Volucias*, there are many valuable medicinal trees,—teak, sappan, eagle-wood, wood-ool (*Hopex*), and other *Dryas oenopneus*, *Cela alacea*, *Pter oenopneus*, *Xylin*, non-wood, and other dye-woods and resinous trees, these last forming in many districts a large proportion of the more open forests, with an undergrowth of bamboo.

Numerous caravans of cattle, horse, mules, and porters pass Thae annually from Yun-nan (north-east China) to the north-east (Siam). Shan states, whence many of them proceed via Cheng-mai to Mou-lam (Moulmein). They bring from China silk goods, tea, opium, and brass wares, and take back raw cotton, deer and rhinoceros horns, ivory, and saltpetre. The northern states, which are a great breeding-ground for cattle and ponies—elephants too are exported into Burmah—and down teak and other produce. The proposed railway from Mou-lam via Myittha to the Chinese frontier, and thence to sea, 190 miles from the Chinese frontier, is intended to stimulate not only the traffic with China but the local resources (see address by Mr. Holt Hallett, C.B., in *London Chamber of Commerce Journal*, 5th May 1885). The eastern states, comprising nearly half the area and a considerable part of the wealth of the Kingdom, send much produce via Koat to Bangkok. They produce chiefly China grass (*Chenopodium murale*), sugar, indigo, salt, lac, and cotton. The *Chenopodium* (a substitute for betel), beeswax, benzoin, lac, iron, lime, sulphur, salt, coarse pottery, mats, lutes, hides, and bones, horns, and tusks of elephants, rhinoceroses, and boars. European cottons and hardware and Chinese goods penetrate everywhere, the chief entrepôts being Nangkok in the east and Cheng-mai in the west. The eastern plains produce alternate crops of rice and salt. The rains dissolve the salt in the soil and wash it down, making it easy to evaporate. In the dry season the salt comes to the surface in very dry up from the surface. Much alcohol is distilled and consumed. Vast quantities (6900 to 7900 tons) of dried fish are prepared at Lake Tonle-sap, and at fisheries on the coast.² Although silk has been known from remote antiquity, it is produced exclusively by the Lao communities settled throughout the country,—the chief centres being Koat and Bhatkumpung. The export in 1884 was 825 cwt., exports valued at £19,890, but the best quality hardly reaches the Bangkok and market, its natural bright yellow colour making it difficult to dye. There is, however, not much of it, the demand for the better kinds being supplied from Cambodia. But for the apathy and indolence of the people the production might be largely increased, the spinning and reeling apparatus too are very primitive, though some beautiful cloths are woven at Cheng-mai. Much of the trade in teak and cattle is worked by Burmese, otherwise almost all the trade of the country is in Chinese hands. In some of the remoter districts barter is resorted to, beeswax, salt, lac, and has of non being mediums of exchange; but generally money is used, and sometimes Indian rupees. Civilization increases in the eastern districts as the frontier of China is approached. In 1884 419 vessels cleared from Bangkok with cargoes valued at £27,170, of these 240 (tonnage, 151,884) were British. In addition, there were 143 trucks (tonnage, 38,560). The total value of the exports was £2,332,240, viz. better the principal item, £1,444,200. The imports were valued at £1,044,255, the chief items being—grey and white shirtings, £161,997, opium (704 chests), £81,410, chowls, &c., shawls, a cotton cloth from Bombay, £105,264. In 1885 the exports were valued at £1,907,006 and the imports at £1,380,233. The exports being in excess of the imports, the difference is paid in Mexican dollars, which are melted down and re-coined,—the silver coinage being the standard of weight.

The money and weights seem to be the same as the Old Cam-Couage bodhan. A copper coinage has replaced the cowries, and there is also a silver coinage, viz. the *huang*=71 cents, the *silang*=15 cents, weights the *bat* or *tikal*=60 cents or half a crown, 5 *tikals*=8 Mexican dollars. From the *tikal* upwards these coins are also used as measures of weight. Thus 1 *tikal* weighs 144 grains, 1 *huang* 250 grains, 4 *tikals*=1 *tanlung*, 20 *tanlung*=1 *chang* or catty, or two Chinese catties, =3.2 lb. There are a few gold coins, but not

¹ But on the neighbouring ranges the fall is, at Mou-lam 144 inches, at Tavoy 202, at Mergui 185.

² During the floods vast quantities of fish swarm into the rice-grounds and are caught when the water recedes, furnishing a valuable and abundant food-supply.

tion, which in many of these southern towns is much mixed Pechani, the port of Bangkok, 3 miles from the river's mouth, is fortified, as is Pakiet Lang, 5 miles higher up, which is inhabited chiefly by Peguans. Villages cannot extend hence across the delta towards the Mekong. Nearer its mouth is the town of Meiklong, peopled by Chinese merchants, Indians, and gaudians. Higher up the river, at the foot of the hills, is Papi, peopled by descendants of Cambodian captives. Pechaburi, a little to the south, at the foot of a range some 1500 feet high, where the king has a palace, is built after English designs; its inhabitants are Peguans. Penru, on the east side of the Gulf of Siam, on the Khiaiyok river, has sugar plantations cultivated by Chinese. At Bangkhuang, at the mouth of the river, are extensive fisheries. Bangkok contains 800 miles of the river, and possesses docks, and there a good many tank ships are built. In the Lao or Siam country to the north Chiang-mai (Zimma) is the most important tributary state. Its capital, Chiang-mai, the Jangmai of early European travellers, is the principal town of that region, with broad streets of good teak-built houses, surrounded by gardens, numerous pagodas, markets, and a large population. It lies in the wide fertile valley of the Me-kung, and is a great entrepot of trade from Bangkok and south-west China (Yunnan and Siam), which finds its natural outlet thence to the Bay of Bengal. The rice, timber, &c., of the districts through which this route passes are considerable. Laping, in the same valley, and Lagong, on a neighbouring tributary, are Lao towns of less importance and subordinate to Chiang-mai, as are formerly Nan and Phe, fertile teak-producing valleys to the east. Kiang-mai and Kiang-seng, to the north, on the Salween, are the old Lao capitals of note (see Siam), as was Luang Prabang, with its charming capital, which, like Chiang-mai, still retains some administrative independence. The extensive fertile and partly wooded plains to the north and east support great herds of cattle. With Yuen-chang, a little lower down the river, Luang Prabang held its own for centuries against both Siam and Burmah. On the destruction of Yuen-chang in 1823, Bangkok, 23 miles lower down, increased in size and importance, and now has an extensive trade in English and Chinese goods. This district might perhaps without much difficulty be opened up by an easy route starting from Lakhon, only 100 miles distant from the sea. One of the most important provincial centres is the district of Koat, on the eastern plateau. The country is a series of fertile oases, separated by tracts of waterless forest, containing good timber, and full of game. The town is fortified, and has about thirty pagodas. The country is well cultivated, belonging to the Chinese merchants. Coat roads converge hither with the traffic both of north Laos and of the Cambodian provinces south and east, the latter passing up the fertile Monn valley on its way to Bangkok. The whole region between the Dang-ik Mountains and the Monn river is full of splendid ruins, attesting the former Cambodian influence as far at least as 16° north, to which limit, therefore, the southward movement of the Laos may be supposed to have reached at the end of these buildings. The principal ruins of the district are found at Koat, Bassac, Phnum, and Kuchan. The character of this wonderful series of buildings, the greatest of which, those of Angkor, are on Siamese territory, have been touched on under CAMBODIA (p. 1), to which they properly belong; but it may be mentioned here that the earliest inscription yet found, relating to the erection of a Sivite lingam, is interpreted as belonging to 583 years = 697 A.D., though another, undated, refers to three generations on only. The earliest reference unambiguously Buddhist that have been found are the centuries later than this.

Education

With the exception of a few schools in the capital, education is entirely in the hands of the priests, the boys going to the temples between the ages of eight or nine and thirteen. The teaching is elementary, and, by the precepts of Buddhism, must be gratuitous, the pupils repaying it by manual services in house or boat or garden, or by presents of food. At thirteen the boy enters on a novitiate, which lasts till the age of twenty-one, but, if not inclined for strictly, he may give it up after three or four months,—this temporary consecration symbolizing a separation from the world. At twenty-one, if so disposed, he may enter the priesthood, but there are no perpetual vows. Girls are taught, if at all, only at home, by parents or brothers. There are no educational endowments, but a certain number of persons occupy themselves with literary studies, as history, astrology, or alchemy, with which medicine is inseparably combined. Medical practice, indeed, comprises a good deal of magic; but there is also considerable knowledge of medicinal herbs, and ancient medical works were written in Pali. Inoculation was long ago introduced by the Chinese, and vaccination lately by European missionaries. Women after childbirth are exposed for some time to the heat of a strong fire, the result being sometimes fatal.

Arts.

Skill is shown in the casting of large metal statues 50 feet high or more, in repoussé work in gold and silver, in enamelling on metals, and in gold and silver lacquer work. Their drawing is spirited, but strictly conventional. The system of music is elaborate, but with no written notation. There is no harmony, but all the instruments of the orchestra play in unison, breaking off into

variations and then returning to the air. They are proud of their national music, and both men and women play and sing equally. Their instruments are—a lamnongon with wooden or metal bars struck with a hammer, a two-stringed and a three-stringed violin, flutes, drums, and pipes, also the Lao "organ," the tones of which, produced by metal tongues in the pipes, are very effective.

The Buddhism of Siam is the same as that of Cochin, but slight religious doctrinal differences, much insisted on, from the Buddha. It is, however, professed in its purity by very few. The religious reform initiated by King Phra Mongkut, himself for many years a priest, has divided the people of the capital into two sects,—the reformist, known as Dhammayut, and the older or unenlightened, Phra Mah Nikan. The former attach more weight to the observance of the canon than to meditation. The latter, on the other hand, divided into two parties, the one holding more to meditation, the other to the study of the scriptures. The only Buddhist temple remaining in the country is at Bangkok, and its priests are said to be of Indian descent. Brahmins, however, are constantly employed in divination, in fixing the fortunate days for warlike expeditions, business transactions, marriages, and the like, and in arranging festivals. Buddhism is corrupted by a general vulgar notion of propitiation of nats or phias (spirits or demons), superstition in the more remote districts constitutes practically the only religion. The belief in these spirits informs and affects every department of life. There are local evil divinities to whom temples or shrines are erected. Others with human or animal form dwell in the water. Others cause children to sicken and die. Others wound and destroy as snakes do. By certain spells women can become tigers or vengeful. Brides of the dead are sometimes possessed, and they are carried out not by the door but by an extemporized opening, so that they may not be able to find their way back. The numerous offerings and honors paid to these spirits lead to drunkenness and to killing of animals in sacrifice. Phialie worship prevails to a considerable extent, notwithstanding the efforts of the king to put it down. A female incarnation of deity, the Nang Tim, is found in one or two temples in Laos. Pilgrimages are frequently made to sacred places with Indian names (all the chief towns, indeed, have an official Indian name). Many of the figures and designs employed in the ornamentation of houses are really talismans intended to avert evil. The temples, with their surrounding monastic establishments, form a conspicuous feature everywhere. Some are very extensive, covering altogether an area of 150 acres. At Nakhon Phanom, for example, the main quarters are the existing buildings reserved by seven generations of "acquiring merit." The temples (*wats*) hold very little landed or house property, but, where they have been built or repaired by the king, or presented to him by some high official, they enjoy a small income chargeable on the revenues of the district, besides receiving presents from the king when he visits them in state. The priests of such temples are bound in return to give them services at state ceremonies, and then similar affairs, such as the repairs of temples and disciplinary matters, are administered by a special department of state. There remain now at Bangkok only two communities of nuns, who are employed in the service of the temples, and are allowed to receive voluntary offerings.

The numerous public festivals are partly connected with religion, Festivals.

but are accompanied with much rejoicing and amusement. Among them are the *lun* and the fixed New-Year's Day, and the festival of agriculture, when the plough is guided by the minister, the ladies of the court following and sowing seeds, which are picked up by the people to add to their usual savings. At the ceremony at which the king and his ministers pledge themselves, the former to administer impartial justice, the latter to be faithful and loyal in their service, the oath is taken by drinking water, and the meeting of the king and nobles, with all the attendants, in a gala, comes a gorgeous spectacle, the day terminating with fireworks and processions of boats. On the king's state visits to the *wats* there are festive processions of boats and troops. Other festivals are at the beginning and end of the rainy season. When the floods begin to subside there is a great *wata* procession, and the priests command the *watas* to retire. Even the entering of the king's ban is made an occasion for rejoicing. In every family the entering, at the age of twelve or thirteen, of the first-born son on the day of the great ceremony, is not practised, except by way of imitation, among the Laos. The head is considered very sacred (this is a characteristic Pagan notion), no one must touch it, nor may it be raised above that of a superior, as in a carriage or boat. The funeral ceremonies of a prince or great man, often delayed for some months after death, are also attended by elaborate feasting, dancing, and other amusements in temporary buildings erected for the purpose. At the death of a man, with the exception of the poor, whose bodies are given to the widows and wild beasts, and women who die in childbirth, are usually buried within the *wats*, the ashes being preserved, or mixed with lime to plaster the sacred walls. A rich man will often bequeath a limb to the buds and beasts.

The Siamese month is lunar, and, as a lunar month contains 29½ Calendar days, they give the odd months 29 and the even 30. This gives

frequently swelled by the enumeration of single fables which are but parts of larger collections.

The number of works on law is considerable, and it is remarkable that, while in Burmah many Pali codes have currency, not a single Pali text-book on law should have been discovered in Siam, all that we meet with in the law books are a few Pali quotations here and there. *Laksana Pha Thammawat Laksana Pha Jha*, an introduction to the code of Siamese laws, founded on the Dharmaguttra and on royal edicts, was completed in 1804. It contains thirty books, at the head of which stands the *Pha Thammawat*, attributed to Manosha or Manu, a treatise on the classification of laws. Next comes the *Indiraphat*, or book of India, a guide or exhortation to counsellors and judges, and then the *Pha Thammawat*, or rules for the general conduct of judicial business. Then follow in order the undesignated sections—disputes, plants and allegations, official rank, classification of people, debt, marriage, criminal law, abduction, slavery, disputes connected with land, evidence, inheritance, examining officers, appeal, disputes as to classification of people, radius of responsibility for burglaries, &c., the thirty-six laws, the royal edicts, trial by ordeal of water and fire, laws of the palace, laws of the priesthood, offences against the king, offences against the people, rebellion, ancient statutes, recent statutes. Only one of these sections, the one on slavery, has been translated into English, by Dr Bradley, it appeared in the *Bangkok Calendar*. The whole work has been printed at Bangkok in two volumes. The *Kathu Pha Aiyalai*, another compendium of laws, contains edicts principally referring to assaults, adultery, and the appraisement of fines. Among these we find the following: "A man who strikes another with a blank book shall be fined as though he had struck him with his hand, but if the assault is committed with a book of the classics the offender shall be fined twice as much as he would have had to pay for assaulting with a stick." The *Laksana*

Tot Fong, or law of plants and allegations, and of the institution and summary dismissal of suits, appears to be identical with the fifth section of the printed code. There is also a separate work called *Pha Thammawat*, which, though identical in name with the section of the *Laksana Pha Thammawat* above described, covers much more ground. A compendium of law entitled *Uang Kot Man Mudag Thai*, or Code of Laws of the Kingdom of Siam, in two volumes, was printed at Bangkok in 1879. Colonel Low, who did not touch on jurisprudence in his essay on Siamese literature, made good the omission in a separate article "On the Laws of Siam," in the first volume of Logan's *Journal of the Indian Archipelago* (Singapore, 1847).

Pallagors, in his "Catalogue præcipuum librorum lingue Thai" (*Gleanings*, pp. 172-180), gives the titles of a good many treatises on scientific subjects, medicine, mathematics, astrology, but none appear to have been critically examined. In the first volume of his *Description du royaume Thai* (1854) are inserted various pieces translated from Siamese works. See also on the Siamese language and literature generally the "Remarks" by the Rev O Gutzlaff, in the *Transactions of the Royal Asiatic Society*, vol. III (1835) pp. 291-304, and on the literature Leyden's "Essay" above referred to (*Miscellaneous Papers*, vol. I pp. 113-147). It is only in quite recent times that an Annamese influence has begun to be traceable in the language and literature of the Siamese.

In 1810 Dr Leyden undertook, at the instance of the Calcutta Auxiliary Bible Society, to superintend a translation of the four Gospels into Siamese, but he died before the project was carried into effect. Subsequently Messrs Gutzlaff and Tordin, assisted by learned natives, laboured till 1833 at a trustworthy translation of the new Testament into Siamese. Their task was continued and completed by Messrs Jones and Robinson, and the work was published in 1846. (R. E.)
